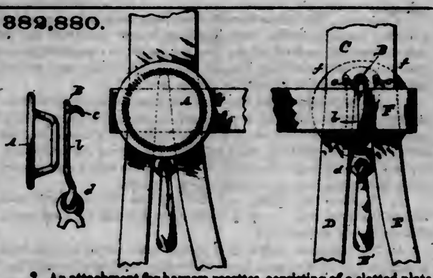
30. The combination of two portions of a series multiple electric-railway circuit and an automatic variable-resistance shunting device, substantially as set out, between the two portions of the railway to shunt more or less current around the motors on one portion of the railway and deliver it to the other portion of the railway, with two generators having similar poles coupled to the same line-conductor, but on opposite ends thereof, having the other and similar poles coupled to the other working-conductor at a point midway between the terminals of the working-conductors, whereby the resistance to the passage of the current shall be equal for all positions of the motors on the line, and the total resistance of the line shall be greatly reduced, substantially as and for the purpose specified.

382,878. MANUFACTURE OF BOOTS OR SHOES. JOHN C. IVERY, Somerville, Mass. Filed July 1, 1887. Serial No. 243,094. (No model.)

Claim.—In the manufacture of turned soots or shoes, that improvement which consists in uniting the soles and uppers by first lasting the upper to an unchamfered sole, then indenting and perforating the soles at different points simultaneously, as set forth, whereby an indentation is made successively in advance of each perforation, and finally stitching the parts together, all substantially as shown and described.

382,879. SPEED-BOX. Baron FRITZ JAGEMAN, Ste. Croix, Switzerland. Filed Mar. 30, 1888. Serial No. 268,891. (No model.) Patented in Germany Sept. 8, 1887, No. 43,511.



Claim.—1. The combination of the music-roller and its axle *c*, having on it a disk, *m'*, the driving-shaft *d*, having in it a bearing for one end of said axle, a coupling-connection, *k*, between said axle and shaft, a sliding bolt, *d'*, having a bearing for the other end of said axle, a bearing, *i*, for said sliding bolt, having a curved groove, *v'*, a lever, *h h'*, attached to said bolt and working in said curved groove, and a hooked bar, *y*, connected with said bolt and engaging with said disk *m'*, all substantially as and for the purpose herein described.

2. The combination, with the music-roller and its axle *c*, provided with disks *m m'*, of the levers 1 1, having fixed fulcrums and provided with seats or saddles 3 3 for said disks, a connecting-bar, 7, between said seats or saddles, and a hand-lever, 8, to operate on said connecting-bar, all substantially as and for the purpose herein described.

382,880. HARMING-ROSETTE ATTACHMENT. RICHARD W. JONES, Syracuse, N. Y. Filed Mar. 31, 1888. Serial No. 269,112. (No model.)

Claim.—1. As an attachment for harness-rosettes, an oblong slotted plate provided with hooks or studs at its upper end, the slot adapted to receive the loop or eye of a rosette, and the hooks or studs to secure the head-strap and brow-band of a bridle, substantially as set forth.

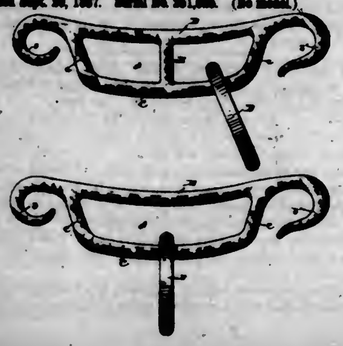
382,880.

2. An attachment for harness-rosettes, consisting of a slotted plate with hooks or studs on its rear upper portion, and a gag-runner at its lower end, substantially as set forth.

3. An attachment for harness-rosettes, consisting of a slotted plate with hooks or studs on its rear upper portion, and a gag-runner at its lower end, in combination with a rosette provided with a loop or eye, substantially as set forth.

4. The combination of the slotted plate having hooks or studs on its upper rear portion and a gag-runner at its lower end, and the head-strap, brow-band, and throat and cheek straps of a bridle, substantially as set forth.

382,881. DEVICE FOR CONVERTING MOTION. SALVIN F. KELLOGG, Clay Centre, Kans. Filed Sept. 12, 1887. Serial No. 249,570. (No model.)



Claim.—1. The combination of the supporting-frame, the gear-wheels mounted in said frame and meshing together and provided with internal ratchet-rims, the oscillating lever mounted above said wheels, the reciprocating rod connected to said lever, the pawls loosely mounted on the gear-wheel shafts, and the links connecting the opposite ends of the lever with the said pawls, substantially as described.

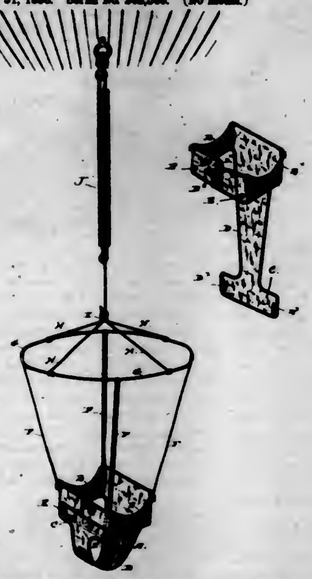
2. The combination of the supporting-frame, the cog-wheels mounted thereon and geared together and provided with internal ratchet-rims, the standards mounted on the supporting-frame, the oscillating lever fulcramed between said standards and forked at one end, the reciprocating rod having a yoke on one side, the head-block pivotally mounted in said yoke, and to which the tines of the forked end of the oscillating lever are fitted, the pawls loosely mounted on the shafts of the cog-wheels and engaging the ratchet-rims thereof, and the links connecting the ends of the lever with said pawls, substantially as specified.

382,882. COMPOSITION OF MATTER. JOHN A. KIESSLER, New York, N. Y. Filed Oct. 28, 1887. Serial No. 253,157. (Specimens.)

Claim.—The herein-described composition for castings, consisting of concrete and sugar, in about the proportions specified.

382,883. HAME-LINK. HEMAN R. LAMSON, Champaign, Ill. Filed Sept. 20, 1887. Serial No. 251,088. (No model.)

Claim.—1. The herein-described one-piece hame-link, comprising a top bar having a central depending loop formed therewith and its ends extended on each side of said loop and curved to engage the hame-eyes, one of said ends being adapted to close against the loop around one of the hame-eyes, all substantially as specified.



2. The herein-described hame-link, composed of an upper connecting-bar having its ends bent, as described, one of which is elongated to permit its closing around the eye of the hame, and a lower loop-rod having upturned ends lying just within the bent ends of the connecting-bar and formed integral therewith, in combination with a ring secured in the loop of the link, all substantially as set forth.

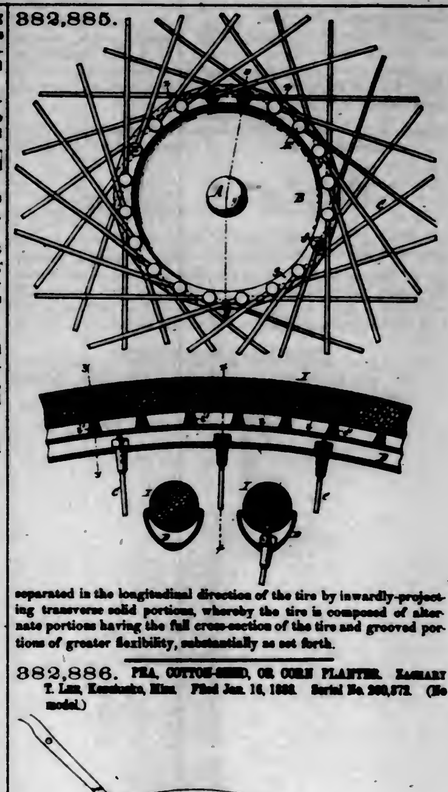
3. The hame-link having a central loop and curved hooked ends outside this loop, and a central division-bar dividing the loop-space, all substantially as described.

4. The hame-link consisting of an upper bar having its ends bent to engage the hame-eyes, a loop-rod formed integral with said bar; a division-bar in said loop-space connecting the loop-rod with the upper bar, and a ring in one of the spaces of said loop, substantially as specified.

5. The hame-link for harness, consisting of an upper bar, B, having bent ends *b b'*, a loop-rod, C, having bent ends *c c*, formed integral with bar A and widened at the junctions therewith, a re-enforce division-bar, E, connecting bar B and rod C centrally of the loop-space, and a solid ring, D, mounted on the loop-bar on one side of bar E, all constructed and arranged substantially as specified.

382,884. BABY-JUMPER. BENJAMIN G. LATHROP, Oakland, Cal. Filed Jan. 31, 1888. Serial No. 262,569. (No model.)

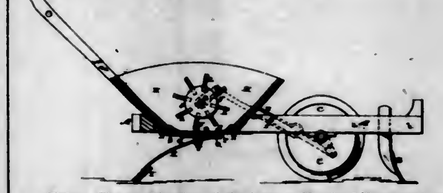
Claim.—The combination of the sling, composed of the body-band having armpits B B×, buttons B^9 and E, button-holes B^9, and the crotch-piece D, having cross-shaped end C, formed with button-holes B^9, to receive buttons E, the suspension-straps F, the hoop G, cords H, and spring J, all arranged substantially as described.



382,885. VELOCIPEDE-WHEEL. ROBERT G. LATTA, Friendship, N. Y., assignor to the Pope Manufacturing Company, Portland, Me. Filed Sept. 16, 1887. Serial No. 249,893. (No model.)

Claim.—1. The combination, with the hub-flange and two spokes headed at their inner ends, of a straight cylindrical coupler seated in an opening in the hub-flange and provided on opposite sides of the hub-flange with countersunk openings in which the headed ends of the spokes are seated, the spokes resting against the flange and the inner side of the spoke-head resting inside the flange, substantially as set forth.

2. The combination, with the spokes and the hub-flange bent or corrugated near its outer edge, of couplers seated in said corrugated portion of the hub-flange and supporting the inner ends of the spokes, substantially as set forth.

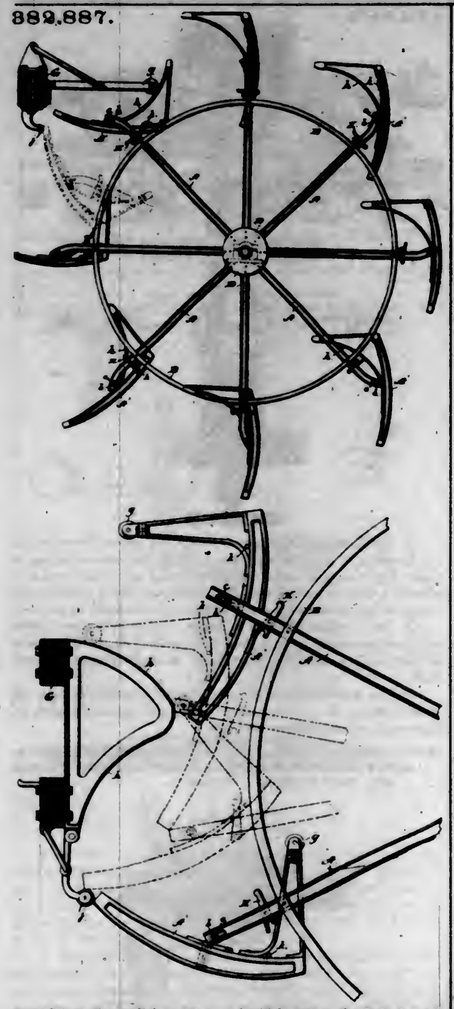


3. The combination, with the wheel-rim, of a flexible tire provided on its inner surface with a peripheral series of depressions or recesses

382,885.

separated in the longitudinal direction of the tire by inwardly-projecting transverse solid portions, whereby the tire is composed of alternate portions having the full cross-section of the tire and grooved portions of greater flexibility, substantially as set forth.

382,886. PEA, COTTON-SEED, OR CORN PLANTER. ZACHARY T. LEE, Kosciusko, Miss. Filed Jan. 16, 1888. Serial No. 260,572. (No model.)



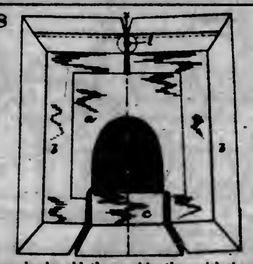
Claim.—The combination of the hopper H, wheel J, secured to the shaft G, and provided with adjustable pins L, the plate O, held in position against the bottom by the guides N, the slide R, which moves through the guides Q, and is provided with the projection U, spring S, and the spring cleaning device T, which has its inner end turned upward, substantially as shown and described.

382,887. CONSTRUCTION OF WATER-WHEELS WITH MOVABLE FLOATS OR PADDLES. JULES FRANÇOIS LEMOINE, Paris, France. Filed Nov. 16, 1887. Serial No. 255,203. (No model.) Patented in France June 2, 1887, No. 171,628; in Belgium Oct. 28, 1887, No. 78,376; in England Oct. 26, 1887, No. 14,695, and in Germany Nov. 2, 1887, No. 4,260.

Claim.—1. In a water-wheel, the combination of a paddle suspended on pivots in an arm of the wheel, said pivots being situated on the paddle somewhat above its center of gravity, so that it tends to hang vertically, an arm projecting from the upper end of the paddle, a stationary roller or rollers carried by a fixed beam with which said arm comes in contact, so as to cant the paddle over from its vertical position into a radial or nearly radial position, and a catch on an arm of the wheel that holds the paddle in the canted or radial position until the paddle passes out of the water, substantially as described.

2. In a water-wheel, the combination of a paddle suspended on pivots in an arm of the wheel, said pivots being situated above its center of gravity and free to slide in radial slots in the said arm, an arm projecting from the upper end of the paddle, one or more stationary rollers carried by a fixed beam and with which the said arm comes in contact, so as to turn the paddle from a vertical to a radial or nearly radial position, a forked catch on an arm of the wheel, and a stud on the paddle which passes behind the catch while the paddle is being

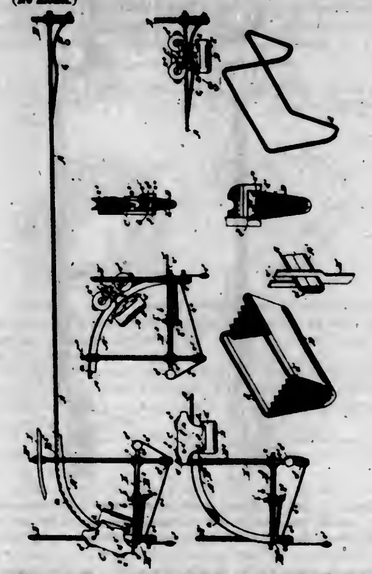
382,887.



turned into the radial position, and which enters the forked catch when the paddle, having slid outward in the slots, is set free by the roller and tends to resume its vertical position, substantially as described.

3. In a water-wheel, the combination of a paddle pivotally mounted in radial slots in an arm of the wheel, a forked catch on the said arm, and a stud on the paddle, said stud being so situated as to pass behind the said catch when the paddle is turned on its pivots and while said pivots are situated at the inner ends of the radial slots, and to pass into the slot of the catch when the paddle is turned on its pivots in a contrary direction and while said pivots are situated in the outer ends of the slots, substantially as described.

4. In a water-wheel, the combination of a paddle pivotally mounted in an arm of the wheel, so as to tend to hang vertically, a curved arm projecting from the upper end of the paddle, an upper stationary roller carried by a fixed beam and against which said arm bears, so as to turn the paddle on its pivots, a lower stationary roller, also carried by said fixed beam, against which the lower end of the paddle bears, so as to be turned still farther on its pivots, and a catch on an arm of the wheel into which a stud on the paddle catches after it has been released by the lower roller, substantially as described.



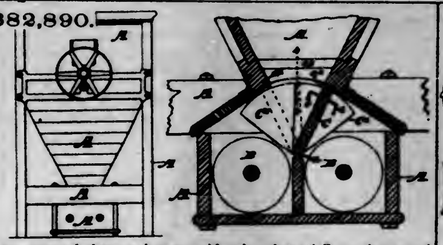
382,888. HEEL-MOLD. EDWARD J. LE GAY, Boston, Mass. Filed Jan. 18, 1888. Serial No. 261,078. (No model.)

382,888

Claim.—In a heel-mold, the combination, with the separable rigid holders, of the integral elastic piece held thereby, having a seamless molded surface normally more widely opened at its forward than at its rear end, and adapted to be compressed at such forward end to form the narrower front portion of the heel, substantially as described.

382,889. CASH AND PARCEL CARRYING APPARATUS. HENRY L. LOVEJOY, Lowell, Mass. Filed Sept. 16, 1887. Serial No. 249,851. (No model.)

Claim.—1. The combination of a track or way having a straight section and an arc-shaped end section, a carrier adapted to travel on said way, and a lever having its fulcrum at the center of said arc, and adapted, when turned upon its fulcrum, to propel said carrier along said arc and from said arc onto said straight section, as and for the purpose specified.



2. The combination of the track and a carrier adapted to travel thereon, said track having an arc-shaped end section, a lever having its fulcrum at the center of said arc, and stops to limit the motion of said lever, as and for the purpose specified.

3. A carrier adapted to be hung upon a suspended track and to travel thereon, having a frame extending below said track, provided with a groove in its under side, pins or projections extending into said groove from the sides thereof, and a pouch of flexible material having a spring-frame adapted to be compressed at the top to pass said pins, and to spring outward over said pins and to be retained thereby, as and for the purpose specified.

382,890. SHIFTING GATE FOR CONVEYERS. DANIEL W. MARMON, Indianapolis, Ind., assignor to the Herdyte & Marmon Company, same place. Filed June 5, 1886. Serial No. 167,725. (No model.)

Claim.—The combination of the casing A, a central partition thereto, conveyers on each side of said partition, shifting gates mounted on said partition and provided with ends C, each of which is of just sufficient size to overlap the edge of that on the adjacent gate when it is turned in the opposite direction, and the cross-partitions c^2, which

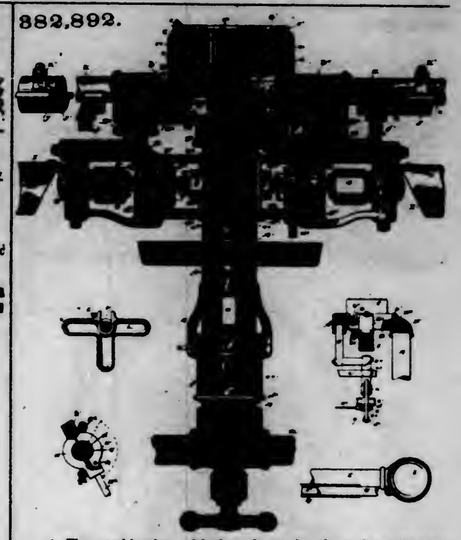
382,890.

are arranged above and cover said ends, substantially as shown and described, and for the purposes specified.

382,891. PITMAN ATTACHMENT FOR MOWING-MACHINES. FRANK MCMAHON, ADA C. SHARP, and CHARLES H. LILES, Darlington, Ind. Ter. Filed Jan. 21, 1888. Serial No. 261,473. (No model.)

Claim.—1. The combination of the wheel and the plates secured thereto with the pitman-rod having a head formed upon one end, and which head fits between the wheel and the plates, substantially as shown.

2. The combination of the wheel, having a circular recess, B, formed in its outer side, the two semicircular plates F, secured to the outer side of the wheel, and also provided with a recess, and a pitman-rod provided with a head which fits in the recess in the wheel and plate, substantially as described.



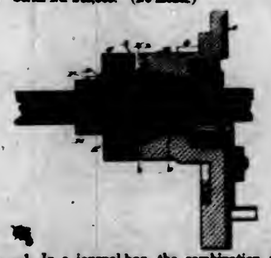
382,892. VAPOR-BURNER. WILLIAM MEYERSBERG, Cleveland, Ohio. Filed June 17, 1887. Serial No. 241,681. (No model.)

Claim.—1. The combination, with a needle-valve having a screw-threaded portion and a thimble screw-threaded internally, of a sleeve mounted on the valve, said sleeve being screw-threaded externally and internally for engaging the threads of the thimble and of the valve, and an adjustable clamp or clutch adapted to grip the sleeve for operating the latter, substantially as set forth.

2. The combination, with a needle-valve having a screw-threaded portion and an angular portion adapted to extend through a similar-shaped opening, wherein said valve may have an endwise movement, but not a rotary movement, and a stationary thimble screw-threaded internally, of a sleeve mounted on the valve, said sleeve being screw-threaded externally and internally for engaging the threads of the thimble and of the valve, and an adjustable clamp or clutch adapted to grip the sleeve for operating the latter, substantially as set forth.

3. The combination, with a needle-valve, a stationary thimble, and a sleeve adapted to turn in the thimble, said sleeve being internally threaded for the reception of the needle-valve, of an adjustable friction clamp or clutch mounted on the sleeve for operating the same, substantially as set forth.

382,892.



4. The combination, with the valve and a sleeve for reciprocating the valve, of an adjustable friction-clutch, the latter consisting of a pair of pivoted jaws and a screw for holding said jaws together, a suitable handle connected with the clutch, and lugs for limiting the movement of the clutch in either direction, substantially as set forth.

5. The combination, with a burner having cylindrical slotted shell and imperforate top and upwardly-projecting rim, of one or more internal circumferential ribs integral with the shell, substantially as set forth.

6. The combination, with retort, lateral commingling-tube, and outside burner, of a lighting-tube, trough, and connecting-tubes for the trough, substantially as set forth.

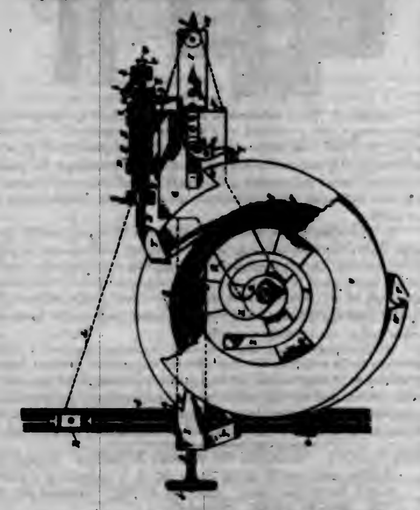
382,893. JOURNAL-BOX. JOHN C. MILLER, Springfield, Ohio, assignor to the Thomas Manufacturing Company, same place. Filed Sept. 7, 1887. Serial No. 248,608. (No model.)

Claim.—1. In a journal-box, the combination, with a slotted sleeve having a sphere-like enlargement, of the box proper, composed of two parts whose adjacent faces are each provided with a spherical enlargement which embraces the said sphere-like enlargement, with a space between them, and devices to draw the said parts toward each other and axially to the sleeve, whereby the sleeve is compressed and its interior shaft-journal reduced in diameter.

2. In a journal-box, the combination, with the box proper, composed of two vertical parts having horizontal openings therein and whose adjacent faces are each provided with a spherical enlargement and devices to draw said parts together, of a compressible bearing fitted within said box, composed of a slotted sleeve loosely fitted in said openings and having a sphere-like enlargement within the said spherical enlargement of the box proper, and compressible by drawing the parts together in a direction longitudinally to the slot in the sleeve.

382,894. HEDDAEUS. JOHN F. K. O'CONNOR, Yonkers, N. Y. Filed Oct. 15, 1887. Serial No. 252,512. (No model.)

Claim.—1. An automatic cover-closing inkstand comprising two or more ink-receptacles located and secured in place upon a common base, in immediate proximity to each other, so that the cover of one on opening it comes into direct contact with either or all of the other cov-



382,894.

ers that may be open and thereby closes the same, substantially as and for the purpose hereinbefore described and shown.

2. In an automatic cover-closing inkstand comprising two or more ink-receptacles located upon a common base, the combination of the common base with a sub-base by means of a revolving socket and pivot, substantially as and for the purpose hereinbefore described and shown.

382,895. ROCK-DRILL. WILLIAM O'KEEFE, Hilston, Mont. Filed July 27, 1887. Serial No. 245,033. (No model.)

Claim.—1. The standard and guide-adjustably fixed and having the traveling carriage moving upon the guide, in combination with the drill, the sleeve through which it passes, and the rotating mechanism, and the wheel or disk having the spring-handled hammers attached thereto, and the spring or elastic turning-crank, substantially as herein described.

2. The adjustable guide, the drill-carriage traveling thereon, and the cylindrical box supported on the carriage and having a zigzag or cam groove around it, in combination with the cylindrical drill-carrying sleeve within the box, having a pin projecting outwardly into the cam-slot, and a centrally-fulcrumed lever, Y, one end of which acts to reciprocate the drill-carrying sleeve, and the cam W upon the hammer-carrying disk, and a retracting-spring, *d*, acting upon the opposite end of the lever, substantially as herein described.

3. The cylindrical drill-carrying sleeve B, loosely fitting into the stationary box or holder D, and a pin projecting from the sleeve through a zigzag or cam slot in the box or holder, in combination with a lever, Y, by which the sleeve is reciprocated within the holder, said lever having the arms *a* and *b* standing diagonally, so that one will strike the front and the other the rear of the circumferential groove in the drill-sleeve to reciprocate it and cause the pin to travel in the cam-groove, substantially as herein described.

4. The cylindrical sleeve B, having the exterior pin projecting into a zigzag slot in the box or holder D, within which it is reciprocated and rotated, and having an axial hole through its center, with a square or polygonal chamber at the rear end; in combination with a drill-shank loosely fitting the hole in the sleeve, and a square or polygonal collar secured to the drill-shank and fitting the chamber, substantially as herein described.

5. The drill-carrying sleeve B, box or holder D, and the forked reciprocating lever supported upon the traveling carriage, in combination with the rotary disk having pins and cam flanges, the shaft of which is journaled in extensions or supports from the carriage, and the hammers having the curved elastic handles secured to the periphery of the disk between the projecting flanges, substantially as herein described.

382,896. LUBRICATING CRANK-PIN. GARDNER B. PARKER, Worcester, Mass., assignor to the Richardson Manufacturing Company, same place. Filed Dec. 10, 1887. Serial No. 258,260. (No model.)

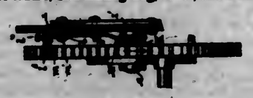
Claim.—The combination, with a crank disk or arm and a connecting-rod, S, having the end 7, provided with an oil-tube, 10, of the crank-pin 3, of the same external diameter and having a central chamber, 4, and an oil-feed hole, 5, therein, the position of said feed-hole corresponding to the position of said oil-tube for the introduction of oil into said chamber 4, and a bolt, 6, for closing the outer end of the chamber 4, and a washer for holding the end of the connecting-rod upon the crank-pin 3, substantially as shown and described.

382,897. DEVICE FOR REGULATING TEETH. JOHN J. B. PARSONS, Belleville, Ill. Filed July 30, 1887. Serial No. 245,731. (No model.)

Claim.—1. A dental arched spring for regulating teeth, provided with an adjusting-screw extending lengthwise of the leg of the spring, engaging a bearing attached to the bow, and a threaded lug on the loop-band, substantially as specified.

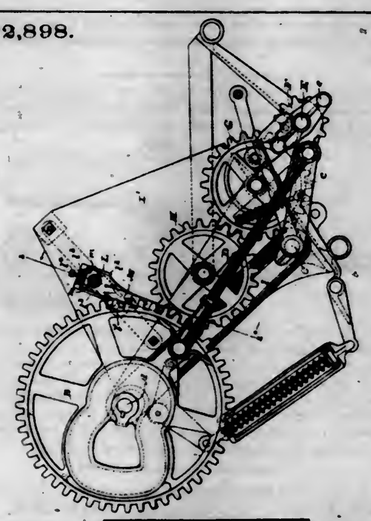
2. The combination, with a dental bow-spring, of an adjustable clamp having a threaded perforation, an adjustable slide-bearing, and an adjusting-screw extending parallel to the leg of the bow-spring, substantially as specified.

3. The combination, with a dental bow-spring, of the open loop C secured by the clamp-screw *y* and adjusted by the screw *k*, substantially as specified.



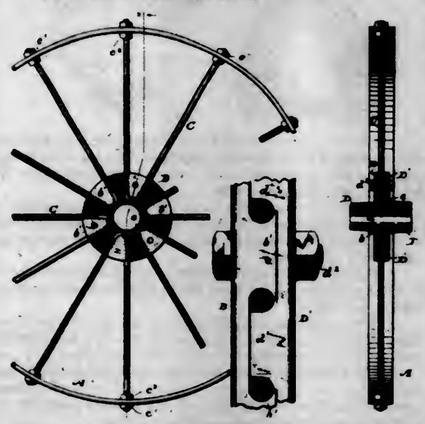
4. The combination, with a dental bow-spring, of a branched loop-clamp having a clamp-screw, a bearing-slide having a double-wedge fastening, and a regulating-screw, substantially as specified.

5. The combination, with a dental bow-spring and its slides, bearing attachment, and regulating devices, of the double-wedge fastenings, each consisting of a thin or ribbon form middle portion increasing in thickness toward the ends, substantially as specified.



382,898. GRAIN-BINDER. HENRY H. PERSHING, Chicago, Ill., assignor to the McCormick Harvesting Machine Company, same place. Filed Dec. 7, 1886. Serial No. 220,878. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, with the main gear in a binding attachment, of the ratchet-teeth on the inner face of said gear, the chair bolted to the adjacent frame, the longitudinally-slotted plate-spring seated in said chair, and the bolt passing through the slot in said spring, through the chair and frame, and serving to secure the three together, and the set-screw mounted in a lug on said chair bearing against the heel end of the spring.



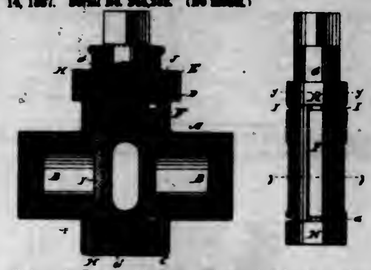
2. The combination, substantially as hereinbefore set forth, of the chair L, having lateral snugs *P*, the plate-spring or dog having a longitudinal slot in its shank and an upturned flange at its heel end, the set-screw in the lug of the chair bearing against said flange, the bolt which enters the open end of the chair to the frame, and the bolt passing through the slot in the dog, through the chair near its lug end and through the frame, and uniting dog, chair, and frame.

382,898.

382,899. WHEEL. HENRY R. PRESSER, Chicago, Ill., assignor to the McCormick Harvesting Machine Company, same place. Filed Sept. 1, 1887. Serial No. 248,503. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the metal wheel-rim, the central binding-disk provided with equidistant open lugs upon its face, the centrally-bent spokes catching over said lugs, and the independent detachable hub.

2. The combination, in a metal wheel, of a metal rim and a central binding-disk provided with lugs upon its face, spokes formed of centrally-bent rods which fit over said lugs at their apexes and extend thence to the rim, an independent hub having a bearing-sleeve passing through the center of the disk, and a flange which comes against the face of said disk and confines the spokes thereon, and bolts passing through said flange and disk.



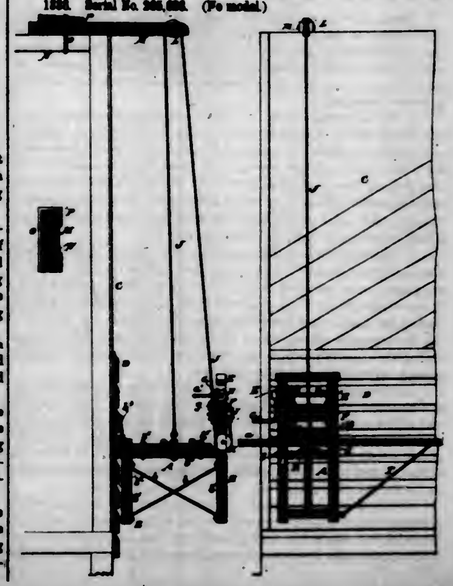
3. The combination, substantially as hereinbefore set forth, with the metal wheel-rim, the central binding-disk and its flaring lugs, and the centrally-bent spokes, of the tapering hub, its annular flange, and the bolts uniting said flange to the binding-disk.

4. The combination, substantially as hereinbefore set forth, of the wheel-rim, the central binding-disk having radially-flaring lugs, the centrally-bent spokes taking over said lugs and at their ends passing through the rim, the nuts applied to the outer end of said spokes exteriorly to the rim, the hub and its annular flange, and the bolts uniting said flange to the binding-disk.

5. The combination, substantially as hereinbefore set forth, of the wheel-rim, the central binding-disk having radially-flaring lugs, the centrally-bent spokes taking over said lugs and at their ends passing through the rim, the nuts applied to the outer end of said spokes exteriorly to the rim, the hub and its annular flange, and the bolts uniting said flange to the binding-disk.

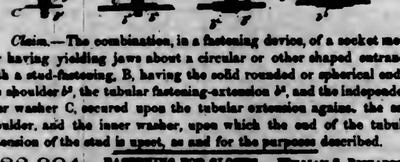
6. The combination, substantially as hereinbefore set forth, of the wheel-rim, the central binding-disk having flaring lugs, the centrally-bent spokes taking over said lugs, the hub having an annular flange provided with teeth or projections entering into the spaces between said lugs, and the bolts uniting said flange to the binding-disk.

382,900. COCK. JOSEPH A. PEROT, New York, N. Y. Filed July 14, 1887. Serial No. 244,262. (No model.)



Claim.—1. The combination, with the shell having a plug-seat, a fluid-passage, and a cap-seat, of a cap made to engage said cap-seat, a plug provided with necks and with longitudinal packing-strips, and collars movably secured to said necks and made to engage the packing-strips, one of said collars being made to rest upon the plug-seat, and said cap being made to act upon the other collar, substantially as set forth.

2. The combination, with the shell having a plug-seat, a fluid-passage, and a cap-seat, of a cap made to engage said cap-seat, a plug provided with longitudinal packing-strips, and movable collars, with which the cap and plug-seat respectively engage, whereby the collars are made to act on said packing-strips, one of said collars being made to rest upon the plug-seat, and said cap being made to act upon the other collar, substantially as set forth.



3. The combination, with the shell having a plug-seat, a fluid-passage, and a cap-seat, of a cap made to engage said cap-seat, a plug provided with longitudinal dovetail grooves, packing-strips secured in said grooves, and movable collars made to act upon said packing-strips, one of said collars being made to rest upon the plug-seat, and said cap being made to act upon the other collar, substantially as set forth.

382,901. SCAFFOLD FOR WOODEN BUILDINGS. CHARLES W. RANDALL and JAMES H. SMITH, Jersey City, N. J., assignors of one-third to S. F. Bailey, same place. Filed Feb. 11, 1887. Renewed Feb. 23, 1888. Serial No. 265,033. (No model.)

Claim.—1. In a carpenter's scaffold, the combination of the platform-frame B, having a rubber roll to bear against the house, the hand-shaft G, carrying detent *g* and pinion H, the windlass having spur-wheel I, the adjacent steadying-pulley K, the trunk Q, bars R R, and pins S S, the superposed pulley L, and the rope J, the latter attached at one end to the windlass and at the other to the middle of the platform, as shown and described.

382,902. VEHICLE-AXLE. RICHARDS F. RICHARDSON, Cincinnati, Ohio. Filed Oct. 27, 1887. Serial No. 253,502. (No model.)

Claim.—1. A resilient wire ring, H, having an opening or blank, A, in its circumference, and hollowed or dished diametrically in two lines, one line being at right angles to the other, substantially as herein set forth.

2. The combination, with axle-box A, having chamber *a* at its inner end and circular ridge or elevation *d* on the bottom of said chamber, of an open resilient wire ring, H A, hollowed or dished diametrically in two lines, one line being at right angles to the other, substantially as herein set forth.

3. The combination, with a chambered or shouldered axle-box, A *a*, of an open resilient wire ring, H A, hollowed or dished diametrically in two lines, one line being at right angles to the other, substantially as herein set forth.

4. The chamber or socket *a* at the inner end of the axle-box, having a circular ridge or elevation, *d*, on its bottom, substantially as herein set forth.

5. The combination, with chamber or socket *a* at the inner end of the axle-box, having the circular ridge or elevation *d*, of a washer composed of leather or other similar suitable material, substantially as and for the purpose specified.

6. An axle-arm having a collar or shoulder, *b*, and a circular ridge or elevation, *b'*, constructed on the front face of said collar, intermediate its inner and outer edges, substantially as and for the purpose specified.

7. The combination, with collar *b* on the axle-arm, having the circular ridge or elevation *b'*, of a washer, D, composed of leather or other similar suitable material, substantially as and for the purpose specified.

8. The combination of an axle-box having at its inner end a chamber or socket, *a*, provided with a circular ridge or elevation, *d*, and an axle-arm having collar *b* and circular elevation *b'*, said ridges or elevations embedding themselves in the substance of the lubricating-washer D on the turning home of the nut on the axle-arm, substantially as and for the purpose specified.

9. The combination of axle-box A, having a socket or chamber, A', at its outer end, the axle-arm C, nut G, having a circular ridge or elevation, *g*, on its inner face, and a lubricating-washer, E, constructed, arranged, and operating substantially as herein set forth.

382,903. GLOVE-FASTENING. WILLIAM S. RICHARDSON, Boston, and JOSIAH R. CRANE, Newton, Mass., assignors to the Ball and Socket Fastener Company, Boston, N. H. Filed Dec. 31, 1883. Serial No. 157,260. (No model.)

Claim.—The combination, in a fastening device, of a socket member having yielding jaws about a circular or other shaped entrance, with a stud-fastening, B, having the solid rounded or spherical end *b*, the shoulder b^2, the tubular fastening-extension b^3, and the independent over washer C, secured upon the tubular extension against the said shoulder, said the inner washer, upon which the end of the tubular extension of the stud is upset, as and for the purposes described.

382,904. FASTENING FOR GLOVES. WILLIAM S. RICHARDSON, Boston, Mass., assignor to the Ball and Socket Fastener Company, Boston, N. H. Filed Jan. 24, 1888. Serial No. 261,794. (No model.)

Claim.—1. In the fastening for gloves and other articles, the combination of the cap *a*, the collet *b*, having the central hole, *b'*, and

382,904.

the slit eyelet *c*, held in the hole of the collet by the collet and the cap, as and for the purposes described.

2. The combination, in a fastening for gloves and other articles, of the cap *a*, the collet *b*, the slit eyelet *c*, and the prongs or fastenings b^3, integral with the collet, substantially as described.

3. The combination, in a fastening for gloves and other articles, of the cap *a*, the collet *b*, the slit eyelet *c*, held by the collet and cap, as specified, the fastening prongs or extensions b^3, extending from the outer section of the fastening, and the under washer, *d'*, having the holes *d*, as and for the purposes described.

4. The combination, in a fastening for gloves and other articles, of the cap *a*, the collet *b*, the slit eyelet *c*, held by the collet and cap, as specified, the under washer, *d'*, its sleeve d^2, and fastening prongs or extensions for uniting the collet and the under washer, substantially as described.

5. The combination of the cap *a*, the collet *b*, having the hole *b'* and united to the cap, with the slit eyelet *c*, having the enlarged section *c'*, the shoulder c^2, and the grasping-section c^3, having the opening c^4, substantially as described.

6. In a fastening for gloves and other articles, the combination of the cap *a*, having a flat or substantially flat top, the collet *b*, made dish-shaped and united at its edge to the cap, with the slit eyelet *c*, held by its flange between the collet and cap, substantially as described.

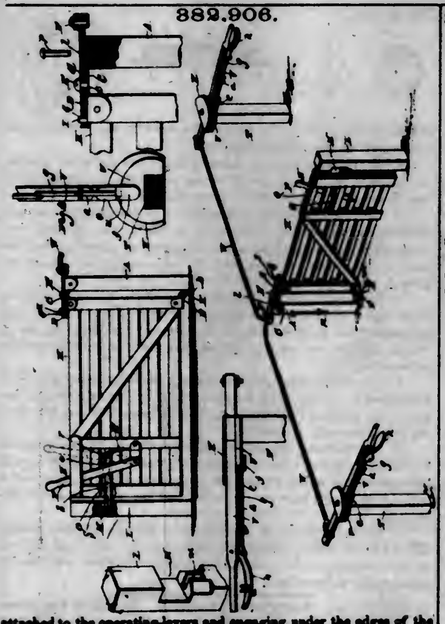
7. The combination, in a fastening for gloves and other articles, of the collet *b*, having the short prongs, with the cap *a* and the ball or stud receiving device *c*, supported between the collet and the cap, substantially as described.

382,905. FASTENING FOR GLOVES. WILLIAM S. RICHARDSON, Boston, Mass., assignor to the Ball and Socket Fastener Company, Boston, N. H. Filed Jan. 24, 1888. Serial No. 261,795. (No model.)

Claim.—The improvement in fastenings for gloves and other articles, comprising the cap *a*, the collet *b*, having a large hole, *b'*, the slit eyelet *c*, having the flange *c'* and an extension which enters the hole in the collet, and is of a size sufficient to provide a space or recess between it and the inner edge of the collet, and an eyelet under washer or fastening having a fastening extension or extensions which enter the collet-hole outside the extension of the slit eyelet, and is or are upset or turned upon the flange of the eyelet and caused to lap or extend upon the upper surface of the collet, as and for the purposes set forth.

382,906. GATE. REUBEN H. SAYER, New Martinsville, assignor of two-thirds to Thomas W. Carroll and John W. Carroll, Keyser, W. Va. Filed Jan. 17, 1888. Serial No. 261,018. (No model.)

Claim.—1. The combination of the gate, the lever D, the standards erected to the sides of the gate, the lever V, mounted on said standards, connecting-rods between the levers V and D, and clutches carried by the levers V and engaging the standards, as set forth.



2. The combination of the gate, mechanism for tilting and swinging the same, the latch-post, the spring-actuated bolt having the shoulder S, and the pins *s* above the bolt and engaged by the shoulder S, substantially as specified.

3. The combination with the hinge-post and the gate hinged at its bottom thereto, of the lever D, mounted on the upper end of the post and connected pivotally at its inner end to the top of the gate, the standards T T, the shouldered plates on their upper ends, and the operating-levers mounted on the plates and connected to the lever D, the said operating-levers being provided with clutches to engage shoulders on the said plates, substantially as and for the purpose specified.

4. The combination, with the lever D, mounted on a suitable post, and the gate hinged to the post and connected to the inner end of the lever, of the shouldered plates U U, suitably supported at convenient distances on opposite sides of the gate, the operating-levers mounted on the plates and connected at their outer ends to the outer end of the lever D, and the clutches mounted on the levers and comprising the bolts *g*, which are adapted to engage the shoulders on the plates U, and the handles mounted on the operating-levers and connected to the said bolts, substantially as and for the purpose specified.

5. The combination, with the lever D, mounted on a suitable post, and the gate hinged to the post and connected to the inner end of the lever, of the plates U U, having shoulders *u u* thereon, the operating-levers connected at their outer ends to the lever D, the guide-plates *f*,

382,906.

attached to the operating-levers and engaging under the edges of the plates U U, and the clutches mounted on the operating-levers and comprising the bolts *g g*, sliding in suitable keepers, *e* and *e*, and the handles connected to the bolts and adapted, when released, to drop at their free ends and project the bolts into engagement with the said shoulders *u*, substantially as and for the purpose specified.

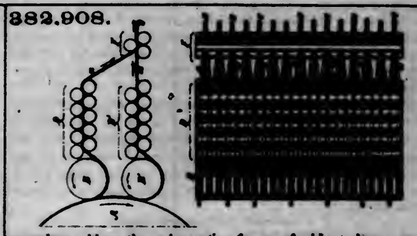
6. The combination, with the gate hinged to a suitable post and connected to the end of a lever, D, of the plates U U, having shoulders *u u* thereon, the operating-levers mounted on the plates and provided with automatic clutches to engage the said shoulders, and the caps arranged over the plates, substantially as and for the purpose specified.

7. The combination of the post having a socket in its upper end, the lever D, mounted on the post and having an aperture adapted to align with the said socket, the gate hinged to the post and connected at its top to the inner end of the lever D, operating-levers connected to the outer end of the said lever D, and the pin *p*, adapted to be inserted in the aligned aperture and socket to lock the lever D against movement, substantially as and for the purpose specified.

382,907. MANUFACTURE OF ARTIFICIAL COPAL, ROBERT REHAAS, Stuttgart, Würtemberg, Germany. Filed Mar. 27, 1885. Serial No. 160,377. (Specimens.)

Claim.—1. The new resinous product herein described, which is produced by the action of an alcohol on a resin acid, which dissolves readily in petroleum-benzine, but is insoluble in alkaline carbonates, and which by the action of a caustic alkali splits up into a resin acid and an ether.

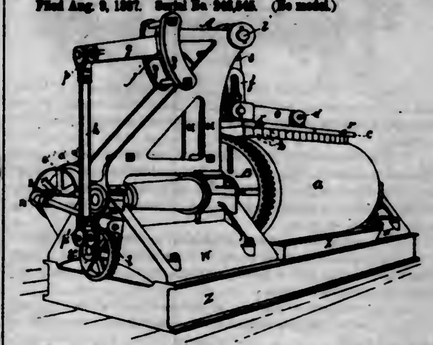
2. The new resinous product herein described, produced by the action of an alcohol upon colophony, which product is soluble in petroleum-benzine but insoluble in alkaline carbonates, and which by the action of caustic alkalies splits up into abitic acid and the ether of the alcohol employed in the operation.



382,908. MACHINE FOR MAKING HEAVY ROVINGS. JOHN SCHOLES, Philadelphia, Pa. Filed Mar. 5, 1887. Serial No. 229,774. (No model.)

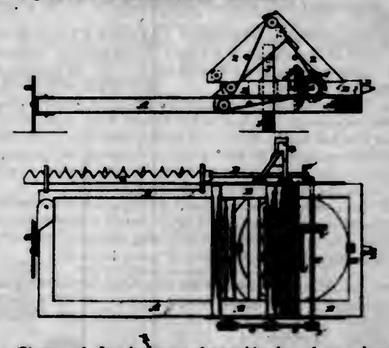
Brief.—Each fibrous web or strip is condensed to form a fine slubbing, and then several fine slubbings are united and subjected to a second rubbing operation to form a heavy slubbing.

Claim.—1. The combination of the cylinder and doffers of a carding-machine, upper and lower sets of rubbers, one for each doffer, a single set of secondary rubbers, and means for supporting and operating said rubbers, all substantially as specified.



2. The combination of the cylinder and doffers of a carding-machine, upper and lower sets of rubbers, one for each doffer, a set of

382,908.

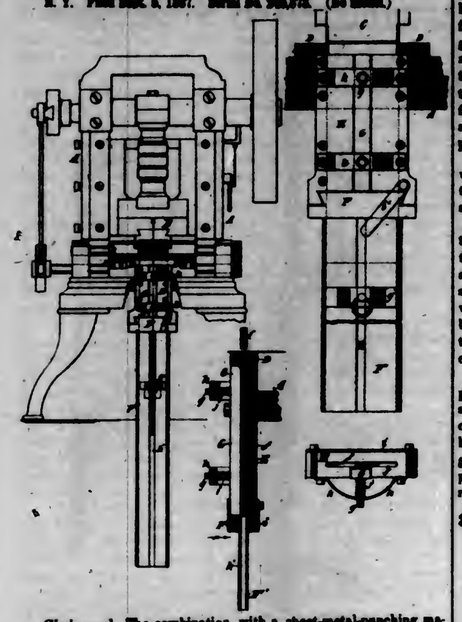


secondary rubbers, the reciprocating frames of said sets, bars connecting the frames of one of the sets of main rubbers with those of the secondary set, and means for reciprocating the rubber frames, all substantially as specified.

382,909. POLISHING-LATHE. HIRAM H. SNOVILLE, Chicago, Ill. Filed Aug. 9, 1887. Serial No. 246,045. (No model.)

Claim.—In a stone-polishing lathe, a frame to receive and hold the polishing-bricks, in combination with a bell-crank lever, A, link *c*, arm or bar *f*, connecting bar or rod A, worm-wheel *l*, and worm *m*, substantially as and for the purposes specified.

382,910. HARVESTER. JAMES SHIELDS, Broadway, Va. Filed Aug. 16, 1887. Serial No. 246,572. (No model.)



Claim.—1. In a harvester, the combination of a supplemental frame, in which the grain-wheel is mounted, having the tongue secured thereto, and the platform-frame, the supplemental wheel-carrying frame being swiveled upon the stubble end of the platform-frame, whereby said frame can be swung around and bring the tongue and main wheel into line with the platform, substantially as shown.

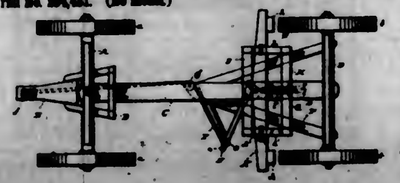
2. In a harvester, the combination of a supplemental wheel-carrying frame, the driving-wheel journaled therein, the tongue secured to the wheel-frame, the platform-frame, upon the inner end of which the wheel-carrying frame is swiveled, and the pivoted grain-wheel on the grain end of the platform-frame, whereby the grain-wheel, the supplemental or wheel-carrying frame, and the tongue can be turned into line with the platform-frame, substantially as described.

3. The combination, in a harvester, of a supplemental wheel-carrying frame, in which the driving-wheel is journaled, and to which the tongue is secured, of the platform-frame, upon which is swiveled at its

stubble end the wheel-carrying frame, and which is supported at its grain end by the pivoted grain-wheel, the said wheel-carrying frame having a spindle adapted to receive a supplemental wheel when the wheel-carrying frame and the tongue are turned into a line with the platform-frame for the purpose of transporting the machine, substantially as set forth.

382,911. MATT-HOLDER FOR FURNISHING-MACHINES. RALPH J. SHUPLEY, Waterbury, Conn., assignor to George W. Hoffe, New York, N. Y. Filed Sept. 5, 1887. Serial No. 248,572. (No model.)

Claim.—1. The combination, with a sheet-metal-punching machine, of a slotted case for receiving the blanks as cut out, and a presser-bar for applying friction to the edges of such blanks, and a removable sheath below the slotted case for receiving the blanks and in which they are conveyed away, substantially as set forth.



2. The combination, with a sheet-metal-punching machine, of the slotted case E, the friction-bar G, pins *g*, coiled springs *j*, bearing-bars A, the plate *i*, swinging arm *l'*, and a sheath, F', having a dovetailed block to be removably connected to the case E, substantially as set forth.

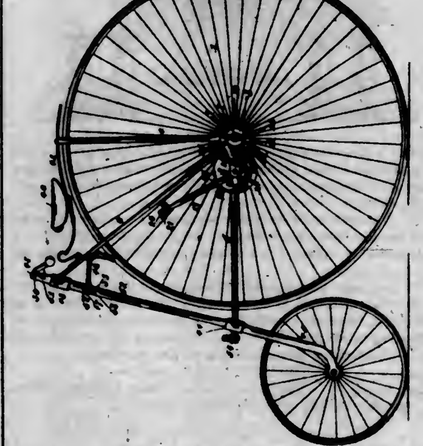
3. In a sheet-metal-punching machine, the combination of the slotted case E, the lower end of which has a dovetail groove, with the dovetailed block F and sheath F', adapted to be connected to said case E, the friction-bar G, and springs for pressing said bar against the descending blanks, and the holder *g'* in the case F', substantially as set forth.

4. The combination of a slotted case for receiving blanks from a punching-machine, with a sheath detachably connected with said slotted case for receiving the blanks therefrom, substantially as described.

5. The combination of a slotted case for receiving blanks from a punching-machine, with a longitudinally-slotted sheath detachably connected with said slotted case for receiving the blanks therefrom, substantially as described.

382,912. WAGON-BRAKE. JOB SMITH, Chemung, N. Y., assignor of one-half to Elmer E. Warren, same place. Filed Nov. 7, 1887. Serial No. 254,451. (No model.)

382,912.



Claim.—1. In a wagon-brake, the combination of the rectangular guide-frame constructed as described and secured upon the rear bounds, the brake-bar sliding between the side guide-plates of said frame, the guide-loops embracing the upper of said side guide-plates, the guide-bar extending rearward from said brake-bar and passing through an opening in a standard rising from the rear plate of the guide-frame, the coiled spring surrounding the guide-bar between the standard and the brake-bar, the toggle-joint formed by the lever pivoted to the front of said guide-frame and to the link connecting with brake-bar, and the rope actuating said toggle-joint, substantially as and for the purpose described.

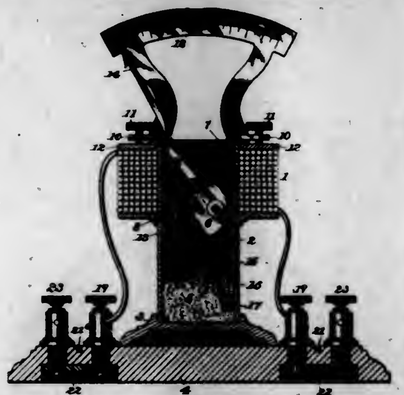
2. The combination, with the guide-frame and brake-bar sliding within said frame, of the link M, pivoted to the front of said frame, the lever N, the pulleys O, O', and *f*, and the rope P, substantially as specified.

3. In combination with a wagon, and adapted to be secured upon the rear bounds thereof, the brake mechanism described, consisting of the rectangular frame having the upper and lower front and side plates and the rear plate provided with a guide-standard, the brake-bar sliding between the side plates and having a guide-bar standing rearward through the guide-standard and surrounded by a coiled spring between said standard and the bar, the toggle-jointed lever pivoted in the front of the guide-frame, and the rope for operating same, all constructed substantially as and for the purpose described.

4. The guide-frame composed of the front plates *g g*, the side plates *h h'*, and rear plate, H, provided with the perforated guide-standard I, and end blocks separating the upper and lower plates, in combination with the brake-bar sliding between the side plates and having the rear guide-bar, L, the lever N, pivoted to the front of the guide-frame and to the link M, connecting with the brake-bar, the pulley O in the outer end of the lever, the pulley attached to the reach, and the rope, substantially as and for the purpose described.

382,913. BICYCLE. SIDNEY SMITH, Pine Bluff, Ark. Filed Jan. 16, 1888. Serial No. 261,022. (No model.)

Claim.—1. In a bicycle, the combination of the central circular frame, 7, having segmental slots 8, the circular frame 9, having the forwardly-projecting arms supporting the foot-levers and the driving-gear, and the notted bolts passing through the segmental slots and the circular frame, adjusting the latter, as shown, and for the purpose specified.



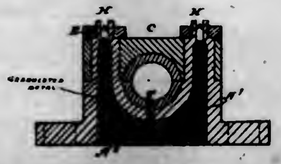
2. In a bicycle, the combination of a circular frame, 7, having segmental slots 8, the circular frame 9, having bolts 10 and arm 12, and provided with the cross-bar 16, having connecting-lips 18 and arm 13, connected by bolts 14 and 15 to the other arm, the drum or ratchet-box within the frame having the drum-strap, and the foot-lever having the disks formed with the segmental slots 25, and having the drum-strap secured between them, as shown, and for the purpose specified.

3. In a bicycle, the combination of the adjustable frame 9, having arms 12 and 13, the disks having the cogs or notches 23 and journaled between the ends of the arms, and the lever pivoted with its bifurcated inner ends straddling the disks upon the journal-bolt of the disks and having the spring-bolt engaging the cogs or notches, as shown, and for the purpose specified.

4. In a bicycle, the combination of the drum or ratchet-box, the circular frame surrounding the said box and having its cross-bar secured to the axle or shaft and formed with the forwardly-projecting arms connected by the journal-bolt 14 and the smaller bolt, 15, the disks 22, having the segmental slot 25 and journaled upon the journal-bolt, and formed with the bolts 26, 27, and 28, and bolt 29, and having the cylinder 30 and circular grooves 32 and 33 in their inner faces, the semicircular plates having the perforation and the hooked ends and sliding in the grooves, and the drum-straps secured to the drum and having the hooked end and the pin near the end, as shown, and for the purpose specified.

5. The combination of the steering-rod having the upper tubular portion provided with longitudinal slots in its sides, the brake-bar fulcrumed upon the handle-bar, the rod in the tubular portion of the steering-bar, having its upper end pivoted to the brake-bar and having the cross-head at its lower end sliding in the slots and the ring, the spring for holding the rod and ring up, and the brake having the bifurcated arm straddling the steering-rod and bearing against the under side of the ring of the cross-head, as shown, and for the purpose specified.

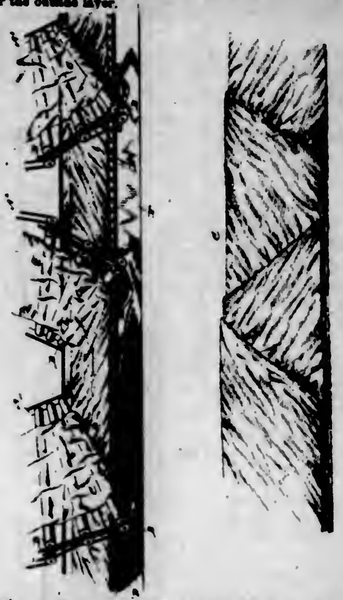
382,914. ELECTRIC INDICATOR. JOHN TRESCOTHICK, Hartford, Conn. Filed May 23, 1887. Serial No. 239,072. (No model.)



Claim.—1. A solenoid, in combination with an armature which is eccentrically pivoted thereto, and is provided with a lever carrying an adjustable counterpoise and a fan, substantially as and for the purpose specified.

2. In an electric indicator, a hollow spool and a helix which is located on said spool, in combination with an armature pivoted in a frame which is adjustable in said spool, substantially as and for the purpose specified.

3. A hollow spool, a helix which is wound thereon, a dash-pot which is formed therein, and an armature which is provided with an index-finger, fan, and counterbalancing-lever, in combination with an adjustable frame in which said armature is eccentrically pivoted within said spool, substantially as and for the purpose specified.

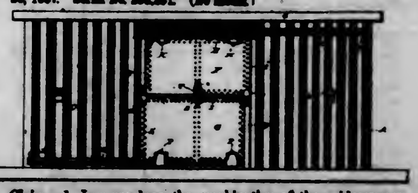


382,915. LUBRICATOR. ETIENNE VERNY, Récourt, France. Filed Nov. 10, 1887. Serial No. 254,234. (No model.)

Claim.—As means for lubricating rotary shafts, granulated metal saturated with oil, the whole placed within a chamber forming a part of a journal-box, and the chamber communicating with a rotary shaft within said journal-box.

382,916. METHOD OF MAKING COTTON-BATTING. EDWARD WALKER and DAVID WILLIAMS, Cohoes, N. Y. Original application filed Mar. 24, 1887, Serial No. 232,262. Divided and this application filed Nov. 23, 1887. Serial No. 256,469. (No model.)

Brief.—The fleeces from several carding-machines are obliquely deposited upon an apron traveling at right angles to the front of the machines. A bat is thus formed of layers whose fibers lie oblique to the direction of the length of the web, and the fibers of each layer lie across the fibers of the layer beneath. The bat is afterward folded in a direction parallel with the edges. The best grade of stock may be used for the outside layer.



Claim.—1. The method of forming cotton-batting which consists in placing a fleece or layer of cotton upon a traveling surface, and then applying to said first layer as it moves with the traveling surface, in a single continuous unbroken layer extending lengthwise of the first layer, a second layer or fleece fed obliquely to the line of travel of the moving surface, and also obliquely to its own width, substantially as described.

2. The method of forming cotton-batting which consists in placing a fleece or layer of cotton upon a traveling surface, then applying to said first layer as it moves with the traveling surface, in a single continuous unbroken layer extending lengthwise of the first layer, a second layer or fleece fed obliquely to the line of travel of the moving surface, and also obliquely to its own width, and afterward folding the web so formed upon itself lengthwise thereof, substantially as described.

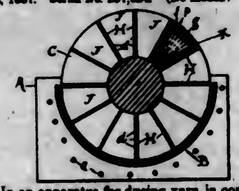
3. The method of forming cotton batting which consists in placing a fleece or layer of cotton upon a traveling apron, and then applying to said first layer as it moves with the traveling surface, in continuous unbroken layers extending lengthwise of the first layer, a series of other layers fed in opposite directions to each other, and one upon the other, and each obliquely to the line of travel of the moving surface, and also obliquely to its own width, substantially as and for the purpose described.

382,917. CAR-DOOR. JOHN G. WARNE, St. Louis, Mo. Filed Nov. 26, 1887. Serial No. 256,251. (No model.)

Claim.—1. In a car-door, the combination of the guideways secured to the outer surface of the side of the car, and the door formed of an upper and lower section moving upon said guideways, and having their meeting joints covered by a downwardly-depending flange, and each section having its vertical joint on the side on which it opens protected by an inwardly-standing flange, substantially as specified.

2. A car-door composed of the rectangular upper and lower sections, each consisting of an interior frame and exterior metallic plate properly secured to said frame, the said doors sliding outward in opposite directions and the guideways secured to the adjacent side of the car, substantially as specified.

3. The combination of the car-door composed of an upper and lower rectangular section, each consisting of an inner frame and an outer metallic plate secured to said frame and bent inward at its edges to overlap the exposed joints between the sections and the door-opening, and extending downward to overlap the joint between the meeting edges of the sections, of the longitudinal guide beams and strips, the hooked engaging-plates secured to the sections and sliding on said strips, and the guiding and retaining brackets, substantially as specified.



4. The combination, with the car, the horizontal guide-beams secured longitudinally to the outside of the car, the rabbeted vertical side clips, E, adjoining the doorway or opening of the car, and provided, respectively, with the shoulder *x* and lower reduced portion, *y*, and the shoulder *x'* and upper reduced portion, *y'*, of the door-section F and G, the flange or extension I of the upper section extending over the upper edge of the lower section, the clips J and N, attached, respectively, to the upper and lower sections, and the inwardly-bent portions *i m* of the upper and lower sections, respectively covering said clips J and N, substantially as specified.

5. In a car, the combination, with the side provided with a proper doorway and the guide-beams extending longitudinally in opposite directions from the top and bottom, respectively, of said doorway, of the two rectangular door-sections sliding in opposite directions on the guide-beams, and the fastening devices, substantially as described, to connect said sections together, as specified.

6. In a car, a door composed of oppositely-sliding upper and lower sections, each section consisting of a rectangular inner frame and an outer covering secured to the frame by splices, having their ends bent up or upset on the inner surface of the frame, substantially as specified.

7. In a car, the combination, with the vertical, partly-rabbeted, and shouldered side clips, E, the upper and lower guide-beams, and the guide-strips secured to said beams, of the sectioned door, each section of which is composed of an inner rectangular frame and an outer covering secured to said frame, the vertical clips J N, secured to said sections, the hooked engaging-plates, and the guide-brackets, substantially as specified.

382,918. DYEING APPARATUS. URIAH WILDIN, Cohoes, N. Y. Filed Dec. 12, 1887. Serial No. 257,694. (No model.)

Claim.—1. In an apparatus for dyeing yarn, in combination with a rotary dipping-wheel provided with partitions forming compartments, a series of removable frames adapted for insertion in said compartments and provided with pins for holding yarn, substantially as and for the purposes described.

2. In an apparatus for dyeing yarn, in combination with a rotary dipping-wheel provided with pockets formed by radial open-work partitions, a series of removable frames provided with fixed pins, and hinged lids adapted to fit in said pockets, substantially as and for the purposes described.

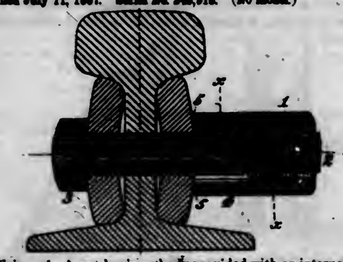
3. In combination with a dipping-wheel divided into compartments, substantially as shown, a series of removable frames provided with yarn-holding devices and adapted for insertion in said compartments, each of which frames is constructed in two sections which are adjustable to or from each other, whereby the frame may be extended or reduced, substantially as set forth and described.

4. In combination with a dipping-wheel provided with radial partitions, a series of frames, K, each having an open-work base provided with fixed pins P, and a hinged lid, *f*, substantially as and for the purposes described.

382,919. SULKY-PLOW. RICHARD C. WHEELWRIGHT, South Bend, Ind. Filed Feb. 16, 1888. Serial No. 264,292. (No model.)

Claim.—1. The combination of a plow with a U-shaped hanger pivoted upon the front end of the plow-beam and carrying on its free end an adjustable wheel, and a locking-dog for said hanger, pivoted on the beam and adapted to engage the hanger automatically and hold the wheel parallel with the beam, substantially as described.

382,919.



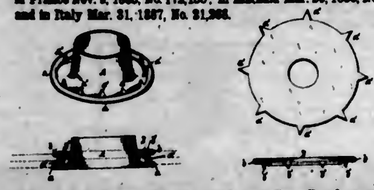
2. The combination of the plow with the bar D, a wheel mounted thereon, and the rods H H, attached to bar D at one end and adjustably secured to the plow-beam at the other end, whereby the bar D is adjusted, substantially as and for the purpose described.

3. The combination of plow A with the bar D, its adjusting-rods H H and brackets I I, and the adjustable lever E and rack F on bar D, and the wheel W, mounted on said lever, all constructed and arranged substantially as and for the purpose specified.

4. The combination of the plow with the caster C, mounted on the rear end of the plow-beam, the adjustable bar D, adjustable lever E, pivotally mounted on bar D and wheel W thereon, and the hanger J, the adjustable lever K, and the wheel M, all substantially as and for the purpose described.

5. The combination of the plow, the caster C, mounted on the rear end of the beam, and the adjustable bar D and lever E, rack F, and wheel W, with U-shaped bracket J, pivotally mounted on the front end of the beam, and lever K, rack L, mounted on said bracket, and wheel M, and the spring-controlled dog N, all constructed and arranged substantially in the manner and for the purpose described.

382,920. NUT-LOCK. GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa. Filed July 11, 1887. Serial No. 243,913. (No model.)

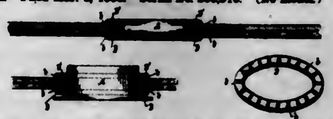


Claim.—1. A nut having a body provided with an internal thread which is adapted to engage an ordinary single-threaded bolt to which the nut is to be applied, and is of proper length to exert the maximum clamping force which the bolt is designed to sustain, and having its bearing-face located upon a blank or unthreaded extension which is reduced in thickness relatively to the body sufficiently to present a substantial degree of elasticity, substantially as set forth.

2. A nut having its bearing-face located upon a blank or unthreaded elastic extension of its body in the form of two or more concentric bands, substantially as set forth.

3. The combination of a nut having an ordinary internally-threaded body and having its bearing-face located upon an elastic unthreaded extension reduced in thickness relatively to the body, as described, and a bolt the thickness of metal of which is reduced between its head and the adjacent end of its thread, substantially as set forth.

382,921. SAIL-GROMMET. WILLIAM W. WILCOX, Middletown, Conn. Filed Mar. 5, 1888. Serial No. 266,515. (No model.) Patented in France Nov. 9, 1885, No. 173,150; in England Mar. 20, 1886, No. 4,383, and in Italy Mar. 31, 1887, No. 21,266.

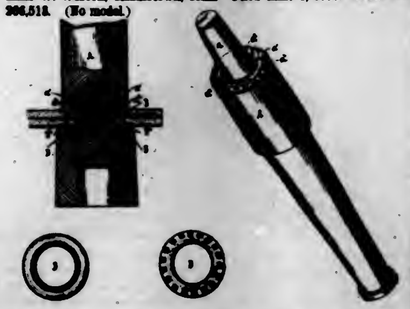


Claim.—1. The combination, with a washer, B, of an eyelet to form a sail-grommet provided with a rolled rim, the edge of which is provided with a series of upwardly-projecting barbs, *a'*, to engage the

sail when the eyelet is clinched in position on the washer, substantially as described.

2. The combination, with an eyelet provided with a rim, *a*, the edge of which is formed with a series of upwardly-projecting barbs, *a'*, of a washer, B, adapted to the eyelet and having barbs *b'* around its central opening, substantially as described.

382,922. SAIL-GROMMET. WILLIAM W. WILCOX, Middletown, Conn. Filed Mar. 8, 1888. Serial No. 266,516. (No model.)



Claim.—A sail-grommet composed of an eyelet, A, and two rings, B B', of equal diameter, adapted to surround the eyelet-barrel loosely on opposite sides of the sail-cloth, the opposing faces of said rings being roughened or barbed, substantially as shown and described.

382,923. SAIL-GROMMET. WILLIAM W. WILCOX, Middletown Conn. Filed Mar. 8, 1888. Serial No. 266,517. (No model.)

Claim.—A sail-grommet composed of a metallic eyelet and of a sheet-metal washer which is provided at its inner edge with projections which are bent outward and upward, substantially as described.

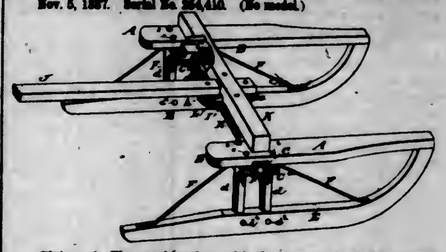
382,924. PUNCH AND DIE FOR SAIL-GROMMETS, &c. WILLIAM W. WILCOX, Middletown, Conn. Filed Mar. 8, 1888. Serial No. 266,518. (No model.)

Claim.—1. The combination, with a die having a central orifice, of a punch having a central projecting nipple, *a*, and a series of outwardly-projecting teeth, a^2, around the inner end portion of the nipple, substantially as described.

2. The combination, with a die having a central orifice, of a punch having a projecting nipple, *a*, and a clinching-shoulder, *a'*, and outwardly-projecting teeth a^2 around the inner end portion of the nipple, substantially as described.

3. The combination, with a punch having a nipple, *a*, of a die consisting of a disk having a central orifice, and provided with a series of outwardly-projecting teeth, b^2, arranged around the orifice, substantially as described.

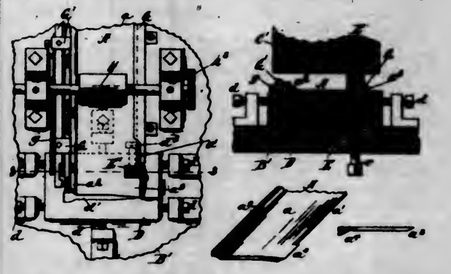
382,925. SLATE-ERASER. GOTTLIEB WILKENING, Dayton, Ohio. Filed Oct. 14, 1887. Serial No. 252,302. (No model.)



Claim.—1. A slate-eraser comprising a hollow case, a flexible reservoir with flanged base, and an aperture terminating in a cup at the top, and a holder with sponge attached to the tapering end thereof and suited to have contact with the cup of said reservoir within said case, substantially as set forth.

2. The case A, for a slate-eraser, having the clasp D on its outside to engage a sponge, and in combination with the reservoir C and a suitable holder for an erasing-sponge, substantially as set forth.

3. In a slate-eraser, the holder B, with sponges on both ends, in combination with the flexible reservoir C and the case A, substantially as and for the purposes specified.

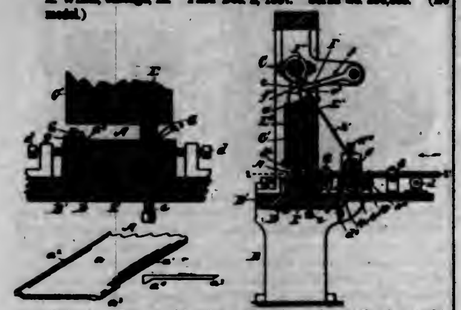


382,926. SOD-SLEDGE. MELVIN D. WILLIAMS, Dexter, Minn. Filed Nov. 5, 1887. Serial No. 254,410. (No model.)

Claim.—1. The combination, with the runners E, of the vertical supports *d*, arranged in pairs, as shown, and provided at their upper ends with horizontal portions, of the rave, the two-part box supported by the horizontal portions of said supports and confined between the same and the rave, and the bolts *e*, passed through the rave, the two parts of the box, and the horizontal portion of the supports, and serving to secure them all together, as set forth.

2. The combination, with the runners E, of the vertical supports *d*, arranged in pairs, as shown, and each provided at its upper end with a horizontal portion, of the rave provided upon its under face with a transverse groove, the two-part box supported upon the horizontal portions of said supports and confined between the same and the rave, the upper part of the box being formed with a transverse rib engaging said groove, and the bolts *e*, passed through the rave, the two parts of the box, and the horizontal portions of the supports, and serving to secure them all together, substantially as described.

382,927. PROCESS OF CUTTING HORSESHOE-NAILS. HARRY A. WILLS, Chicago, Ill. Filed May 12, 1887. Serial No. 237,967. (No model.)



Claim.—1. The herein-described process of making horseshoe-nails, which consists in forming a bevel upon one side of the point edge of a suitably-rolled bar and then punching the nails successively from the said bar, both operations being performed as the bar is fed along through a single machine, substantially as and for the purpose specified.

2. The hereinbefore-described process of making horseshoe-nails by a continuous operation, which consists in alternately first beveling the point edge of a portion of the bar and then cutting from the beveled portion the finished nail, and repeating these operations, substantially as and for the purposes specified.

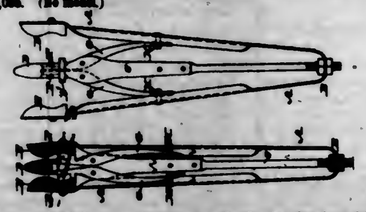
3. The hereinbefore-described process of making horseshoe-nails, which consists in first beveling the point edge of a portion of the bar and then forcing the bar backward so as to produce a drawing action on the point by the pressure of the beveling-dies, and then cutting from the beveled bar the finished nail, substantially as and for the purposes specified.

4. The herein-described process of making horseshoe-nails in a continuous operation, which consists in gradually beveling the point edge of a suitably-formed bar, gaging the position of the said bar for the cutting-dies from the said beveled edge, and then cutting the nails successively from the said bar while thus gaged, substantially as and for the purposes specified.

382,928. MACHINE FOR MAKING HORSESHOE-NAILS. HARRY A. WILLS, Chicago, Ill. Filed Dec. 2, 1887. Serial No. 256,595. (No model.)

Claim.—1. In a machine for making horseshoe-nails, the combination, with suitable cutting-dies, of beveling-dies to operate upon the point edge of the bar in front of the cutting-dies, substantially as and for the purposes specified.

2. In a machine for making horseshoe-nails, the combination, with the die-plunger and its cutting-die, of the beveling-die mounted in said plunger and operating independently of the same, substantially as and for the purposes specified.

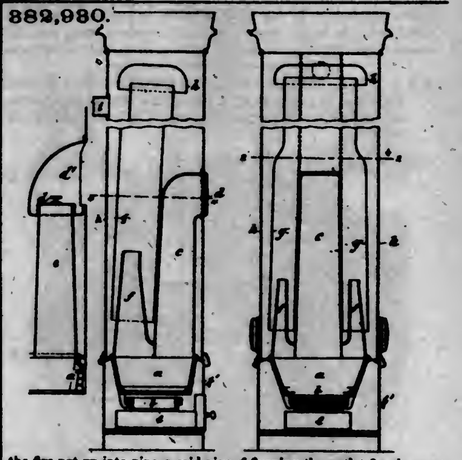


3. In a machine for making horseshoe-nails, the combination, with the die-block D, having female cutting-die *d'* and female beveling-die E, of the die-plunger C, reciprocating in vertical ways and carrying the male cutting-die d^2 and the male beveling-die E', mounted in said die-plunger and reciprocating independently of the same, substantially as and for the purposes specified.

4. The combination, with the female cutting and beveling dies, of the die-plunger C, carrying the male cutting-die and connected by pitman *e* to the crank-shaft G, the male beveling-die E', mounted to reciprocate in the die-plunger C, a suitable spring to thrust the said beveling-die normally upward, the vibrating arm F, arranged to bear on the head of the said beveling-die, and the cam F', mounted on the shaft G, to vibrate the arm F, substantially as and for the purposes specified.

5. In a machine for making horseshoe-nails, the combination, with the fixed guide for supporting one edge of the bar from which the nails are cut, of a yielding guide for supporting the other edge, substantially as and for the purposes specified.

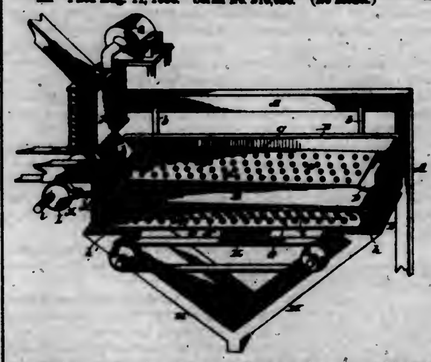
6. In a machine for making horseshoe-nails, the combination, with the beveling-dies arranged to operate on one edge of the bar, and the fixed guide G, for supporting said edge, said guide extending to the cutting-dies and forming a gage for the beveled edge of the bar, of the yielding spring-controlled guide G', for supporting the other edge of the bar, substantially as and for the purposes specified.



382,929. TOOL FOR GROOVING THE MOUTHS OF BOTTLES. WILLIAM H. WILSON, Camden, N. J. Filed Nov. 16, 1886. Serial No. 219,088. (No model.)

Claim.—A tool for grooving the mouth of a bottle, comprising the spring-jaws A, having the eyes or sockets H secured thereto on the inner sides thereof, and having the detachable molds B secured at their ends, the stem C, adjustable in said jaws and having the slotted head D, with shoulders D', the levers G, partly within the said stem and pivoted thereto, each of the said levers having at one of its ends the bit F, the other end freely entering the eye H, the said shoulders D' forming a seat for the neck of the bottle and adapted to abut against the lower portion of the molds, substantially as described.

382,930. HEATING-STOVE. ERNST A. WEMAN, Stockholm, Sweden. Filed June 20, 1887. Serial No. 242,703. (No model.)

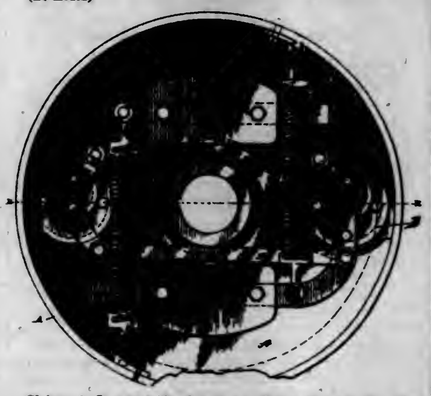


Claim.—1. In a stove, the combination, with the drum *h*, closed at top and bottom and provided with an outlet for the products of combustion, of the upright pipe *g*, arranged within said drum and open at top and bottom, the fire-pot *a*, and the pipe or pipes *f*, extending from the fire-pot up into pipe *g*, said pipe *f* forming the outlet for the products of combustion from the fire-pot, substantially as set forth.

2. In a stove, the combination, with the drum *h*, closed at top and bottom and provided with an outlet for the products of combustion, of the fire-pot *a*, the magazine *c*, the pipe *g*, arranged inside the drum and open at both ends, and the tapered pipes *f*, extending from the fire-pot up into said tube *g*, and forming a passage for the products of combustion, as set forth.

3. In a stove, the combination, with the drum *h*, closed at top and bottom and provided with an outlet for the products of combustion, the fire-pot, the pipe or pipes *f*, and open-ended pipe *g*, all respectively arranged as set forth, of the cap A, having the form of an inverted cup arranged over the upper end of pipe *g*, with the rim extending below the top of the said tube, as set forth.

382,931. RICE-SEPARATOR. CHARLES J. ALLEN, New Orleans, La. Filed Aug. 11, 1888. Serial No. 282,690. (No model.)



Claim.—1. In a rice-separator, a sheet-metal screen provided with rows or series of indented perforations, the said plate at points between said rows of perforations being punctured from underneath, forming series of upwardly-projecting burrs, substantially as set forth.

2. The combination, with a supporting-frame, a vibratory casing suspended therein, and a rotary shaft for giving motion to the casing, of a pair of oppositely-slanting screens located in the casing, a table located between the screens, there being a space between one end of the table and the end of the casing, and also a space between the two ends of the lower screen and the ends of the casing, a removable bottom section adapted to fill one of the spaces, and rice-conduits extending from the spaces formed at the ends of the lower screen and uniting into one, substantially as set forth.

3. The combination, with a supporting-frame, a vibratory casing suspended therein, and a rotary shaft for giving motion to the casing, of a pair of oppositely-slanting screens located in the casing, a table located between the screens with a space between one end of the table and the end of the casing, and also with a space between the two ends of the lower screen and the ends of the casing, a removable bottom

section adapted to fill one of the spaces, a cleaner-brush carried in contact with the lower screen, and rice-conduits extending from the spaces formed at the ends of the lower screen, substantially as set forth.

382,932. GOVERNOR FOR STEAM-ENGINES. JAMES B. ALLFREE, Indianapolis, Ind., assignor of one-half to Robert Shriver and Harrison Swartzwelder, Cumberland, Md. Filed Sept. 1, 1887. Serial No. 248,563. (No model.)

Claim.—1. In a centrifugal governor, the combination of a valve-actuating eccentric having an opening or transverse slot adapted to fit freely over a crank-shank, and two double auxiliary eccentrics (composed of inner and outer eccentrics) fitted into the web of the casing and connected with the movable plate K, carrying the valve-actuating eccentric, by eccentric-pins J, substantially as set forth.

2. In a centrifugal governor, the combination of a suitable casing, a valve-actuating eccentric having an opening or transverse slot adapted to fit freely over a crank-shaft, two double auxiliary eccentrics (composed each of an inner and an outer eccentric) fitted into the web of the casing and connected with the movable plate K, carrying the valve-actuating eccentric, by eccentric-pins J, and intermediate mechanism connecting the two pairs of auxiliary eccentrics to secure their proper relative movements, substantially as and for the purposes set forth.

3. In a centrifugal governor such as described, the arrangement of two pairs of auxiliary eccentrics on opposite sides of the valve-actuating eccentric, in combination with suitable mechanism for rotating the inner and outer eccentrics of each pair in opposite directions to secure the movement of the valve-actuating eccentric in a straight line, substantially as set forth.

4. In a centrifugal governor, the two double auxiliary eccentrics arranged opposite to each other on opposite sides of the hub, the movable plate K, carrying the valve-actuating eccentric, weighted levers F, and small levers I, bolted to the eccentrics, in combination with links H H', pivoted to the levers I at one end and to the lever P at the other, as and for the purpose hereinbefore set forth.

5. The weighted levers F, rigidly bolted to the auxiliary eccentrics, whereby the eccentrics form the pivots of the weighted levers, substantially as hereinbefore set forth.

6. In combination with the two double auxiliary eccentrics, weighted levers F, small levers I, and links H H', the connecting rod or bar P, substantially as and for the purpose set forth.

7. In a governor such as described and provided with two double auxiliary eccentrics on opposite sides of the main eccentric, the inner eccentric of each pair connected with the outer eccentric of the other by suitable mechanism, substantially as and for the purpose set forth.

8. The combination of the casing A, movable plate K, and securing ring or flange Q, substantially as and for the purpose set forth.

9. A steam-engine governor comprising a suitable casing attachable to the driving-shaft of the engine, two pairs of double auxiliary eccentrics journaled in said casing on opposite sides of its center, levers secured to said eccentrics, one to one of each pair, respectively, weights adjustably attached to said levers, counteracting-springs adjustably attached to said levers and to said casing, suitable connections between said levers, and also between the outer and inner eccentrics of the opposite pairs of said auxiliary eccentrics, whereby they are caused to move in harmony, a valve-actuating eccentric, a movable disk or plate to which said valve-actuating eccentric is suitably attached, said disk being sustained and regulated in its movements by one of each pair of said auxiliary eccentrics, and suitable means for holding said disk in place, all substantially as described, as arranged and combined as to operate as set forth.

382,933. SCREW-CUTTING DIE. PETTER A. ASBERGER, Harrisville, Pa. Filed Aug. 26, 1887. Serial No. 247,981. (No model.)

Claim.—1. In a bolt-cutter head, the combination of the head having jaws sliding in radiating recesses in the forward or outer end and confined by a front plate, a ring upon the outer end of the head having cams for operating the jaws and sliding upon the head, and a bolt in a radial recess in the side of the head at the inner end or edge of the ring, having a spring forcing it outward, and having a transverse lip upon the outer end of its head bearing against the inner or rear edge of the ring, the inner concave face of the ring bearing against the face of the head of the bolt at the side of the lip, as shown, and for the purpose specified.

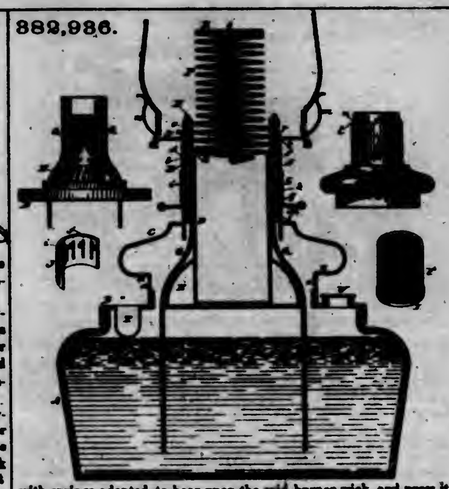
2. In a bolt-cutter head, the combination of the cylindrical head formed with the oblique groove in its side and with radiating recesses in its outer or forward end, jaws sliding in the recesses and having springs forcing them out and obliquely cut-off outer ends, a cam-ring upon the outer end of the head having eccentric or ratchet-shaped recesses in its inner face corresponding to and registering with the oblique ends of the jaws, a ring upon the head inside of the cam-ring having segmental slots and rearwardly-projecting guide-rods, screw-threaded bolts passed through the cam-ring into nuts sliding in the segmental slots of the inner ring, and a ring sliding upon the head, with perforations sliding upon the guide-rods, and having an inwardly-projecting stud engaging and sliding in the oblique guide-groove, as shown, and for the purpose specified.

3. In a bolt-cutter head, the combination of the cylindrical head having the axial perforation and the radiating grooves or recesses in the forward or outer end, and provided with the longitudinal grooves in the sides merging into the radiating recesses and with the oblique groove in the side, levers having slightly outwardly-curved rear ends and pivoted in the longitudinal grooves or recesses, and provided with springs forcing their outer ends outward, jaws having lips and suitable removable bits and sliding in the radiating recesses, said lips engaging the outer ends of the levers, a front plate removably secured over the forward or outer end of the head inclosing the jaws, a cam-ring having eccentric or ratchet-shaped recesses in its inner face bearing against the oblique outer ends of the jaws, an inner ring having rearwardly-extending rods, and having the cam-ring circumferentially adjustable upon its outer face, and a ring sliding upon the head, and having a stud sliding in the oblique groove in the same and having perforations for the guide-rods, as shown, and for the purpose specified.

382,934. STOCK-CAR. HARRISON ABEL, Toledo, Ohio. Filed Feb. 25, 1888. Serial No. 265,202. (No model.)

Claim.—The combination, with a stock-car provided with a standard near one side thereof, of a partition composed of sections hinged together, one of the sections being also hinged to the said standard, a standard secured to the opposite side of the car and provided with a groove into which the free end of the partition is made to fit, and bars and keepers secured to said sections and adapted to engage with each other to hold the partition rigid at its joints, substantially as specified.

382,935. LIFE-PRESERVING CHAIR. JAMES A. ASHWORTH, Yonkers, N. Y. Filed May 11, 1887. Serial No. 237,863. (No model.)



Claim.—1. The combination, with the hinged legs, the inner pair of which are formed with the notches in the upper side of their rear

382,935.

382,936.

portions, of the water-proof material forming the seat and having the buoyant material secured within it, and the pivoted braces, substantially as and for the purpose set forth.

2. The combination, in a life-preserving chair, of the centrally-pivoted legs having the cross-bars at their upper ends, the inner legs having the rear notches, the back-frame having the projecting lower ends, and the water-proof material forming the back and seat and having the buoyant material secured within it, as described, substantially as and for the purpose set forth.

3. The combination, in a life-preserving chair, of the centrally-pivoted legs having the cross-bars at their upper ends and the inner legs being formed with the rear notches, the back-frame having the projecting lower ends, and the water-proof material forming the back and seat having the slack or hinge portions and having the buoyant material secured within it, as described, substantially as and for the purpose set forth.

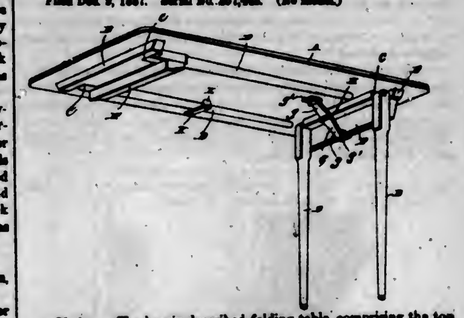
4. The combination, in a life-preserving chair, of the centrally-pivoted legs having the cross-bars at their upper ends and the inner legs having the rear notches, the back-frame having the projecting lower ends, the water-proof material forming the back and seat having the slack or hinge portions and having the buoyant material secured within it, as described, and the strap pivoted at one end to the back-frame and having the loop or ring at its free end adapted to engage with the button on the opposite side of the back-frame, all substantially as and for the purpose herein set forth.

5. In a life-saving chair, the combination, with the centrally-pivoted legs, the outer legs having the recesses in their lower sides near their upper ends, of the back-frame having the lower ends of its side rails extended down below their pivotal point and connected by the transverse brace-rod, the ends of which engage with the said recesses of the outer legs, the water-proof material forming the back and seat, and the buoyant material secured therein, substantially as and for the purpose set forth.

6. In a life-saving chair, the combination, with the centrally-pivoted legs, the inner legs having the notches formed in the rear portions and the outer legs having the recesses formed in their lower sides near their upper ends, of the back-frame having the lower ends of its side rails extended down below their pivotal points and connected by the transverse brace-rod, the ends of which engage with the said recesses of the outer legs, the water-proof material forming the back and seat, and the buoyant material secured therein, substantially as and for the purpose set forth.

382,936. LAMP. S. WM. BARRETT and HENRY B. BRADY, Meriden, Conn. Filed Feb. 20, 1887. Serial No. 228,163. (No model.)

Claim.—1. In a tubular-wick lamp, the combination of the outer tube surrounding the wick, constructed with an outwardly-projecting shoulder, *l*, and with projections *r* above, and the ring chimney-gallery N, corresponding in diameter to the upper end of the wick-tube, and with notches upon its inner edge corresponding to the projections on the wick-tube, the said ring-gallery provided with devices to secure the chimney thereon, substantially as described.



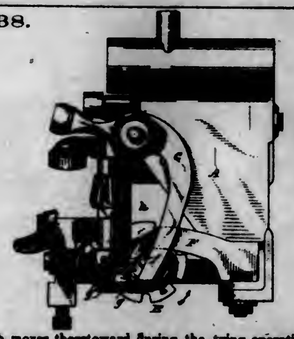
2. In a tubular-wick lamp, the combination of a concentric inner tube and an outer tube forming a wick-chamber between them, a wick-feed consisting of a ring arranged within the outer tube and adapted to move up and down therein, the said ring constructed with inwardly-projecting spurs to engage the wick, and a collar, l, surrounding the said outer tube and adjacent to the said ring, the said outer tube slotted vertically between the said ring and collar, and the said ring and collar connected through said tube, substantially as described.

3. In a tubular-wick lamp, the combination of a concentric inner tube and an outer tube forming a wick-chamber between them, the said inner tube having an annular shoulder upon its outside near its upper end and in said wick-chamber, a feeder-wick surrounding the inner tube, and so as to abut against said shoulder, a burner-wick surrounding the upper end of said feeder-wick, and a wick-adjuster within the outer tube and adapted to surround the burner-wick, the said ring having a projection therefrom outside the outer tube, whereby the said ring is made adjustable vertically, and the said ring constructed with springs adapted to bear upon the said burner-wick and press it against the feeder-wick, substantially as described.

4. In a central-draft lamp, the combination of the inner tube, an enlarged chamber, E, around the lower end of the said tube, said chamber being perforated for the admission of air to the tube, and a base surrounding said perforated chamber, the base having perforations to admit air to the said chamber, substantially as and for the purpose described.

5. In a lamp-fount, the glass cup T, introduced from the top of the fount and extending therein, substantially as and for the purpose described.

382,937. FOLDING TABLE. BARNET BABCOCK, Lenawee, N. Y. Filed Dec. 9, 1887. Serial No. 257,463. (No model.)



Claim.—The herein-described folding table, comprising the top A, the transverse cleats B, having the shoulders C, the legs D, pivoted to said shoulders, the cross-braces E, connecting the outer sides of said legs and resting against the corresponding cleats when the legs are perpendicular to the top, the buttons K, arranged to be turned outward and hold both pairs of legs folded, and the hinged braces G, each having legs *g g* of equal length, one of which is pivoted in an ear, *f*, secured to the table, and the other to a similar ear secured to the corresponding brace, E', the said braces folding upward and outward and resting between the top of the table and the corresponding braces E, in order to be protected and out of sight, substantially as specified.

382,938. GRAIN-BINDER. WILLIAM B. BAKER, Chicago, Ill. Filed Aug. 4, 1884. Serial No. 140,033. (No model.) Patented in England July 19, 1884, No. 10,320; in Victoria Oct. 2, 1884, No. 3,864; in New Zealand Nov. 20, 1884, No. 1,200; in South Australia Feb. 2, 1885, No. 951, and in New South Wales Feb. 3, 1885, No. 1,008.

Claim.—1. In combination with the knotter or band-securing device, an underlying cord-guide having a recurved hook at its end beneath the knotter, and a holder beneath the cord-guide adapted to receive the ends of the band and carry them along the guide until they come into the room formed by said hook and in position for the action of the band-securing device.

2. The combination of the knotter or tying-bill, a swinging

382,938.

holder which moves therstoward during the tying operation, and a cord-guide arranged between the knotter and holder and having a recurved hook at its end adjacent to the knotter, whereby the proper position of the band ends relatively to the latter is preserved irrespective of the directional thrusts imparted to them.

3. The cord-guide F, having the outline shown and described, with the recurving-hook *f* at its end, and arranged substantially as set forth.

382,939. COAL-HOD. EDWARD BARRATH, Cincinnati, Ohio, assignor to Victor R. Knecht, same place. Filed Feb. 23, 1888. Serial No. 264,949. (No model.)

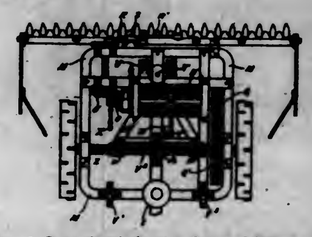
Claim.—1. The blank for a coal-hod, provided with slits 3 and circular creased line 4, for forming the shell 1, and the cone 2 for a coal-hod, substantially as specified.

2. The shell and crimped bottom of a coal-hod of a single piece of metal, the crimps of the bottom being on its upper side, substantially as described.

3. A coal-hod consisting of a shell and crimped bottom of a single piece of metal having a V-shaped peripheral edge at the base thereof, the crimps of the bottom being on the upper side with the inner ones overlying the outer ones, and a base having an upper cylindrical portion compressed within the V-shaped peripheral edge to form a lock-seam, substantially as described.

382,940. PLOW. ARNOLD G. BAMBERGER, Anlander, N. C. Filed Dec. 20, 1887. Serial No. 258,494. (No model.)

Claim.—1. In a plow, the combination, with the point, of the landside and plate having the concave circular front portion provided with the shoulder for engaging the flange portion of the point, substantially as specified.



2. In a plow, the landside provided on its inner face with the thickened portion and arc slot having the recess and the clamping-bolt therein, the lug on the edge of the thickened portion, and the rib, substantially as specified.

3. In a plow, the combination of the mold-board and landside having the circular flanged edge and the point having the shoulder *e* and the inclined keeper or flange *f*, substantially as specified.

4. In an adjustable plow, the plate-piece bolted to the inner face of the point portion and mold-board, and the outstanding plate-piece rounded at its rear edge and having the opening for the clamping-bolt, and the adjusting-rack, substantially as specified.

5. In a plow, the removable adjusting device, consisting of the plate-pieces E F, the braces *g g'*, the rack A, and the opening *i*, in combination with the clamping-bolt, the arc slot, and the rib, substantially as specified.

382,941. ELECTRICAL AGRICULTURAL SYSTEM. EDWARD H. RAVELEY, New York, N. Y. Original application filed Dec. 11, 1886, Serial No. 180,411. Divided and this application filed Nov. 28, 1887. Serial No. 256,081. (No model.)

Claim.—1. In an electrical system for supplying current from a stationary source to a movable translating device, the combination, with an electrically-propelled vehicle, of a main line extending transversely to the course of movement of said vehicle and an intermediate conductor provided with a rotative connection permitting movement of the vehicle about a central point.

2. In an electrical system for supplying current from a stationary source to a movable translating device, the combination, with a main supply-line, of an electrically-propelled vehicle, means for guiding the vehicle at will, a winding-drum, and a conductor between the main line and the vehicle adapted to be wound on said drum and provided with a rotative connection permitting movement of the vehicle about a center.

3. In an electrical system for supplying current from a stationary source to a movable translating device, the combination, with an exposed main line, of an electric motor, means for guiding the same at will, a winding-drum, and an intermediate conductor between the motor and the main line adapted to be wound on said drum and having a traveling connection with said main line.

4. In an electrical system for supplying current from a stationary source to a movable translating device, the combination of an exposed main line extending along one side of a field or district, a conductor having a traveling connection therewith and equal in length to the transverse dimension of said field or district, a movable electric motor adapted to follow said conductor, and means for guiding said motor at will.

5. The combination, with a main supply-line, of a bare conductor having at one end a traveling connection with said line, an insulated drum upon which said conductor is adapted to be wound, and a movable electrical translating device on the opposite end of said conductor.

6. In an electrical agricultural system, the combination, with a main-line wire extending along one side of a field, of an electrically-propelled machine having an extensible connection therewith, permitting a transverse movement of the machine relatively to the wire.

7. In an electrical agricultural system, the combination of a main supply-line, an electrically-propelled vehicle having a traveling connection with said line, a propelling-motor for the vehicle, and mechanism on the vehicle actuated thereby.

8. In an electrical agricultural system, the combination, with a main supply-line, of an electrically-propelled vehicle having a movement to and from said line and provided with a rotative electrical connection therewith, whereby it may turn about a central point.

9. In an electrical agricultural system, the combination of the main supply-conductor, a bare secondary conductor having a traveling connection with the main, an insulated drum for said secondary conductor, an electrically-propelled vehicle having a rotative connection with the main through the secondary, and means for guiding said vehicle at will.

10. In an electrical agricultural system, the combination of a main supply-line extending along one side of a field or district, a bare secondary supply-conductor having a length equal to the transverse dimension of said field or district and a traveling connection with said main line, an electrically-propelled vehicle, means for guiding the same at will, and an insulated drum on said vehicle, on which the secondary conductor is adapted to be wound.

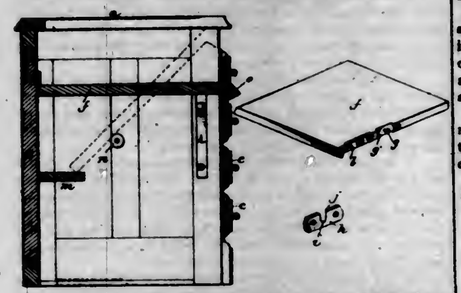
11. In an electrical agricultural system, the combination of a main supply-conductor, a secondary conductor having a traveling connection therewith, an electrically-propelled vehicle, means for guiding the same at will, a drum on the vehicle for the secondary conductor, and a standard over which said conductor passes in reaching said drum.

12. In an electrical agricultural system, the combination, with a main line extending along one side of a field or district and suspended from the tops of a line of posts, of a transverse conductor having a traveling connection therewith and of a length equal to the transverse dimension of the field or district, an electrically-propelled vehicle in constant connection with said conductor, and means for guiding the same at will.

13. The combination, with a main supply-conductor extending along one side of a field or district, a corresponding line on the opposite side, a transverse conductor having a traveling connection at each end, and a movable electric motor having a connection with said transverse conductor.

14. The combination of the positive and negative supply-lines on opposite sides of a field or district, respectively, a transverse conductor having a traveling connection with said lines at its opposite ends, and a movable electric motor included in the circuit of said conductor.

15. The combination of the positive and negative lines on opposite sides of a field or district, respectively, two parallel wires having a length equal to the transverse dimension of the field or district and a traveling connection with the said lines, respectively, and a movable electric motor in circuit between said wires.



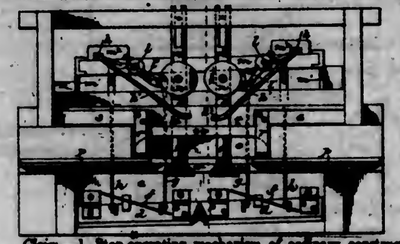
16. In an electrically-propelled harvesting-machine, the combination, with a propelling-motor, of a stationary conductor with which the motor has a traveling rotative connection permitting movement of the machine about a center, means for guiding the machine at will, and a cutting-bar extending transversely in front of the machine.

17. The combination, with a movable electric translating device, of a stationary source of current, an intermediate conductor, a winding-drum therefor, and a traveling guide for directing the conductor on the drum.

18. The combination, with a movable electric motor, of a stationary source of current, a movable electric translating device, two intermediate conductors extending from opposite directions, and a winding-drum upon which said conductors are oppositely wound, so that one may wind up as the other unwinds.

19. The combination, with a moving vehicle, of an electric translating device thereon, a stationary source of current, an intermediate conductor, and a winding-drum for said conductor movable about a vertical axis.

382,942. TYPE-WRITER CABINET. LUTHER G. BILLINGS, Washington, D. C. Filed Oct. 24, 1887. Serial No. 253,262. (No model.)



Claim.—1. A type-writer cabinet comprising a desk having a recess to receive the machine and a hinged top for such recess, a shelf or platform for the machine pivoted between its ends in said recess, a catch to engage said shelf and retain it in horizontal position, and a lock to connect the hinged top and shelf in position of disuse, substantially as set forth.

2. The desk or cabinet A, having the recess *d*, combined with the shelf *f*, pivoted in said recess by means of the lateral journals *g*, permanently attached to said shelf and provided with heads, and the notched bearings *h*, secured to the sides of the recess and into which the headed journals are detachably fitted to not only allow the shelf to be swung or rotated upon its journals, but also to permit the shelf and its attached journals to be removed bodily from the desk at pleasure, and serving, further, to brace or tie together the sides of the desk when in place, substantially as described.

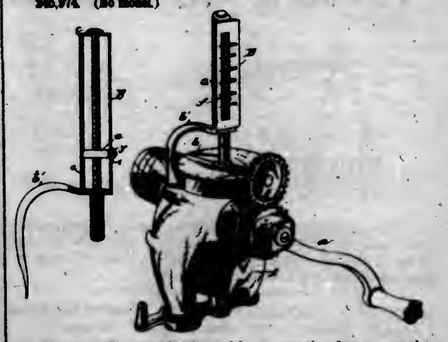
3. The desk or cabinet A, having the recess *d* and a movable top for such recess, combined with the shelf *f*, operable independently of the top and pivoted between its ends within the said recess by means of the headed journals *g*, permanently attached to the sides of the said shelf, and the notched or countersunk bearings *h*, secured to the sides of the recess and receiving the headed journals to tie together the parts of the desk and permitting the free movement of said journaled shelf within and out from them, and a catch, all constructed and arranged substantially as described.

4. The desk or cabinet A, having a recess, *d*, combined with a gravitating shelf, its journals, and bearings arranged in said recess, a catch, a stationary shelf, *m*, and buffers *n* and *o*, substantially as described.

382,943. REED-ORGAN STOP-ACTION. LUTHER G. BILLINGS, Washington, D. C. Filed Nov. 4, 1887. Serial No. 254,212. (No model.)

Claim.—1. Stop-operating mechanism of ordinary construction having its stop-knob arranged in a recess or inclosure, combined with a secondary operating mechanism coupled therewith and controlling access to said recess or inclosure, substantially as described.

2. Stop-operating mechanism of ordinary construction having its stop-knobs arranged in a recess, combined with secondary stop-operating mechanism coupled with and operated by doors or slides for such recess, substantially as described.



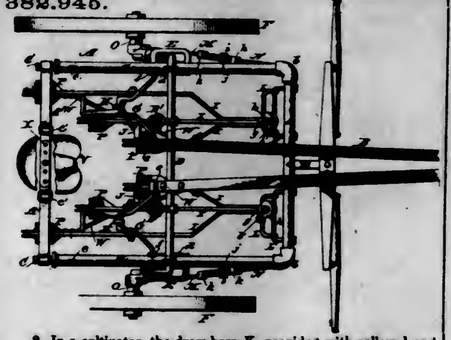
3. An ordinary stop-operating mechanism having its knobs arranged in a recess along with the knobs of any desired number of other stops, combined with a secondary stop-operating mechanism comprising doors to close said recess when all the stop-knobs are withdrawn therein, so as to render all the stops or reeds inoperative, rods connected to any desired stop-action, and rock-shafts and tappets thereon co-operating with said rods and doors, substantially as described.

4. The spring-closed mutes and an ordinary stop mechanism connected therewith, and having its stop-knobs arranged in an inclosure, combined with a secondary operating mechanism, including the doors or covers of said inclosure for opening the mutes after the stop mechanism is closed and rendered operable only upon the closing of the stop mechanism, substantially as described.

5. The combination, with the mutes and their springs, and ordinary stop mechanism connected therewith and arranged in a recess wherein it may be concealed, of a secondary operating mechanism comprising connections with the mutes, doors for the recess, and interposed mechanism for closing and opening the mutes, respectively, by the opening and closing of the said doors, substantially as described.

6. The doors *p* and co-operating wiper-blocks *s*, tappet-armed rock-shafts *k*, rods *g*, and spring-mutes, combined with ordinary stops, the stop-knobs of which are arranged in a recess with which the doors co-operate, substantially as described.

382,944. REGISTERING DEVICE FOR MEASURING-FAUCETS. JULIUS A. BLOUNER, Sioux City, Iowa. Filed Aug. 2, 1887. Serial No. 245,974. (No model.)



Claim.—The combination, with a measuring-faucet, a register adapted for connection therewith, consisting of the revolving spindle having a bifurcated end for connection with the index-finger of said faucet, a case for inclosing the same, a traveling block in connection with said spindle, an index-finger carried thereby, and a suitable dial, substantially as described.

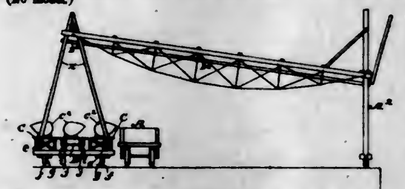
382,945. CULTIVATOR. DENNIS S. BLUE and LEANDER HALTER, Fremont, Ohio. Filed Jan. 21, 1888. Serial No. 261,518. (No model.)

Claim.—1. The combination, with the draw-bars K, provided with rollers A and hooks *b'*, of the guides L, connected to independent brackets L', substantially as and for the purpose set forth.

382,945.

2. In a cultivator, the draw-bars K, provided with rollers k and hooks b', in combination with the beams I, carrying shovels P, and the guides L, connected to independent brackets L', substantially as and for the purpose specified.

3. In a cultivator, the axle D, extending through eyes *d* on the frame, and the yokes E, having eyes *f*, in combination with the levers G, for raising the shovels, and the springs E' and chains *d'*, substantially as and for the purposes described.



4. In a cultivator, the combination, with the frame and axle thereof and the hollow bearings O, through which the axle passes, of the extensible braces formed of the sections M N, having overlapping guides and adjustably connected together, substantially as and for the purpose set forth.

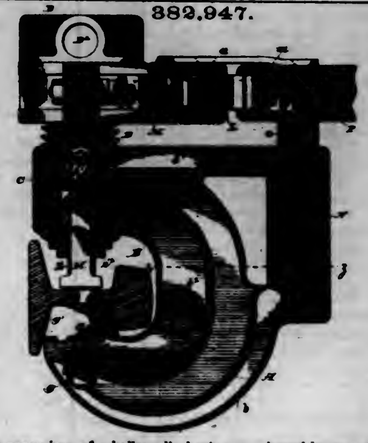
5. In a cultivator, the combination, with the extensible rods C and straps A', connected thereto, of the seat V and springs X, formed of adjustable sections and connected to the straps by links *c'*, substantially as and for the purpose set forth.

6. The combination, with the beam I, having shank or boot *m*, of the bracket for attaching thereto the harrow-teeth, consisting of the sections R S T, the two outer sections having grooved shanks *r*, and the middle section having perforated arms therefor, and a hub, *o*, for connecting it to the shank or shoe of the beam, and set-screws for connecting the several parts together, substantially as and for the purpose specified.

7. The beams and draw-bars of a cultivator and the brackets consisting of the sections R S T, detachably connected together and adapted to carry harrow-teeth, in combination with the beam-arms U, claw *u*, rod *v*, and screw-bolt *a'*, formed with eyes to receive the eyes of the rod, substantially as and for the purpose described.

382,946. APPARATUS FOR HANDLING MATERIAL. ALEXANDER H. BROWN, Cleveland, Ohio. Filed Mar. 5, 1887. Serial No. 229,905. (No model.)

Claim.—The combination, with a hoisting and conveying machine, of the duplex-truck device or bucket-shifting apparatus described, having mounted thereon the pier of the hoisting and conveying machine, all substantially as set forth and described.



382,947. COMPOUND-LEVER PUNCH. CHARLES M. BROWN, Rockford, Ill. Filed Dec. 9, 1887. Serial No. 257,447. (No model.)

Claim.—1. In a punching-machine, the combination, with jaws and a screw-punch, of a die seated in the lower jaw and having a flanged lower end, and a clamping-plate having an opening, and a recess for the reception of the die and its flange, whereby the die is supported on all sides, substantially as set forth.

2. In a punching-machine, the combination, with jaws and a punch, of a hollow die having a flanged lower end and a clamping-plate having a central opening, and a recess to receive the lower end of the die and its flange, whereby the die is firmly clamped at all sides, substantially as set forth.

3. In a punching-machine, the combination, with jaws the lower one of which has an opening through same, and a punch mounted in

382,947.

the upper jaw, of a hollow die having an enlarged lower end and a clamping-plate having an opening conforming in shape to the enlarged end of the die, whereby when the clamping-plate is locked in position the die is firmly supported on all sides.

4. In a punching-machine, the combination, with jaws the lower one of which has an opening through the same, of a hollow die having a flanged lower end and a slightly-conical upper end, and a clamping-plate having a recess to receive the flanged end of the die and adapted to be secured to the jaw and lock the die over the opening in the jaw, said plate having a form to correspond with the shape of the rail-bar being operated upon, substantially as set forth.

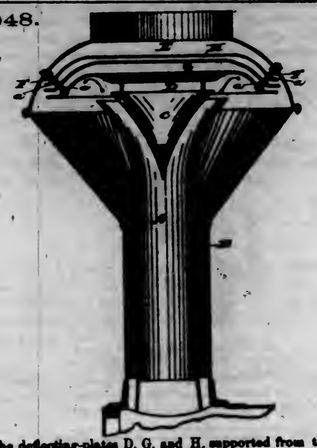
5. In a punching-machine, the combination, with jaws, of a punch in the upper jaw, a die on the lower jaw, a pair of pivoted arms located alongside of the upper jaw, each arm having a flattened portion, and springs adapted to bear against said flattened portions for yieldingly holding the arms in position.

6. In a punching-machine, the combination, with a jaw, a screw therein, and a punch, said screw having a ratchet-toothed wheel thereon, of a bracket mounted on the screw, spring-actuated pawl for engaging the teeth of the wheel, and a pivoted lever for imparting motion to this bracket, substantially as set forth.

7. In a punching-machine, the combination, with a jaw, a shaft, and a screw adapted to turn in the jaw, said screw having ratchet-teeth thereon, of a bracket mounted on the screw and having a spring-actuated pawl held normally in contact with the teeth, a toothed segment attached to said bracket, and a lever affixed to the shaft and provided with teeth which mesh with the teeth on the segment attached to the bracket, substantially as set forth.

8. In a punching-machine, the combination, with a jaw, a screw adapted to turn therein, and a punch in the screw, of a bracket mounted on the screw and adapted to engage with the latter, a toothed segment on the bracket, and a pivoted lever having a toothed segment adapted to mesh with the teeth of the segment on the bracket in operating the screw, substantially as set forth.

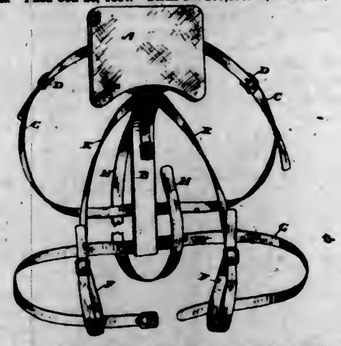
9. In a punching-machine, the combination, with a jaw, a screw therein, and a bracket mounted on the screw, said bracket having a toothed segment, of a toothed lever pivoted on the jaw and a link loosely connecting the lever and bracket, substantially as set forth.



10. In a punching-machine, the combination, with a jaw and a screw therein, of a lever pivoted to the jaw-frame and devices connecting the lever with the screw for operating the latter, substantially as set forth.

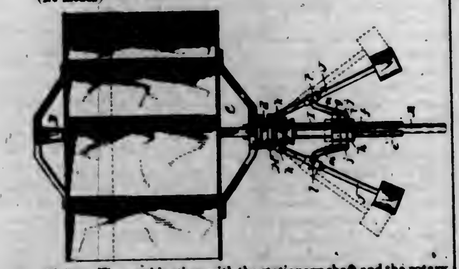
11. In a punching-machine, the combination, with a jaw and a screw, of a bracket mounted on the screw and devices, substantially as described, connecting the bracket with the screw, whereby it can turn on the screw when moved in one direction and turn the screw when moved in the opposite direction, and a lever pivoted on the jaw-frame and adapted to operate the bracket, substantially as set forth.

382,948. SPARK-ARRESTER. HOWDEN ROSS, St. Thomas, Ontario, assignor of one-half to James Henry Radford, Toronto, Canada. Filed Aug. 21, 1888. Renewed Apr. 5, 1888. Serial No. 269,663. (No model.)



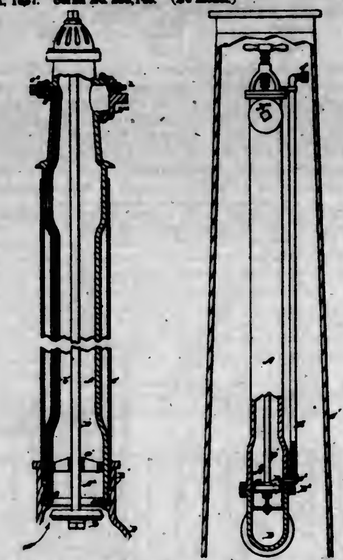
Claim.—1. A smoke-stack having a bell-mouthed pipe, A, inserted in it, so as to leave a space between the case B and the said bell-mouthed pipe A, the combination of the cone C, suspended from the deflecting-plate D, which is supported from the top of the bonnet E by the bolts F, substantially as and for the purpose specified.

382,948.



2. The deflecting-plates D, G, and H, supported from the top of the bonnet E by the bolts F, having adjusting-nuts *e* on them, in combination with the inverted cone C, suspended from the plate D within the bell-mouth of the pipe A, substantially as and for the purpose specified.

382,949. HEAD-REST. JOHN W. CAMPBELL, Toronto, Ontario Canada. Filed Oct. 28, 1887. Serial No. 253,855. (No model.)

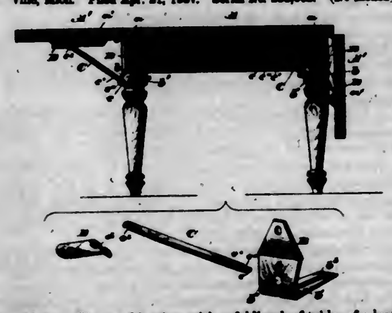


Claim.—The head-rest described, consisting of the head-rest A, the upright B, attached thereto, the shoulder-straps C, attached to the head-rest and passed behind said upright, the arm-straps E, secured to the upper part of the upright and formed at their free ends with loops, the body-strap G, attached to the upright, and the securing strap H, attached to said upright, all substantially as and for the purpose specified.

382,950. GOVERNOR FOR WIND-WHEEL SHAFTS. WARSHAM S. CAMPBELL, New Britain, Conn. Filed Dec. 16, 1887. Serial No. 258,053. (No model.)

Claim.—The combination, with the stationary shaft and the rotary wheel, of the sleeve H, movable with the wheel and formed with eccentric groove *d* and conical bore, the tapered sleeve I, vertically movable on the fixed shaft and formed at its lower end with a vertical slot engaging a lug on the shaft, the collars *g h* on the sleeve I, the loose collar *i* on the shaft between said collars *g h* and formed with lugs *j*, the weighted arms J, pivoted at their upper ends to the lower end of the sleeve H, and the links *m*, pivoted at one end to the lugs *j* of the loose collar and at the other end to the arms J intermediate their ends, substantially as shown and described, and for the purpose specified.

382,951. FIRE-HYDRANT. DANIEL W. CARROLL, Detroit, Mich., assignor of one-half to Edmund A. Chapoton, same place. Filed Mar. 31, 1887. Serial No. 233,142. (No model.)



Claim.—1. The combination, with a fire-hydrant and its case, of a valve provided with a hollow valve-stem extending to or near the top, said hollow space communicating at a point just above the valve with the interior of the case, and an attachment upon the case adapted to receive the discharge end of a steam-hose or air-pump, the construction being such that steam or air admitted into the case through the said attachment will expel the water from the case up through the hollow valve-stem, substantially as described.

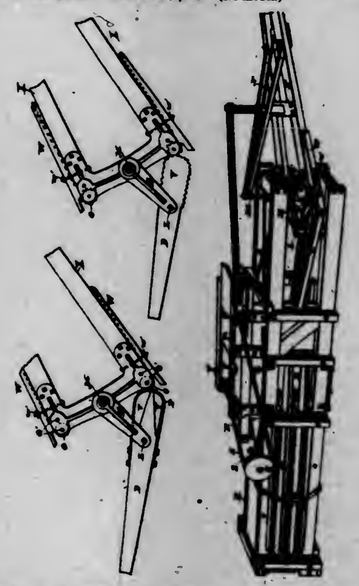
2. The combination, with a fire-hydrant, of a hollow valve-stem communicating at its base above the valve with the chamber of the hydrant, said hollow orifice in the stem closed at the top of the stem by a removable plug or stopper, the construction being such that by the removal of the stopper the water in the case may be forced out through the passage in the valve-stem, substantially as described.

3. The combination, with a fire-hydrant having a hollow valve-stem communicating at its base above the valve with the interior of the hydrant-case, of a nipple, *h*, in the plug-cap h^3, adapted to receive the discharge end of the steam-hose or air-pump, substantially as and for the purposes described.

382,952. TABLE-LEAF SUPPORT. HENRY J. CHAPMAN, Middleville, Mich. Filed Apr. 21, 1887. Serial No. 235,662. (No model.)

Claim.—The combination, with a folding-leaf table, of a leaf-support consisting, substantially as before set forth, of a hinge-plate se-

cured to the table-leaf, a brace-rod hinged to said plate at one end and provided at its opposite end with an enlarged boss and a cross-bar connected by a narrow neck, and a slotted keeper-plate secured to the side sill of the table, and having its abutting surface so disposed that its upper end is at a greater distance from the hinged pintle *d* than the lower end when the table-leaf is at the limit of its upward movement.



382,953. OPEN RING. JOSEPH DANIELS, Cleveland, Ohio. Filed Oct. 31, 1887. Serial No. 253,840. (No model.)

Claim.—1. An open overlapping ring having its ends bent inward and provided with a free space at the angle of and between said bent ends, forming a seat for a ring or link, substantially as set forth.

2. An open ring formed of a single piece of metal, as gold wire, bent to overlap and having its ends turned sharply inward toward the center of the ring from different points of its overlapped portion, whereby an overlapped free space is formed at the angle of the bent ends to hold a link or the like, substantially as shown and described.

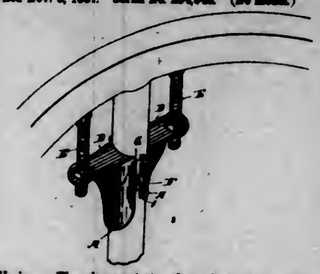
382,954. BALING-PRESS. PETER K. DEDERICK, Albany, N. Y. Filed Jan. 4, 1883. Serial No. 80,903. (No model.)

Claim.—1. In a baling-press, the combination, with the arm or pitman connected to the traverser, of the chilled pieces inserted in the outer end of said arm, and the metal band encircling the outer end of said arm and the inserted pieces, substantially as described.

2. In a baling-press, the combination, with the two arms comprising the toggle and the horse lever or sweep, of the adjustable rollers mounted on said sweep, substantially as described.

3. In a baling-press, the combination, with the two arms comprising the toggle, of the horse lever or sweep, the rollers mounted on said sweep, and the bumpers attached to said sweep and projecting out beyond the rollers, the whole constructed and arranged substantially as described.

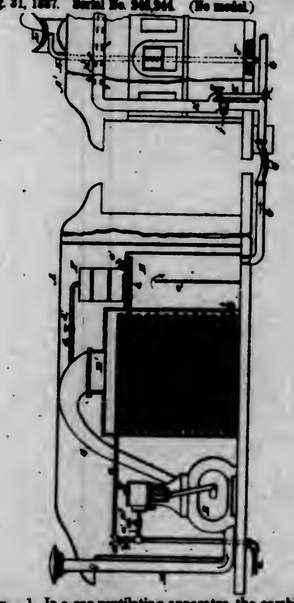
4. In a baling-press, the combination, with the horse lever or sweep carrying the rollers, of the bumpers secured to said sweep and capable of adjustment in and out, substantially as described.



5. In a continuously-operating baling-press, the combination, with the press-case, of a wheel projecting in the path of the moving column of pressed material in the press, and a movable indicator operated from said wheel, denoting by its position the length of the bale being formed, substantially as described.

6. The combination, with the press, of the shaft carrying the toothed wheel and the pulley, the belt, the indicator on the belt, and a guide pulley or pulleys, substantially as described.

7. In a baling-press, the combination, with the two arms comprising the toggle, of the horse lever or sweep and the bumpers attached to said sweep, substantially as described.



8. In a baling-press, the combination, with the two arms comprising the toggle, of the horse lever or sweep and the adjustable bumpers attached to said sweep, substantially as described.

382,955. TIRE-TIGHTENER. FRANK S. DUREE, Fort Scott, Kans. Filed Nov. 8, 1887. Serial No. 254,962. (No model.)

Claim.—The clamps A A, adapted to grip a spoke and having the interlocking hinge formed of the hooks G and the lugs *f*, together with the fastening bolt and nut, substantially as and for the purpose set forth.

382,956. CAR HEATING AND VENTILATING APPARATUS. JACOB T. HARVEY, Jacksonville, Fla., assignor of three-fourths to John H. Stephens, Charles R. Hibbs, and Robert S. Harvin, same place. Filed Aug. 31, 1887. Serial No. 248,244. (No model.)

Claim.—1. In a car-ventilating apparatus, the combination, with an air-blower, of a closed water-tank with spray-pipes, a chamber containing said spray-pipes, a conduit leading from the blower for the passage of air therethrough, and a pipe connecting the water-tank with the blast-pipe of the blower, substantially as and for the purpose described.

2. The combination, with an air-blower, of a chamber, E, having a vertical partition, *e*, extending nearly to the top and connected to the blower for a passage of air over said partition, and a water-tank, F, located above the same, and having a spray-pipe contained within the top of chamber E, substantially as and for the purpose described.

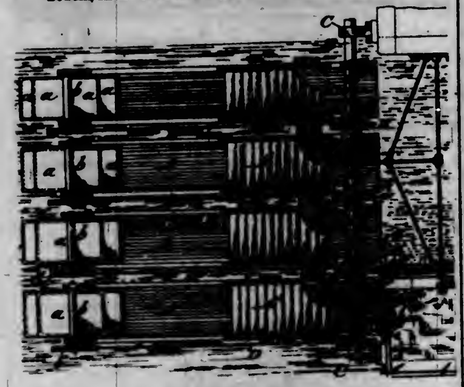
3. The combination of heating-chamber D', with steam-coil D, the blast-pipe C, blower B, with engine B', spray-chamber E, with partition *e*, and water-tank F, with spray-pipe *c* and pressure-pipe *d*, substantially as and for the purpose described.

4. The combination, with the longitudinal blast-pipe having an inlet branch opening into the car, of a supplementary injector-pipe, I, opening into the branch pipe, to permit the blast of air passing into the car to draw in an additional supply through said injector-pipe.

5. The combination of the two longitudinal pipes G G', arranged at the bottom of the car upon opposite sides thereof, the air-pipes H H', rising from opposite ends and opposite sides of the car, and having independent connections with pipes G G', with dampers, gratings J, having independent connecting-pipes with pipes G and G', and dampers located in said connecting-pipes, substantially as and for the purpose described.

382,957. CARRIAGE-CURTAIN-CORD HOLDER. JAMES G. BENNETT, New Haven, Conn., assignor to English & Mersick, same place. Filed Jan. 30, 1888. Serial No. 262,411. (No model.)

Claim.—The herein-described carriage-curtain-cord holder C, having a recess, *b*, opening from its under side, a vertical slot, *a*, into the said recess, and a spring, *d*, in said recess, combined with the tip B, adapted for attachment to the cord and for introduction in the socket, substantially as described.



382,958. IMPLEMENT FOR TURNING TUBULAR FABRICS. LOUIS BAUMER, Philadelphia, Pa. Filed June 28, 1887. Serial No. 243,288. (No model.)

Claim.—1. A hand-tool for the purpose named, consisting of a ring having a rod attached at one side thereof at a right angle to the plane of the ring and in line therewith, substantially as described.

2. A device for turning tubular fabrics, consisting of a ring, a supporting-rod detachably secured to one side of said ring at a right angle to the plane of the ring and in line therewith, and a base attached to the lower end of said rod, said parts combined substantially as described.

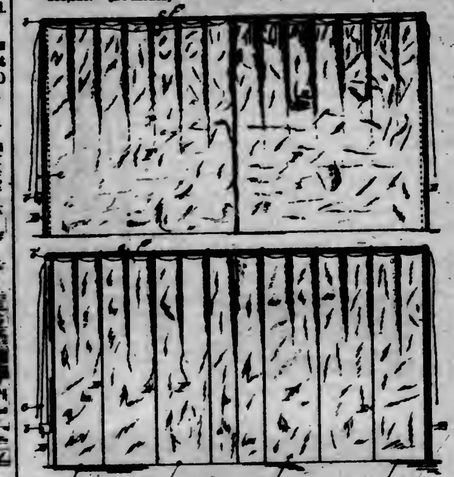
382,959. WATER-CURRENT-POWER TRANSMITTER. HARRY V. B. BENNETT, Boston, assignor of one-half to Henry B. Webb, West Newton, Mass. Filed Nov. 11, 1887. Serial No. 254,594. (No model.)

Claim.—1. The herein-described water-current-power transmitter, consisting in the combination of a swinging float, a stationary air-pipe on which one end of the float is hung, a water-wheel carried by the float, suitable gears on the air-pipe, an air-compressing mechanism connected to said gears, and a driving-belt between the water-wheel and the gears for actuating the latter to drive the said mechanism and compress air into the air-pipe, substantially as described.

2. The combination of the swinging float A, the stationary support B, on which one end of the float is hung, the gear F on the support B and carrying-pulley E, the water-wheel on the float having pulley *b'*, and the belt-connection D between pulleys *b'* and E, all arranged to operate any desired mechanism, substantially as described.

3. The combination of a swinging float, a water-wheel thereon, an air-pipe, B, on which the float is hung, said pipe resting on supports on the shore, a crank-axle, *c*, actuated by connection with the water-wheel, the cylinder J K, carried on pipe B and communicating therewith, air-compressing cylinder H, communicating with said cylinders J K, and the pitman I, connected to crank-axle *c* for operating a piston in cylinder H, all substantially as described.

4. The combination of a swinging float, a water-wheel thereon, an air-pipe, B, on which the float is hung, said pipe resting on supports on the shore, the gear F on pipe B, rigid to pulley E, likewise on said pipe, the gear G, meshing with gear F, crank-axle *c*, carrying the gear G and suitably journaled, the belt D, whereby the water-wheel actuates the pulley E and other mechanism, the swiveling cylinders J K, carried on pipe B and communicating therewith, air-compressing cylinder H, communicating therewith, air-compressing cylinder H, communicating with cylinders J K, and the pitman I, connected to the crank-axle *c* and a piston within cylinder H, all arranged to operate substantially as described.



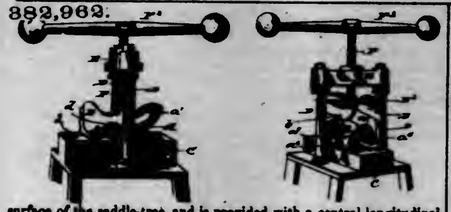
382,960. HYDRANT. CHARLES G. HYDE, St. Louis, Mo. Filed Aug. 6, 1887. Serial No. 246,469. (No model.)

Claim.—1. In a hydrant, a main water-pipe and a nozzle-section provided with a projection on the outside below the nozzle, in combination with casings made in sections, said casings having a corresponding recess at upper end to encircle the projection of nozzle-section, and having inwardly-projecting lugs below, said casings secured together and to the nozzle-section, substantially as described.

2. In a hydrant, a water-pipe and nozzle-section, in combination with a vertically-sliding frost-casing and an outer casing open at the bottom, made in sections, and provided with inwardly-projecting lugs, and an enlarged chamber below said lugs, substantially as and for the purpose specified.

382,961. STALLS FOR SEPARATING HORSES ON RACE-TRACKS. PETER A. FERRAR, San Francisco, Cal. Filed Oct. 26, 1887. Serial No. 253,255. (No model.)

Claim.—1. The combination, with suitable side supports, of transverse supporting means mounted upon the side supports, and curtains or partitions suspended from the transverse supporting means to form removable stalls upon a race-track, substantially as set forth.



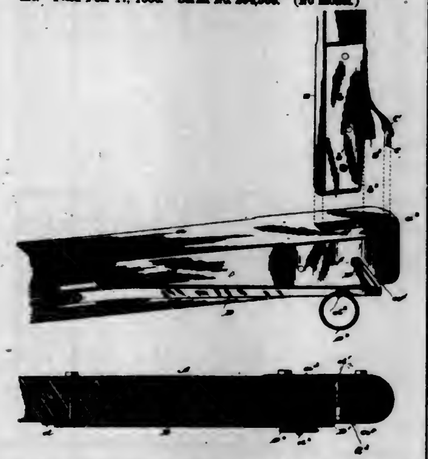
2. The combination, with suitable side supports, of transverse supporting means mounted thereupon, and curtains or partitions suspended from the transverse supporting means to form removable stalls upon a race-track, and a removable transverse curtain or screen placed in front of said stalls, as and for the purpose set forth.

3. In a device of the kind described, the combination, with the standards or posts, one pair of which is provided with pulleys and reels, as described, of the transverse supporting-ropes and the depending partitions, substantially as set forth.

382,962. PRESS FOR FORMING LEATHER SADDLE-TREES. JOHN H. FINK, Louisville, Ky., assignor of one-half to Henry B. Fallmann, same place. Filed Jan. 3, 1888. Serial No. 259,573. (No model.)

Claim.—1. In a press for forming saddle-trees of layers of leather or other flexible material, the combination of two independent dies, the top surface of the bottom one of which conforms to the under

382,962.



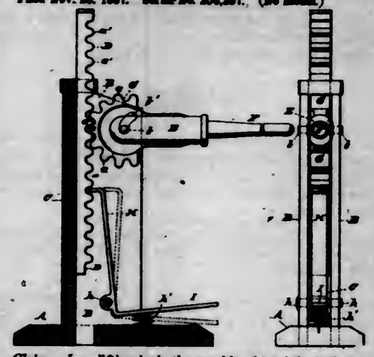
surface of the saddle-tree, and is provided with a central longitudinal raised portion and with a transverse rib at its front end, while the bottom surface of the top die conforms to the top of the saddle-tree, substantially as set forth.

2. In a press for forming saddle-trees of layers of leather or other flexible material, the combination of two independent dies, the top surface of the bottom one of which conforms to the under surface of the saddle-tree, and is provided with a central longitudinal raised portion and with a transverse rib at its front end, while the bottom surface of the top die conforms to the top of the saddle-tree, the bottom die being provided with guides which are engaged by the top die and retain the latter in position, substantially as set forth.

3. In a press for forming saddle-trees of layers of leather or other flexible material, a pair of dies having their inner faces corresponding to the contour of the saddle-trees and provided with a transverse rib at the forward portion of the bottom die, holes or perforations in the said rib for the reception of pegs adapted to retain the lower layer of material in position while building up the tree, and a longitudinal rib extending along the bottom die, substantially as and for the purpose set forth.

4. In a press for forming saddle-trees of layers of leather or other flexible material, a bottom die having guides thereon, and a top die provided with recesses for the reception of said guides, substantially as set forth.

382,963. WAGON-STANDARD. JOSEPH H. FOWLER, Mack's Creek Mo. Filed Feb. 17, 1888. Serial No. 264,309. (No model.)

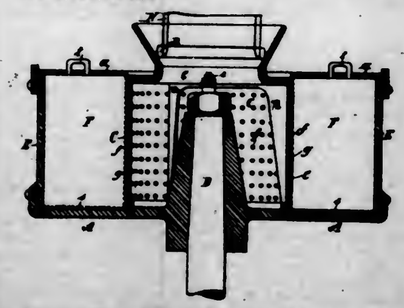


Claim.—1. The combination of the mortised and apertured bolster, the elongated spring-arm secured to the bolster, having a notched locking-bolt formed on its outer free end at right angles thereto, and the standard having an apertured tenon at its lower end, substantially as described.

2. The combination of a bolster having a mortise therein with tapered sides intersected by a transverse horizontal aperture and a vertical aperture near its outer end in line with the mortise, the spring-arm secured to said bolster, having a right-angled locking-bolt formed integral with its outer free end, a standard having a tenon with tapering sides and edges, and a transverse aperture extending therethrough, and a spring brace-stay secured to one edge of said standard having a lower reduced end to engage the aperture at the outer end of the bolster, substantially as described.

3. The combination of a bolster having a mortise formed with tapering sides, a horizontal aperture extending therethrough, and a vertical aperture near the outer end thereof, a metallic sheathing inclosing the outer end of said bolster, an elongated spring-arm secured to the side of said bolster, having a right-angled locking-bolt on the outer end thereof formed with an indentation, the operating ring or loop secured to the arm, the standard having a lower apertured tenon formed with tapered sides and a shoulder, and the spring brace-stay having a lower reduced end, substantially as described.

382,964. LIFTING-JACK. ROBERT M. FRALEY, Forest Hill, Ind. Filed Nov. 26, 1887. Serial No. 256,287. (No model.)

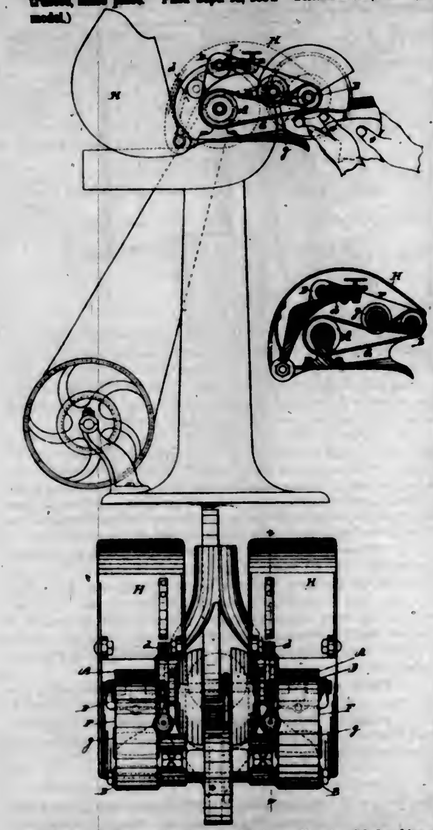


Claim.—In a lifting-jack, the combination of the bed-piece A, the standard having the walls B C, the socket E, having the enlarged end provided with the segmental rack G, having journal-bearings in the curved slot *b'*, the lever F, the rack-bar D, the clutch pivoted between the walls B, and having the foot-lever I, and the coiled spring *h'* beneath the foot-lever, substantially as specified.

382,965. MOP-WRINGER. GEORGE B. FERNEAU, Middleville, Mich. Filed Dec. 22, 1887. Serial No. 258,730. (No model.)

Claim.—The combination of the rectangular frame A, having the collar B attached to the upper portion thereof and the cross-bar *a* at the lower end, the handle having movement through said collar B, provided with the ratchet-collar on the lower end thereof, which in turn is provided with a loop at its lower end, the sliding plate moving against the sides of the rectangular frame interposed between the ratchet-collar and the loop on the lower end thereof, and the spring-pawl secured to the upper end of the rectangular frame, substantially as described.

382,966. CENTRIFUGAL MACHINE. ANDREAS FENTAS, Amsterdam, Netherlands, assignor to Maatschappy Vereenigdschap Wester-Suiker-Raffinaderij, same place. Filed June 25, 1887. Serial No. 242,602. (No model.) Patented in England Aug. 27, 1886, No. 10,172, and Mar. 31, 1886, No. 4,516; in France Nov. 16, 1886, No. 172,315, and in Germany Mar. 26, 1886, No. 36,737.



Claim.—1. The combination, with a rotary drum and a perforated cap centrally located within the same, of partitions removably located within said drum, each provided with a lateral flange or extension upon its lower end and with a handle upon its upper end, said partitions forming compartments between the peripheries of the drum and cap, substantially as described.

2. The combination, with a rotary drum and a perforated cap removably located in the drum and provided with vertical grooves in its outer periphery, of partitions removably located in the drum and held in the grooves of the cap, said partitions being provided with lateral flanges upon their lower edges, and with longitudinal vertical blades projecting from the same sides of the partitions as the lateral flanges, substantially as described.

3. In a centrifugal machine, the combination, with the cylindrical perforated outer drum, of the inner cylindrical perforated drum or cap centrally and removably located in the outer drum and provided with vertical grooves in its outer periphery, the removable radial partitions forming compartments between the outer periphery of the cap and inner periphery of the outer drum, the inner vertical edges of said partitions entering said grooves in the inner cap or drum, and means whereby said partitions can be removed, substantially as described.

4. The combination, with a rotary drum and a perforated inner drum or cap centrally located within the outer drum, of removable partitions forming compartments between the outer drum and the inner drum or cap, and a lateral flange or extension upon the lower end of each partition forming the bottoms of said compartments, for the purpose described.

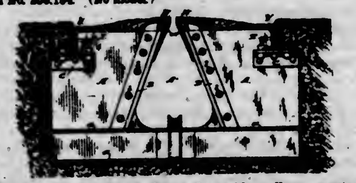
382,967. MACHINE FOR BUFFING BOOT OR SHOE SOLES. GEORGE A. FULLERTON, Boston, Mass., assignor to George H. P. Flagg, trustee, same place. Filed Sept. 15, 1884. Serial No. 142,971. (No model.)

Claim.—1. In combination, the driving-pulley A, with fixed boxes, the cushioned pulley B, also with fixed boxes, the movable pulley D, with movable boxes, and the abrasive belt F, all arranged as shown—that is, both the driving-pulley and the cushioned pulley being in stationary boxes and arranged at nearly equal distances from the movable pulley D, which is brought nearly between the pulleys A and B in order to remove or replace the belt, and into the position shown to tighten the belt.

2. In combination, abrasive belt F and its pulleys, with hood H, the hood closing a chamber in which the belt runs, except at its mouth, for the introduction of the work, and at its outlet, which is under the abrasive belt and communicates with the fan-chamber, as set forth.

3. In combination, abrasive belt F, carrier-belt G, and pulleys A, B, D, and *g*, the pulleys A and B being common to both belts, the pulley D serving to tighten or slacken the belt F, and the pulley *g* to tighten or slacken belt G, substantially as described.

382,968. STORAGE-BATTERY. CHARLES B. P. GIBBS, New York, N. Y. Filed Mar. 31, 1887. Serial No. 233,111. (No model.)



Claim.—1. In a storage-battery, the open-work insulating-frame E, composed of members crossing each other, in combination with the storage-plates D, provided with holes *d* opposite the angles formed by the crossing of said members, substantially as specified.

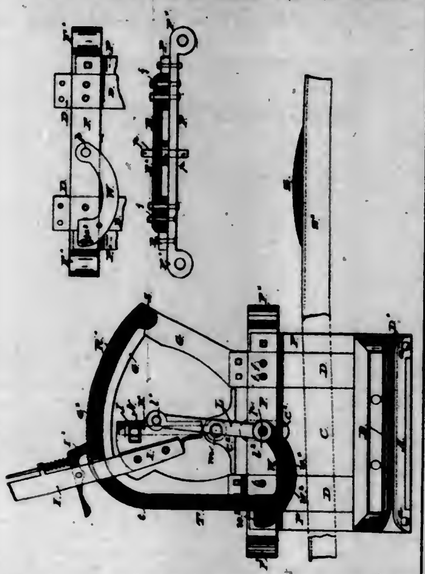
2. In a storage-battery, the open-work insulating-frames E, composed of members crossing each other, in combination with the storage-plates D, having holes *d*, and the pin F, arranged for joint operation, as herein specified.

3. In a storage-battery, in combination with two or more sub-batteries, B, and their plates and connections, the switch-board P, comprising a number of separate plates, Q, connected to one pole of the several batteries, a number of remote and separate plates, R, connected to the other pole of the several batteries, a number of independent auxiliary plates, Q', arranged adjacent to each of said plates Q, a number of independent auxiliary plates, R', arranged adjacent to said plates R, binding-posts Q^2, connected to said independent plates Q', and binding-posts R^2, connected to said independent plates R', all of said plates being provided with notches in their adjacent faces, whereby said several batteries are adapted to be connected at will in series or multiple by plugs T, substantially as specified.

4. The method described of filling cavities in the plates of a storage-battery by immersing in a suitable liquid and electrically connecting and sending a current through the plates under such conditions as to fill the cavities with peroxide by disintegration or deposition, or both, and exposure of plates to crystallize and absorb oxygen, substantially as herein specified.

382,969. CONSTRUCTION OF SUBWAY-YOKES FOR CABLE ROADS. SAMUEL GIBSON, San Francisco, Cal. Filed Dec. 27, 1887. Serial No. 259,194. (No model.)

Claim.—1. A yoke or frame for cable-railway construction, formed of a single plate, A, with a flanged bottom and an opening above the same for the cable-way, and the slot-iron supports B B, and rail-chairs C C, fastened to the plate in position, as described.



2. A yoke for cable-railway construction, having solid portions or webs between the cable-way opening and the rail supports or chairs at the outer edges for the full depth of the yoke, and the seats and recesses A^1 A^1 at the upper corners for the rails, substantially as and for the purpose set forth.

3. A yoke for cable-railway construction, having solid web portions, as described, with cut-away portions at the upper outer corners for the rails to let the inner flange of the rails into the plate, in combination with the hook-fastening E, which takes through the web of the rail and into the plate, as described.

4. The combination of the flanged plate A, angle-iron supports B B on either side of the cable-way opening in the plate, the flange *a*, and the slot-irons, substantially as described.

5. The herein-described yoke, having the rail-seats A^3, recesses for the rail-flanges, and the rail-chairs secured to the sides of the plate which forms the body of the yoke, substantially as described.

382,970. CABLE-RAILWAY GRIP. SAMUEL GIBSON, San Francisco, Cal. Filed Dec. 27, 1887. Serial No. 259,185. (No model.)

Claim.—1. An automatic let-go for cable-railway grips of the lever kind, consisting of the curved bar R^x, the curved plate W, pivoted at one end to some stationary part of the grip-frame, and the connecting-bar T, constructed and applied for operation substantially as described, the said plate W being set to strike and be thrown up by a projection on the surface of the roadway and the curved bar being placed to engage with the point of the locking-dog that holds the grip-lever, as set forth.

2. In combination with the grip-frame having upright guide-plates D D and sliding plate C, with cross-pieces E F and the jaws A B, the removable wearing-plates P, placed as described, and secured by fastenings to the stationary frame, for the purpose set forth.

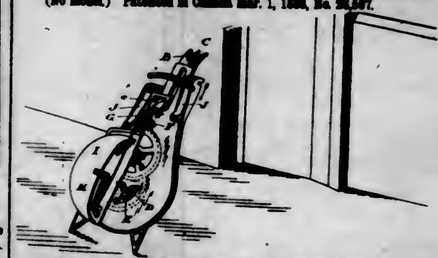
3. The herein-described grip-frame for lever-grips, consisting of the frame D D D^x E, cast in one piece, the removable wearing-plates P, the seat D^3, for the lower jaw, and the cross-piece F, constructed and combined as set forth.

4. In combination with the lever I and the slide to be operated by it, the block K, having an extensible rod or part, as M, let into the block, and having a nut, N, for adjusting it, to the end of which the slide is attached, and a connecting link or links pivoted at one end to a fixed point below said point of attachment to the slide, and at the other end to the block above said point, substantially as described, for operation as set forth.

5. The herein-described adjustable toggle-connection, consisting of the block K, having a socket for the eyebolt or screw-threaded rod M, the rod movable in said socket, the nut N, and the eye I^2 on the block for the pin of a connecting-link, as set forth.

6. In a cable-railway grip, a sliding jaw-carrier, a jaw-operating lever, and a toggle-connection consisting of the block K on the end of the lever, the links L L, connecting said block to some fixed point on the stationary frame, and the adjustable bolt or bar M, attached to the slide at a point between the ends of said links and capable of being extended in said block, as set forth.

7. The combination, with the locking-segment fixed to or making a part of the stationary frame of a cable-grip, as described, of the curved bar R^x, pivoted at one end to the segment, the bar T, which is jointed to said curved bar, and the curved plate W, pivoted to the grip-frame and attached to the bar T, substantially as described, for operation with a stop or projection on the roadway, as set forth.



382,971. ALARM-LOCK. HERMAN GRAMM and DAVID GRIMM, Montville, Pa. Filed May 13, 1887. Serial No. 238,043. (Model.)

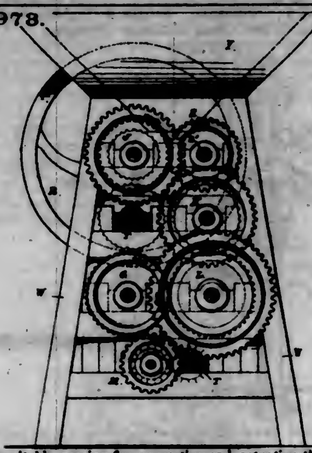
Claim.—1. In a lock, the lock-bolt provided with beveled projections *c* and laterally-projecting tooth *c'*, and pivoted piece B, provided with curved bar *e* and notches b^1, the said bolt and the piece B being placed in parallel planes in position to be operated by a key having bits a^2 a^3, in combination with spring-arm G, provided with projection g^2 in position near said bolt and piece B, and in a plane between the said parallel planes, and adapted to engage with pallet H, and an alarm mechanism provided with a pallet and an actuating-spring, substantially as and for the purposes described.

2. In combination with a lock-casing provided with an aperture, *g*, formed with a shoulder, *g'*, a spring-arm, G, adapted to connect with an alarm mechanism and provided with a projection, g^2, which is held in position, as shown, to connect with an ordinary key in the lock, and a bent arm, Q, extending through aperture *g*, and an alarm mechanism, substantially as set forth and described.

382,972. BURGLAR-ALARM. SAMUEL GOLDEN and JOSEPH CLARKE, Toronto, Ontario, Canada. Filed Feb. 4, 1888. Serial No. 262,908. (No model.) Patented in Canada Mar. 1, 1888, No. 26,567.

Claim.—1. A plate provided with suitable feet and arranged to support a bell and its ringing mechanism, in combination with a longitudinally-sliding bar adjustably connected to the bell mechanism, and a crank-disk in the connection between the bar and the bell mechanism, whereby the longitudinal movement of the bar will cause the bell to ring, substantially as and for the purpose specified.

2. A plate provided with suitable feet and arranged to support a bell and its ringing mechanism, and spring-hammers J, pivoted upon the plate, in combination with a longitudinally-sliding bar connected to the bell mechanism in such a manner that the longitudinal movement of the bar will cause the bell to ring, and a T-bar, K, connected to the said bar, arranged to strike the spring-hammers on the longitudinal movement of the bar, substantially as and for the purpose specified.

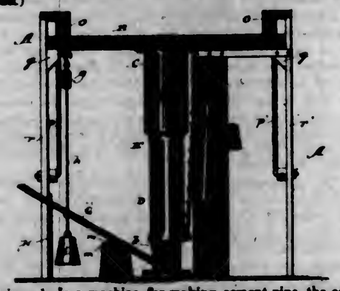


3. A plate, A, provided with suitable feet, *a*, a bar, B, adjustably connected to the said plate and having a slot, *b*, made in it, through which the spindle D projects, and is connected to the bar B by the pin *d*, as described, in combination with the bell-hammer arm H, pivoted at *e*, and operated by the crank-disk G, connected to the spindle F, which is geared to the spindle D, deriving motion therefrom upon the longitudinal adjustment of the bar B, substantially as and for the purpose specified.

4. The plate A, provided with suitable feet, *a*, and having pivoted upon it the spring-hammers J, in combination with the bar B, having attached to it the T-bar K, arranged to strike the spring-hammers J upon the longitudinal adjustment of the bar B, substantially as and for the purpose specified.

382,973. MACHINE FOR DISINTEGRATING BITUMINOUS SUBSTANCES. BRAD SHARP, San Francisco, Cal. Filed Sept. 26, 1887. Serial No. 250,907. (No model.)

Claim.—1. In a machine for disintegrating and reducing bituminous substances, the combination, with the supporting-frame, of the two sets of upper rollers fluted longitudinally and mounted upon shafts journaled in the frame, the two circumferentially-fluted rollers, whose shafts are journaled in the frame beneath the upper rollers, the two knife-carrying rollers located beneath the circumferentially-fluted roll-



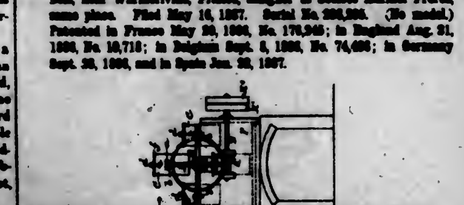
382,973.

ers, and suitable gearing for connecting and actuating these rollers, all substantially as described.

2. The combination of the supporting-frame, the set of longitudinally-fluted rollers A A^x, mounted on shafts S S^x, carrying gears E E^x, and said shaft S carrying fly-wheel R, the set of longitudinally-fluted rollers B B^x, gears J K for actuating them, the set of circumferentially-fluted rollers C C^x, and gears N P for actuating them, and the rollers D D, carrying knives D^x and driven by meshing gears L M, all arranged substantially as described.

382,974. MACHINE FOR MAKING CEMENT PIPES. LEE G. HAAS, Oak Park, Ill. Filed Aug. 16, 1887. Serial No. 247,056. (No model.)

Claim.—1. In a machine for making cement pipe, the combination of a core tapering in one direction and a jacket surrounding the core and tapering in the opposite direction, substantially as described.



2. In a machine for making cement pipe, the combination of a stationary core tapering in one direction and a movable jacket surrounding the core and tapering in the opposite direction, substantially as described.

3. In a machine for making cement pipe, the combination of a vertically-movable table provided with an opening, a stationary vertical core tapering toward its upper end and extending in line with the center of the opening in the table, and a jacket tapering toward its lower end, secured to the table around the opening therein, and surrounding the core, substantially as described.

4. In a machine for making cement pipe, the combination of a frame, A, carrying a vertically-movable table, B, provided with an opening, a stationary vertical core, D, tapering toward its upper end, surrounded toward its lower end by a sleeve, E, and extending in line with the center of the opening in the table, a jacket, C, tapering toward its lower end, into which the sleeve enters, and secured to the table around the opening therein to surround the core, a ring, I, surrounding the core within the jacket near the base thereof, and means, substantially as described, for raising the sleeve and ring within the jacket, substantially as set forth.

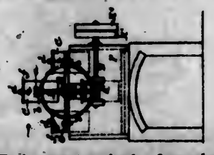
5. In a machine for making cement pipe, the combination of a frame, A, carrying a vertically-movable table, B, provided with an opening, a stationary vertical core, D, tapering toward its upper end, surrounded toward its lower end by a sleeve, E, provided with a lug, A, and extending in line with the center of the opening in the table, a jacket, C, tapering toward its lower end, into which the sleeve enters, and secured to the table around the opening therein to surround the core, a ring, I, surrounding the core within the jacket near the base thereof, a crank, F^2, connected with the sleeve to raise it, a weighted lever, G, fulcrumed beyond one of its sides, and a curved guide, H, for the long arm of the lever, substantially as described.

382,975. VISE. BENJAMIN R. HAAS, Bradford, Pa. Filed Jan. 30, 1888. Serial No. 262,641. (No model.)

Claim.—1. The combination of the bar A, having the perforated fixed jaw B, secured to its inner end, the lever C, having a jaw secured to its outer end and made to pass through the perforation in the stationary jaw, and having the strap E secured to its inner end, with the serrated dog and the screw for operating it, the lever being placed in close contact with the inner edge of the bar, substantially as shown.

2. The combination of the dog F, made rounding upon its inner side, the screw H, swiveled to the dog, the bar A, serrated upon its outer side, so as to engage with the dog, and having the perforated jaw B secured to its upper end, the lever C, having a head secured to its outer end, and the strap E, secured to its inner end and through which the screw H passes, the upper inner corner of the bar A being slightly beveled away, so as to allow the lever C a slight backward movement, substantially as described.

382,976. ELECTRIC TELE-THERMOSCOPE. HARRY W. HAINES, Louisville, Colo. Filed Aug. 27, 1887. Serial No. 248,091. (No model.)



Claim.—1. The pulsator consisting of the curved tube provided with bulbs, one at each end, and additional tubes extending short distances into said bulbs, substantially as and for the purpose set forth.

2. The pulsator consisting of the curved tube provided with bulbs, one at each end, and additional tubes extending short distances into said bulbs, in combination with the air-chamber connected with one of said additional tubes, substantially as and for the purpose set forth.

3. The combination, with the pulsator comprising a curved tube having bulbs, one at each end, and connected to an air-chamber, of the thermostatic spring, and the regulating or adjusting screws which are adapted to have connection separately with an arm of said spring, the same being arranged in an electric circuit, substantially as and for the purpose set forth.

4. The combination, with the pulsator, of the thermostatic spring provided with an arm to which near its free or outer end are applied supplementary or contact springs, and the adjusting or regulating screws, the same being included in an electric circuit, substantially as and for the purpose set forth.

382,977. APPARATUS FOR DYEING. ALBERT HASSEL, Val-de-Bois, near Warmeriville, France, assignor to Soudet Hassel Frères, same place. Filed May 16, 1887. Serial No. 238,203. (No model.) Patented in France May 20, 1886, No. 176,945; in England Aug. 21, 1886, No. 10,718; in Belgium Sept. 8, 1886, No. 74,686; in Germany Sept. 20, 1886, and in Spain Jan. 20, 1887.

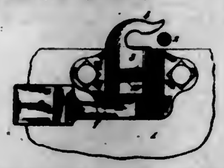
Claim.—1. The improved mechanism for mechanical dyeing, consisting of the combination of a vat for containing liquid, a rotatable frame journaled within said vat, and a series of receptacles for inclosing the fibrous matter carried by said frame, each of said receptacles

having imperforate sides and foraminous ends, said ends being located within the receptacle, whereby open-mouthed chambers having closed sides and perforated bottoms are formed at both ends of the receptacles at all times when the mechanism is in operation.

2. The improved mechanism for mechanical dyeing, consisting of the combination of a vat for containing liquid, a rotatable frame journaled within said vat, and a series of receptacles for inclosing the fibrous matter to be treated carried by said frame, each receptacle having imperforate sides and foraminous ends between which the fibrous matter is confined, one of said foraminous ends being removable and adjustable, whereby the fibrous matter may be inserted in the receptacle and securely retained therein.

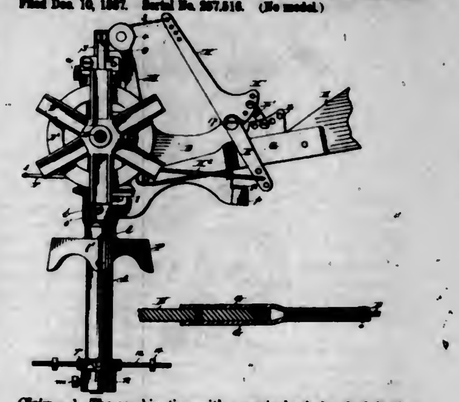
3. The improved mechanism for mechanical dyeing, consisting of the combination of a vat for containing liquid, a rotatable frame journaled within said vat, and a series of receptacles for inclosing the fibrous matter, each journaled in said frame, the journals of each of said receptacles being above its center of gravity, and each of said receptacles having imperforate sides and foraminous ends, the upper foraminous end being located below the rim of the receptacle, whereby an open-mouthed chamber is formed at the upper end of the receptacle.

382,978. LUBRICATOR. THOMAS J. HARE, Detroit, Mich., assignor to R. G. Pelthousen and C. A. Sherwood, Buffalo, N. Y. Filed Oct. 3, 1887. Serial No. 251,256. (No model.)



Claim.—In combination with the base A, having an internally threaded and chambered upwardly-extending sleeve, A', having a discharge-orifice located at the lower part thereof, the body C, and cover D, having a hollow stem, D², and fluid-opening D', an independent spring-pressed stopper, I, the adjustable sleeve E, attached to the sleeve A' by a screw-thread, and driver G attached to the sleeve E, so as to have independently only a rotary movement, and a valve, B, connected by a slip-joint to the driver and screw-threaded into the sleeve A', substantially as set forth.

382,979. INKING APPARATUS FOR PRINTING-MACHINES. JOHN T. HAWKINS, Taunton, Mass. Filed Dec. 14, 1887. Serial No. 257,572. (No model.)



Claim.—In an inking apparatus of a printing-machine, the combination, with inclined bearings, as 9, of slotted ball-crank levers, as 6, fulcrumed laterally on studs, as 7, carrying on one arm sockets or bearings for the form-rollers resting upon said inclined bearings, and in the other arm set-screws, as 14, secured in position by check-nuts, as 15, and impinging upon lugs, as 5, formed on or secured to the frame of the machine, and thumb or other nuts, as 13, and studs, as 11, for securing said levers in place, whereby the adjusting only of said set-screws performs the adjustment of the form-rollers both to the form and to the distributer-roller and permits of the ready removal and replacing of the form-rollers without disturbing their adjustment, substantially as set forth.

382,980. ELEVATOR-LOCK. EMILE J. HERMAN, St. Louis, Mo., assignor to the Safety Hatch Door Company, same place. Filed Jan. 21, 1888. Serial No. 261,474. (No model.)

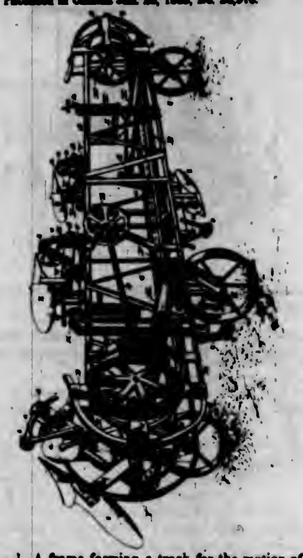
Claim.—In an elevator-lock, the combination of the box or housing having a fixed jaw and an inclined slot, a bolt adapted to fit in the box or housing and having two or more holes, an operating-lever on the bolt, and a pin adapted to fit in either of the holes and to work in the slot, substantially as and for the purpose set forth.

382,981. WINDMILL. WILLIAM W. HELSDON, Dunkirk, Ind. Filed Dec. 10, 1887. Serial No. 257,516. (No model.)

Claim.—1. The combination, with a vertical tubular shaft having suitable bearings therefor, of vane-bracket B, mounted on said shaft and having a horizontal movement therewith, vane H, pivoted at its inner end to said bracket, shifting lever K, having projecting arm K', connected with said vane and pivoted to said bracket, whereby said vane may be lifted, wheel-bracket C, loosely mounted on said tubular shaft, and having a horizontal movement thereon, said bracket provided with stops 9 8 and projecting arm C', wind-wheel D, journaled on said wheel-bracket, driving-shaft E, actuated by said wheel, crank-wheel N, pitman O, pump-rod S, and rod K² for connecting the shifting lever with the wheel-bracket, substantially as set forth and described.

2. The combination, with a vertical tubular shaft and suitable bearings therefor, of a vane-bracket, B, mounted on said shaft and having a horizontal movement therewith, said bracket provided with the boss *p* and lug *g*, a vane, H, secured to extension-plates G G, and pivoted to said bracket through the inner ends of said extension-plates, shifting lever K, having lifting-arm K', graduating-plate L, connecting link L', wire rope 3, wheel-bracket C, loosely mounted on said tubular shaft to one side of a line parallel with the vane-bracket thereon, said bracket provided with stops 8 9 and arm C', wind-wheel D, driving-shaft E, crank-wheel N, pitman O, pump-rod S, and rod K², connecting the shifting lever with the arm C' of the wheel-bracket, substantially as set forth and described.

3. The combination, with a vertical tubular shaft and suitable bearings therefor, of a vane-bracket, B, mounted on said shaft and moving horizontally therewith, vane H, pivoted on said bracket, a shifting lever, K, pivoted to the bracket for lifting said vane, a link for connecting said vane to the shifting lever, wheel-bracket C, loosely mounted on said tubular shaft, and having a horizontal movement thereon, rod K², for connecting the shifting lever with said wheel-bracket, a wind-wheel journaled on said bracket and actuating the driving-shaft E, crank-wheel N, pitman O, pump-rod S, cap-box *c*, secured to the upper arm of the wheel-bracket and acting as a rotary guide to the pump-rod, thimble R, having an annular flange inwardly projecting at its lower end, and circular plate 5, through which the pump-rod and shifting-lever rope pass, and which has a rotary movement therewith as the wind-wheel is thrown in and out of the wind substantially as set forth and described.



382,982. REFRIGERATOR. GEORGE R. HOVEMEIER, Chicago, Ill., and GEORGE F. SMITH, Michigan City, Ind. Filed Mar. 16, 1887. Serial No. 230,444. (No model.)

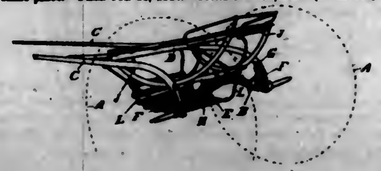
Claim.—1. In a refrigerator having double walls, the combination, with the provision-chambers, of an ice-box located above the same and provided with a central opening communicating with the provision-chambers, the side flues, *a a*, and the two hinged covers separated by a fine space, which space communicates with the side flues, the inner cover having the slot *d*, communicating with the ice-box, as set forth.

2. In a refrigerator, the double walls and an intermediate lining of charcoal mixed with paper-pulp or some other adhesive material, substantially as described.

382,983. STEAM PLOWING APPARATUS. EDWARD IRELETON, Toronto, Ontario, Canada. Filed May 14, 1888. Serial No. 273,587. (No model.) Patented in Canada Jan. 20, 1888, No. 30,970.

Claim.—1. A frame forming a track for the motion of one or more plow-carriages, in combination with beams carried on caster-wheels and connected to said frame by a pivot-joint, substantially as set forth, and for the purpose specified.

2. The beams H, supported by the caster-wheels G, in combination with the triangular brackets connected by a pivot-joint to the beams H and having one end jointed to a part of the frame, while the other end is connected to and actuated by a screw-spindle, substantially as and for the purpose specified.



3. A frame made of any suitable material, but preferably of iron or steel, arranged to form a track for the movement of plow-carriages and having semicircular ends with the frame forming a double track along the lower side and around the semicircular ends, substantially as shown, and for the purpose specified.

4. The combination of the frame A, having the double track, a carriage supported on wheels adjusted to travel on said track and having one or more plows attached to it, and an endless chain for moving said carriage, substantially as described.

5. The combination of the frame A, having the double track, a plow-carriage having a plow-beam, W, and one or more plows, and an endless chain for moving said carriage, substantially as described.

6. The combination of the frame A, having a track, an endless chain on said frame, a plow-carriage on the track of said frame, and the bars *f*, connecting the carriage with the endless chain, substantially as described.

382,984. ROAD-CART. CHARLES W. JEWETT and GEORGE H. JEWETT, Jackson, Mich., assignors to the Collins Manufacturing Company, same place. Filed Oct. 13, 1887. Serial No. 252,051. (No model.)

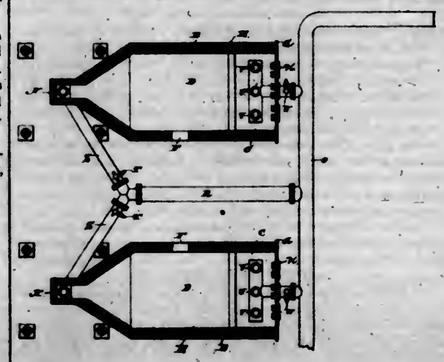
Claim.—1. In a cart, the combination, with the axle, shafts, and spring, of the hanger-iron G, secured to the shafts and carrying a pin, *b*, and the hanger F, suspended from said pin and having two legs, one extended vertically and the other curved, substantially as and for the purposes specified.

2. In a road-cart, the combination, with the semi-elliptical seat-spring E, of the pivot-pin *b*, secured to the rear end of the shaft, and the hanger F, having the flaring eye *e* at its upper end and the straight and curved bifurcations at its lower end, substantially as described.

382,985. BOOT OR SHOE. JOHN W. JONES, Shoreditch, County of Middlesex, and EDWARD KYE BENHAM, London, England. Filed Mar. 7, 1888. Serial No. 266,642. (No model.)

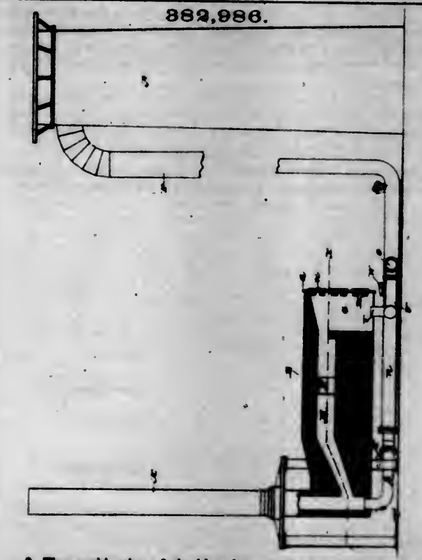
Claim.—1. The combination, in boots or shoes, of a metal plate, *c*, secured to the "upper" and insole with a sliding fore part, *a*, a sliding metal waist, *f*, and heel *h*, substantially as set forth.

2. A boot or shoe constructed with a malleable metal plate, *c*, secured to the upper and insole, and having its outer edge, *d*, projecting, so as to allow the fore part or outer sole, *a*, and metal waist *f* to be slid on the two parts being thus firmly secured to the upper and insole and also firmly secured to each other by the screws *g*, substantially as set forth.



3. A boot or shoe constructed with a malleable metal plate, *c*, sewed all round (to the upper and insole) a short distance from its edge *c'*, upon which are slid the outer sole, *a*, the metal waist *f*, and the heel *h*, these parts being respectively prevented from coming off or apart by screws *g g* and *i i*, substantially as set forth.

4. A boot or shoe having a metal waist, *f*, with edges *f'* turned under to slide under and embrace a metal plate, such as *c*, secured to the upper and insole, substantially as set forth.



5. A boot or shoe having a sliding fore part or outer sole, *a*, with a projecting metal edge or rim, *b*, on its inside, to slide under and embrace the edge *c'* of a metal plate, such as *c*, secured to the upper and insole, the back edge of the sliding fore part, *a*, passing under the front edge of the metal waist *f*, these two parts being held together by screws, and thereby firmly secured to the upper and insole, all substantially as set forth.

382,986. REHEATING-FURNACE. THOMAS C. JONES, Lynchburg, Va. Filed July 16, 1887. Serial No. 244,266. (No model.)

Claim.—1. The combination of the blast-furnace, the reheating-furnace having a combustion-chamber, C, and a stack or chimney, N, and a pipe leading from the blast-furnace to carry off the blast-furnace gases, and having branch pipes communicating with the combustion-chambers C, and with the lower ends of the chimneys or stacks, substantially as set forth.

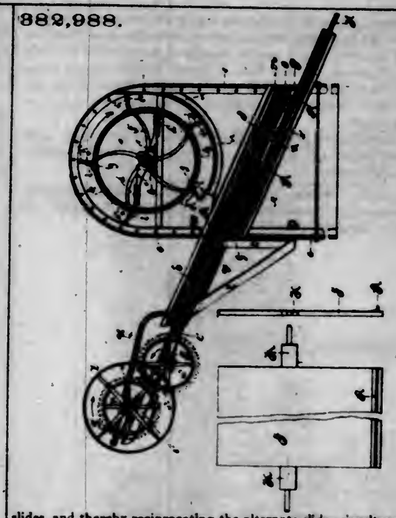
382,986.

2. The combination of the blast-furnace, the series of reheating-furnaces, each having a combustion-chamber, C, and a chimney or stack, N, the pipe P, leading from the top of the blast-furnace, the pipe O, extending from the pipe P past the front ends of the reheating-furnaces, the T-shaped pipe U, leading from the said pipe O and provided with the damper W, and the vertical pipes V in the combustion-chambers, and the pipes R S, leading from the pipe O to the lower ends of the chimneys or stacks N, and provided with dampers T, substantially as specified.

382,987. **HYDROGRAPH.** AMELIA KAHN, St. Joseph, Mo. Original application filed Mar. 21, 1887, Serial No. 231,712. Divided and this application filed Mar. 9, 1888. Serial No. 266,704. (No model.)

Claim.—1. Nose-guards having their upper end adjustably secured to the glass or its frame, and having the lower end unattached and normally free to move either in or out relatively to the edge of the glass, but having its forward or backward movement restricted by the sides of the frame or glass itself, substantially as and for the purpose set forth.

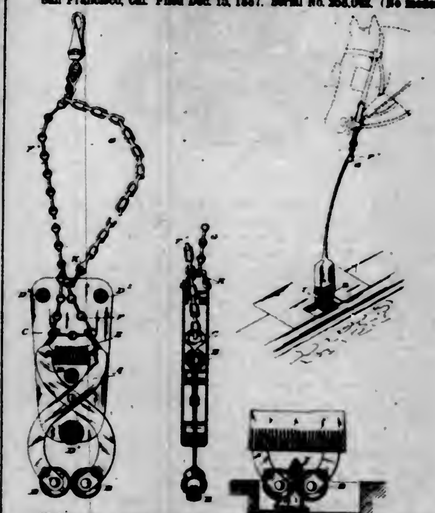
2. Nose-guards provided with pads of yielding material, as described, and having their lower end unattached and normally free to move in or out relatively to the edge of the glass, but having the forward and backward movement restricted by the sides of the frame or glass itself, substantially as and for the purposes set forth.



382,988. **PEA-SHELLING MACHINE.** ROBERT KAEGER, Brunswick, Prussia, Germany, assignor, by direct and mesne assignments, to Hermann Froling, same place. Filed Feb. 25, 1886. Serial No. 193,119. (No model.) Patented in Austria-Hungary Jan. 11, 1886, No. 2,826 and No. 22,114; in Belgium Jan. 13, 1886, No. 71,603; in England Jan. 14, 1886, No. 601; in France Jan. 13, 1886, No. 173,599, and in Italy Feb. 13, 1886, XX, 1,676, CCCLXXXIX, 19,406.

Claim.—1. The combination of the guideways, the slides arranged therein one above another and in different vertical planes, said slides having the sweeps bearing against their opposing faces, and means, substantially as set forth, to reciprocate the alternate slides simultaneously in opposite directions, substantially as specified.

2. The combination of the inclined guideways, the slides arranged thereon one above another and in different vertical planes, and means, substantially as specified, to reciprocate the alternate slides simultaneously in opposite directions, substantially as set forth.

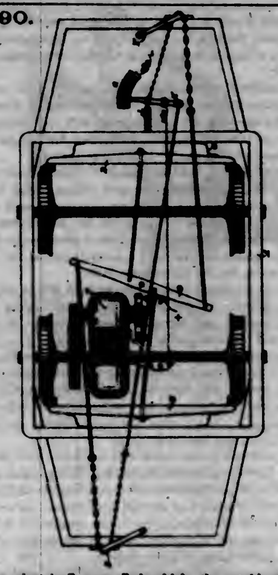


3. The combination of the inclined guideways, the slides arranged thereon one above another and in different vertical planes, said slides being connected together alternately, the crank-shafts rotating in opposite directions, and the pitmen connecting said crank-shafts to the

382,988.

slides, and thereby reciprocating the alternate slides simultaneously in opposite directions, substantially as specified.

382,989. **DEVICE FOR HITCHING HORSES.** CONSTANTIN KAUFER, San Francisco, Cal. Filed Dec. 15, 1887. Serial No. 258,062. (No model.)



Claim.—1. A weighted hitching-strap contained in a casing, or otherwise held, which consists of a tongs having wheels or rollers in the ends of the jaws, and two chains or straps of different lengths, one of which is connected to the short arms of the tongs and the other to the metal casing, as described.

2. In a hitching device, the combination, with the long and short parallel straps or chains, arranged as set forth, of a weighted holding-tongs having a retractive spring in the short arms, as described, and rollers or wheels in the jaws thereof, adapted to be opened when struck upon a hitching ring or loop, in the manner as set forth.

382,990. **ELECTRICALLY-PROPELLED VEHICLE.** WALTER B. KNIGHT, New York, N. Y. Filed Jan. 20, 1888. Serial No. 261,347. (No model.)

Claim.—1. In an electrically-propelled vehicle, the combination, with the propelling-motor, of a circuit-controlling regulator therefor, an actuating-spring for moving it in one direction, a manual device for moving it in the opposite direction, and a brake for the vehicle controlled by said device.

382,990.

2. In an electrically-propelled vehicle, the combination, with the propelling-motor, of a circuit-controlling regulator therefor, an actuating-spring for operating it in one direction, a manual device for operating it in the opposite direction, and a brake for the vehicle controlled by said device.

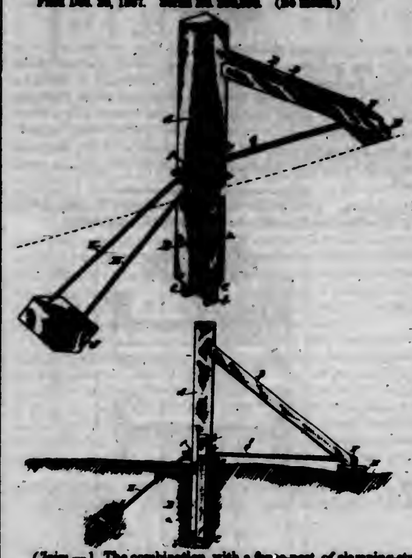
3. In an electrically-propelled vehicle, the combination, with the propelling-motor, of a circuit-controlling regulator therefor, a manual device on each end of the vehicle for actuating said regulator, and a brake for the vehicle controlled by said manual device.

4. In an electrically-propelled vehicle, the combination, with a brake, of a retractile spring therefor, a manual device on each end of the vehicle for actuating said brake, and an electrical regulator therefor connected with the said devices so as to be worked thereby.

5. In an electrically-propelled vehicle, the combination, with the brake, of a retractile spring therefor, a manual device on each end of the vehicle for actuating said brake, the propelling-motor, an electrical regulator therefor, a spring for actuating it in one direction, and a connection with the said manual devices for actuating it in the other direction.

6. The combination, in an electrically-propelled vehicle, of a resistance, a brake, and a common actuating device therefor extending to opposite ends of said vehicle.

382,991. **MUSICAL WIND-INSTRUMENT.** ALEXANDER LEPAGE, Philadelphia, Pa. Filed May 27, 1887. Serial No. 239,574. (No model.)



Claim.—1. In musical wind-instruments having looped tubes for varying the length of vibrating air-columns, the combination of said looped tubes with piston-valves provided with helical guides, substantially as set forth.

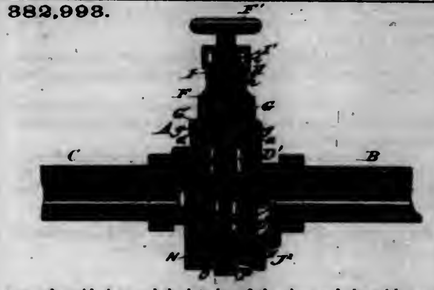
2. In piston-valves for musical wind-instruments, the combination of a piston-valve with a helical guide and rotatable key, substantially as set forth.

3. In piston-valves for musical instruments, the combination of helical tubular passages through the valve with a helical guiding mechanism, substantially as set forth.

4. The combination of helical tubular passages through the valve C, having a continuation of the taper of the mouth-pipe, with the mouth-pipe A, having a continuous gradual enlargement from the mouth-piece A' to the said valve, substantially as set forth.

382,992. **FENCE-POST.** LAFAYETTE W. LINDLEY, Louisville, Ky. Filed Dec. 26, 1887. Serial No. 259,203. (No model.)

Claim.—1. The combination, with a fence-post, of clamping-straps secured on opposite sides of its lower end, an anchor-block between the straps, and a bolt passed through the lower ends of said straps below the anchor-block for firmly clamping this block, substantially as described.



2. The combination of the post perforated transversely at its lower end, the anchor-block, the straps C C, bolted upon opposite sides of the post and extending down on opposite sides of the anchor-block and adapted to firmly clamp the same, the anchor-block J, embedded in the ground a short distance from the lower end of the post, the inclined brace-rods H H, connecting the lower end of the post with the said anchor-block J, the upper ends of the said rods H H being screw-threaded and passed through the transverse apertures in the lower end of the post, and the nuts *f f* upon the upper screw-threaded ends of the rods H H, as and for the purpose set forth.

3. In a fence-post, the combination of the post perforated transversely at its lower end, the anchor-block B, the straps C C, bolted upon opposite sides of the post and extending down upon opposite sides of the block B and adapted to clamp the same, the anchor-block J, embedded in the ground a short distance from the post, the inclined brace-rods H H, connecting the lower end of the post with the block J, the upper ends of the said rods H H being screw-threaded and passed through the apertures in the lower end of the post, the tightening-nuts *f f* upon the brace-rods H H, the inclined braces D D, resting against the upper end of the post upon the opposite side from the anchor-block J, the block B, placed under the lower ends of the braces D D, the perforated plate F, abutting against the lower ends of the braces D D, the horizontal tie-rod connecting the lower end of the post to the said abutting plate F, and the nut *f* upon the said tie-rod, substantially as herein set forth.

382,993. **THROTTLE-VALVE.** ROWE W. LEE, Salem, N. Y. Filed Dec. 16, 1887. Serial No. 258,089. (No model.)

Claim.—In a valve, the combination, with the main body having inlet and outlet pipes, of a two-part plug fitting therein, the upper of which parts is formed with lateral holes opening communication be-

382,993.

tween the said pipes and the interior of the plug, and also with a recess at its top to form a seat for the valve, and the lower of which parts closes the lowermost extremity of the valve-body, is formed at its top with an annular recess, forming a water and steam tight joint between it and the upper portion, and is also formed with a screw-threaded perforation and a screw-threaded drainage-plug normally closing the said perforation, and having a recess in its side extending but partially to its head, substantially as and for the purposes herein set forth.

382,994. AUTOMATIC CAR-BRAKE. ROWIN W. LOSS, Bolivar, N. Y. Filed Jan. 27, 1888. Serial No. 262,132. (No model.)

Claim.—1. In an automatic car-brake, the combination, with pressure-rods, of sliding plates adapted to be moved thereby, and brake beams and shoes connected with the said sliding plates.

2. In an automatic car-brake, the combination, with pressure-rods and sliding plates, of brake-beams having shoes or blocks, and pivoted rods between the pairs of brake-beams and connected therewith and with the said sliding plates.

3. The combination, in an automatic car-brake, with the car-axle, of a grooved cylinder secured thereto and having pivoted dogs, and a pivoted switch-bar adapted to be operated upon by the said dogs in the manner and for the purposes substantially as herein set forth.

4. A switch-bar having a recess at its extremity, in combination with a projection situated within the said recess and having lugs, a spring at the rear of said projection, connecting rods or cables secured to the said lugs, and means, substantially as described, for winding the said connecting rods or cables, for the purpose set forth.

5. The combination, in a car-brake, with a pivoted switch-bar and its connecting rods or cables, of a grooved cylinder, pivoted dogs situated obliquely thereon, for the purposes set forth, and springs for keeping the said dogs in their normal position, substantially as shown and described.

6. The combination, in an automatic car-brake, of pressure-rods and sliding plates, pivoted supports for the said sliding plates, and pivoted switch-bar carrying the said supports, with the grooved cylinder, and the dogs, all arranged in the manner and for the purposes substantially as herein set forth.

7. The combination, in a car-brake, of pressure-rods and sliding plates, with pivoted supports for the said sliding plates, having lugs or projections, a plate having curved grooves or recesses adapted to receive the said lugs and to act as guide for the pivoted supports, switch-bar carrying the said support, rods or cables secured to the said switch-bar, and means, substantially such as described, for winding the said rods or cables, for the purposes set forth.

8. In an automatic car-brake, pressure-rods, sliding plates adapted to be engaged thereby, pivoted support for the said sliding plates, having lugs or projections, and curved recesses adapted to be engaged by the said lugs and to act as guides for the said support, in combination with pivoted switch-bar carrying the said support and having a recess at its extremity, a projection situated within the said recess, having lugs, a spring at the rear of said projection, cables secured to the lugs of the projection, means for winding the said cables, grooved cylinder secured to the car-axle, and pivoted dogs situated obliquely thereon, all arranged for the purposes herein set forth.

9. The combination, in an automatic car-brake, with pressure-rods having spring-joints at their extremities, and sliding plates and pivoted supports therefor, of pivoted switch-bar carrying the said pivoted support, and grooved cylinder and pivoted dogs thereon, all arranged substantially as described, whereby the brake mechanism is adapted to be thrown into and out of position and the extremities of the pressure-rods will not be liable to injury thereby.

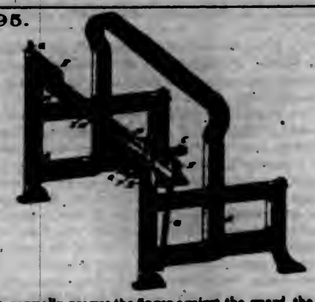
10. In an automatic car-brake, the combination, with axles thereof and tapered cylinder situated thereon and formed with spiral grooves, of lever-bars adapted to engage therewith, brake beams and shoes, and rods connecting the said lever-bar with the brake-beams, whereby the brakes will be automatically operated in the event of the parting of the train.

11. In an automatic car-brake, the combination, with axles thereof, tapered cylinders situated thereon and formed with spiral grooves, and brake-beams and their shoes, of lever-bars adapted to engage therewith and connected with the said brake-beams, supports for the said lever-bars, and pressure-rods having conical extensions and coiled springs, substantially as described, whereby the lever-bars will be normally out of engagement by their supports being normally located upon the largest portion of the conical extension.

12. The combination, in an automatic car-brake, with the pressure-rods having conical extensions and coiled springs, lever-bars also having coiled springs to increase their power, and supports for the said lever-bars, of conical tubes secured to the car-axles, having spiral grooves, brake-beams and their shoes, and rods connecting the said beams with the lever-bars, all arranged to operate in the manner and for the purposes substantially as herein set forth.

13. In an automatic car-brake, the pressure-rods, lever-bars, supports for the said lever-bars, brake-beams and their shoes, and pivoted rods between the pairs of brake-beams and connected therewith, in combination with conical tubes secured to the car-axles and having spiral grooves, and rods connecting the lever-bars with the said pivoted rods, all arranged for joint operation substantially as described.

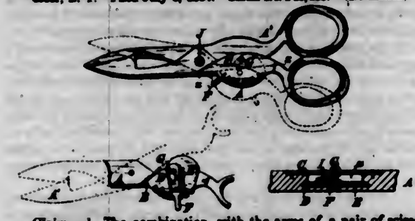
14. The lever-bars having elongated slots, and headed pins secured to the car-body and passing through the said slots, in combination with cables at the rear of said lever-bars, adapted to engage with hooks on the car, substantially as described, whereby the said lever-bar can be drawn back and secured and the device rendered inoperative when desired.



382,995. LOOM-SHUTTLE RELIEF MECHANISM. S. TAYLOR MCKINNEY, Piedmont, S. C. Filed Nov. 10, 1887. Serial No. 254,751. (No model.)

Brief.—One of the swords of the lay carries a bell-crank lever connected at one end to one of the lay-pitmen, and carrying an anti-friction roller at the other end. Said roller bears upon an arm connected to the usual rod having the finger and spring. Just before the forward movement of the lay the lovers described release the pressure of the finger upon the shuttle-binder.

Claim.—1. In a loom, the combination, with the lay, the shuttle check or guard, a shaft having a finger, and a spring in proximity to the shaft which normally presses the finger against the guard, the pitman, and the bell-crank lever connected thereto, of a relief-bar connected to the rock-shaft and constructed to be actuated by the bell-crank lever.



2. In a loom, the combination, with the lay, the shuttle check or guard, a rock-shaft having a finger, and a spring in proximity to the shaft which normally presses the finger against the guard, the pitman, and the bell-crank lever connected thereto and provided at one end with a roller, of a relief-bar connected to the rock-shaft and constructed to be actuated by the bell-crank lever.

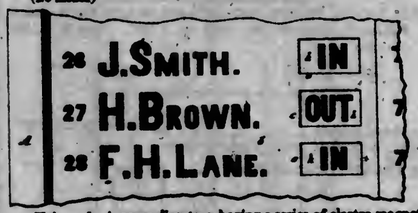
382,995.

3. In a loom, the combination, with the lay, the shuttle check or guard, a rock-shaft having a rod or finger, and a spring mounted in proximity to the shaft to normally press the finger against the guard or check, of a pitman, a bell-crank lever connected thereto and provided at one end with a roller, and a relief-bar connected to the rock-shaft and constructed to be actuated by the bell-crank lever.

382,996. BUTTON-HOLE SCISSORS. LUTHER C. HOLMAN, Rochester, N. Y. Filed July 6, 1887. Serial No. 243,425. (No model.)

Claim.—1. The combination, with the arms of a pair of scissors and a cam pivoted to one arm and adapted to be swung on its pivot to engage the other arm and limit the movement of said arms, of a lock for positively holding said cam in adjusted position, substantially as described.

2. The combination, with a pair of scissors and a cam pivotally connected to one arm and adapted to be swung on its pivot to engage the other arm and limit the movement of the two arms toward each other, of a projection or tooth moved by the cam, and a notched surface with which said projection or tooth engages for holding the cam in adjusted position, substantially as described.



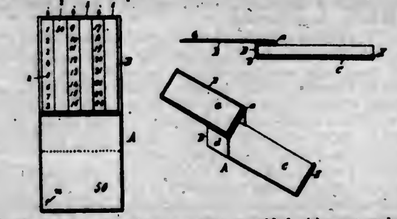
3. The combination, with a pair of scissors and a cam pivotally connected to one arm and adapted to be swung on its pivot to engage the other arm and limit the movement of the two arms toward each other, of a projection or tooth moved by the cam, a notched surface with which said projection or tooth engages for holding the cam in adjusted position, and a spring for holding said projection or tooth and notched surface in engagement, substantially as described.

4. The combination, with the pivoted arms of a pair of button-hole-cutting scissors, a cam pivoted on one arm and adapted to limit the movement of the blades toward each other, the series of adjusting-notches beneath said cam, and the adjusting-lever above the same, of a tooth or projection on the lever, and a notch or slot in the cam through which the tooth or projection passes to engage the adjusting-notches, whereby the cam is held in adjusted position, substantially as described.

5. The combination, with the pivoted arms of a pair of button-hole-cutting scissors, a cam pivoted on one arm and adapted to limit the movement of the blades toward each other, the series of adjusting-notches beneath said cam, and the adjusting-lever above the same, with its projection passing through a notch or slot in the cam for engaging the notches, of a spring secured to said lever and bearing against the inclosing-walls for holding the projection in engagement with the notches, as set forth.

6. In a pair of button-hole-cutting scissors, the combination, with the cam having a notch or slot therein pivoted in a depression in one arm of the scissors and adapted to be swung on its pivot to engage the other arm and limit the movement of the two arms toward each other, of the notched segmental plate held by the arm beneath the cam, the lever above the cam having the tooth or projection thereon passing through said notch or slot in the cam and engaging the notches in the segmental plate, a spring carried by said lever for holding said tooth in engagement with the notches, the plate for covering the depression in which said parts are located, and the pivot for holding the parts in position, substantially as described.

382,997. DIRECTORY-INDICATOR FOR BUILDINGS, &c. THOMAS J. HEFFERN, New York, N. Y. Filed May 24, 1887. Serial No. 239,248. (No model.)



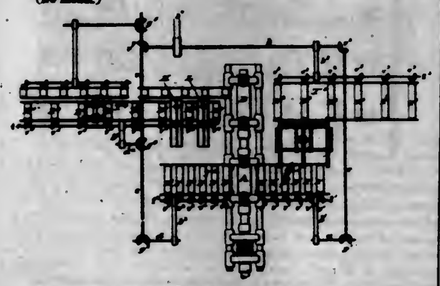
Claim.—1. A name-directory having a series of electro-magnetic indicators respectively adjoining said names, and adapted each to either of two positions, and thereby to convey information concerning the persons represented thereby, in combination with the circuit-wires, a source of current, and a series of keys respectively located in the rooms of said persons, substantially as described, each circuit being unbroken at all points, except the key belonging to it, whereby the positions of the indicators are determined solely by the operation of the respective keys at the rooms.

2. In a directory-indicator for buildings, the combination of a name or symbol representing a person, a polarized electro-magnet and armature having an indicator or target attached thereto adapted to take either of two positions, and by its position to signal information concerning the person represented, circuit-wires, a battery, and a reversing-key at the room occupied by said person, the circuit being unbroken at all other points, substantially as described.

3. In a directory-indicator for building, the combination of a name or symbol representing a person, a polarized electro-magnet having a movable armature adapted to take either of two positions, and thereby to display to view such words as "In" and "Out," or either of them, in juxtaposition to said name, a battery, circuit-wires to a distant part of the building, and a reversing-key therein, said circuit being unbroken at all other points, substantially as described, whereby the person represented can from a distance set the indicator at will.

382,998. CHECK AND PAD PROTECTOR. GEORGE A. MEYER, Brooklyn, N. Y. Filed Sept. 1, 1887. Serial No. 248,488. (No model.)

Claim.—A pad or check protector provided with a cap or hook for holding the stub end of the pad, a rigid cover having an overhanging edge to receive the back of the pad, and a hinged cover joined to said cap, the jointed cover having its inner side provided with a sheet of ciliss to be ruled and numbered, substantially as and for the purpose set forth.



382,999. NUT-LOCK. WALTER A. MILLER, Strasburg, Pa., assignor of one-half to Ezra F. Landis, Lancaster, Pa. Filed Nov. 12, 1887. Serial No. 254,967. (No model.)

Claim.—1. In combination with a bolt and nut, a washer having besides its central perforation a segmental recess, *d*, and an eccentric recess, *d'*, communicating with said central perforation, and a key having a lateral projection adapted to enter said eccentric recess and provided with an acute edge to engage with the threads of the bolt, substantially as and for the purpose described.

2. In combination with a bolt and nut, a washer having a segmental recess, *d*, cut out of its face, a central perforation for the passage of the bolt, and an eccentric recess, d^2, communicating with said central perforation and extending throughout the washer, and a key having laterally an eccentric projection beveled at its inner end and received into the recess of the washer for engagement with the threads of the bolt, substantially as and for the purpose described.

383,000. FEEDING APPLIANCE FOR ROLLING-MILLS. JOSEPH MERRAM, Jr., Johnstown, Pa. Filed Oct. 3, 1887. Serial No. 251,354. (No model.)

Claim.—1. In a feeding appliance for rolling-mills, the combination of a rising and falling table and an arm pivoted thereto, the outer end of this arm being connected by a link to a fixed pivot, a continuation of this arm extending upward for the purpose of pushing over the piece being rolled when the table rises and by the act thereof, substantially as set forth.

2. In a feeding appliance for a rolling-mill, the combination of a rising and falling table, an arm pivoted thereto, and a link connecting the said arm with a second similar pivotally-swinging arm, the said second swinging arm being connected by a pivoted link with a stationary point, the whole acting together to cause the first-mentioned swinging arm to push over and tilt the pieces being rolled as the table rises and by the act thereof, substantially as set forth.

3. In a feeding appliance for rolling-mills, the combination of a rising and falling table, and pivotally-swinging arms thereon, the axes of said pivots being coincident, the outer end of said arms being connected by a flat strip or bar, the whole being adapted to swing by the act of the rising or lowering of the table for the purpose of pushing over the piece being rolled, and for extending longitudinally the range of the position of said piece while it is being acted upon, substantially as and for the purpose set forth.

4. In a feeding appliance for a rolling-mill, the combination of a rising and falling table, said pivotally-swinging arms thereon, the axes of the pivots being coincident, the outer end of said arms being connected by a flat strip or bar, the whole adapted to swing by the act of raising or lowering the table through the means of pivoted links, one end of each of said links being pivotally attached to each one of said arms, and the other end of each of said links being pivotally attached to a fixed point, substantially as set forth.

5. In a feeding appliance for a rolling-mill, the combination of a rising and falling feed-table connected with one berth of rolls, a stationary feed-table connected with a second berth of rolls, a tilting slide-over located between aforesaid tables, a single-acting hydraulic motor adapted to tilt the slide-over in one direction, and a counter-weight adapted to tilt the slide-over in the opposite direction, substantially as set forth.

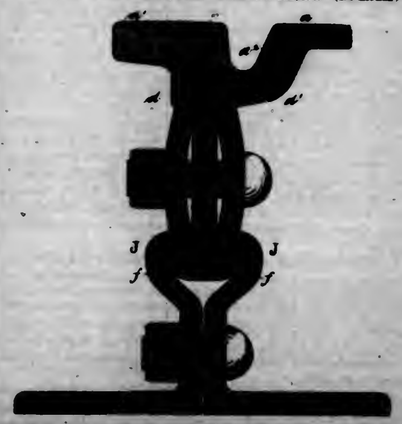
6. In an appliance for feeding rolling-mills, the combination of a rising and falling table connected with one berth of rolls, a stationary table connected with a second berth of rolls, and a tilting slide-over pivoted near its center and actuated by means of an independent motor, substantially as and for the purpose set forth.

7. As a device for transferring partly-rolled rails from one berth of rolls to another, a tilting slide-over pivotally supported at some point near its center, and having its portion between the pivoted point and the receiving edge concavely curved on its upper side for the purpose of gradually and surely starting the partly-rolled rail on its downward slide, substantially as set forth.

8. As a device for transferring partly-rolled rails laterally from one berth of rolls to another, a tilting slide-over pivoted near its center, and provided with hooks on its delivering edge to retain the piece being operated upon, so that it may be gently lowered in place, substantially as and for the purpose set forth.

9. In a feeding appliance for rolling-mills, the combination of a pivoted and tilting feed-table provided with driven and reversible rollers, a frame carrying a roller arranged to slide transversely on said table, and automatic mechanism to slide this frame simultaneously with the movement of the tilting table, substantially as and for the purpose set forth.

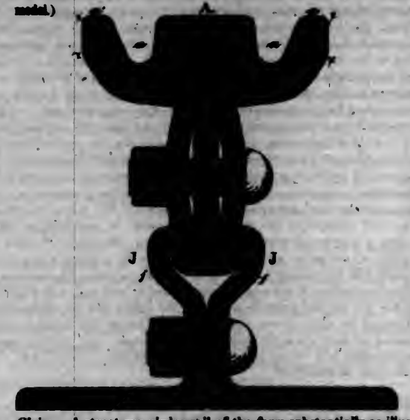
10. In a tilting feed-table for a rolling-mill, the combination, with the frame thereof, of a transversely-sliding frame carrying a driven and reversible roller across said tilting table, substantially as and for the purpose set forth.



11. In a tilting feed-table for a rolling-mill, the combination of a shaft extending lengthwise of said table in bearings affixed thereto, driven through some suitable connection from some outward source of power, a series of bevel-wheels on this shaft engaging with similar bevel-wheels attached to feed-rollers which have their bearings in said tilting table, two bevel-wheels attached to this shaft engaging with two other bevel-wheels, each of which is attached to one of two spur-gears, each of said spur-gears engaging with one of two other spur-gears, a feathered shaft sliding through each of the latter spur-gears, the bearing of each of these shafts being attached to one of two transversely-sliding frames, two shaped rollers respectively attached to said last-mentioned shafts, a rock-shaft extending longitudinally under the tilting table with its bearings affixed thereto, arms attached to this rock-shaft, links pivotally connecting ends of said arms to the before-mentioned transversely-sliding frames, an arm affixed to said rock-shaft, a link pivotally connecting this arm with a fixed point below the table, and a hydraulic motor for operating the table, substantially as and for the purpose set forth.

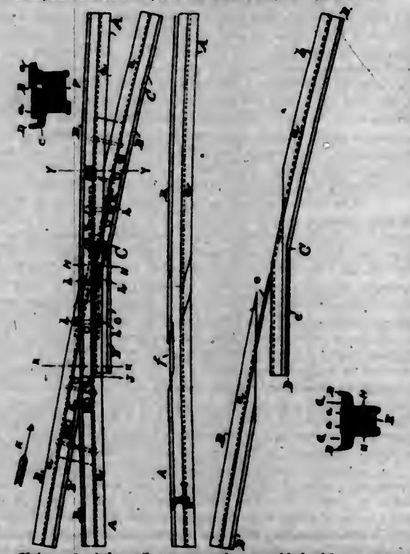
12. In a feeding appliance for rolling-mills, the combination of a rising and falling feed-table on one side of the rolls, a stationary feed-table on the other side of the rolls, a pivoted and tilting apron located over the stationary table to receive the end of the partly-rolled rail and lower it gently to its feeding position, and mechanism connecting this rising and falling apron with the rising and falling feed-table, so that the act of lowering the rising and falling feed-table lowers the rising and falling apron, substantially as and for the purpose set forth.

13. In a feeding appliance for a rolling-mill, the combination of a tilting feed-table on one side of the rolls, a stationary feed-table on the other side of the rolls, a pivoted tilting apron located over the stationary feed-table, a stationary stop arranged in front of the central roll and over the stationary table entirely above the lower pass of the rolls, and mechanism connecting the tilting apron with the tilting table on the other side of the rolls, so that they may both be operated together by means of the same motor, substantially as and for the purpose set forth.



14. In mechanism to prevent a piece from entering the rolls of a rolling-mill until the receiving-table is in proper position to receive it, the combination of a fixed stop located opposite the middle roll of the mill, a rising and falling apron located so that its upper position is lower than the top of the stop, so that when the rolled piece is expelled by the action of the rolls it may fall a measurable distance upon the apron, and mechanism to connect this tilting apron with the receiving-table, so that the rolled piece is only at a position to pass through the rolls when the receiving-table is ready to receive it, substantially as and for the purpose set forth.

383,001. GROOVED GIRDER-RAIL. ARTHUR J. MOXHAM, Johnstown, Pa. Filed Nov. 30, 1886. Serial No. 219,408. (No model.)

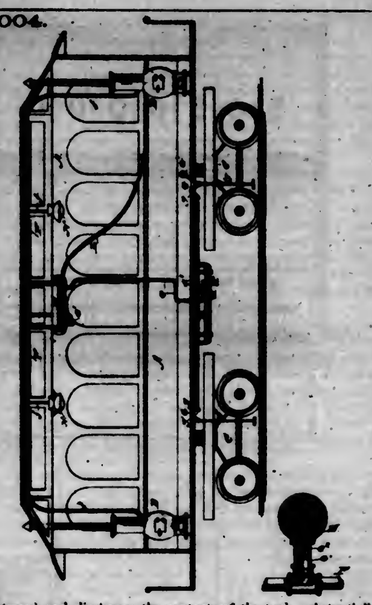


Claim.—A street-car girder-rail of the form substantially as illustrated in the accompanying drawings, consisting of a vertical central web terminating at bottom in a double-shouldered stub or bead, as F, and provided with a head having a shoulder, *d*, a groove, *d'*, and an overhanging lip, *d²*, substantially as and for the purpose set forth.

383,002. DOUBLE-GROOVED GIRDER-RAIL. ARTHUR J. MOXHAM, Johnstown, Pa. Filed Nov. 30, 1886. Serial No. 219,409. (No model.)

Claim.—A street-car girder-rail of the form substantially as illustrated in the accompanying drawings, consisting of a vertical central web terminating at bottom in a double-shouldered stub or bead, as F, and at top in a flat head having a center bearing portion for the tread of the car-wheels, grooves on each side thereof for the flanges of said wheels, and exterior portions, as *d' d'*, on the outer sides of said grooves, provided with straight sides between points *x x*, substantially as and for the purposes set forth.

383,003. ACUTE CURVE-CROSSING. ARTHUR J. MOXHAM, Johnstown, Pa. Filed Dec. 30, 1887. Serial No. 259,202. (No model.)



Claim.—A girder-rail curve-crossing provided with a cut-away guard and an auxiliary guard opposite the opening formed by said cutting away of the said guard, substantially as described, for the purposes set forth.

383,004. FIRE-EXTINGUISHER FOR RAILWAY-CARS. GEORGE W. GRANT, Columbus, Ohio. Filed May 20, 1887. Serial No. 238,324. (No model.)

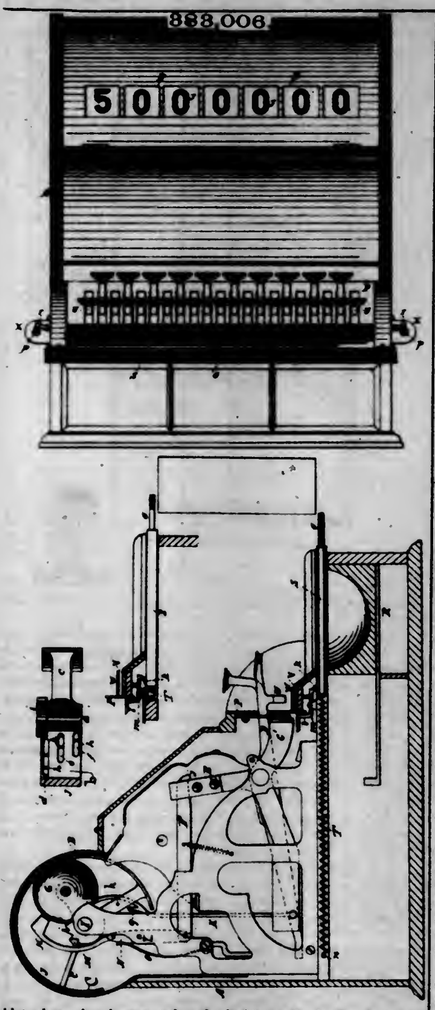
Claim.—1. The combination, in a fire-extinguisher for cars, of a compressed-air receiver with a tank for containing a fire-extinguishing material, and having an outlet and an outward-opening spring-pressed valve thereto, and a pipe leading from the compressed-air receiver to the tank and provided with a valve, whereby, when the compressed air is admitted into the tank, the pressure will force the spring-valve outward and discharge the contents of the tank, substantially as set forth.

383,004.

2. The combination, in a fire-extinguisher for cars, with the air-brake system applied thereto, of a tank for containing a fire-extinguishing material and provided with an outlet in its bottom, an outward-opening spring-seated valve therein, a pipe connecting the upper part of the tank with the compressed-air supply of the brake system, and a valve in said pipe, substantially as set forth.

3. The combination, in a fire-extinguisher for cars, with air-brake mechanism, of the fire-extinguishing mechanism, a valved pipe leading from the air-brake cylinder to the fire-extinguisher, the rock-shafts G, having cranks *g* and end cranks, *g'*, the triggers J, depending from cranks *g'* down between the wheels of the trucks, the hand-lifts G', extending up through the floor of the car, and the rod H, connected at its ends to cranks *g'* and between its ends to the valve in the said valved pipe, substantially as set forth.

4. In a fire-extinguisher for cars, the combination of the air-brake mechanism, the tank E, having the outlet *e'* in its bottom, the downward-opening valve e^2 therein, a spring for closing said valve against the pressure of the normal contents of said tank, the pipe F, extending from end to end of the car and having branches leading to the stoves and to the lamps, and a hose connected directly to the tank, with a pipe for conducting the compressed air from the brake mechanism into the top of the tank, whereby the extinguishing material will be forced by the full power of the compressed air through the pipes to the stoves and lamps or through the hose, substantially as set forth.



383,005. BILLIARD-CUSHION. JOHN D. O'CONNOR, New York, N. Y. Filed Jan. 18, 1888. Serial No. 261,113. (No model.)

Claim.—A cushion-strip composed of vulcanized rubber or other allied gum, and having incorporated within it and near its outer face a strip of canvas wound or rolled on itself to form an upper cord-like edge, as specified, and extending from said cord-like edge downwardly toward the base or foot of the cushion, all in substantially the manner and for the purpose set forth.

383,006. CASE INDICATOR AND REGISTER. JOHN H. PATTERSON, Dayton, Ohio. Filed Jan. 19, 1887. Serial No. 224,703. (No model.)

Claim.—1. In an indicating-machine, the combination of a series of keys of fixed values, a movable indicating-tablet provided with a series of numbers corresponding to those represented by the series of keys, a stationary reading-opening, mechanism between the keys and the tablet for actuating and controlling the extent of movement of the

ing-opening, mechanism between the keys and the tablet for actuating and controlling the extent of movement of the tablet when a key is operated, and a locking and releasing device for the tablet controlled by all the keys, whereby when a key is actuated the tablet will be moved to bring to the reading-opening the number on it corresponding to the number represented by said key, and when any other key of the series is actuated the tablet will be released and moved so as to expose at the reading-opening the number represented by said last-mentioned key, and whereby, also, the registering mechanism will be operated upon the actuation of each key, substantially as described.

4. In a registering and indicating machine, the combination of a series of keys of fixed values, a registering mechanism operated thereby, a rocking indicating-tablet provided with a series of numbers corresponding to those represented by the series of keys, a stationary reading-opening, mechanism between the keys and the tablet for actuating and controlling the extent of movement of the rocking tablet when a key is operated, and a locking and releasing device for the tablet controlled by all the keys, whereby when a key is actuated the tablet will be rocked to bring to the reading-opening the number on it corresponding to the number represented by said key, and when any other key of the series is actuated the tablet will be released and dropped, so as to expose at the reading-opening the number represented by said last-mentioned key, and whereby, also, the registering mechanism will be operated upon the actuation of each key, substantially as described.

5. In an indicating-machine, the combination of a series of movable indicating-tablets each provided with a series of numbers, a series of keys of fixed values for each movable indicating-tablet, stationary openings through which the numbers on the tablets may be read, mechanism between each series of keys and its co-operating tablet for actuating and controlling the extent of movement of the tablet when any key of the series is operated, and a locking and releasing device for each movable tablet controlled by all the keys of the particular series, whereby when two or more keys of different series are actuated the corresponding tablets will be moved so as to bring to the reading-opening the numbers on the several tablets corresponding to the keys that are actuated.

6. In an indicating-machine, the combination of a series of rocking indicating-tablets each provided with a series of numbers, a series of keys of fixed values for each rocking indicating-tablet, stationary openings through which the numbers on the rocking tablet may be read, mechanism between each series of keys and its co-operating rocking tablet for actuating and controlling the extent of movement of the tablet when any key of the series is operated, and a locking and releasing device for each rocking tablet controlled by all the keys of the particular series, whereby when two or more keys of different series are actuated the corresponding tablets will be rocked, so as to bring to the reading-opening the numbers on the several rocking tablets corresponding to the keys that are actuated, substantially as described.

7. In an indicating-machine, the combination of a series of keys of fixed values, a movable indicating-tablet provided with a series of numbers in duplicate corresponding to the numbers represented by the keys, two stationary reading-openings, and intermediate mechanism between the keys and the tablet, by which, when either of the keys is actuated, the tablet will be moved a distance sufficient to bring into view simultaneously at the two reading-openings the duplicates of the number represented by the key actuated, substantially as described.

8. In an indicating-machine, the combination of a series of keys of fixed values, a rocking indicating-tablet provided with a series of numbers in duplicate corresponding to the numbers represented by the keys, two stationary reading-openings, and intermediate mechanism between the keys and the tablet, by which, when either of the keys is actuated, the tablet will be rocked a distance to bring into view simultaneously at the two reading-openings the duplicates of the numbers represented by the key actuated, substantially as described.

9. In a cash register and indicator provided with registering mechanism and a series of keys for operating said mechanism, the combination of a series of rocking tablets arranged upon a common axis, and a series of lifting-arms connected to said keys and arranged to engage with said tablets when operated, but normally out of operative contact with them, whereby the operation of any one of said keys elevates its lifting-rod to move its tablet, substantially as and for the purpose described.

10. In a cash register and indicator provided with registering mechanism and a series of keys for operating said mechanism, the combination of a series of rocking tablets arranged upon a common axis, positively-acting retaining devices for holding said tablets in their normal and in their actuated positions, and a series of lifting-arms connected to said keys and arranged to engage with said tablets, whereby the operation of any one of said keys elevates its lifting-rod to move its tablet, and whereby said tablet when so moved is held with its number exposed to view, substantially as described.

11. In a cash register and indicator provided with registering mechanism and a series of keys for operating said mechanism, the combination of a series of weighted rocking tablets arranged upon a common axis and a series of lifting-arms connected to said keys and arranged to engage with said tablets when operated, but normally out of operative contact with them, whereby the operation of any one of said keys elevates its lifting-rod to move its tablet, substantially as and for the purpose described.

12. In a cash register and indicator provided with registering mechanism and a series of keys for operating said mechanism, the combination of a series of weighted rocking tablets arranged upon a common axis, retaining devices for holding said tablets in their vibrated positions, and a series of lifting-arms connected to said keys and arranged to engage with said tablets when operated, but normally out of operative contact with them, whereby the operation of any one of said keys elevates its lifting-rod to move its tablet, and whereby said tablet, when so moved, is held with its number exposed to view, substantially as described.

13. In a cash register and indicator provided with a series of tablets for exposing to view the amount of each purchase, a registering mechanism for registering the amount of said purchase, and a series of keys of fixed values for operating said tablets and registering mechanism simultaneously, a series of types, one secured to each key and bearing a number corresponding to the value of the key, and inking mechanism or its equivalent, whereby any one of the keys may be operated to simultaneously expose its tablet, register its value, and print its number on a check placed under said type.

14. In a cash register and indicator provided with a series of tablets for exposing to view the amount of each purchase, a registering mechanism for registering the amount of said purchase, a series of keys of fixed values for operating said tablets and registering mechanism simultaneously, and a casing inclosing all said parts, a series of types, one secured to each key outside the casing and bearing a number corresponding to the value of the key, whereby any one of the keys may be operated to simultaneously expose its tablet, register its value, and print its number on a check placed under said type, substantially as described.

15. In a cash register and indicator provided with a series of tablets for exposing to view the amount of each purchase, a registering mechanism for registering the amount of said purchase, and a series of keys of fixed values for operating said tablets and registering mechanism simultaneously, a series of types, one on the under side of the front of each key and bearing a number corresponding to the value of the key, and inking mechanism or its equivalent, whereby any one of the keys may be operated to simultaneously expose its tablet, register its value, and print its number on a check placed under said type.

16. In a cash register and indicator, the combination, with a vibrating frame and a series of operating-keys for depressing said frame, of a till, a spring-latch, a sliding till-cover engaged by said latch, and springs for operating said cover to expose the till whenever one of said keys is operated, substantially as described.

17. In a cash register and indicator, the combination, with the operating-keys D and lifting-rods K, provided with fingers *g*, of the rocking tablets J, with which said fingers are adapted to engage, substantially as and for the purpose described.

18. In a cash register and indicator, the combination, with the operating-keys D and lifting-rods K, provided with fingers *g*, of the rocking tablets J, with which said fingers are adapted to engage, the shaft L, provided with dogs M, ratchets *i* upon the hubs of the tablets, and connecting mechanism for uniting the shaft L to the vibrating frame C, substantially as and for the purpose specified.

19. The combination, with a casing having a reading opening or slot therein and a tablet having a series of figures or characters thereon adapted to be exposed at said opening, of a series of keys indicating amounts corresponding to those on the tablet and suitable projections connected to the keys for operating the tablet, arranged at varying distances from the said tablet corresponding to the distance necessary to move it to expose the particular character represented by the key, substantially as described.

20. In a cash register and indicator, the combination, with a casing having a reading opening or slot therein and a tablet having a series of amounts indicated thereon adapted to be exposed at said opening, of a series of keys indicating amounts corresponding to those on the tablet, a registering mechanism for each key, and suitable projections connected to the keys for operating the tablet, arranged at varying distances from said tablet corresponding to the distance necessary to move the latter to expose the particular amount represented by the key, substantially as described.

21. In a cash register and indicator, the combination, with the casing having the reading-opening, and the pivoted segmental tablet having a series of amounts indicated thereon adapted to be exposed at said opening, of a series of keys representing various amounts, a registering mechanism for each key, and projections connected to the keys for operating the tablet and arranged at varying distances from it corresponding to the distance necessary to move it to expose the particular amount represented by the key, substantially as described.

22. The combination, with the casing having reading-openings at front and rear, and a pivoted segmental tablet having two corresponding series of amounts indicated thereon, of a series of keys corresponding to the amounts on the tablet and having projections for operating the latter at various distances from said tablet corresponding to the distance necessary to move it to expose the particular amount represented by the key, substantially as described.

23. The combination, with a gravitating tablet pivoted upon a horizontal axis or shaft, and provided with a face substantially parallel with said axis, and having characters indicated thereon, of a series of keys pivoted upon an axis parallel with said tablet-axis, a stationary reading-opening, mechanism between the keys and the tablet for actuating and controlling the extent of movement of the tablet when the keys are actuated, and a locking and releasing device for the movable tablet controlled by all the keys, substantially as and for the purpose described.

24. The combination, with a gravitating rocking tablet pivoted upon an axis or shaft and provided with a face substantially parallel with said axis, and having characters indicated thereon, of a series of keys pivoted upon an axis parallel with said tablet-axis, a stationary reading-opening, mechanism between the keys and tablet for actuating and controlling the extent of movement of the tablet when the keys are operated, and a locking and releasing device for the movable tablet controlled by all of the keys, substantially as and for the purpose described.

25. In a registering and indicating machine, the combination of a series of keys of fixed values, registering mechanism operated by said keys for registering the amount of each key operated, and a series of pivoted rocking tablets having faces substantially parallel with their pivotal centers, upon which a character or characters are indicated, and connections between said keys and tablets, whereby the operation of any of the keys registers the value of the key and moves the tablet to expose to view a number corresponding to the value of the key operated, substantially as described.

26. In a registering and indicating machine, the combination of a series of keys of fixed values, registering mechanism operated by said keys for registering the amount of each key operated, and a series of pivoted rocking tablets each having a face substantially parallel with its axis, each of said tablets being connected to a group of two or more keys and provided with a series of numbers upon the face mentioned corresponding to the value of one of the keys, whereby the operation of any one of the keys of a group registers the value of said key and moves the tablet to expose to view the number corresponding to the value of the said key.

27. In a registering and indicating machine, the combination of a series of keys of fixed values, registering mechanism operated by said keys for registering the amount of each key operated, and a series of pivoted rocking tablets each having a face substantially parallel with its axis, with connecting mechanism and a series of retaining devices for releasing and locking said tablets, whereby the operation of any one of the keys registers the value of the key operated and holds the tablet with said number exposed to view, and whereby the operation of another key releases the exposed tablet.

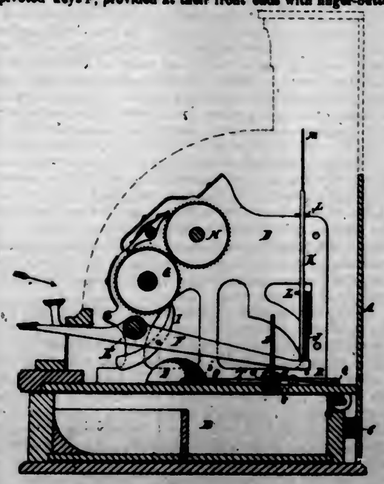
28. In a cash-indicator, the combination of a series of keys of fixed values, a movable indicating-tablet provided with a series of numbers corresponding to those represented by the keys, a stationary reading-opening, connecting mechanism between said keys and movable tablet for actuating and controlling the extent of movement of said tablet when a key is operated, a ratchet on said tablet, and a locking-dog engaging therewith, a vibrating bar actuated by each of the keys, and tripping mechanism actuated by said vibrating bar and operating said locking-dog, substantially as and for the purpose described.

29. In a cash-indicator, the combination of a series of keys of fixed values, a rocking indicating-tablet provided with a series of numbers corresponding to those represented by the keys, a stationary reading-opening, connecting mechanism between said keys and rocking tablet for actuating and controlling the extent of movement of said tablet when a key is operated, a ratchet secured to the hub of said rocking tablet, a locking-dog engaging with said ratchet, a vibrating bar actuated by each of the keys, and tripping mechanism actuated by said vibrating bar and operating said locking-dog, substantially as and for the purpose described.

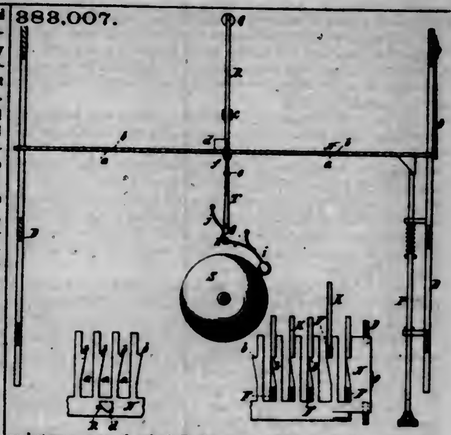
30. In a cash-indicator, the combination of a series of keys of fixed values, a movable indicating-tablet provided with a series of numbers corresponding to those represented by the keys, a stationary reading-opening, connecting mechanism between said keys and movable tablet for actuating and controlling the extent of movement of said tablet when a key is operated, a ratchet on said tablet, and a locking-dog engaging therewith, a gong and gong-hammer, a vibrating bar actuated by each of the keys, and tripping mechanism actuated by said vibrating bar and operating said locking-dog and gong-hammer, substantially as described.

31. In a cash-indicator, the combination of a series of keys of fixed values, a movable indicating-tablet provided with a series of numbers corresponding to those represented by the keys, a stationary reading-opening, suitable projections actuated by the keys for operating the tablet and arranged at varying distances from said tablet corresponding to the distance necessary to move it to expose the particular number represented by the key operated, a ratchet on said tablet, and a locking-dog engaging therewith, a vibrating bar actuated by each of the keys, and tripping mechanism actuated by said vibrating bar and operating said locking-dog, substantially as and for the purpose described.

32. In a cash register and indicator, the combination of a series of keys of fixed values, registering mechanism actuated by said keys, a movable indicating-tablet provided with a series of numbers corresponding to those represented by the keys, a stationary reading-opening, connecting mechanism between said keys and movable tablet for actuating and controlling the extent of movement of said tablet, a ratchet on said tablet, and a locking-dog engaging therewith, a vibrating bar actuated by each of the keys, and the tripping mechanism actuated by said vibrating bar and operating said locking-dog, substantially as and for the purpose described.



33. In a cash register and indicator, the combination of a series of keys of fixed values, registering mechanism operated by said keys, a movable indicating-tablet provided with a series of numbers corresponding to those represented by the keys, a stationary reading-opening, suitable projections actuated by the keys for operating the tablet and arranged at varying distances from said tablet corresponding to the distance necessary to move it to expose the particular number represented by the key operated, a ratchet on said tablet, and a locking-dog engaging therewith, a vibrating bar actuated by each of the keys, and tripping mechanism actuated by said vibrating bar and operating said locking-dog, substantially as and for the purpose described.

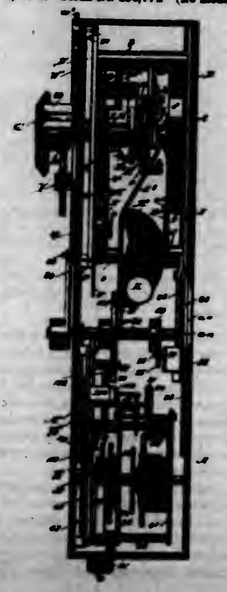


34. In a cash register and indicator, the combination of a series of keys of fixed values, registering mechanism operated by said keys, a movable indicating-tablet provided with a series of numbers corresponding to those represented by the keys, a series of lifting-arms actuated by said keys and arranged to engage with said tablet, a ratchet on said tablet, and a locking-dog engaging therewith, a vibrating bar actuated by each of the keys, and tripping mechanism actuated by said vibrating bar and operating said locking-dog, substantially as and for the purpose described.

35. In a cash register and indicator, the combination of a series of keys of fixed values, registering mechanism operated by said keys, a movable indicating-tablet provided with a series of numbers corresponding to those represented by the keys, a series of lifting-arms actuated by said keys and provided with projections at varying distances from said tablet and arranged to engage therewith, a ratchet on said tablet and a locking-dog engaging therewith, a vibrating bar actuated by each of the keys, and tripping mechanism actuated by said vibrating bar and operating said locking-dog, substantially as and for the purpose described.

383,007. CASH REGISTER AND INDICATOR. JOHN H. PATTERSON, Dayton, Ohio. Filed Feb. 4, 1888. Serial No. 262,980. (No model.)

Claim.—1. In a cash register and indicator, the combination of the pivoted keys F, provided at their front ends with finger-buttons,



and strung upon the shaft E, the vertical tablet-rods K, arranged in guides and carrying the indicating-tablets M, and the slotted supporting-bar N, operating when a key is depressed to its fullest extent to automatically engage said key and hold its rear end elevated and its tablet exposed to view and to disengage said key and engage a second key when the latter is fully depressed, substantially as described.

2. The combination of the keys F, pivoted on the shaft E, tablet-rods K and tablets M, slotted supporting-bar N, drawer B, drawer-bolt Q, and a cam mechanism on the bar N for operating said bolt Q, substantially as and for the purpose described.

3. The combination of the keys F, pivoted on the shaft E, tablet-rods K and tablets M, slotted supporting-bar N, gong S, and its gong-hammer, and tripping mechanism between the bar N and said gong-hammer operated by said bar, substantially as and for the purpose described.

4. The combination of the keys F, pivoted on the shaft E, tablet-rods K and tablets M, slotted supporting-bar N, drawer B, drawer-bolt Q, gong S and its gong-hammer, and connecting mechanism between the bar N and the drawer-bolt and gong-hammer and operated by the bar N, substantially as and for the purpose described.

383,008. FARE-REGISTER. WILLIAM PROUT, Chicago, Ill., assignor to the Pigott Time and Fare Register Company, same place. Filed May 2, 1887. Serial No. 236,774. (No model.)

Claim.—1. In a fare-register, the combination, with the indicator-dial freely movable in either direction and a total-registering dial in one-way gear with said indicator-dial, of a shaft for turning said dials and an operating-rod geared with said shaft and extending through the cab-body in proximity to the driver's seat, substantially as described.

2. In a fare-register, the combination, with an indicator-dial and freely moving therewith in either direction, provided with an operating-shaft, of a total-registering dial mounted upon said shaft and in one-way gear with the indicator-dial, an inclosing-casing provided with sight-openings opposite said dials, an operating-rod detachably geared with the outer end of said shaft, a crank-handle for said operating-rod, and a ratchet-plate for determining the position of said crank-handle, substantially as described.

3. In a fare-register, the combination, with the registering mechanism, of an inclosing-casing for said mechanism, a sustaining-frame for said inclosing-casing, suitable fastenings for detachably connecting said casing and frame, and an operating-rod fixed to the cab-body and leading from said sustaining-frame in proximity to the driver's seat and in detachable gear with the registering mechanism, whereby said registering mechanism can be readily withdrawn from the cab for purposes of inspection, substantially as described.

4. In a fare-register, the combination, with the distance-registering mechanism, comprising an indicator-dial freely movable in either direction and a total-registering dial in one-way gear therewith, of an inclosing-casing for said mechanism having sight-openings therein, an operating-shaft for said dials extending through said inclosing-casing and provided at its end with a gear-wheel, and an operating-rod fixed to the cab-body and provided at one end with a gear-wheel to engage with the gear-wheel upon the shaft of the registering mechanism while said mechanism is in use, and having its opposite end extending in proximity to the driver's seat and provided with a crank-handle, substantially as described.

5. In a fare-register, the combination, with an indicator-dial freely movable in either direction and consisting of a movable annular plate and a central disk within said plate, of a total-registering mechanism in one-way gear with said indicator-dial, an operating-shaft whereon both of said dials are sustained, and an inclosing-casing having sight-openings therein opposite said dials, substantially as described.

6. In a fare-register, the combination, with a main drive-shaft, and with a gear-wheel for operating said shaft, of indicator and registering dials respectively arranged at opposite ends of said shaft, the indicator-dial being fixed to and moving with the shaft in either direction and the registering-dial being loosely journaled on said shaft, and an intermediate pawl-and-ratchet mechanism for locking the registering-dial in one-way gear with said shaft, substantially as described.

7. In a fare-register, the combination, with a main drive-shaft, and with a gear-wheel for revolving said shaft in either direction, of an indicator-dial consisting of an annular dial-plate connected with the main shaft and a dial-disk set within said annular plate and sustained freely upon the shaft, and a pawl-and-ratchet mechanism intermediate said plate and disk to actuate the latter by movement of this annular plate in either direction, substantially as set forth.

8. In a fare-register, the combination, with a main drive-shaft revolving freely in either direction, and with an indicator-dial consisting of an annular dial-plate fixed to said shaft, and a dial-disk set freely thereon and within a cup-shaped chamber of said plate, of a pawl-and-ratchet mechanism intermediate said plate and disk to actuate the latter by movement of the annular plate in either direction, a fixed trip projecting into the path of said pawl, and a stationary star-wheel set upon said main shaft independently of the movement thereof, and a locking-pawl secured to the dial-disk to engage with said star-wheel, substantially as described.

9. In a fare-register, the combination, with a main drive-shaft, and with an indicator-dial mounted upon and revolving with said shaft in either direction, of a gear-wheel set upon said shaft to actuate the same and having grooved hub and detent thereon, and a locking-wheel received circumferentially within said groove and notched in part about its periphery to engage said detent, whereby the indicator-dial may be reset at the zero-point, substantially as described.

10. In a fare-register, the combination, with the registering mechanism, the inclosing-casing therefor, and the sustaining-frame for said casing, of a sliding flap extending from said frame and a locking-pawl in the path thereof, secured to said casing and dogging with the main drive-shaft of the registering mechanism, substantially as set forth.

11. In a fare-register, the combination, with a clock mechanism, of a time-fare-registering mechanism in gear therewith and suitable actuating mechanism under the control of the driver, whereby the dial of said registering mechanism can be operated in forward direction independently of the clock mechanism, substantially as described.

12. In a fare-register, the combination, with a clock mechanism, of a time-fare-registering mechanism in gear therewith and a pawl-and-ratchet wheel for imparting forward movement to the dial of said time-fare-registering mechanism independently of the clock mechanism, substantially as described.

13. In a fare-register, the combination, with a clock mechanism, of a time-fare-registering mechanism, a stop for checking the movement of the clock mechanism, and a suitable actuating mechanism for imparting forward movement to the dial of said register mechanism independently of the clock mechanism, substantially as described.

14. In a fare-register, the combination, with a clock mechanism, of a time-fare-registering mechanism, a movable gear for throwing the said mechanisms into and out of connection, a stop for arresting the clock mechanism, and a pawl-and-ratchet wheel for imparting movement to the registering mechanism independently of the clock mechanism, substantially as described.

15. In a fare-register, the combination, with a clock mechanism, of a time-fare-registering mechanism operated thereby and a movable pinion for throwing said clock mechanism into engagement with the registering mechanism, substantially as described.

16. In a fare-register, the combination, with a clock mechanism and a time-fare-registering mechanism, of a movable gear-pinion for throwing said mechanism into and out of engagement and a lever for operating said gear-pinion, substantially as described.

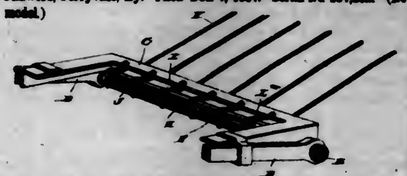
17. In a fare-register, the combination, with a clock mechanism and a time-fare-registering mechanism, of two gear-wheels for connecting the clock mechanism and the time-fare-registering mechanism and a movable gear-pinion for throwing said gear-wheels into engagement, substantially as described.

18. In a fare-register, the combination, with a clock mechanism and a time-fare-registering mechanism, of intermediate gear mechanism comprising gear-wheels connected with said registering mechanism and with the clock mechanism, one of said gear-wheels being loosely mounted on a shaft of the clock mechanism, a driving-plate on said shaft adapted to engage with said gear-wheel, a movable gear-pinion for throwing said gear-wheels into engagement, and suitable means for imparting an independent movement to said loosely-mounted gear-wheel, substantially as described.

19. In a fare-register, the combination, with the time-fare-registering mechanism and the clock mechanism, of a gear-wheel loosely mounted on a shaft of said clock mechanism, a driving-plate for revolving said gear-wheel, a spring for imparting an independent revolution to said gear-wheel, and a movable pinion for connecting said gear-wheel with said registering mechanism, substantially as described.

20. In a fare-register, the combination, with the clock mechanism and the time-fare-registering mechanism, of gear-wheels for connecting said mechanisms, a movable pinion for throwing said gear-wheels into engagement, a lever for controlling the movement of said pinion, and a stop-plate connected with said lever for arresting the movement of the clock, substantially as described.

21. In a fare-register, the combination, with the clock mechanism and the time-fare-registering mechanism, of gear-wheels for connecting said mechanisms, a movable pinion for throwing said gear-wheels into engagement, a lever for operating said pinion, a ratchet-wheel connected with the dial of the registering mechanism, and a pawl connected with the lever and engaging with the teeth of said ratchet-wheel, substantially as described.



22. In a fare-register, the combination, with the clock mechanism and the time-fare-registering mechanism, of gear-wheels connected with said mechanisms, a movable pinion for throwing said gear-wheels into engagement, a lever for operating the movable pinion, a stop-plate connected with said lever for arresting the movement of the clock mechanism, the ratchet-wheel connected with the dial of the registering mechanism, a pawl connected with said lever and engaging with said ratchet-wheel, and a pawl for arresting the backward movement of said ratchet-wheel, substantially as described.

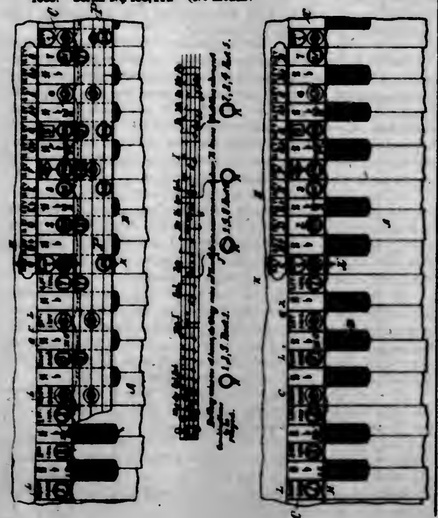
23. In a fare-register, the combination, with the clock mechanism and the time-fare-registering mechanism, of gear-wheels connected with said mechanisms, a movable pinion for throwing said gear-wheels into engagement, a lever for operating said movable pinion, a rocking plate for controlling the movement of said lever, and a shaft for operating said rocking plate, substantially as described.

24. In a fare-register, the combination, with the clock mechanism and the time-fare-registering mechanism, and suitable devices for throwing said mechanisms into engagement, of a dial for said registering mechanism comprising two disks, a ratchet-wheel for operating one of said disks independently of the other, and suitable mechanism for operating said ratchet-wheel, substantially as described.

25. In a fare-register, the combination, with the clock mechanism, of a time-fare-registering mechanism having a dial comprising two disks, one of said disks having a cam-plate connected therewith, and the other of said disks having a ratchet-wheel connected therewith, and a lever for transmitting movement from one of said disks to the other, said lever being provided with a stud for engagement with the cam-plate, and with a pawl for engagement with the ratchet-wheel, substantially as described.

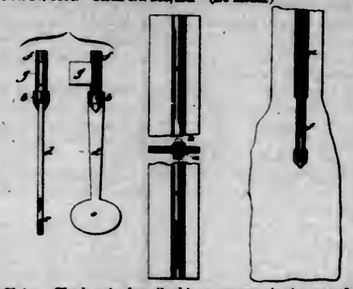
388,009. BUNDLE-CARRIER FOR HARVESTERS. DAVID H. PREWITT, Perryville, Ky. Filed Dec. 7, 1887. Serial No. 257,222. (No model.)

Claim.—The combination of the cross-bar of the frame C, the supporting-arms D, the rock-shaft mounted in said arms below said frame and having a longitudinal recess and a series of vertical perforations in the base of the recess, means for rotating said shaft, and the carrying-bars having the vertical portions J at their inner ends passed through said vertical perforations in the recess of said shaft and playing freely therein, and the crank-arms L at the upper ends of the portions J, said crank-arms being turned to the rear of the vertical portions and pivoted to the cross-bar of the frame C, as set forth.



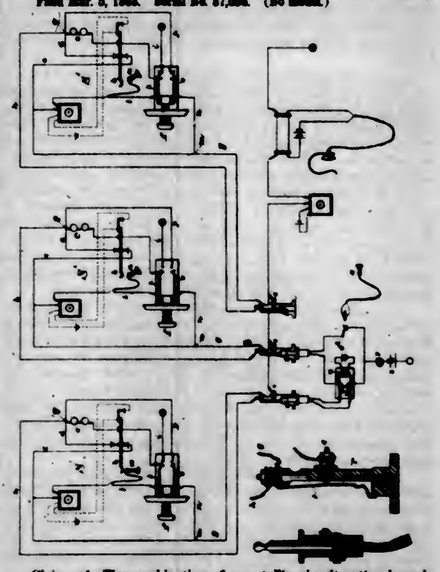
388,010. DEVICE FOR OPERATING CHURNS, WASHING-MACHINES, &c. JULIUS REEVES, Philadelphia, Pa. Filed May 19, 1887. Serial No. 238,713. (No model.)

Claim.—1. An improved mechanical motor, consisting of the swing A, having pivotal bar *a* and cross-rod *b*, the lever C, pivoted to said bar *a* and connected to said rod *b*, and having at its lower end the pin H, and the lever E, pivoted to the standard of the swing and having the slot G in its upper portion and an elbow with stirrups carrying the roller I, said parts being combined substantially as and for the purpose set forth.



2. The standards B, having pivotal bar *a*, mechanism, substantially as described, adapted to rock on said cross-bar and carrying the cross-rod *b*, and a lever on said pivotal bar having means to actuate a second lever, the latter pivoted to the said standards and having an elbow carrying rollers, said parts being combined substantially as described.

388,011. MUSIC-CHART. GERRETT S. RICE, Chicago, Ill.; Sarah Rice administratrix of said Gerrett S. Rice, deceased. Filed Jan. 19, 1885. Serial No. 153,444. (No model.)



Claim.—A movable chart or indicator capable of being placed on the key-board of any instrument, provided with signs and symbols of different shapes and forms arranged in the manner described, to represent the respective harmonic families, and properly spaced, in combination with a key-indicator permanently attached thereto, all constructed and operating substantially as shown.

388,012. MANUFACTURE OF DOOR-KEYS. HENRY B. SARGENT, New Haven, Conn., assignor to Sargent & Company, same place. Filed Feb. 27, 1888. Serial No. 265,415. (No model.)

Claim.—The herein-described improvement in the manufacture of door-keys, consisting in, first, rolling a flat bar with a longitudinal rib, *a*, upon each side; second, flattening the said ribs into the plane of the adjacent portions of the bar, but leaving the shoulder portion *b* projecting from each side of the said flattened portion and the bit portion of the spindle reduced in diameter; third, cutting the blank from the said flat-shaped portion of the bar, substantially as described.

388,013. TELEPHONE-EXCHANGE SYSTEM. CHARLES H. SCRIBNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Mar. 5, 1883. Serial No. 87,254. (No model.)

Claim.—1. The combination of a metallic circuit with a branch circuit containing the operator's telephone and a switch included in the metallic circuit, whereby said metallic circuit may be connected to and disconnected from said branch circuit, substantially as specified.

2. A metallic circuit, in combination with a branch circuit to ground at the central office, including a telephone and a switch at the subscriber's station, whereby the telephone of said subscriber may be connected into a circuit branched from the metallic circuit to ground at the subscriber's station.

3. The united metallic circuits of two subscribers, in combination with a branch circuit to ground, including an annunciator and battery and switches, whereby either subscriber may ground the metallic circuit, and thereby close the battery and drop the annunciator, substantially as set forth.

4. The combination of a series of metallic circuits each extending from the central office to a different subscriber's station, and a branch line to ground at the central office, including the operator's telephone, and switches at the central office, one switch included in each metallic circuit, said switches normally connecting their respective metallic circuits with the said branch line.

5. A spring-jack consisting of the frame *r*, insulated point *s*, and the insulated spring or lever adapted to make contact with said frame and contact-point.

6. In a subscriber's telephone-outfit for metallic-circuit lines, the signal-bell and telephone, in combination with a branch circuit to ground, and switches and connections whereby the subscriber may bring the telephone and signal-bell alternately into and out of the line-circuit and may remove the telephone from the line-circuit and connect it into said branch circuit.

7. A loop-plug, in combination with a switching device, said switching device being adapted to receive said loop-plug and having three contact-pieces, said contact-pieces being electrically connected in the switching device when the plug is not in it and being electrically disconnected in the switching device when the plug is in it.

8. A loop-plug, in combination with a switching device, said switching device being adapted to receive said loop-plug and provided with three contact-pieces, two of which are line contact-pieces, said contact-pieces being in electric connection with the third contact-piece when the plug is not in the switching device and being electrically disconnected from said third contact-piece when the plug is in the switching device.

9. The combination of a loop-plug with a switching device adapted to receive said loop-plug, the switching device having two insulated line-connections and a third insulated connection, and one of said insulated line-connections being normally in electric contact with the other line-connection, and also with said third insulated connection, and being removed from electric contact with said line-connection and said third connection when the plug is inserted.

10. The combination of a loop-plug with a switching device, the loop-plug having two insulated connections, and the switching device having two insulated line-connections and a third insulated connection and adapted to receive the loop-plug, one of said line-connections being normally in electric contact with the other line-connection and with said third insulated connection when the plug is not inserted, and when the plug is inserted said line-connections being disconnected from each other and from said third insulated connection, and each connected with a corresponding insulated connection of the loop-plug.

11. In the central office of a telephone-exchange, two or more switching devices, each of which has two insulated contact-pieces connected to the two terminals of a metallic-circuit telephone-line, and a third insulated contact-piece connected with a ground-line common to said switches, and loop-plugs with flexible cords adapted to be placed in and removed from said switching devices, in combination with an operator's telephone in said ground-line, whereby when a loop-plug is inserted into any switching device the operator's telephone is disconnected from the line connected with said switching device, said operator's telephone being again automatically connected to said line when the plug is removed.

12. In the central office of a telephone-exchange, a loop-plug with a flexible cord and a switching device adapted to receive said plug, said switching device having two insulated contact-pieces connected to the two terminals of a metallic-circuit telephone-line, and also a third insulated contact-piece connected to a ground-line, said third contact-piece being electrically connected with the other contact-pieces when the plug is not in the switching device, and being electrically disconnected from said pieces when the plug is in the switching device, in combination with an operator's telephone in said ground-line, whereby when the plug is in the switching device the operator's telephone is disconnected from the line-terminals, and when the plug is not in the switching device the operator's telephone is in electrical connection with both of said line-terminals.

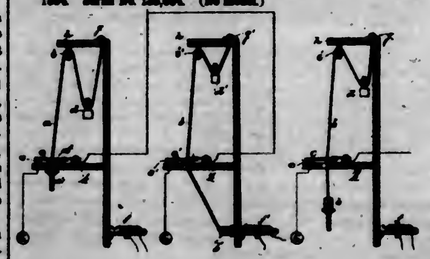
13. In the central office of a telephone-exchange, loop-plugs with two or more switching devices, each of which has two insulated line contact-pieces connected to the two terminals of a metallic-circuit telephone-line, and also each provided with a third insulated contact-piece, which pieces are respectively in electrical connection with said line contact-pieces when a loop-plug is not in the switching device, said third pieces being disconnected from said line contact-pieces when a loop-plug is in the switching device, and an operator's telephone in a ground-line connected to said third insulated contact-pieces, whereby when a loop-plug is in either switching device the operator's telephone is disconnected from both terminals of the line connected thereto, and when the loop-plug is not in the switching device the operator's telephone is connected to both terminals of said line.

14. A subscriber's telephone-circuit, said circuit extending from the central office to the subscriber's office and thence back to the central office, a telephone in said circuit at the subscriber's office, a switching device by which said telephone may be removed from said circuit and connected into a branch circuit, one end of which is connected to said subscriber's circuit and the other end of which is connected with the ground, in combination with a switching device and an operator's telephone at the central office, the operator's telephone being connected on one side to the ground and on the other side to the switching device, the switching device being connected to the two terminals of the subscriber's circuit, whereby the subscriber, by operating the switching device at his station, may bring his telephone into circuit with the operator's telephone, and whereby the operator, by operating the switching device at the central office, may disconnect the subscriber's circuit from his telephone and connect it with another subscriber's circuit.

15. The switching device, consisting of a frame provided with a plug-hole of considerable depth, a spring or lever, and a third contact-point, in combination with a loop-plug adapted to lift the spring or lever from the contact-point, and also at the same time from contact with the frame, whereby the lever and frame may be connected, respectively, to different contacts of the loop-plug, and when the plug is removed automatically connected to the third contact-point.

16. A metallic-circuit telephone-line terminating in the central office of an exchange, in combination with a branch line at the central office containing the operator's telephone, said branch line being grounded on one side of the telephone, and being normally connected on the other side of the telephone to both terminals of said telephone-line, and a switching device, whereby said branch line may be disconnected from the terminals of said telephone-line.

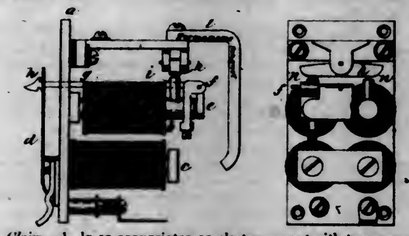
17. The combination of two or more metallic-circuit telephone-lines centering in the central office of a telephone-exchange, with a branch line at the central office containing the operator's telephone, said branch line being grounded on one side of the telephone, and normally connected on the other side of the telephone with all of said lines, and switching devices, whereby any of said telephone-lines may be disconnected from said branch line.



18. The combination of two or more metallic-circuit telephone-lines centering in the central office of a telephone-exchange, with a branch line at the central office containing the operator's telephone, said branch line being grounded on one side of the telephone, and normally connected on the other side of the telephone with all of said telephone-lines, and switching devices, whereby any of said telephone-lines may be disconnected from said branch line, and any two of said telephone-lines may be looped together in metallic circuit for conversation.

19. In a telephone-exchange system, a metallic-circuit telephone-line normally grounded at the central office through an operator's telephone, in combination with a switch at the subscriber's office, whereby the subscriber may, for conversation with the central office, establish a circuit which shall embrace the ground, his own and the operator's telephone, and part or all of said telephone-line.

20. In a telephone-exchange system, two or more metallic-circuit telephone-lines, all normally grounded at the central office through an operator's telephone, in combination with switches, one at each subscriber's office, whereby any subscriber may, for conversation with the central office, establish a ground-circuit which shall embrace his own and the operator's telephone and part or all of his telephone-line.



21. In a telephone-exchange, two or more metallic-circuit telephone-lines, all normally grounded at the central office through an operator's telephone, in combination with switches, one at each subscriber's station, whereby any subscriber may, for conversation with the central office, establish a ground-circuit which shall embrace his own and the operator's telephone and part or all of his telephone-line, and switching devices at the central office, one for each of said lines, whereby the operator may connect together any two of said lines for exchange communication.

388,014. SWITCH-BOARD. CHARLES H. SCRIBNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed June 16, 1884. Serial No. 135,594. (No model.)

Claim.—The combination, with the switch-board, of the cords attached to the lower side of the upper shelf toward the back, the weighted pulleys and the fixed pulleys, the lower shelf provided with openings for the cords, and the plugs below the lower shelf, whereby the cords are held taut and the weighted pulleys respectively carried out of the way of the weights and cords on either side as the plugs are drawn down or allowed to return to their position against the lower shelf, substantially as and for the purpose specified.

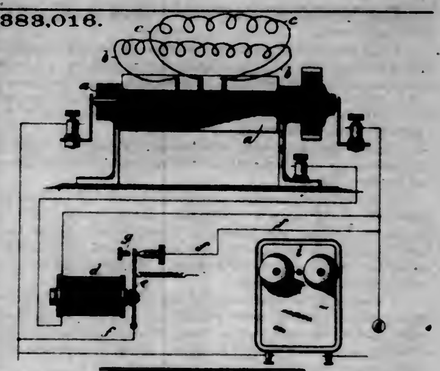
383,015. CLEARING-OUT ANNUNCIATOR. CHARLES R. SCRIBNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 27, 1886. Renewed Nov. 21, 1887. Serial No. 255,772. (No model.)

Claim.—1. In an annunciator, an electro-magnet with two armatures, one of said armatures being polarized, the other armature being neutral, in combination with an electro-magnet normally shunted out of circuit by the said polarized armature, and a shutter normally held by the armature-lever of neutral armature, said shutter being opposed to the poles of the normally-shunted magnet, whereby alternating currents traversing the annunciator will prevent the shutter from falling.

2. An electric annunciator provided with two armatures, one of said armatures being polarized and the other neutral, the neutral armature being extended and provided with a catch for holding up the annunciator-shutter, said shutter being connected with the armature of another electro-magnet, in combination with circuit-connections, whereby a straight current through the coils of the annunciator operates the neutral armature thereof to cause the shutter to fall, the coils of the magnet, of which the shutter serves as an armature, being shunted out by the polarized armature.

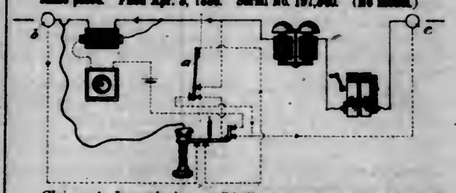
3. In an electric annunciator, the combination, with the neutral armature connected with the double detent, of the shutter normally supported thereby, said shutter being of iron and placed so as to be acted upon by an electro-magnet, *c*, the polarized armature of the annunciator, and circuit-connections, whereby a straight current sent through the electro-magnet of the annunciator is shunted from electro-magnet *c*, while the double detent is operated to permit the shutter to fall, substantially as described.

4. An electric annunciator consisting of an electro-magnet and two armatures, one of which is polarized and the other neutral, the neutral armature being connected with a double detent which serves to retain an iron shutter, in combination with an electro-magnet, *c*, presented to said shutter, and circuit-connections, whereby current of one polarity causes the detent to vibrate and release the shutter, magnet *c* being at the time shunted out by the polarized armature.



5. The combination, with an electro-magnet normally shunted out of circuit by the polarized armature of the electro-magnet of an annunciator, of the neutral armature of said electric annunciator extended to form a double detent, the iron shutter supported thereby, said shutter being presented to the poles of the normally-shunted electro-magnet, whereby the shutter is retained in position or allowed to fall, according as current of one polarity or current in reversals is sent through the annunciator.

383,016. AUTOMATIC SHUNT FOR MAGNETO-GENERATORS. CHARLES R. SCRIBNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 3, 1885. Serial No. 184,561. (No model.)



Claim.—1. The combination, with a dynamo or magneto electric machine, of a shunt-circuit around the machine, an extra coil upon the armature, an electro-magnet included in the circuit of said extra coil, and the armature-lever of said electro-magnet included in the shunt-circuit, whereby the shunt-circuit is held open and current sent to line when the machine is in operation.

2. In a dynamo or magneto electric machine, the revolving armature provided with two coils wound thereon, one of said coils being included in the main circuit and the other coil including an electro-magnet, and a shunt-wire around the machine including the armature of said electro-magnet, said shunt-wire being closed when the armature is at rest, but open when the armature is revolved to energize the electro-magnet, substantially as described.

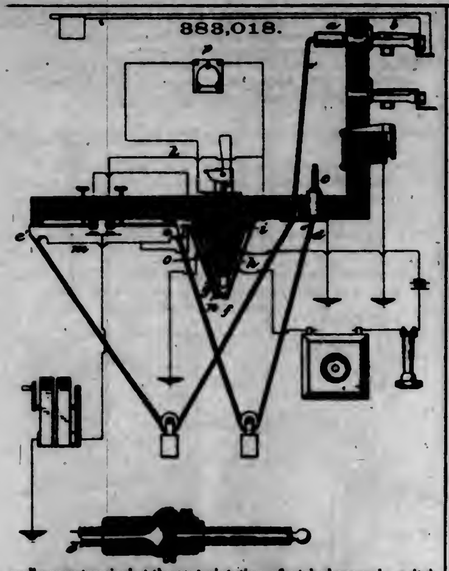
383,016.

383,017. TEST-CIRCUIT FOR TELEPHONE CALL-BOXES. CHARLES R. SCRIBNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Apr. 5, 1886. Serial No. 197,940. (No model.)

Claim.—1. In a telephone call-bell apparatus, a test key or switch normally connected in circuit between the telephone-switch and the telephone-line, a contact-point opposed to said test key or switch, with which the test-key may be connected, while at the same time the branch between the telephone switch and line is broken, and circuits connected with the generator and bell, whereby different parts of the box may be tested on disconnecting the line from the binding-post, substantially as and for the purpose specified.

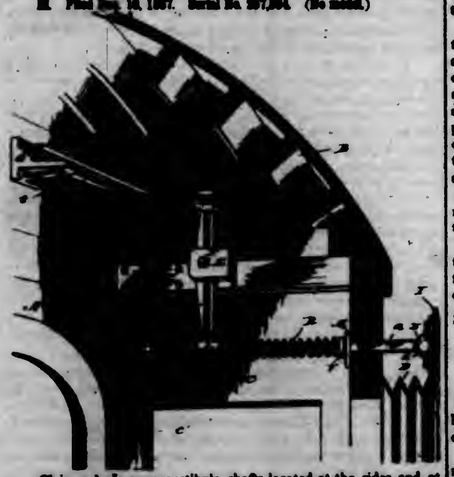
2. In a telephone-call apparatus, the combination, with the telephone-switch and shunt-circuits, as described, of a circuit-changing device normally included in a branch circuit between the line and telephone-switch, and a contact-point against which said circuit-changing device may be closed to form a test-circuit and open the said branch circuit, thereby changing the circuits of the apparatus for testing, substantially as and for the purpose specified.

3. In a telephone call and signal apparatus, the combination, with the binding-posts *b c*, each disconnected from the lines leading out of the bell, the telephone-switch, the circuit-changing device *a*, and the generator and circuits, whereby the different parts of the apparatus may be tested, substantially as described.



383,018. KEY-BOARD APPARATUS FOR TELEPHONE-EXCHANGES. CHARLES R. SCRIBNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 27, 1886. Renewed Nov. 21, 1887. Serial No. 255,772. (No model.)

Claim.—1. In a key-board system, the combination of double-pointed plugs connected together by double-stranded cords, the tips of the plugs being connected by one strand and the insulated sleeves by the other strand of the cord, ground-contact upon the hook of each plug, said ground-contact being permanently connected with the tip, a listening-key included in the circuit of the strand, connecting the tips of the plugs, and a ground-switch operated by said listening-key, connected with the strand included between the sleeves of said plug, whereby the operator's telephone outfit may be included in one of the strands of the cord and the other strand simultaneously grounded, substantially as shown and described.



2. A metallic circuit extending from the spring of a spring-jack switch at a telephone-exchange station out through a subscriber's station and back to the insulated frame of said switch, in combination with a loop-plug inserted in said switch, a double-stranded cord connecting with said loop-switch, the strand connecting with the tip of the plug being normally grounded and the other strand being normally open, a telephone, and a switching device, whereby the telephone may be looped into the strand connecting with the tip, while the other strand which connects with the sleeve is grounded to complete a metallic circuit through the said telephone and the subscriber's station.

3. The combination, with a metallic circuit extending from ground at the central office through a subscriber's station and back to a normally-open terminal at the central station, of a telephone and a switching device, said switching device having contacts connecting with the said telephone, and a ground-contact, whereby the telephone may be looped into the grounded side of said metallic circuit, and the normally-open side of said circuit simultaneously closed to ground to complete the circuit from the normal ground at the subscriber's station through the metallic circuit and back to the ground last formed at the central station.

383,018.

383,019. REGISTER FOR CAR-VESTIBULES. ERNST H. SAMMIS, Pullman, assignor to the Pullman's Palace Car Company, Chicago, Ill. Filed Nov. 10, 1887. Serial No. 257,504. (No model.)

Claim.—1. In a car-vestibule, shafts located at the sides and at the upper portion of the vestibule, adapted to longitudinal movement, their front or outer ends bearing against the abutting-plates of the flexible vestibule portion, and their rear or inner ends being connected by a lever or system of levers with buffer-springs interposed between said levers and shaft so as a resistance to the inward movement of the latter.

2. In a car-vestibule, shafts located at the sides of the vestibule, adapted for longitudinal movement, having at their inner or rear ends lever attachments connecting one shaft with the other, and being provided with spherical outer ends, a spring interposed between the shaft and lever as a resisting medium for said shaft, in combination with the abutting-plate of a flexible vestibule, said plate being provided with sockets adapted in conjunction with the spherical shaft ends to form ball-and-socket joints.

3. In a car-vestibule, shafts at each side of the upper portion of the vestibule bearing against the abutting-plate of a flexible connection, and having connected therewith springs affording yielding resistance to inward movement thereof, in combination with a system of equalizing-levers, consisting of vertical bars at the sides and a horizontal equalizing-bar attached to the end of the car, to which said vertical bars are pivotally or flexibly attached.

4. In a car-vestibule, the shafts *a* and abutting-plate I, provided with ball-and-socket joints K L at their bearing, one with the other, in combination with springs R, vertical levers F, and horizontal lever H, substantially as and for the purpose set forth.

5. In a car-vestibule, the combination of the flexible vestibule portion D, shafts *a*, springs R, vertical levers F, and horizontal lever H, substantially as and for the purpose set forth.

383,020. TRITURATOR. LOUIS SEIBMAN, Milwaukee, Wis. Filed Jan. 11, 1887. Serial No. 223,902. (No model.)

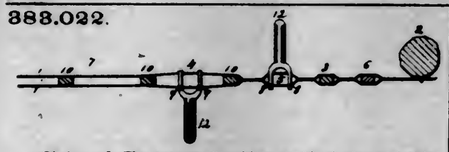
Claim.—1. The combination, in a triturating-machine, of a revolving mortar, a spider, a series of stationary division-plates suspended therefrom within the mortar, a series of independent stemless pestles, and a series of stationary separating-plates adjacent to the inner side surface of the mortar and extending only part way across the space between each two of the described stationary division-plates.

2. The combination, in a triturating-machine, of a revolving mortar, a housing surrounding the same, a spider above the mortar and secured to the upper platform of the housing, a series of stationary division-plates secured to and depending from the spider within the mortar and meeting at the center thereof, a series of independent stemless pestles located within the spaces between the said division-plates, a series of arms hinged to the housing-platform and projecting over the mortar, and a series of stationary separating-plates secured to said arms and suspended within the mortar adjacent to its inner side surface.

3. The combination, with a revolving mortar, of a series of triturating-disks or stemless pestles, flattened at the bottom, loosely resting thereon.

4. The combination, in a triturating-machine, of a revolving mortar, a series of stationary division-plates suspended within the same, free from contact with said mortar or its shaft, and a series of flattened circular triturating-disks loosely resting in said mortar.

383,021. BUTTON-HOLE OPENER. JOHN B. SEEVERS, Portland, Oreg. Filed May 14, 1887. Serial No. 238,097. (No model.)



Claim.—1. As a new article of manufacture, the button-hole opener having a pointed conical head rounded at its base, and a shank or handle, substantially as shown and described.

2. A device for opening button-holes, consisting, essentially, of a rod having tapering heads of different sizes at one end thereof, and a handle, substantially as set forth.

3. As a new article of manufacture, a device for opening button-holes, consisting, essentially, of a rod having an oval-shaped head at one end and screw-threaded at its opposite end, the screw-threaded end and head being in a plane passing longitudinally through the rod, the said rod being bent at a point between the head and screw to form a handle, substantially as set forth.

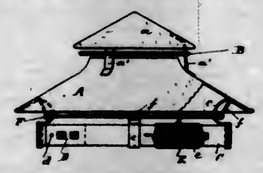
383,022. PROCESS OF MAKING COMBINED WIRE AND PICKET FENCES. WILLIAM X. SEWELL, Washington, D. C. Filed Aug. 26, 1885. Serial No. 211,257. (No model.)

383,022.

Claim.—1. The process of making combined wire and picket fence, which consists in first securing one or more pairs of wires upon supports; secondly, placing a series of pickets between the two wires of each pair, and, thirdly, twisting loops in the pairs of wires between the pickets so placed and placing other pickets in the said loops, substantially as shown and described.

2. The process of making combined wire and picket fence, which consists in first placing two or more pickets between one or more pairs of wires; secondly, twisting the two wires of each pair together in two places at the same time, forming loops between the said pickets, and then placing other pickets in the loops named, substantially as shown and described.

383,023. HOLLOW VESSEL AND METHOD OF MAKING THE SAME. THOMAS F. STEVENSON, Brooklyn, N. Y. Filed May 28, 1887. Serial No. 239,634. (No model.)



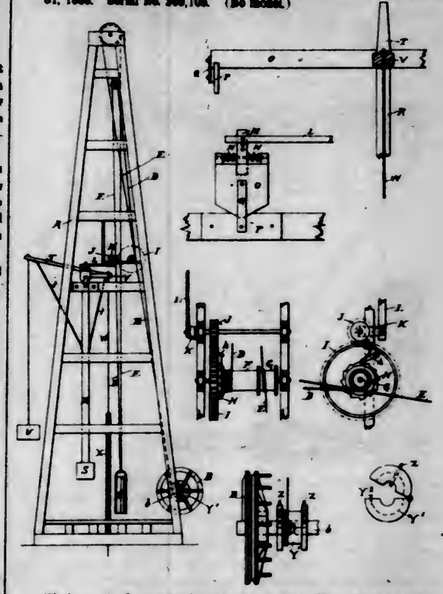
Claim.—1. The method herein specified of making hollow metallic vessels, consisting in casting a hollow blank with cylindrical sides that are thicker than the end, and then reducing the thickness of the sides of the vessel and extending the same in length, substantially as set forth.

2. A hollow metallic vessel having a head or end of metal that is consolidated by hammering, and sides that are of wrought metal, substantially as set forth.

3. The method herein specified of making hollow metallic vessels, consisting in casting a hollow blank, subjecting the end portion to a hammering or forging operation to consolidate the metal, and heating and rolling the metal to reduce the thickness of the sides and to elongate the cylindrical portion, substantially as set forth.

4. The hollow metallic vessel having a cast-metal end, with a base or foot thereon, and with wrought-metal sides, the end, the sides, and the foot or support being integral without seam or joint, substantially as set forth.

383,024. MILK-CAN COVER. FREDERICK STORK, Kewaskum, Wis. Filed Feb. 21, 1888. Serial No. 264,800. (No model.)



Claim.—1. The combination, with the cover, of the rim united thereto by elastic supports and provided with a series of holes, and the bolts for securing the rim when adjusted to the desired size, substantially as set forth.

2. The combination, with a cover, of a rim secured thereto by elastic supports, a spring joining the ends of the rim, and a guard-ring secured below the cover in the ventilating-space between it and the rim, substantially as and for the purpose set forth.

3. The combination, with a cover, of a rim united thereto by elastic supports, and a spring joining the ends of the rim and causing it to fit tightly on the can.

4. The combination, with a cover provided with a top portion secured to it by supports, leaving a ventilating-space between the two parts, a rim secured to the under side of the cover by elastic supports, and also leaving a ventilating-space around the cover, a spring joining the ends of the rim, and guard-rings secured in the middle of the said ventilating-spaces, substantially as and for the purpose set forth.

383,025. APPARATUS FOR OPERATING OIL-WELL PUMPS. OSMERAN C. STOVER, Bradford, Pa. Filed Apr. 12, 1888. Renewed Mar. 31, 1888. Serial No. 269,103. (No model.)

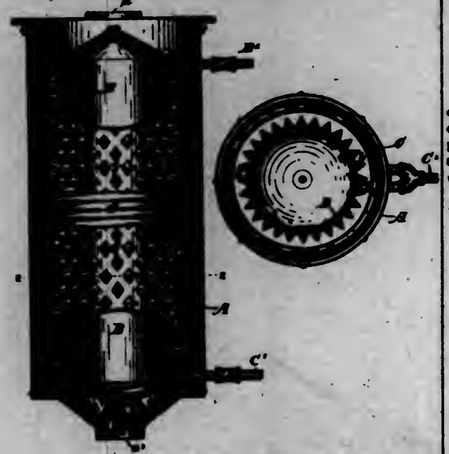
Claim.—1. In a pumping-rig, the combination of a supporting-frame, a rocking beam pivoted in the frame and provided with a counter-balance to the weight of the pump-rod, a vibrating pendulum secured to the said beam, a heavy descending weight and intermediate winding-gear for keeping up the vibrations of the pendulum, and a spring-connection interposed between the said gear and the rocking beam, substantially as and for the purpose set forth.

2. In a pumping-rig, the combination of a supporting-frame, a rocking beam pivoted in the frame, a vibrating pendulum secured to the beam, a descending weight provided with a cord, a revolving barrel for the cord, intermediate winding-gear provided with a ratchet and pawl and connecting the barrel with the rocking beam, and a revoluble bull-wheel connected to one end of the said cord for winding the other end of the cord upon the barrel, substantially as and for the purpose set forth.

3. In a pumping-rig, the combination of a supporting-frame, a rocking beam pivoted in the frame, a vibrating pendulum secured to the beam, a descending weight provided with a cord, the barrels F and G, having the ends of the said cord wound around them, as set forth, intermediate winding-gear provided with a ratchet and pawl and connecting the barrels with the rocking beam, the bull-wheel mounted upon a revoluble shaft, a sleeve having the end of the cord passing around barrel G secured to it, and a retractible pin for connecting the sleeve to the shaft, substantially as and for the purpose set forth.

383,026. SCREEN-SCRAPER FOR PULP OR PAPER MILLS. MARTIN V. STREETER, Franklin Falls, N. H. Filed June 20, 1887. Serial No. 242,449. (No model.)

Claim.—1. The combination of a screen, a shaft carrying sprocket-wheels mounted on top at one end thereof, two or more slack chains, suitable scrapers arranged at regular intervals and carried thereon, and suitable slide-ways for carrying the upper scrapers at a uniform



383,026.

height from one to another set of sprocket-wheels, for the purpose set forth.

2. The combination of a screen having inclined ends, a shaft and sprocket or rag wheels mounted on top near each end, two or more slack chains, suitable scrapers channeled on one side and arranged at regular intervals and carried thereon, and suitable slideways for carrying the upper scrapers at a uniform height from end to end of said screen, substantially for the purpose described.

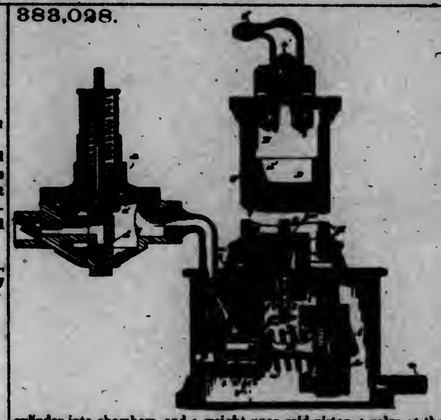
383,027. GRAIN-HEATER. JAMES WARBURTON, Indianapolis, Ind., assignor to the Perfyrio & Harman Company, same place. Filed May 31, 1887. Serial No. 239,769. (No model.)

Claim.—1. In a grain-heater, the combination, with its other parts, of an internal cylinder provided with the pointed external projections, *b*.

2. In a grain-heater, the combination, with its other parts, of an internal cylinder provided with diamond-shaped projections which extend out nearly to the surrounding portion of the structure.

3. In a grain-heater, the combination, with its other parts, of an internal cylinder which is provided with projections arranged in diagonal rows, whereby the grain is given an irregular course through the heater.

4. The combination of the outer casing, A, inner cylinder, B, provided with the projections *b*, arranged in diagonal rows, the surrounding pipe-coil C, and the hopper A', all arranged and operating substantially as set forth.



383,028. HYDRAULIC AIR-PUMP. EDWARD H. WEATHERHEAD, Cleveland, Ohio. Filed Apr. 7, 1887. Serial No. 234,078. (No model.)

Claim.—1. In a hydraulic air-pump, a main cylinder closed throughout its length and having air inlets and outlets at one end and water inlets and outlets at the other end, a piston in said cylinder by which the air and water are separated, and a counter pressing device as a spring or weight, within the cylinder to bear the piston down and expel the water from the cylinder, in combination with a valve located in the water-inlet channel leading to said cylinder, and a separate piston to operate said valve having a water-channel communicating with the source of water-supply and operated by the pressure of the same substantially as set forth.

2. In a hydraulic air-pump, a main cylinder provided with a piston and a pressure device, as a spring or weight, bearing upon said piston and confined within the cylinder, to force the piston back toward the starting-point and expel the water from the cylinder, in combination with a main valve in the water-supply channel, and a separate piston to actuate said valve, having a channel connecting with the source of water-supply behind the main valve therein, by which said piston and valve are operated when the main valve is closed, substantially as set forth.

3. In a hydraulic air-pump, a main cylinder having air and water passages at its respective ends, a close-fitting piston separating the

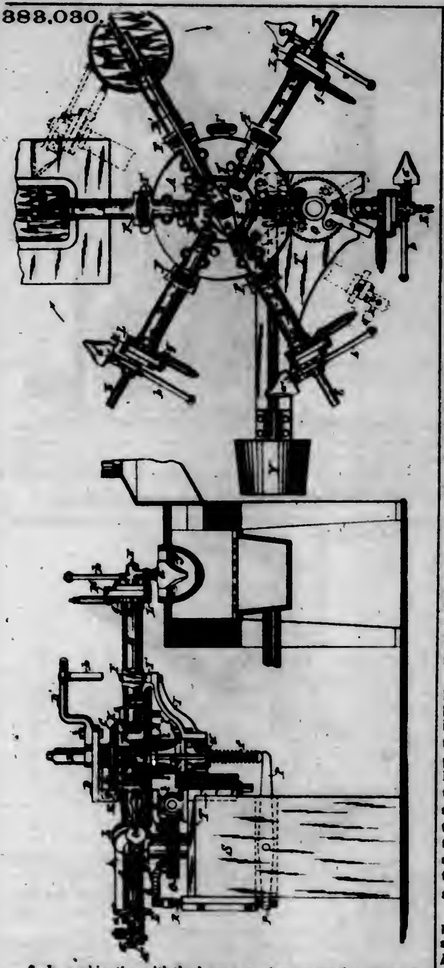
383,028.

cylinder into chambers, and a weight upon said piston, a valve at the end of the cylinder, and a connecting-piece between the valve and the piston, in combination with a valve in the water-supply channel, and a separate piston provided with water-pressure for controlling the said valve, substantially as set forth.

383,029. LIFTING-JACK. JAMES WEATHERS, Indianapolis, Ind. Filed Mar. 8, 1888. Serial No. 266,886. (No model.)

Claim.—1. In a lifting-jack, the combination of the standard, the rack-bar, the hand-lever swung by links, and its bar *i*, adapted to engage with the teeth of said rack-bar, a gravitating-pawl, the upper and lower primary guides, and an auxiliary guide, D, secured to the arms of the lower primary guide, substantially as described.

2. The combination, with the auxiliary guide D, provided with lifting-toes, of the standard B, a rack-bar, C, guided vertically and connected to the said guide D, and an operating-lever, substantially as described.



3. The combination, with the rack-bar and standard of a lifting-jack, of an auxiliary guide-bar secured to the lower primary guide and provided with lifting-toes above and below this guide, substantially as described.

4. The combination, in a lifting-jack, of the base A, the standard rising perpendicularly therefrom, the vertically-movable rack-bar having hooked teeth, the upper and lower primary guides, the auxiliary guide provided with lifting-toes at and between its extremities and rigidly secured to the lower primary guide, the bifurcated hand-lever swung from the upper primary guide by links and provided with a transverse lifting-bar, *i*, adapted to engage with the teeth of the rack-bar, and a gravitating angular pawl pivoted to the upper primary guide and adapted to be tripped by the said lifting-bar on the bifurcated end of the hand-lever, all substantially as described.

383,030. MACHINE FOR HEATING AND HARDENING METAL ARTICLES. HARVEY WHITE, Syracuse, N. Y., assignor to the Whitman & Barnes Manufacturing Company of Ohio. Filed June 6, 1887. Serial No. 240,602. (No model.)

Claim.—1. In combination with the heater, carriers mounted on a rotatory support and with their free ends in a path across the heater, holders or tongs connected to said carriers, and a tripper arranged in the path of the heater to automatically throw the heated articles from the holders, as set forth.

388,080.

2. In combination with the heater, carriers mounted on a rotatory support and with their free ends in a path across the heater, tongs connected to said carriers, spring holding the tongs normally closed, and a tripper in the path of the heater to automatically open said tongs, as set forth.

3. In combination with the heater, a series of arms carried on a rotatory support and arranged with their free ends in a path across the heater, shafts journaled longitudinally in said arms, pinions secured to said shafts, segmental racks adapted to mesh with said pinions, and holders or tongs secured to said shafts, substantially as and for the purpose set forth.

4. In combination with the heater, a series of arms carried on a rotatory support and with their free ends in a path across the heater, a corresponding series of projections on said support, a rotary cam arranged to successively engage said projections, and holders carried on the free ends of the said arms and adapted to carry the articles to be heated, substantially as set forth.

5. The combination of a series of arms extended from a rotatory support, a corresponding series of projections on said support, a rotary cam arranged to successively engage said projections, shafts journaled longitudinally on the aforesaid arms, holders or tongs connected to the outer ends of the said shafts, pinions secured to the inner end portions of the shafts, and two sets of segmental racks arranged to engage the pinions at diametrically-opposite points thereof, and the racks of each set situated at different points in a circle concentric with the pivoted support of the aforesaid arms, substantially as described and shown.

6. In combination with the arms extended from a rotatory support, and the normally-closed tongs having one of their respective jaws hooked on the free ends of said arms and the companion jaws hinged to the fixed jaws and provided with tripping-shanks, and an arm sustained across the path of the said tripping-shanks and by their encounter open the tongs, substantially as set forth.

7. The combination of the turn-table A, the arms B B, projecting therefrom and provided with the lugs *c c*, the jaws *a a*, hooked on the free ends of said arms, the jaws *a' a'*, provided with the shanks *b b*, the plate C, arranged stationary above the turn-table, the arm D, supported movably vertically and pivoted above the plate C and adapted to engage the lug *c*, the spring *d*, secured to the aforesaid plate and arranged to actuate the arm D, the arm D', extended from the arm D and reaching with its free end across the path of the shanks *b b*, and a lifter adapted to lift the arm D clear from the lug *c*, substantially as and for the purpose set forth.

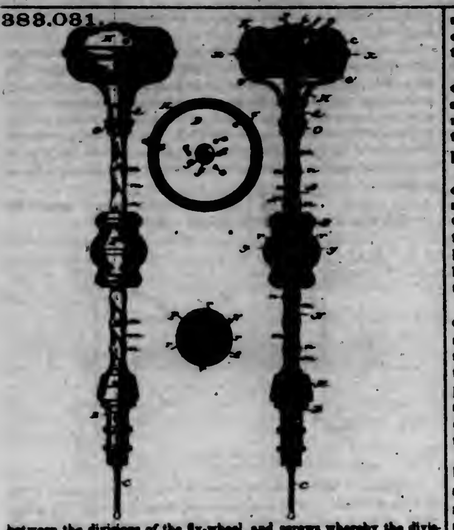
8. In combination with the frame H, the turn-table A, the arms B B, projecting therefrom and provided with the lugs *c c*, the shafts E E, journaled longitudinally in said arms and having affixed to them the pinions F F, the brackets I, having affixed to them the segmental racks I', adapted to engage the under side of the pinion F, the stationary plate C, having affixed to it the segmental racks K, adapted to engage the upper side of the other of the aforesaid pinions, the jaws *a a*, rigidly attached to the outer ends of the shafts E E, the jaws *a' a'*, hinged to the said fixed jaws and provided with the shanks *b b*, the springs *c c*, holding the jaws normally closed, the pivoted arm D, supported movably vertically and adapted to engage the lugs *c c*, the spring *d*, arranged to actuate the arm D, the arm D', extended from the arm D and reaching with its free end across the path of the shanks *b b*, and the plunger *f*, adapted to lift the arm D, substantially as and for the purpose set forth.

9. The combination of the arm B, carried on a rotatory support, the shaft E, provided with the pinion F F, the segmental racks I and K, adapted to engage said pinions, respectively, at opposite sides, the locking-plate L, rigidly attached to the arm E, the plate M, fixed to the shaft E, and the dog *g*, connected to the latter plate and adapted to engage the locking-plate at different points of the circumference thereof, substantially as described and shown, for the purpose set forth.

10. In combination with the arms B B, carried on a rotatory support and provided with lugs *c c*, the shafts E E, provided with the pinions F F, the segmental racks I and K, adapted to engage said pinions, respectively, at opposite sides, the jaws *a a*, fixed to said shafts, the jaws *a' a'*, hinged and provided with the shanks *b b*, the locking-plates L L, rigid on the arms B B, the plates M M, fixed to the shafts E E, the dogs *g g*, connected to the latter plates and adapted to engage the locking-plates, the stationary plate C, the arm D, pivoted above said plate and movable vertically and adapted to engage the lugs *c c*, the spring *d*, arranged to actuate the arm D, the arm D', extended from the aforesaid arm and having its free end in the path of the shanks *b b*, and the plunger *f*, adapted to lift the arm D and throw the same out of engagement with the lug *c*, substantially as described and shown.

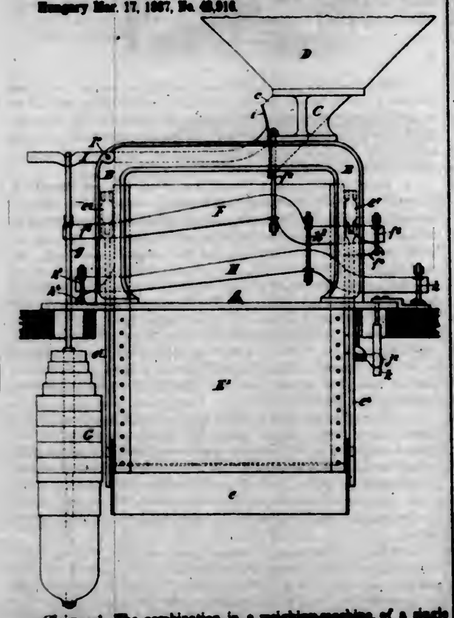
11. In combination with the arms B B, carried on a rotatory support, and the jaws *a a'*, carried by said arms and provided with the shanks *b b*, the spring-actuated pivoted arm D, provided with the slot *h*, the arm D', provided on the arm D, and the clamping-bolt *i*, passing through the arm D' and slot *h* and adjustably securing the two arms to each other, as described and shown.

12. The combination of the tubular shaft *n*, turn-table A, provided with the projections *l l*, arms B B, extended from said turn-table and provided with lugs *c c*, tongs *a a' b*, carried by said arms, the plunger *f*, extending longitudinally through the shaft *n*, the sleeve N, riding on the upper end of said plunger and having rigidly secured to it the arm D, adapted to engage the lugs *c c*, the arm D', extended from the arm D and adapted to trip the tongs, the wheel O, having affixed to it the cams *o o*, the pivoted lever P, having one end under the plunger *f*, and the push-bar R, riding on the opposite end of said lever and arranged in the path of the cams *o o*, to be actuated thereby, substantially as described and shown.



388,081. DRILL-STOCK. ANDREW ALLISON, New York, N. Y. Filed Oct. 31, 1887. Serial No. 253,978. (No model.)

Claim.—1. The combination of the spindle, the shell or handle fitted upon one end thereof and furnishing a pivotal bearing for said end, a socket-piece secured upon the opposite end of the spindle, an interposed spirally-grooved sleeve encircling the spindle loosely and having a limited longitudinal play thereon between the socket-piece and handle, a nut fitted upon the sleeve to engage its spiral grooves, and a clutch formed between the proximate ends of the sleeve and socket-piece, substantially in the manner and for the purpose herein set forth.



2. The combination of the spindle, the divided fly-wheel, a pin fixed radially in the spindle to project therefrom into a circular recess between the divisions of the fly-wheel, and screws whereby the divisions are clamped upon the pin, substantially in the manner and for the purpose herein set forth.

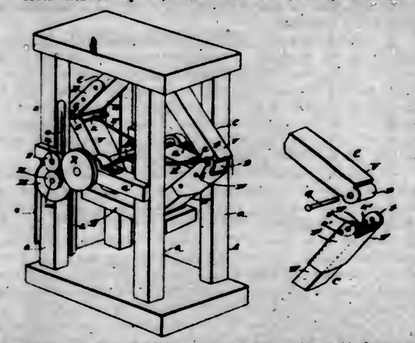
3. The combination of the drill-spindle, the fly-wheel attached to the end thereof, and a shell or handle inclosing the fly-wheel and furnishing an end bearing for the spindle, substantially in the manner and for the purpose herein set forth.

388,081.

388,082. APPARATUS FOR WINNOWING GRAIN. WILLIAM R. AVERY, Digbeth, Birmingham, County of Warwick, England. Filed Nov. 11, 1886. Serial No. 218,691. (No model.) Patented in England May 1, 1886, No. 5,931; in France Oct. 2, 1886, No. 176,886; in Belgium Oct. 14, 1886, No. 74,290; in Germany Oct. 16, 1886, No. 39,008; in Spain Jan. 17, 1887, No. 6,997; in Italy Jan. 28, 1887, No. 169, and in Austria-Hungary Mar. 17, 1887, No. 43,916.

Claim.—1. The combination, in a weighing-machine, of a single hopper receptacle for containing the substance to be weighed, and two sets of weighing-levers connected together and both surrounding the said box or receptacle, each set being connected with the said box or receptacle independently of the other, and one being connected with one side of said box or receptacle and the other with the opposite side thereof, substantially as herein described.

2. The combination, in a weighing-machine, of a single box or receptacle for containing the substance to be weighed, and two connected sets of weighing-levers surrounding the box one above another and connected with the box or receptacle independently of each other above the center of gravity thereof, one on one side and the other on the opposite side thereof, substantially as herein described.



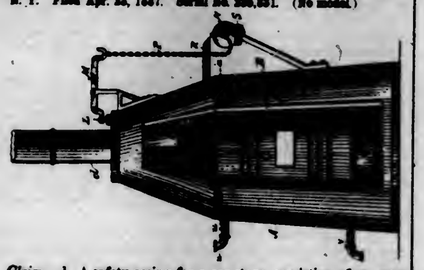
3. The combination, with the box or receptacle E E', of the pair of levers F and their connections *f*, the pair of levers H and their connections *h'*, the said levers and their connections surrounding the box or receptacle, one pair above the other, the fixed fulcra f^3 and *h* for the two pairs of levers, the independent connections f^5 f^6 and h^2 h^3 between the respective pairs of levers and the opposite sides of the box or receptacle, and the counterbalance-weight G, suspended from the levers F, all substantially as herein described.

4. The combination, with the box or receptacle E E', having two compartments and the tilting bottoms *e e'*, of the rock-shaft e^2 and its attached rock-levers e^3 e^4 and notched quadrant-plate e^{10}, the connections e^5 e^6 between said rock-levers and tilting bottoms, the bolt *j*, attached to the box, for engaging with the notches of the quadrant-plate, the weighted lever for holding up the said bolt, and the fixed stirrup *k*, for operating on said weighted lever to produce the withdrawal of the bolt from the notches of the quadrant-plate, all substantially as herein described.

5. The combination, with the weighing-receptacle, of an arresting-bolt, a tripping-connection, substantially as herein described, between said bolt and receptacle, for producing the arrest of the descent of the receptacle by the bolt, and means, substantially as herein described, for automatically withdrawing the bolt to liberate the receptacle, as and for the purpose herein set forth.

6. The combination, with the weighing-beam or weighing-receptacle, of the sliding stop-bolt *l*, the lever *m*, having a connection, substantially as herein described, with the beam or receptacle, and a trip-connection, m^2, with the bolt, the weighted cord *n'*, attached to the bolt, the pulley *o* for said cord, the fly *q'*, and the ratchet-wheel *s'*, pawl *p'*, and spur-gearing *p q* between the pulley and fly, all substantially as and for the purpose herein set forth.

388,083. BALING-PRESS. JOHN H. BARNES, Hilsboro, Tex., assignor of one-half to James Wright Gillespie, same place. Filed Mar. 3, 1887. Renewed Apr. 16, 1888. Serial No. 270,891. (No model.)



Claim.—1. In a baling-press, the frame A, drum A', the power-ropes K K K', to be wound thereon, and the platen B, combined with the levers C, having rounded upper and lower ends to operate in rounded sockets in the said platen and the upper part of the frame, and the toggle-joints near the centers of the said levers, comprising the rounded projection on one of the members adapted to fit a corresponding cavity or recess in the adjacent end of the other member, the lateral ears *f*, and the pin to pass through said ears and the rounded projection, substantially as and for the purpose set forth.

2. In a baling-press, the combination of the frame A, horizontal drum A', power-ropes K K', platen B, levers C, having toggle-joints near the center, comprising a rounded projection on the end of one member and a corresponding socket on the other, ears *f*, pivot-pin passing through the said projection and the ears, and the loop or link *k*, secured in the inner edges of the said ears, and having the ends of the power-ropes K secured thereto, substantially as and for the purpose set forth.

3. In combination with a baling-press having a platen to be operated by a revolving drum adapted to be rotated alternately in opposite directions, the hand-wheel M, operated by steam or other power through the band or belt L, the friction-wheel N, shaft *m*, on which

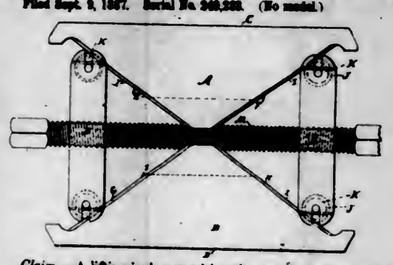
the wheels M and N are rigidly secured, the lever O, pivoted on the pin *o*, secured to the frame of the press or a similar support, the friction-wheel P, journaled on a shaft, *n*, said shafts *m* and *n* being journaled in bearings in the lever O, respectively below and above and at equal distances from the said pivot *o*, so that the peripheral edges of the said pulleys are in contact, and the friction-pulley R on the end of the drum A', and adapted to be rotated in opposite directions as the pulleys N and P are alternately brought in contact therewith by moving the lever O, substantially as described, for the purpose hereinbefore set forth.

383,034. SAFETY-CASING FOR CAR-HEATERS. ALONZO BELL, Washington, D. C., assignor of one-half to Baker, Smith & Co., New York, N. Y. Filed Apr. 23, 1887. Serial No. 236,031. (No model.)

Claim.—1. A safety-casing for a car-stove, consisting of an outer casing open at the side to expose the fuel, draft, and ash openings of the stove, in combination with a sliding plate having a horizontal movement for closing said opening in said outer casing, a spring connected with said sliding plate for closing the same, and a detent for holding the sliding plate in an open position against the tension of the spring, substantially as set forth and described.

2. A safety-casing for a car-stove, consisting of an outer casing open at the side to expose the fuel, draft, and ash openings of the stove and provided with an opening for the passage of smoke, in combination with a sliding plate having a horizontal movement for closing said openings in said outer casing, a spring connected with said sliding plate for closing the same, a detent for holding the sliding plate in an open position against the tension of the spring, and a tripping device for releasing said detent in case of an accident to the car, substantially as set forth and described.

3. A safety-casing for a car-stove, consisting of an outer casing open at the side to expose the fuel, draft, and ash openings of the stove, in combination with a sliding plate adapted to cover said openings, a spring connected with said plate for closing the same, catch L, for holding the slide in an open position against the tension of the spring, lever M, for tripping said catch, chain or rope P, attached to said lever, ball N, secured to said chain, and concave seat S, for seating said ball, substantially as set forth and described.



4. A safety-casing for a car-stove, consisting of an outer casing open at the side to expose the fuel, draft, and ash openings of the stove, in combination with a sliding plate adapted to cover said openings, spring K, for actuating said sliding plate, spring-catch L, for holding said plate in an open position against the tension of the spring, lever M, for tripping said catch, chain or rope P, attached to said lever, ball N, secured to said chain or rope, concave seat S, for seating said ball, and guide-rail R, for limiting the swing of the ball when unseated, substantially as set forth and described.

5. A safety-casing for a car-stove, consisting of an outer casing open at the side to expose the fuel, draft, and ash openings of the stove, in combination with a sliding plate having a horizontal movement for closing said opening in said outer casing, spring K, connected with said sliding plate for closing the same, catch L, for holding the sliding plate in an open position against the tension of the spring, and stationary platform D, supported by center standard, O, for elevating the stove above the bottom plate of the outer casing, so as to afford a free movement to said spring, substantially as set forth and described.

6. A safety-casing for a car-stove, consisting of an outer casing open at the side to expose the fuel, draft, and ash openings of the stove and provided with openings in its top plate for the passage of smoke, said openings surrounded with a collar for connection with the outer smoke-pipe of the stove, in combination with an inner sliding portion adapted to cover said openings in the outer casing, said sliding portion provided with smoke-openings, and a collar surrounding the same for connection with the inner smoke-pipe and corresponding in location with those in the outer casing, a spring connected with said sliding plate for imparting a horizontal movement to the same, a catch for holding the sliding plate in an open position against the tension of the spring, and a tripping device for releasing said catch in case of an accident to the car, substantially as set forth and described.

7. A safety-casing for a car-stove, consisting of an outer casing open at the side to expose the fuel, draft, and ash openings of the stove and provided with vertical cleat E, undercut at one edge, in combination with an inner sliding portion having a horizontal movement for closing the opening in said outer casing, said sliding portion having opening *g* and fitting under cleat E when the sliding portion is closed, spring-latch F, engaging with opening *g*, and rod H, adapted to enter said opening *g* and release the latch therein, substantially as set forth and described.

383,035. HOISTING-JACK. WILLIAM H. BELL, Pittsburg, Pa. Filed Sept. 9, 1887. Serial No. 249,269. (No model.)

Claim.—A lifting-jack comprising the two similar sections A and B, each provided with reversely-inclined faces, and with two roller guide-tracks, I, upon each of the said faces, the tracks I, provided with the right and left hand screw-threaded holes, the outside roller-spindle bearings and the middle bearings, *l*, the rollers K, journaled in said tracks and provided with grooves J engaging with the said guide-tracks, and the right and left hand threaded screw M for operating the said tracks and forcing the rollers against the inclines, substantially as set forth.

383,036. POCKET-BOX FOR POSTAGE-STAMPS. JOHN H. BARNES, Minneapolis, Minn. Filed Nov. 10, 1887. Serial No. 254,800. (No model.)

Claim.—1. The combination of a casing open at one end and one side, a holder hinged to said casing, said holder being open at its top and bottom and provided with inwardly-projecting lugs at its opposite ends, movable plates disposed within said holder, and a spring between said plates for forcing them outward in opposite directions, substantially as described.

2. The combination of a casing open at one end and one side, a holder hinged to said casing, said holder being open at its top and bottom and provided with inwardly-projecting lugs at its opposite ends, movable concave plates disposed within said holder, and a spring between said plates for forcing them outward in opposite directions, substantially as described.

3. The combination of a casing open at one end and one side, a holder hinged to said casing, said holder being open at its top and bottom and provided with inwardly-projecting lugs at its opposite ends, the sides of said holder being provided with inturned meeting flanges which form aprons inclined outward toward the top and bottom of the holder, movable plates disposed within said holder, and a spring between said plates for forcing them outward in opposite directions, substantially as described.

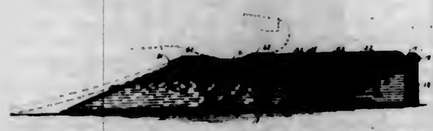
4. The combination of a casing open at one side and one end, a holder hinged to said casing, said holder being open at its top and bottom and provided with inwardly-projecting lugs at its opposite ends, certain of said lugs being sprung outward to serve as frictional catches for retaining the holder in closed position within the casing, movable plates disposed within said holder, and a spring between said plates for forcing them outward in opposite directions, substantially as described.

5. The combination of a casing open at one side and one end, a holder hinged to said casing, said holder being open at its top and bottom and provided with inwardly-projecting lugs at its opposite ends, a ring connected to one of said parts for attachment of a chain, movable plates disposed within said holder, and a spring between said plates for forcing them outward in opposite directions, substantially as described.

6. The combination of a casing open at one side and one end, a holder pivoted to said casing, said holder being open at its top and bottom and provided with inwardly-projecting lugs, movable plates disposed within said box, and a conical spiral spring disposed between said plates for forcing them outward in opposite directions, said spring being adapted to fold within itself, substantially as described.

7. A box for postage-stamps, comprising a holder having an open top provided with inwardly-projecting lugs, a spring within said holder, and a plate disposed within said holder and adapted to clamp the stamps against said lugs, said plate having a concave outer face whereby it is adapted to guide the stamps in upward direction in their removal from the box, substantially as described.

8. A skeleton box or holder for postage-stamps provided with inclined aprons which extend inward from opposite edges of the box for guiding the stamps in their removal, in combination with a plate or follower within said box, a spring for actuating said plate, and lugs or stops against which the stamps are clamped by said plate, substantially as described.



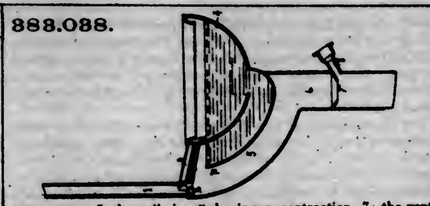
9. A box for postage-stamps, comprising a holder having an open top provided with inwardly-projecting lugs and with inclined aprons which extend inward from opposite edges of the box for guiding the stamps in their removal, a spring within said holder and a plate disposed within said holder and adapted to clamp the stamps against said lugs, said plate having a concave outer face whereby it is adapted to guide the stamps in upward direction onto the said inclined aprons, substantially as described.

10. A box for postage-stamps, comprising a holder having an open top and bottom provided with inwardly-projecting lugs, two movable plates within said holder provided with concave outer faces, and a spring interposed between said plates for forcing them outward to clamp the stamps against said lugs, substantially as described.

11. A skeleton box or holder for postage-stamps, provided with inclined aprons which extend inward from opposite edges of the box on both the upper and lower faces thereof, in combination with two plates or followers within said box, a spring interposed between said plates, and lugs or stops against which the stamps are clamped by said plates, substantially as described.

12. A skeleton box or holder for postage-stamps, provided with inclined aprons which extend inward from opposite edges of the box on both the upper and lower faces thereof, in combination with two plates or followers within said box provided with concave outer faces, a spring interposed between said plates, and lugs or stops against which the stamps are clamped by said plates, substantially as described.

383,037. DEVICE FOR HOLDING AND MOISTENING POSTAGE-STAMPS. JOHN H. BARNES, Minneapolis, Minn. Filed Nov. 14, 1887. Serial No. 255,093. (No model.)



Claim.—1. In a postage-stamp holder, the combination of a stamp-compartment having an open top provided with inwardly-projecting lugs, a movable clamping-plate within said compartment, a spring for actuating said clamping-plate, a water-compartment, a moistening-roller therein, and a guide-apron between said stamp-compartment and roller, said guide-apron having an inwardly-projecting lip which extends below said clamping-plate, substantially as described.

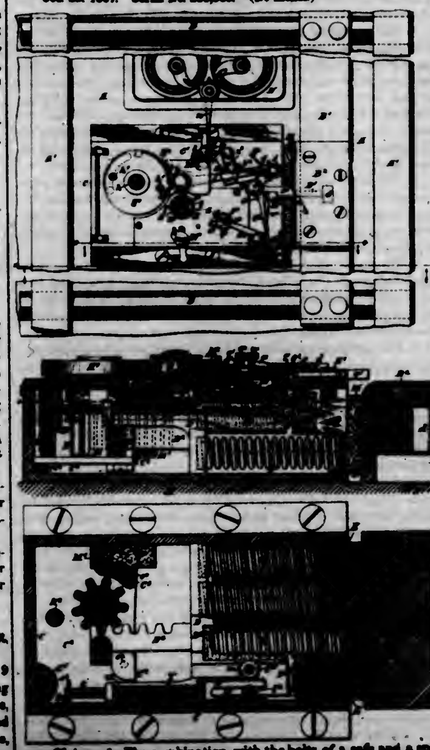
2. In a postage-stamp holder, the combination of a ledge for a letter to be stamped, a stamp-compartment, and an intermediate moistening-roller, substantially as set forth.

3. In a postage-stamp holder, the combination of a stamp-compartment, a water-compartment adjacent thereto, a moistening-roller within the water-compartment, a guide-apron between said compartments, and a ledge for the letter, substantially as set forth.

4. In a postage-stamp holder, the combination of a stamp-compartment, a water-compartment adjacent thereto, a moistening-roller within said water-compartment, and a letter-ledge having a shoulder at its upper end, substantially as set forth.

383,038. SIPHON WATER-CLOSET. DAVID D. BUSH, Detroit, Mich. Filed May 27, 1887. Serial No. 239,544. (No model.)

Claim.—1. The combination of the bowl 4, having partitions 9 and 10, the passage 5, leading from said bowl, the soil-pipe 6, having therein the contraction 7, provided with an inclined upper surface, and a water-supply pipe communicating with the top of the bowl and with the top of the passage 5 above the contraction in the soil-pipe, substantially as described.



2. The combination of the bowl 4, having partitions 9 and 10, the side passage, 5, the soil-pipe 6, having a contraction, 7, the ventilating-pipe 8, leading from the soil-pipe below the contraction 7, and means for supplying water to the bowl and to the top of the side passage, 5, above the contraction in the soil-pipe, substantially as described.

383,039. MOLDING VISCOUS METALS. WALTER BURNHAM, Hyde Park, Ill. Filed Oct. 3, 1887. Serial No. 251,294. (No model.)

Claim.—1. In the art of metal-working, the process of viscous molding, which consists in heating the metallic object under treatment up to a temperature short of the melting-point, but at which the metal of which such object is composed acquires a viscous condition, as described, and in then immediately confining such object in a mold, and subjecting it to a continuously-exerted strong pressure while it is cooling down from the temperature of viscosity to a temperature at which it may be safely relieved from pressure preparatory to its removal from the mold.

2. The process of welding by viscous molding herein described, which consists in heating up to a viscous state the several metallic objects which are to be welded together, and in then immediately confining such objects in a mold, and subjecting them to continuously-exerted strong pressure while they are cooling down from the temperature of viscosity to a temperature at which they may be safely relieved from pressure preparatory to removal from the mold.

383,040. SAFE-LOCK. AUGUSTUS G. BURTON, Chicago, Ill. Filed Oct. 25, 1887. Serial No. 253,203. (No model.)

Claim.—1. The combination, with the bolts of a safe and a spring or weight for casting the bolts, of a detent for holding the casing

spring or weight from moving the bolts, a spring or weight motor for moving said detent, and means for winding, compressing, or lifting the bolt-actuating spring or weight and the actuating spring or weight of the motor, such winding, compressing, or lifting device being common for both the bolt-actuating and motor spring or weight, substantially as described.

2. The combination, with the bolts of a safe and springs applied to actuate the bolts, of a detent for holding the casting-springs from moving the bolts, a motor arranged to act upon and release said detent at a desired time after the bolt-actuating springs have been compressed, said motor comprising a spring, a train of gears, and a speed-regulator, and means for compressing or winding the bolt-actuating springs, constructed to also compress or wind the actuating-spring of the detent-controlling motor, substantially as described.

3. The combination, with the bolts of a safe, of casting and retracting springs, a detent holding the casting-springs from moving the bolts, a motor embracing an actuating-spring adapted to engage and move the said detent at a predetermined time after the compression of the bolt-actuating springs, and a sliding part, as plate D, the movement of which compresses the casting and retracting springs, said sliding part being adapted to also engage and compress the actuating-spring of the motor, substantially as described.

4. The combination, with the bolts of a safe and casting-springs, of a rack-bar, a sliding plate attached to the rack-bar and acting upon said springs, a pinion intermeshing with the rack-bar, a detent holding the casting-springs from moving the bolts, a motor arranged to actuate the said detent at a predetermined time, and a spring for actuating the motor, said spring engaging the sliding plate, whereby the motor-actuating spring is compressed with the casting-springs, substantially as described.

5. The combination, with the bolts of a safe, of a bolt-actuating device comprising a metal shell or case, a sliding plate mounted in the case and acting against the bolts, actuating-springs for casting the bolts, located therein and acting against said sliding plate, a detent engaging said sliding plate, a spring-motor mounted upon the case and operating to move the said detent, and means for compressing the said bolt-actuating springs, constructed to also compress or wind the actuating-springs of the spring-motor, substantially as described.

6. The combination, with the bolts of a safe, of a bolt-actuating device comprising a metal shell or case, a sliding plate mounted in the case and acting against the bolts, actuating-springs for casting the bolts, located therein and acting against said sliding plate, a detent engaging said sliding plate, a motor comprising an actuating-spring, a train of gears, and a speed-regulator mounted upon the case and operating to move the said detent, and means for compressing the said bolt-actuating springs, constructed to also compress or wind the actuating-spring of the spring-motor, substantially as described.

7. The combination, with an actuating-spring and train of gears, of a regulator comprising a rotating driving-spindle, an annular friction-surface surrounding the driving-spindle, weights for frictional contact with the friction-surface, and flexible arms connecting the spindle and weights, substantially as described.

8. The combination, with the bolts of a safe and springs or weights applied to actuate the bolts, of a detent for holding the springs from moving the bolts, a motor arranged to act upon and release said detent, and a stop mechanism for preventing the movement of the motor, substantially as described.

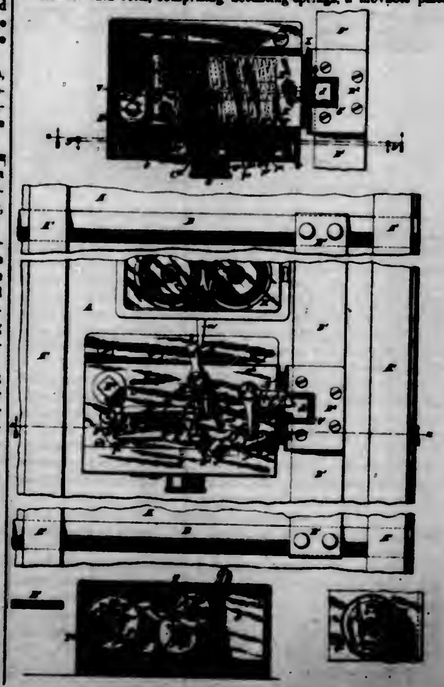
9. The combination, with the bolts of a safe, of bolt-actuating devices comprising a sliding plate acting against the bolts, and suitable springs for actuating said plate, a detent engaging the sliding plate and a motor embracing an actuating-spring and train of gears, adapted to engage and move the detent, and a rack-bar engaging the motor-actuating spring and the driving-pinion of the train of gears, the said spring being interposed between the rack-bar and the sliding plate, substantially as described.

10. The combination, with the bolts of a safe, of bolt-actuating devices comprising a sliding plate acting against the bolts, springs for moving said plate, a detent engaging the sliding plate, and a motor embracing a spring and train of gears and arranged to act upon the detent, a rack-bar engaging the motor-actuating spring and the driving-pinion of the train of gears, and having a guide-rod engaging the sliding plate, said motor-actuating spring being interposed between said sliding plate and the rack-bar, and a guide-surface upon the rack-bar engaging a stationary support, whereby the rack-bar is held in mesh with the pinion, substantially as described.

11. The combination, with the bolts of a safe, of bolt-actuating devices comprising a sliding plate acting against the bolts, springs for actuating the plate, a detent engaging the sliding plate, and a motor embracing an actuating-spring and train of gears provided with a backing-ratchet, said motor being adapted to engage and move the detent, and a rack-bar engaging the motor-actuating spring and the driving-pinion of the train of gears, said spring being interposed between the rack-bar and the sliding plate, substantially as described.

12. The combination, with the bolts of a safe and springs or weights applied to actuate said bolts, of a detent for holding the bolt-actuating springs from moving the bolts, means for holding the detent, comprising an arm the movement of which effects the release of the bolts, and a rotating stop acting upon said arm, substantially as described.

13. The combination, with the bolts of a safe and springs or weights applied to actuate the bolts, of a detent for holding the bolt-actuating springs from moving the bolts, means for holding the detent, comprising an arm the movement of which effects the release of the bolts, and a rotating stop acting upon said arm to release the detent, said stop being arranged to be adjusted about its axis, and thereby to engage the detent-releasing arm at any desired point during its rotation, substantially as described.



14. The combination, with the bolts of a safe and springs for actuating the bolts, of a detent holding the bolts from movement under the action of the springs, a motor for releasing the detent, and a revolving projection or stop actuated by the motor and acting upon the detent, said revolving projection or stop being constructed to engage and move the detent without passing the same, whereby it may be turned backwardly to its original position without interfering with the said detent, substantially as described.

15. The combination, with the bolts of a safe and springs for actuating the bolts, of a detent holding the bolts from movement under the action of the springs, a motor for releasing the detent, and a revolving stop actuated by the motor and acting upon the detent, said stop being connected with a part moved by or with the retracting springs or bolts in the rearward motion of the latter, whereby the stop or projection is restored to its original position when the bolts are retracted, substantially as described.

16. The combination, with the bolts of a safe and springs for actuating the bolts, of a detent holding the bolts from movement under the action of the springs, and a motor embracing a train of gears and a prime mover for releasing the detent, said motor embracing also a shaft driven by the prime mover and connected with the train of gears by a backing-ratchet and engaging a part which is moved when the bolts are retracted, whereby the said shaft may be turned backward independently of the train of gears when the bolts are retracted, substantially as described.

388,041. SAFE-LOCK. ANDREW G. BURTON, Chicago, Ill. Filed Oct. 25, 1887. Serial No. 253,208. (Model.)

Claim.—1. The combination, with the bolts of a safe, of actuating devices for said bolts, comprising actuating-springs, a movable plate

388,041.

against which said springs act, and a spring-compressing lever or key engaging a bearing upon the door and embracing an arm or wing acting at its end against said movable plate, substantially as described.

2. The combination, with the bolts of a safe, of an actuating device for said bolts, comprising a movable plate, as D, against which the springs act, springs located between said plate and a stationary surface of or upon the door, a second set of springs interposed between said movable plate and a part attached to the bolts, and a spring-compressing lever or key engaging a bearing upon the door and embracing a rigid arm or wing constructed to act at its free end against the said movable plate, substantially as described.

3. The combination, with the bolts of a safe, of an actuating device for the bolts, comprising an exterior casing or shell, a movable plate, as D, sliding in the said shell, springs located between the said movable plate and an opposing stationary surface of or upon the door, a second set of springs interposed between the said movable plate and a part attached to the bolts, and a spring-compressing lever or key adapted to engage a bearing upon the case and embracing a rigid arm or wing constructed to act at its free end against the said plate, substantially as described.

4. The combination, with the bolts of a safe, of an actuating device for the bolts, comprising a casing or shell, C, a sliding plate, D, mounted in the shell and connected with the bolts, springs located between the said sliding plate and a stationary surface or part of the shell, a second set of springs interposed between the said sliding plate and a part attached to the bolts, and a spring-compressing lever or key adapted to engage a bearing upon the shell adjacent to the rear end of the latter, and provided with a rigid arm or wing, and an anti-friction roller mounted in the end of said arm or wing and constructed to bear against the said sliding plate, substantially as described.

5. The combination, with the bolts of a safe, of springs for casting the bolts, springs for retracting the bolts, a sliding plate engaging both sets of springs, a detent upon the case engaging the said sliding plate for holding both sets of springs compressed, and means for actuating the detent to release the retracting-springs, substantially as described.

6. The combination, with the bolts of a safe, of actuating devices for the bolts, comprising a shell or casing, a sliding plate therein, springs for retracting the bolts bearing upon said plate and an opposing wall of the shell or casing, springs for casting the bolts bearing against said sliding plate and acting against the bolts, a detent upon the case engaging said sliding plate for holding both sets of springs compressed, and means for actuating the detent to release the retracting-springs, substantially as described.

7. The combination, with the bolts of a safe, of an actuating device for the bolts, comprising casting and retracting springs, a sliding plate against which said casting and retracting springs act, a spring-compressing lever or key engaging bearings upon the safe-door and embracing an arm or wing acting against said sliding plate, a detent engaging the said sliding plate and holding the springs compressed, and means for actuating said detent to release the retracting-springs for opening the door, substantially as described.

8. The combination, with the bolts of a safe, of an actuating device for the said bolts, comprising a sliding plate, as D, retracting-springs interposed between said plate and a stationary part or surface of the door, casting-springs bearing against said sliding plate D, a sliding plate, E, interposed between said casting-springs and a part of or connected with the bolts, a detent engaging the said sliding plate E for holding the springs compressed, another detent engaging the sliding plate D for holding the casting-springs from moving the bolts at the time the several springs are compressed, and means for actuating said detents for releasing the casting and retracting springs, substantially as described.

9. The combination, with the bolts of a safe, of an actuating device for the said bolts, comprising a sliding plate, as D, retracting-springs interposed between said plate and a stationary part or surface of the door, casting-springs bearing against said sliding plate D, a sliding plate, E, interposed between said casting-springs and a part of or connected with the bolts, a spring-compressing lever or key having bearings upon the door and embracing a rigid arm acting at its free end against said sliding plate, a detent engaging the sliding plate D for holding the springs compressed, another detent engaging the sliding plate E for holding the casting-springs from moving the bolts at the time the several springs are compressed, and means for actuating said detents for releasing the casting and retracting springs, substantially as described.

10. The combination, with the bolts of a safe-door, of a shell or casing, C, a sliding plate, D, mounted in said shell or casing, retracting-springs located between the said sliding plate and an opposing part or surface of the casing, casting-springs bearing at one end against said sliding plate D, a sliding plate, E, mounted in the casing and interposed between the said casting-springs and a part attached to and moving with the bolts, a spring-compressing lever or key having bearings in the shell or casing and embracing a rigid arm adapted to bear at its free end against the said plate, a detent mounted upon the case and engaging the said sliding plate D, another detent mounted upon the case and engaging the said sliding plate E, and means for actuating the said detents, substantially as described.

11. The combination, with the bolts of a safe and springs or weights applied to move the bolts, of a sliding part or plate actuated by the springs or weights and acting on the bolts, said sliding part or plate being provided with a projection or stud, and a pivoted detent provided with a shoulder to engage the stud, and with a part or arm located in the path of the stud, whereby the detent will be automatically engaged with the stud by contact of the latter with said part or arm, substantially as described.

12. The combination, with the bolts of a safe and springs or weights applied to move the bolts, of a sliding part or plate actuated by the springs or weights and acting upon the bolts, said sliding part or plate being provided with a projection or stud, and a pivoted detent provided with a shoulder to engage the stud, and with a part or arm located in the path of the stud, said stud being constructed to move in a line passing at one side of the pivoted axis of the detent substantially as described.

13. The combination, with the bolts of a safe and springs or weights applied to move the bolts, of a sliding part or plate actuated by the springs or weights and acting upon the bolts, said sliding part or plate being provided with a projection or stud, and a pivoted detent provided with a shoulder to engage the stud, and with a rigid arm located in the path of the stud, substantially as described.

14. The combination, with the bolts of a safe and springs or weights applied to move the bolts, of a sliding part or plate actuated by the springs or weights and acting upon the bolts, said sliding part or plate being provided with a projection or stud, and a pivoted detent-lever provided with a shoulder to engage the stud, and with an arm or prong located in the path of the stud, a second detent-lever provided with a notch or shoulder, and with an arm or surface located in the path of the detent-lever first mentioned, and a spring-detent engaging and holding from movement said second detent-lever, substantially as described.

15. The combination, with the bolts of a safe and springs applied to move the bolts, of a pivoted arm or detent-lever which holds the springs compressed and is moved in the act of compressing the same, a second detent-lever, as L, provided with a notch or shoulder, as *l*, with an arm or projection, as *l'*, located in the path of the detent-lever first mentioned, and with an arm, as L', provided with a prong forming a stop for limiting the motion of the said detent-lever first mentioned, and a spring-detent engaging said detent-lever, substantially as described.

16. The combination, with the bolts of a safe and springs or weights applied to move the bolts, of a sliding part or plate actuated by the springs or weights and acting upon the bolts, said sliding part or plate being provided with a projection or stud, a pivoted detent-lever, and a spring applied to said detent and acting to hold the arm in contact with the detent-lever and to cause the engagement of the notch or shoulder therewith, and means for actuating said detent, substantially as described.

17. The combination, with the bolts of a safe and actuating-springs for the bolts, of a plate moved by the springs and acting upon the bolts, a pivoted detent-lever, L, constructed to hold the said plate from movement, a detent, as M, provided with a notch or shoulder engaging said detent-lever, and with an arm, M', engaging the free end of said detent-lever, a spring applied to said detent and acting to hold the arm in contact with the detent-lever and to cause the engagement of the notch or shoulder therewith, and means for actuating said detent, substantially as described.

18. The combination, with the bolts of a safe and actuating-springs for the bolts, of a plate moved by the springs and acting upon the bolts, a pivoted detent or detent-lever, L, constructed to hold said plate from movement, a detent-lever, M, provided with a notch or shoulder engaging the said detent-lever L, and with an arm, M', provided with a stop or projection at its free end for limiting the movement of the detent-lever, a spring applied to actuate the detent M to cause its engagement with the detent-lever L, and means for actuating said detent M, substantially as described.

19. The combination, with the bolts of a safe and actuating-springs for the bolts, of a plate moved by the springs and provided with a stud or projection, a detent, I, constructed to engage said stud or pro-

jection and provided with an arm, I^3, a detent, J, provided with a notch or shoulder to engage said arm I^3, and with an arm, J', a spring applied to the lever J and holding the arm J' thereof in contact with the arm I^3, and means for actuating said detent J, substantially as described.

20. The combination, with the bolts of a safe and actuating-springs for the bolts, of a plate moved by the springs and provided with a stud of projection, a detent, I, provided with an arm, I^3, a detent, J, provided with a notch, j', and with an arm, J', having at its end a prong, j^3, a spring applied to actuate said detent J, and means for moving said detent J to release the casting-springs, substantially as described.

21. The combination, with the bolts of a safe, of retracting-springs, a sliding plate, D, engaged with the said springs and connected with the bolts, and a detent engaging said sliding plate, a pivoted detent lever, M, for holding said detent from movement, said lever being provided with a slot, m^2, provided with two notches, m'-m', either of which may be engaged with the detent for holding the latter from movement, substantially as described.

22. The combination, with the retracting-springs and sliding plate D, provided with a stud, D^2, of a pivoted detent-lever, K, provided with a notch or shoulder engaging the said stud, and with an arm, K', a second pivoted detent-lever, L, located in the path of the stud, provided with a short arm, L', notched to engage the end of the detent-lever K, with a projection or arm, l^2, and with a long arm, L^2, and a pivoted spring-detent, M, provided with a notch adapted to engage the longer arm, L^2, of said lever L, substantially as described.

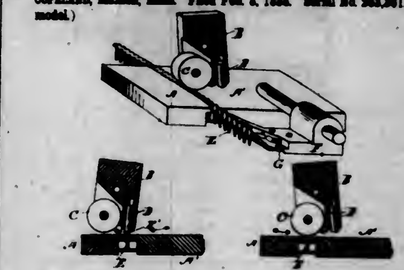
23. The combination, with the safe-bolts and retracting-springs, of a sliding plate D, provided with a stud, D^2, a detent-lever, K, provided with a notch adapted to engage the said stud, and with an arm, K', located in the path of the stud, and a detent-lever, L, engaging the said lever K, for holding the latter in engagement with the stud, said lever L being provided with a notch, l', engaging said lever K, with an arm, L', provided with a prong, l^2, and having a projecting part or arm, l^3, located in the path of the free end of the lever K, substantially as described.

24. The combination, with the bolts of a safe, casting-springs for the bolts, a shell or case, C, inclosing said casting-springs, and a detent, I, mounted upon the case for holding the casting-springs from moving the bolts, of a detent, J, engaging the said detent I, a motor embracing a train of gears located at the side of the said case C, with the axes of rotation of its rotating parts parallel with the plane of rotation of the detents I and J, a revolving stop, T, moved by said motor, and a pivoted lever, U, mounted upon the case with one of its ends in the path of the said stop, and provided with a beveled surface upon its opposite end adapted to engage the said detent J, substantially as described.

25. The combination, with the bolts of a safe and actuating devices for casting and retracting the bolts, of interlocking parts connecting the said actuating devices and the bolts, said interlocking parts being engaged with each other solely by flat engaging-surfaces perpendicular to the plane of the safe-door, whereby the same may become disengaged in case the lock is detached and thrown inwardly away from the door, substantially as described.

26. The combination, with the bolts of a safe and an actuating device embracing a stem, D', provided with a head, d, of a plate attached to the bolts and provided with a slot for engaging the stem, open at its end remote from the door, substantially as described.

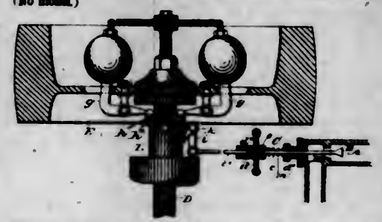
27. The combination, with the bolts of a safe, of a carrying-bar attached thereto, a plate, B^3, attached to the carrying-bar and provided with a slot, b, and with an opening, b', retracting-springs, and a plate, D, acted upon by said springs and provided with a stem, D', having a head, d, engaging said plate B^3, substantially as described.



28. The combination, with the bolts of a safe and springs for actuating the bolts, of a detent holding the bolts from movement under the action of the springs, a motor for releasing the detent, embracing a rotating shaft and a revolving projection or stop upon the shaft constructed to act upon the said detent, a spindle passing through the said shaft and attached to the revolving projection or stop, an arm upon said spindle, and a disk upon the said shaft, and means adjustably connecting the arm with the disk, whereby the angular position of the stop with relation to the shaft may be changed, substantially as described.

383,042. PRINTING-FILM. PASQUAL G. CASPLAN, Philadelphia, Pa. Filed Feb. 17, 1887. Serial No. 227,949. (No specimens.)

Claim.—1. A printing film or pellicle having a raised printing-surface, composed of gelatine, water, bichromate of ammonia, and glycerine, in about the proportions described.

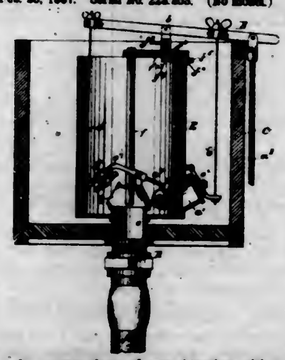


2. A printing film or pellicle having a raised printing-surface, composed of glycerine, water, bichromate of ammonia, and gelatine, and coated with a lacquer of saturated solution of Mossel salt or other solution of iron, substantially as described.

383,043. ART OF HEADING NAILS, TACKS, &c. GEORGE W. COPELAND, Malden, Mass. Filed Feb. 8, 1886. Serial No. 283,261. (No model.)

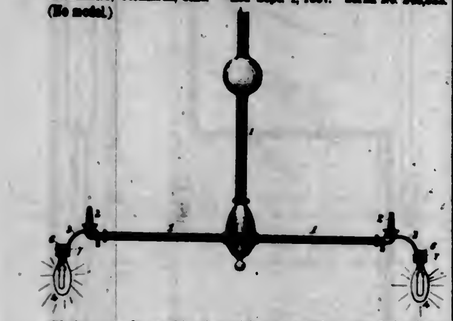
Claim.—That improvement in the art of heading nails or tacks which consists in taking a blank or strip of metal, clamping it rigidly, bending the edge or top portion at an angle, and then bending or swaging the end and parts near the end of said bent portion back upon itself, substantially as described.

383,044. FLY-WHEEL GOVERNOR FOR STEAM-ENGINES. LUCIUS D. COPELAND, Camden, N. J. Filed Nov. 19, 1887. Serial No. 255,632. (No model.)



Claim.—1. In a governor for steam-engines, the combination, with the rotary shaft D and the governor-balls and levers, of a collar, h, revolving with said balls and sliding upon said shaft, a collar, h', loose upon the shaft, a bell-crank, k, and a valve-rod attached thereto, and a spiral spring, m, attached to said rod and adapted to close the valve, substantially as described.

2. In a steam-engine governor, the combination, with the collar h, revolving with the shaft D and sliding thereon, of the governor-balls having levers g g, which bear against the face of said collar, and are connected each to the main shaft by a separate spring, substantially as described.

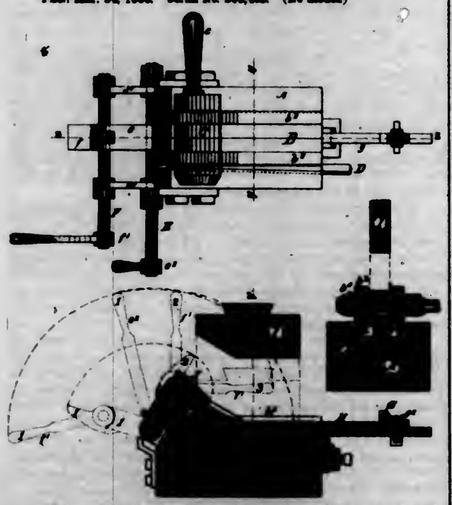


3. In a steam-engine governor, the combination, with the rotary shaft D, the governor-balls and levers, and the valve-rod, of the separate and independent collars h h', the collar h being arranged to revolve with the shaft and the collar h' being loose thereon, substantially as described.

383,045. WATER-CLOSET. JAMES CRAWFORD, Cambridge, Mass. Filed Feb. 25, 1887. Serial No. 228,853. (No model.)

Claim.—In a water-closet, the combination, with a movable seat and a lever, B, connected therewith, of a tank, a service-box having a single escape-passage, e^3, and an inlet, e', from said tank, a valve, e^2, for said inlet connected with said lever, said valve to be opened when the seat is depressed, a valve, e^4, for the said escape-passage, a lever, e^5, by which the said valve e^4 is carried, a float on the end of the said lever e^5 opposite to the said valve e^4, and a rod, e^6, connecting the valve end of the lever e^5 with the said lever B, whereby the escape-valve will be closed by the float as the service-box is filled and opened by the lever B when the seat is raised, substantially as set forth.

383,046. INCANDESCENT-LAMP ATTACHMENT. HARRY M. DOOLITTLE, Columbus, Ohio. Filed Sept. 1, 1887. Serial No. 248,822. (No model.)



Claim.—1. In combination with a supporting-arm, 3, having a perforation at one end, a sleeve in said perforation having a flange pressed against said arm, and an incandescent lamp supported on said sleeve on the opposite side of the arm from the flange, substantially as set forth.

2. The combination of an electric lamp, a perforated arm or hanger, an insulating flanged sleeve passed through the perforation and secured to the lamp, and an insulating-collar interposed between the arm or hanger and the lamp, the said arm or hanger being adapted at its other end to engage a hook or projection, whereby the lamp is supported, substantially as shown and described.

3. The combination, with an electric lamp having a screw-threaded socket, of a metallic or other arm or hanger having perforations in its ends, a flanged insulating-sleeve passing through one perforation and screwing into the socket, and an insulating-collar on the sleeve and placed between the arm or hanger and the lamp-socket, the perforation at the other end of said arm or hanger being adapted to fit over a gas-fixture below the burner, as herein set forth.

383,047. FORGING-MACHINE. DAVID H. DOWNES, Pullman, Ill. Filed Mar. 24, 1888. Serial No. 268,402. (No model.)

Claim.—1. A forging-die provided with transverse openings, in combination with a removable mandrel adapted to be inserted in the die and across the seat thereof by inserting it in said openings, substantially as and for the purposes specified.

2. The two-part die B, provided with transverse openings b^4, in combination with the mandrel C, adapted to be inserted at will in said openings, and the male or drop die I, substantially as and for the purposes specified.

3. A die, B, in combination with a removable transverse mandrel, C, and a bending cam or cams attached to the die and arranged to bend the metal over the mandrel, substantially as and for the purposes specified.

4. The die B, in combination with the removable transverse mandrel C, and the jointed swinging bending-cams e and f, substantially as and for the purposes specified.

5. The die B, in combination with the rock-shafts E F, provided with suitable hand-levers, and the bending-cams e f, secured to the respective shafts, substantially as and for the purposes specified.

383,048. SUPPORT FOR SPINNING-SPINDLES. WILLIAM F. DRAPER and GEORGE A. DRAPER, Hopedale, Mass., assignors to George Draper & Sons, same place. Filed Dec. 20, 1887. Serial No. 258,806. (No model.)

Brief.—The invention is an improvement upon that shown in Letters Patent No. 378,877, dated March 6, 1888, the bolster being tapered and adjusting devices being provided therefor, whereby the degree of looseness of the bolster can be regulated.

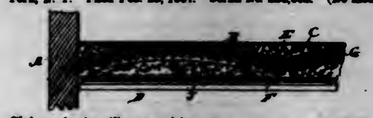
Claim.—1. A spindle-bearing containing the following instrumentalities, viz: a bolster tapered externally, a surrounding internally-tapered support for the bolster, into which the bolster is fitted loosely, and a step and means to adjust the said bolster vertically with relation to the said support to thus increase or decrease the extent of looseness between the said parts, and means to restrain the loose bolster from rotation in the said support, substantially as described.

2. A bolster-support and bolster placed therein loosely, and a step-rest, combined with an intermediate connection, substantially as described, between the said bolster and step-rest, whereby the bolster may be adjusted longitudinally within its support and with relation to the said step-rest, as and for the purposes set forth.

3. A surrounding support having a tapering interior, a bolster having a tapering exterior and a tapering interior and placed in the bolster-support loosely, a spindle supported in the said bolster, and a step-rest, combined with a connecting device, substantially as described, whereby the bolster may be adjusted longitudinally with relation to the step-rest, and with means to restrain the rotation of the bolster in its surrounding support, for the purposes set forth.

4. A surrounding support having a tapering interior, a bolster having a tapering exterior and a tapering interior and placed in the bolster-support loosely, a spindle supported in the said bolster, and a step-rest, combined with a connecting device, substantially as described, whereby the bolster may be adjusted longitudinally with relation to the step-rest, and with means for restraining the rotation of both the bolster and the step-rest in or with relation to the surrounding support.

5. In a spindle-bearing, a bolster tapered externally, a surrounding support tapered internally, and an adjustable step to sustain the weight of the spindle, combined with pins or projections to restrain the rotation of not only the step, but also the bolster within the bolster-support, as and for the purposes set forth.

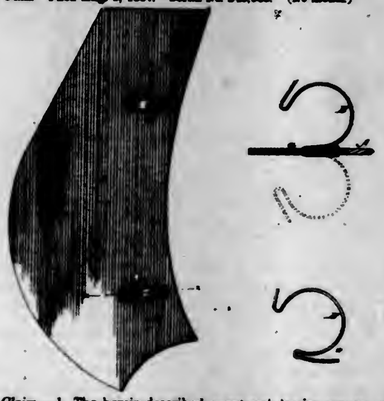


383,049. WRENCH. ALBERT F. M. GARRETT and FRED FRAIM, Daleville, Ala., assignors to said Albert F. M. Garrett. Filed June 22, 1887. Serial No. 242,194. (No model.)

Claim.—The combination, with the handle A and the detachable section F, connected thereto, of the ratchet G, located within a recess in said handle and section and provided with a shank, m, extending out from each side thereof and provided with a square opening, n, the

variable jaws H, secured to said shank, the spring-pawl I, secured to said handle, and the spring-pawl J, secured to the section F on the side opposite the pawl I and formed with hooked end *e*, all substantially as shown and described, and for the purpose specified.

383,050. FIRE-PROOF BUILDING. RAFAEL GUASTAVINO, New York, N. Y. Filed Feb. 20, 1887. Serial No. 228,262. (No model.)



Claim.—1. A ceiling, partition, or staircase composed of two or more layers or rings of brick tiles and an outside layer or ring of cement-faced tiles with raised decorations thereon, the whole set in cement or plaster-of-paris, substantially as set forth.

2. A ceiling, partition, or staircase comprising rings or layers of brick tiles, the tiles of the outer layer being cement-faced and provided with raised ornamentation, and tie-beams having their exposed surfaces covered with metal caps, substantially as set forth.

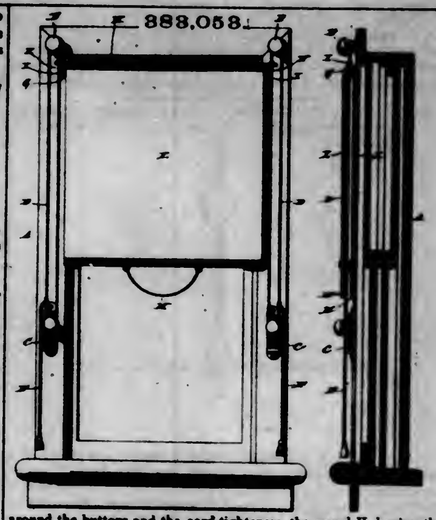
3. A tile for the vaults of fire-proof buildings, having cast upon its face cement ornamentation and provided on its edges with flanges, substantially as and for the purposes set forth.

383,051. SWEAT-PAD. CHARLES J. GUSTAVSON, Salt Lake City, Utah. Filed Aug. 2, 1887. Serial No. 246,063. (No model.)

Claim.—1. The herein-described sweat-pad, having one or more openings or slots extending through the pad, combined with a hook having both ends made alike, and adapted to have either end seated in the slot to constitute a reversible pad, substantially as shown and described.

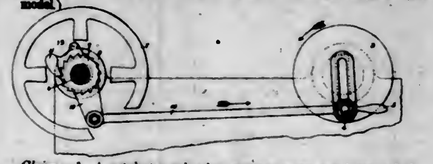
2. A sweat-pad having a re-enforced or eyeleted slot extending through the pad, combined with a flat spring-hook having an end bent as described, and adapted to have said end seated in said slot to constitute a reversible pad, substantially as shown and described.

383,052. DETACHABLE BUTTON OR STUD. HERMANN F. HARMSEN, Hamburg, Germany, assignor to Aug. F. Richter, same place. Filed Jan. 19, 1888. Serial No. 261,264. (No model.)



Claim.—The combination, in a detachable button or stud, of wings *f*, pivoted to a shank, *e*, with a plate, *d*, having arms *e*, connected with the said wings, substantially as specified.

383,053. WINDOW-SHADE. ANNA HOUTZ, Jeffersonville, Ill. Filed Jan. 16, 1888. Serial No. 261,162. (No model.)

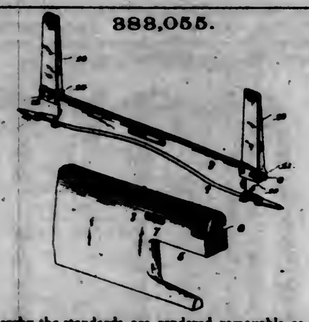


Claim.—1. The combination, with the window-frame, of the buttons B B, the cord-tightenors below said buttons, the endless cords passing around the buttons and the cord-tightenors, the guard H, secured to said endless cords and having depending perforated ears, the roller journaled in said ears, and the curtain passing loosely over said roller and depending from the same in front and rear thereof, but not connected thereto, as set forth.

2. The combination, with the window-frame, of the buttons B B, the cord-tightenors C C, below the buttons, the endless cords passing

around the buttons and the cord-tightenors, the guard H, having the endless cords passed through its ends and secured thereto, the said guard being further provided with the depending perforated ears I, the roller G, journaled in the said ears, the curtain passing over said roller, but not connected thereto, and the cords M, attached to ends of the curtain, as specified.

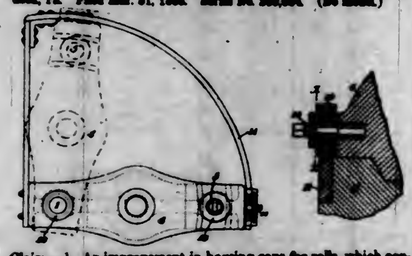
383,054. RATCHET MOVEMENT. WINFIELD S. HUSON, Taunton, Mass., assignor to the Campbell Printing Press and Manufacturing Company, New York, N. Y. Filed Dec. 14, 1887. Serial No. 257,674. (No model.)



Claim.—1. A ratchet mechanism or movement consisting of the following-named elements: a power-transmitting shaft provided with ratchet-teeth, in combination with a boss concentric with said shaft, and a power-lever provided with an elongated eye spanning said shaft, a fulcrum-pin bearing on the circumference of said boss, and a rigid pawl, whereby, upon the application of a reciprocating force to the freed end of said lever, its pawl will positively engage and disengage said ratchet-teeth and rotate accordingly the power-shaft, substantially as and for the purposes set forth.

2. An automatic ratchet mechanism or movement consisting of the following-named elements: a power-transmitting shaft provided with ratchet-teeth, a boss concentric with said shaft, and a lever provided with an elongated eye spanning said shaft, a fulcrum-pin bearing on the circumference of said boss, and a rigid pawl, in combination with reciprocating mechanism connected to the free end of said lever, substantially as described, whereby the ratchet mechanism is automatically operated, substantially as and for the purposes set forth.

3. An automatic ratchet mechanism or movement consisting of the following-named elements: a power-transmitting shaft provided with ratchet-teeth, a boss concentric with said shaft, and a pawl-lever provided with an elongated eye spanning said shaft, a fulcrum-pin bearing on the circumference of said boss, and a rigid pawl, in combination with a rotary shaft, as 2, carrying a slotted plate, as 3, an adjustable stud, as 4, and a connecting-rod articulated at one end to said stud and at the other to said pawl-lever, whereby the ratchet-shaft is intermittently and positively rotated and its degree of rotation adjustably varied, substantially as and for the purposes set forth.



383,055. WAGON-STANDARD. JOHN B. HUTCHINSON, Penn's Grove, N. J. Filed Dec. 15, 1887. Serial No. 257,993. (No model.)

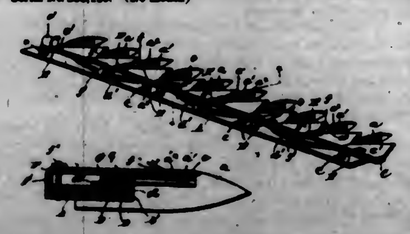
Claim.—The combination of a bolster having its ends extended and formed with open slots in its outer ends and with longitudinal slots parallel or in a line with the open slots, with standards provided with downwardly-projecting flanges or lips at the sides of their lower ends, formed with perforations which register with the slots, bolts,

and nuts, whereby the standards are rendered removable as well as laterally adjustable, as and for the purpose shown and described.

383,056. HOUSING-CAP FOR ROLLS. WILLIAM P. JOHNS, Braddock, Pa. Filed Mar. 31, 1888. Serial No. 269,604. (No model.)

Claim.—1. An improvement in housing-caps for rolls, which consists in a housing-cap pivoted at the end and adapted to swing thereon to uncover the housings and permit the removal of the rolls, substantially as and for the purposes described.

2. An improvement in housing-caps for rolls, which consists in a housing-cap pivoted at the end, in combination with a trunk whereby the other end of the housing-cap is supported in its swinging motion on said pivot, substantially as and for the purposes described.



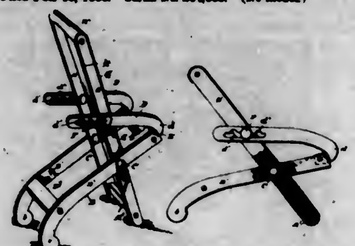
3. An improvement in housing-caps for rolls, which consists in a housing-cap pivoted at the end, in combination with a trunk whereby the other end of the housing-cap is supported in its swinging motion on said pivot, and a roller on the housing-cap which bears on said trunk, substantially as and for the purposes described.

4. An improvement in housing-caps for rolls, which consists in a housing-cap pivoted at the end and adapted to swing thereon to uncover the housings and permit the removal of the rolls, and a roller on which the housing-cap travels in its swinging motion, the axis of said roller being movable vertically to remove the weight of the cap from the roller and cause it to bear on the housing, substantially as and for the purposes described.

5. An improvement in housing-caps for rolls, which consists in a housing-cap pivoted at the end and adapted to swing thereon to uncover the housings and permit the removal of the rolls, and a curved groove in the housing in which a projection on the free end of the cap fits and moves, substantially as and for the purposes described.

6. An improvement in housing-caps for rolls, which consists in a housing-cap pivoted at the end and adapted to swing thereon to uncover the housing, said cap being connected with the housing at the pivoted end by a boss on one fitting in a concavity on the other, substantially as and for the purposes described.

383,057. CUTTER-BAR. WILLIAM P. KENNEDY, Winfield, Iowa, assignor of one-half to H. L. Olsen, same place. Filed Dec. 16, 1887. Serial No. 258,119. (No model.)



Claim.—1. The combination, with the cutter-bar, the finger-bar, and the guard-fingers *c'*, having short guards and recesses c^1 in the rear ends of said guards, of the holding-plates having their points engaging said recesses and having their rear ends bent down and bolted to the finger-bar, and the set-screws engaging tapped recesses in the lower surfaces of the holding-plates and bearing on the upper surfaces of the cutter-bar, as set forth.

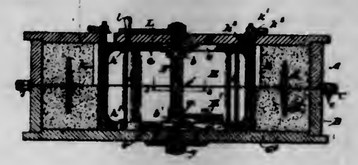
2. The combination, with the cutter-bar, the pins depending therefrom and having anti-friction rollers on their ends, and the finger-bar having the obtuse-angled cam-slots to receive said pins, of the plates F, secured to the finger-bar and extending over the cutter-bar and across the meeting angle of the cam-slots, and the set-screws engaging the under side of said plates and bearing on the upper side of the cutter-bar, substantially as described.

3. The combination of the finger-bar having the obtuse-angled cam-slots and the cutter-bar having the pins depending therefrom and engaging said slots, and the widened portions *d'* in rear of said pins, as set forth.

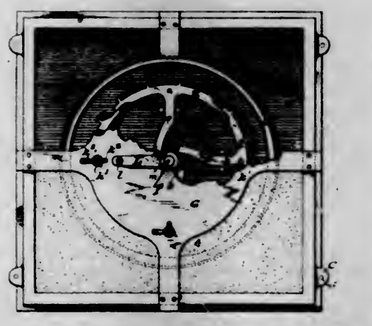
383,058. RECLINING-CHAIR. HIRAM G. KERR, Freeport, Mich., assignor of two-thirds to James D. Coal and Charles A. Curtis, same place. Filed Feb. 14, 1888. Serial No. 264,068. (No model.)

Claim.—1. The herein shown and described reclining-chair, composed of the sections A and B, each section consisting of side pieces and said cross-bars, having their side pieces pivoted together between their ends, the arms having their lower ends overlapping the ends of the section B and connected therewith by the hinges E, and having their upper ends slotted and provided with a series of notches, d^3, the lateral pins F, and the fabric G, having its ends attached to the upper cross-bars of the sections A and B and free between said ends, substantially as described.

2. The herein shown and described reclining-chair, composed of the section A, consisting of straight side pieces and upper and lower cross-bars A^2 and A^3, respectively, the section B, made up of side pieces having their lower ends curved to form feet *b* and upper and lower cross-bars B^2 and B^3, the two sections A and B being pivotally connected together, the arms D, having their lower ends curved to overlap the ends of the side pieces of the section B, and having slots *d'* and a series of notches, d^3, in their upper ends, the hinges E, the lateral pins F, and the fabric G, attached at its ends to the cross-bars A^2 and B^2 of the sections A and B, respectively, substantially as and for the purpose described.



383,059. STOP-WATCH. EDWARD KIRK, Brooklyn, assignor to the Manhattan Watch Company, New York, N. Y. Filed Aug. 4, 1887. Serial No. 246,114. (No model.)



Claim.—1. In a watch, the combination, with the stop-lever carried by a movement and adapted to bear upon a wheel or arbor in said movement, of the wheel *b*, adapted to engage said lever to operate same by turning said wheel, substantially as described.

2. The lever *f*, carried by the movement B and adapted to engage a wheel or arbor in said movement, in combination with the wheel *b*, pivoted in the case A of the watch and adapted to engage said lever to operate same, substantially as herein shown and described.

383,060. **MOLD FOR CASTING METAL.** SYLVANUS D. LOCKE, Hoosick Falls, N. Y., assignor of one-half to the McCormick Harvesting Machine Company, Chicago, Ill. Filed July 23, 1886. Serial No. 208,672. (No model.)

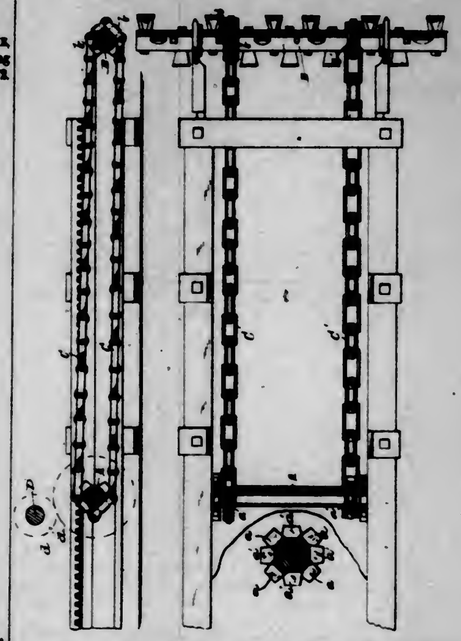
Claim.—1. The combination, substantially as hereinbefore set forth, in a flask, of core-barrel sections having a common controlling device, whereby they are simultaneously governed in their expansion and collapsing, a lock whereby they are held in position at the extremity of their expansion, and whereby they may be released and left to yield before the pressure of the contracting casting, and a spring applied to said controlling device to afford elastic resistance to such yielding.

2. The combination, substantially as hereinbefore set forth, in a flask, of core-barrel sections in each division of the flask, and an interlocking connection, whereby said sections may be simultaneously expanded and collapsed throughout the entire flask.

3. The combination, substantially as hereinbefore set forth, in a flask, of core-barrel sections in each division of the flask, a common controlling device, whereby they are simultaneously expanded and collapsed, and a spring applied to said device to afford an elastic resistance to the collapse.

4. The combination, substantially as hereinbefore set forth, in a flask, of core-barrel sections in the cope and drag, and a sectional operating-spindle dividing upon the parting-line.

5. The combination, substantially as hereinbefore set forth, in a flask, of core-barrel sections in cope and drag, an interlocking connection for simultaneously expanding and collapsing said sections, and a spring applied to said connection, whereby elastic resistance is afforded to such collapse.



6. The combination, substantially as hereinbefore set forth, in a flask, of core-barrel sections in cope and drag, and an interlocking connection for simultaneously expanding and collapsing said sections, a spring applied to said connection, whereby an elastic resistance is afforded to such collapse, and means whereby the stress of said spring may be adjusted.

7. The combination, substantially as hereinbefore set forth, in a flask, of the overlapping core-barrel sections in each division of the flask, the central sectional spindle connected with said sections in said divisions, the crank on said spindle, and a locking device therefor.

8. The combination, substantially as hereinbefore set forth, in a flask, of the core-barrel sections in each division thereof, the sectional interlocking spindle, its hubs and arms connected with said barrel-sections, the crank on said spindle, and the locking-pin.

9. The combination, substantially as hereinbefore set forth, with the core-barrel sections in the cope, of the pins projecting through the slotted top plate of said cope, and the clamping-nuts.

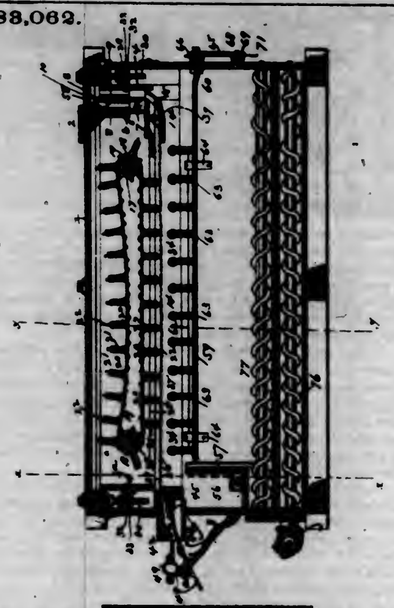
383,061. **MINING-MACHINE.** FRANK LOWRY, Columbus, Ohio, assignor to the Lechner Manufacturing Company, same place. Filed May 27, 1887. Serial No. 239,542. (No model.)

Claim.—1. In a machine for cutting coal or rock, the combination, with the power devices and the cutter-bar, of a chain interposed between the said power devices and the cutter-bar, and the teeth *b b'*, arranged, substantially as set forth, in different axial planes, as described.

2. In a mining-machine, the combination, with the power devices and the cutter-bar, of the chains interposed between the power devices and the cutter-bar, and arranged, substantially as set forth, with the links of one chain out of line transversely with the links of the other chain, as described.

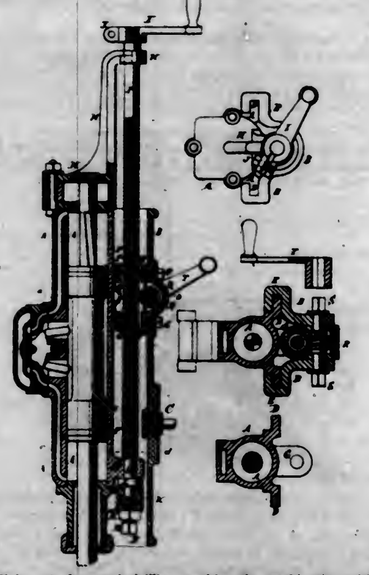
3. The combination, with the power devices and the chains adapted to transmit power, of the chain-driving shaft having two sets of teeth, the teeth of one set being out of the lines of the teeth of the other set, and a shaft driven by the said chain, having two sets of teeth correspondingly out of line, substantially as described.

383,062. **FLOUR-BOLT.** WILLIAM M. LUCAS, Christianville, Ohio. Filed Aug. 18, 1887. Serial No. 247,312. (No model.)



Claim.—1. The combination of the outer casing, a reciprocating sieve, a cleaning-frame below the sieve, the upper portion of which is between the side bars of the sieve and is guided in its vertical movements thereby, a bent shaft below the frame, and the leather straps secured to the frame and to the sides of the casing.

2. The combination of a casing, a partition in one end of the casing, a reciprocating sieve, one end of which projects over the partition, a frame below the sieve, the upper portion of which is between the side bars of the sieve and is guided in its vertical movement thereby, and a bent shaft, one end of which is journaled in the partition and the other end in the casing.

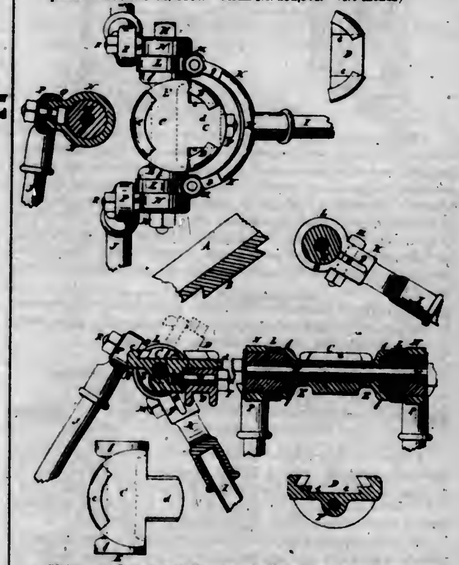


3. The combination of a reciprocating sieve, a cleaning-frame below the sieve, the upper portion of which is between the side bars of the sieve and is guided in its vertical movements thereby, a bent shaft below the frame, a slotted arm secured to one end of the casing, and an adjusting-arm secured at one end to one end of the shaft and at the other end to the slotted arm.

4. The combination of an outer casing, a frame, two arms pivotally secured at their outer ends to the frame, a grooved nut engaging with the inner ends of said arms, a screw-threaded bolt secured to the top of the casing, and a pair of bolts secured to the top of the casing, and having their lower ends bent and secured to the central portions of said arms.

383,062.

383,063. **ROCK-DRILLING MACHINE.** THOMAS J. MURPHY, New York, N. Y., assignor of one-half to Roger Potter, same place. Filed July 27, 1887. Serial No. 245,455. (No model.)

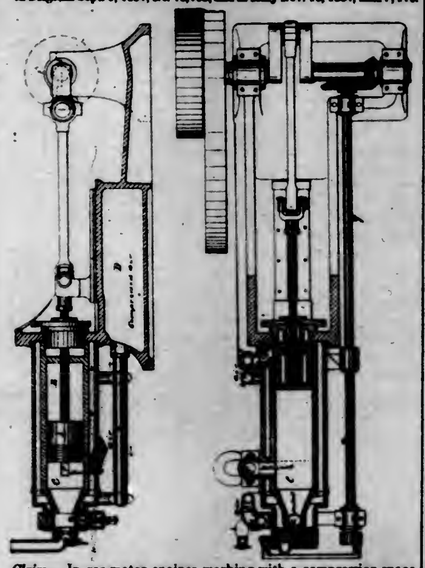


Claim.—1. In a rock-drilling machine, the combination, with the power or driving cylinder and the guide for the same, of a cylinder-adjusting screw provided with smooth-faced portions or journals at or near its opposite ends, an upwardly-extending guide-arm secured at its lower portion to a head of the driving-cylinder and provided with a bearing in its upper portion to receive one journal of the adjusting-screw, a crank upon the screw above the guide-arm, a lug projecting from the cylinder, and in which the opposite journal of the screw operates, a set-screw or the like bearing against the adjusting-screw, and a gear-wheel, worm, and crank, substantially as described.

2. In a rock-drilling machine, the combination, with the power or driving cylinder and a guide in which the cylinder operates, of a cylinder-adjusting screw provided with journals at or near its opposite ends, an upwardly-extending guide-arm secured at one end to the cylinder and provided with a bearing in its opposite end, in which one journal of the screw operates, a threaded portion upon the end of the screw beyond the outer journal, a hand-crank provided with a split head or hub adapted to fit over said threaded portion, a tightening-screw for said hub, a lug projecting from the cylinder, and in which the opposite portion of the adjusting-screw is journaled, and a set-screw or the like to bear upon the lower end of the cylinder-adjusting screw, substantially as described.

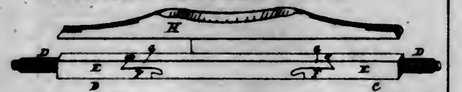
3. The combination, in a rock-drilling machine, with a driving-cylinder and a guide in which the same operates, of a cylinder-adjusting screw journaled at one end in a guide-arm carried by the cylinder, and at its opposite portion in a lug projecting from the cylinder, a collar or head secured to one end of the screw, a lug, and a set-screw passing through said lug and adapted to engage the collar, substantially as described.

4. The combination, in a rock-drilling machine, with a driving-cylinder and a guide in which the same operates, of a cylinder-adjusting screw journaled near its opposite ends in bearings carried by said cylinder, a worm-gear upon said screw and internally threaded, bearings in which said gear is journaled, a cap secured to the cylinder-guide and to which said bearings are secured, a worm journaled in the cylinder-guide and provided with projecting ends, and a crank to operate the worm, substantially as described.



383,064. **TRIPOD FOR ROCK-DRILLING MACHINES.** THOMAS J. MURPHY, New York, N. Y., assignor of one-half to Roger Potter, same place. Filed Oct. 14, 1887. Serial No. 252,378. (No model.)

Claim.—1. In a tripod for rock-drilling machines, the combination, with a dovetail or flanged portion on the drill-stock, of a stationary jaw plate or seat provided with a dovetail segmental projection or jaw, a dovetail tongue projecting from the opposite side of the jaw-plate, a movable jaw provided with a dovetail groove to receive said tongue, a horizontal hub upon the under side of the jaw-plate, a screw-bolt passing through the movable jaw and entering said hub, and supporting-legs jointed onto the hub, substantially as described.

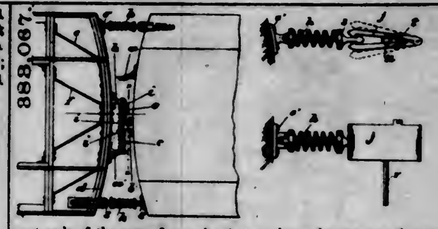


2. In a tripod for drilling-machines, the combination, with a jaw seat or plate and a horizontal hub upon the under side of the same, provided with bell-shaped ends projecting beyond the jaw-plate, of tapered or beveled plugs or hubs seated in said bell-shaped ends, a bolt extending longitudinally through the horizontal hub and plugs and locking the same in the bell-shaped ends, a forked leg provided with loop-heads embracing said plugs, bolts or screws to tighten said loop-heads, a loop-strap embracing each plug and provided with an outwardly-projecting shank, supporting-legs, a bell-shaped head upon each leg adapted to fit over the shanks upon the loop-straps, and a bolt passing through each shank and bell-shaped head, whereby the same are locked together, substantially as described.

383,065. MOTOR-ENGINE WORKED BY COMBUSTIBLE GAS. NICOLAUS A. OTTO, Cologne, Prussia, assignor to the firm thereof Felix Deutz, Deutz on the Rhine, Germany. Filed Sept. 26, 1887. Serial No. 250,734. (No model.) Patented in England Aug. 26, 1887, No. 11,668; in Belgium Sept. 3, 1887, No. 78,708, and in Italy Nov. 10, 1887, XLIV, 170.

Claim.—In gas-motor engines working with a compression-space and with a cycle of four strokes, the method of replacing the residual products of combustion remaining in the cylinder at the end of the expelling-stroke by a combustible charge by first driving out the said products by means of a charge of atmospheric air and then drawing in a variable quantity of combustible gas with or without admixture of air to mix with the said charge of air, the combined charge being partially expanded below atmospheric pressure during the suction-stroke and compressed during the return-stroke, substantially as herein described.

383,066. AXLE FOR VEHICLES. JAMES R. PRESCOTT, Waynesborough, Ga., assignor of one-half to John W. Reynolds, same place. Filed Dec. 15, 1887. Serial No. 257,966. (No model.)



Claim.—1. In a sectional metallic axle, the combination, with the intermediate section having a half-lap extension, *f'*, and a recess, *g*, at the inner end thereof, the journal-sections having the half-lap extension *f'* and a hook-jaw, *f*, to engage with the recess *g*, and a bolster secured to the said axle-sections, substantially as described.

2. In a sectional metallic axle, the combination, with the intermediate section having a half-lap extension, *f'*, a recess, *g*, at the inner end thereof, and a beveled outer end, *g'*, of a journal-section having the half-lap extension *f'*, and a hook-jaw, *f*, to engage with the recess *g*, and an overlying beveled shoulder, *f'*, to engage with the matching portions of the intermediate section, and a bolster secured to the said intermediate and journal sections, substantially as described.

3. In a sectional metallic axle, the combination, with the intermediate section and journal-sections of said axle, having interlocking half-lap extensions, of the interlocking lug or tongue K' upon the shoulders of the one, and the matching-recess K² upon the shoulders of the other, joints, to interlock with each other, a bolster, H, and straps I, substantially as described.

383,067. RAILROAD-CAR. GEORGE M. PULLMAN, Chicago, Ill. Filed Sept. 13, 1887. Serial No. 249,894. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the adjacent ends of the superstructures of two cars of a train, with a spring-coupler, substantially as set forth, whereby the tendency of each superstructure to oscillate is checked and a constant force to restore proper alignment of the car-bodies is obtained.

2. In the construction of railway-cars, springs connecting adjacent ends of the cars of a train, that are located at or near the tops thereof and secured by mechanism that will admit of coupling the parts belonging to one car with or uncoupling from the parts belonging to another car, which springs yield to flexion as a result of oscillation or swaying of the cars, whereby the resistance of said springs to such flexion operates to restrain the oscillatory or swaying motion of the cars, substantially as set forth.

3. The combination, with a train of cars, of springs connecting adjacent ends of cars, located at or near the roofs or tops thereof and secured by mechanism that will admit of coupling the parts belonging to one car with or uncoupling from the parts belonging to another car, which springs yield under tensile strain, as a result of oscillation or swaying of the cars, whereby the resistance of said springs to such tensile strain operates to restrain the oscillatory or swaying motion of said cars, substantially as set forth.

4. In the construction of railway passenger-cars, brackets *b* and *b'*, secured to the car-roof on opposite sides of a central longitudinal line from that of the opposite end of the car, brackets *a*, also secured on opposite sides of a central line at the respective ends of a car, in combination with spiral springs *c* and *c'*, which latter are respectively hinged to the brackets *b* and *b'*, and their opposite ends adapted to bear against brackets *a* and *a'*, substantially as described.

5. In the construction of railway-coaches, springs A, one of which is provided on each end of a car at or near the top thereof and on opposite sides of a central longitudinal line of said car, said springs being provided with a coupling-shank and head, *a*, in combination with clutches *j*, likewise located at each end of the car in positions to couple with said springs when the cars are brought together, substantially as set forth.

6. In the construction of railway-cars, springs A, attached to the several cars of a train at the roof or ends of said cars, that are provided with suitable shanks and coupling-heads, in combination with clutches *j* upon adjacent cars, which latter are provided with cams *a* for opening the jaws of said clutches preparatory to coupling, substantially as described.

383,068. ROAD-SCRAPER. JAMES D. S. REED, Chicago, Ill., assignor of one-half to William G. P. Reed, same place. Filed Sept. 1, 1887. Serial No. 248,443. (No model.)

Claim.—1. The combination, with a wheeled frame, of a scraper provided with a lifting-bail and a handle, and a lever pivoted to the vehicle frame or axle, from the front and short arm of which the scraper is suspended by its bail, and the long arm of which is engagable with the scraper-handle, substantially as described.

2. The combination, with a wheeled frame, a scraper, and a lifting-lever for lifting and suspending said scraper clear of the ground, of a draft-bail pivoted to the frame at its forward end and having a vertical movement at its rear end for engaging and disengaging the front end of the scraper, said a lever, as F, pivoted to the frame of the vehicle and having its shorter arm connected to the draft-bail for lifting the same into engagement with the scraper and raising the front end thereof, and its longer arm adapted to engage and be held in position by a projecting portion of the scraper, substantially as described.

3. The combination of a wheeled axle elevated at its middle portion, a draft-tongue pivoted on said axle, and an adjustable brace-rod connecting the elevated part of the axle with the front portion of the draft-tongue, substantially as described.

4. The combination of a wheeled frame embracing an axle having two horizontal elevated portions, one in front and above the other, of a scraper-lifting lever pivoted to the lower and rear portion of said axle, and a lever pivoted to the front and more elevated portion of the axle, for lifting the front end of the scraper, substantially as described.

383,069. FASTENING FOR GLOVES. WILLIAM S. RICHARDSON, Boston, Mass. Filed Jan. 28, 1888. Serial No. 261,644. (No model.)

Claim.—1. In a fastening for gloves and other articles, the member having a dome or button top, *a*, the jaws *a'*, formed by inward extensions from the lower edge of the button or dome sections of the blank from which it is formed, the fastening-prongs *a²*, integral with the dome, and the stay-piece *a³*, interposed between the jaws and the top of the dome, substantially as described.

2. In a fastening for gloves and other articles, the member having the dome or button top *a*, the jaws *a'*, covered by the dome or button top *a*, and a stay-piece or support for the jaw-plates contained between the top of the dome and the upper surface of the jaws, substantially as described.

3. The combination, in a fastening for gloves and other articles, of the dome or button *a*, the jaws *a'*, and the stay *a³*, having a locating-flange, *c²*, and *b* staying sleeve or section, *d'*, substantially as described.

383,070. GLOVE-FASTENING. WILLIAM S. RICHARDSON, Boston, Mass. Filed Jan. 28, 1888. Serial No. 261,645. (No model.)

Claim.—1. In a fastening for gloves and other articles, a dome or button top, *b*, the jaws *b²*, and stay-piece *c*, having the prongs or fastening-extensions *c'*, as and for the purposes described.

2. The combination of the dome or button top *b*, the jaws *b²*, having the holes or recesses *c²*, with the stay-piece *c*, having the prongs or fastening-extensions *c'*, which extend through said holes or recesses, as and for the purposes described.

3. The combination of the dome or button top *b*, jaws *b²*, stay-piece *c*, having the flange *c²*, the upwardly-extending staying-section *c³*, and the prongs *c'*, substantially as described.

4. The combination of the dome or top *b*, the jaws *b²*, the stay *c*, and the under washer, *d*, connected with the stay-piece to secure the fastening in place, substantially as described.

383,071. FASTENING FOR GLOVES. WILLIAM S. RICHARDSON, Boston, Mass. Filed Jan. 28, 1888. Serial No. 261,646. (No model.)

Claim.—1. A fastening having the dome or button-top A, the independent jaw-plate C, having the flange *c'*, the opening *c²*, and slit *c³*, united to the dome or button-top by lapping its edge or sections thereof upon the under surface of the jaw-plate, and a fastening device having prongs or extensions *b²*, which pass through holes in the jaw-plate C, as and for the purposes described.

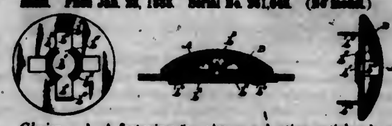
2. The fastening for gloves and other articles, having the dome or button-top A, the independent jaw-plate C, having the flange *c'* and jaw-opening *c²*, and the stay-piece B, having a staying-extension, *b³*, substantially as described.

3. The combination, in a fastening for gloves and other articles, of the dome or button-top A, independent jaw-plate C, having the flange *c'* and jaw-opening *c²*, united by its edge to the dome or button-top, the stay B, and prongs or extensions for securing the fastening in place, substantially as described.

4. The combination, in a fastening, of the dome or button-top A, the independent jaw-plate C, having the jaw-opening *c²*, the stay-piece B, the under washer, and fastening-connections extending from the outer section of the fastening through the material to the under washer, as and for the purposes described.

5. In a fastening for gloves and other articles, the independent dome or button-top A and the jaw-plate having a continuous flange, *c'*, united by its edge to the dome or button-top, and the jaw-opening *c²*, provided with radial slits, substantially as described.

6. In a fastening for gloves and other articles, the combination of the independent dome or button-top, the jaw-plate having a continuous outer edge and inner yielding jaws about a circular or other shaped hole, and united by its edge to the said dome or button-top, the interior stay-piece, B, and its fastening arms or extensions, substantially as described.



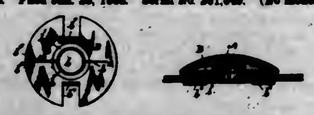
383,072. FASTENING FOR GLOVES. WILLIAM S. RICHARDSON, Boston, Mass. Filed Jan. 28, 1888. Serial No. 261,647. (No model.)

Claim.—1. A fastening for gloves and other articles, consisting of the dome or button-top A, the jaws *b'*, having the holes or recesses *b²* the stay-piece C, having the prong-turning depressions *c²*, and the washer D, having the prongs or fastening-extensions *d*, substantially as described.

2. In a fastening for gloves and other articles, the combination of the dome or button-top A, the jaw-plate having the opening *b²*, jaws *b'*, and the openings or recesses *b²*, with a stay-plate, C, having the prong-turning depressions *c²*, and the washer D, having the prongs *d*, substantially as described.

383,073. GLOVE-FASTENING. WILLIAM S. RICHARDSON, Boston, Mass. Filed Jan. 28, 1888. Serial No. 261,648. (No model.)

Claim.—1. A fastening for gloves and other articles, having a dome or button-top and a jaw-plate provided with integral stays for supporting the jaw-plate in relation to the top of the dome or button-top, with integral fastening prongs or extensions for securing the fastening in place, substantially as described.

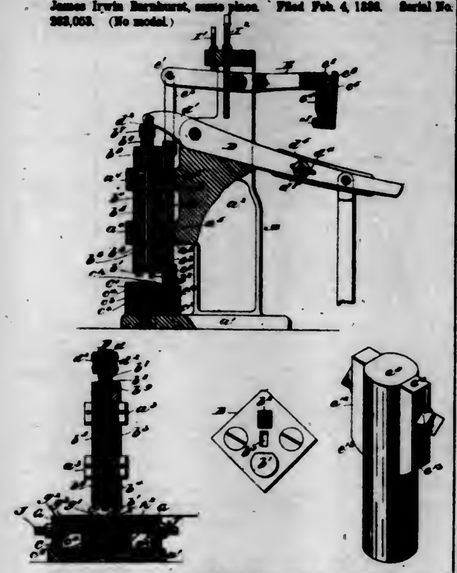


2. The combination, in a fastening, of a dome or button-top, A, and a jaw-plate, B, having the integral stays *b³* and integral prongs *b⁴*, the jaw-opening *b'*, and jaws *b²*, substantially as described.

3. In a fastening for gloves and other articles, the dome or button-top A, the jaw-plate B, having the fastening prongs or projections *b⁴*, formed by striking down sections of the jaw, the openings *b²* thereby formed being connected with the jaw-opening *b'*, and the jaws *b²*, substantially as described.

4. A fastening for gloves and other articles, having a dome or button-top and a jaw-plate secured to the dome or button-top, the jaws *b²*, and the prongs *b⁴*, struck down from the material of the jaw-plate and having their union with the jaw-plate close to the jaw-opening, substantially as described.

5. In a fastening for gloves and other articles, the dome A, the jaw-plate B and its jaw, and stay *b³*, and fastening-prongs integral with the metal of the jaw-plate, substantially as described.



383,074. GLOVE-FASTENING. WILLIAM S. RICHARDSON, Boston, Mass. Filed Jan. 28, 1888. Serial No. 261,649. (No model.)

Claim.—1. A fastening for gloves and other articles, comprising a dome or button-top, A, and a flat jaw-plate, B, having the jaw-opening *b* and slit *b²*, extending from it to the outer edge of the plate, and the fastening prongs or projections *b⁴*, the edge of the jaw-plate being connected with the edge of the dome or button-top in a manner to permit of a slight movement thereof relatively to it, substantially as described.

2. The combination, in a fastening for gloves and other articles, of the dome or button-top A, the jaw-plate B, loosely connected at its edge with a dome or button-top, as described, having the opening *b* and the slit *b²*, extending from the opening to its outer edge, and prongs or extensions *b⁴*, for securing the fastening in place, and the stay-piece C, substantially as described.

383,075. MACHINE FOR ATTACHING FORKS TO UMBRELLA-STRETCHERS. CHARLES T. REDHEFFER, Philadelphia, Pa., assignor to James Irwin Barnhurst, same place. Filed Feb. 4, 1886. Serial No. 208,053. (No model.)

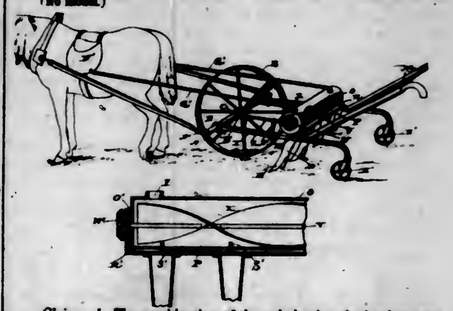
Claim.—1. In a machine of the class recited, the combination of the hammer, the plunger b^4, the die, and the transverse wings or jaws, all arranged and operating with relation to each other as shown and described, together with the mechanism for relatively operating said devices, substantially as and for the purpose set forth.

2. The combination of the die, the vertically-reciprocating hammer, the plunger b^4, the lever connected with said plunger, the transverse reciprocating jaws, the plunger c^3, with which said jaws are connected, and devices, substantially as described, for relatively operating said hammer and plungers, together with the supporting-frame, substantially as and for the purpose set forth.

3. The combination of the die, the vertically-reciprocating hammer, the plunger b^4, the lever D, connected with said plunger, the transverse reciprocating spring-controlled jaws, the plunger c^3, with which said jaws are connected, the lever E, connected with said plunger c^3, the pivoted spring-controlled projection on the end of said lever E, and the spud on the arm of lever D, substantially as and for the purpose set forth.

4. The combination of the die, the vertically-reciprocating hammer, the plunger b^4, the lever connected with said plunger, the transverse reciprocating spring-controlled jaws, the plunger c^3, the cams c^{13}, the blocks F, engaging said cams, the pivoted lever connecting said blocks and jaws, together with devices for operating said hammer and plungers, substantially as and for the purpose set forth.

5. In a machine of the class recited, the combination of the die, the vertically-reciprocating hammer provided with the stud and slotted projection on its lower end, the spring-controlled plunger working centrally in said hammer, the lever D, the plunger c^3, its lever E, the spring-elevated cam-blocks, the beveled horizontal blocks engaging therewith, the oppositely-reciprocating wings or jaws loosely connected with said blocks, together with the spud on lever D and pivoted spring projection on lever E, said spud and projection arranged with relation to each other, all substantially as and for the purpose set forth.



6. In a machine of the class recited, the combination of the stationary die, the vertically-reciprocating hammer provided with the stud and slotted projection on its lower end, the spring-controlled plunger working centrally in said hammer, the lever D, provided with the slot therein, the plunger c^3, its lever E, the spring-elevated cam-blocks, the beveled horizontal blocks engaging therewith, the reciprocating wings or jaws connected loosely with said blocks, together with the spud adjustably secured in said slot, and the pivoted spring-controlled projection on lever E, arranged with relation to the movement of said spud, all substantially as and for the purpose set forth.

7. In a machine of the class recited, the combination of the die, the vertically-reciprocating hammer provided with the stud and slotted projection on its lower end, the spring-controlled plunger working centrally in said hammer, the lever D, the plunger c^3, its lever E, the spring-elevated cam-blocks, the beveled horizontal blocks engaging therewith, the transversely-reciprocating jaws loosely connected with said blocks, the spud on lever D, and the pivoted spring projection on lever E, arranged with relation to the movement of said spud, together with the adjusting screws and nuts for limiting the throw of levers D and E, respectively, all substantially as and for the purpose set forth.

8. In a machine of the class recited, the combination of the die, the vertically-reciprocating hammer provided with the stud and slotted projection on its lower end, the spring-controlled plunger working centrally in said hammer, the lever D, the plunger c^3, its lever E, the spring-elevated cam-blocks, the beveled horizontal blocks engaging therewith, the transversely-reciprocating spring-controlled wings or jaws loosely connected with said blocks, the spud on lever D, and the pivoted spring projection on lever E, arranged with relation to the movement of said spud, together with the adjusting screws and nuts for limiting the throw of said wings, substantially as and for the purpose set forth.

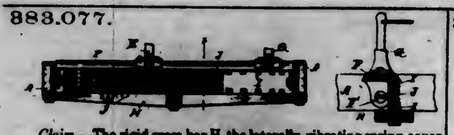
9. In a machine of the said class, the combination, with the die, of the laterally-offset plates I, secured on said die, substantially as and for the purpose specified.

383,076. CULTIVATOR, GRAIN-DRILL, AND HARROW. WILLIAM B. ROBERTS, Sullivan, Ind. Filed July 30, 1887. Serial No. 245,661. (No model.)

Claim.—1. The combination of the axle having the hooks at the ends for the attachment of the traces, the wheel B, journaled to the center of the axle, the clevises attached to the axle near its ends and adjustable thereon, and the beams connected to the said clevises, substantially as described.

2. The combination of the axle, the wheel B, journaled thereon, the beams connected to the axle, the cylinder arranged transversely on the beams and having the discharge-openings and the spouts or conveyers depending therefrom, the worm conveyer journaled in the cylinder, and the gearing connecting the said conveyer to the wheel B, substantially as described.

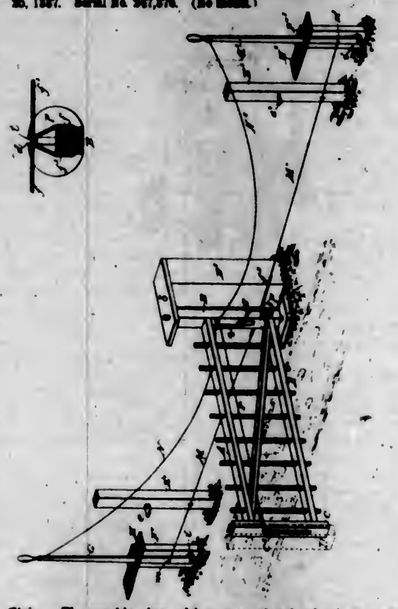
3. The combination of the axle, the wheel B, journaled thereon, the beams connected to the axle, the cylinder arranged transversely on the beam and having the discharge-openings, the worm conveyer journaled in the cylinder, the gearing connecting the said conveyer to wheel B, the sack or receptacle adapted to be supported on the back of the draft-animal, and the flexible tubes connecting the said sack or receptacle with the cylinder, substantially as described.



4. The combination of the axle, the wheel B, journaled thereon and having the miter-gear-wheel C, the beams connected to the axle, the cylinder arranged transversely on the beams, said cylinder having the discharge-openings, the worm conveyer journaled in the cylinder and having the miter-wheel W attached to one end of the shaft, the longitudinal rod Z, journaled in suitable bearings and having the miter-pinions meshing with the wheels C and W, for the purpose set forth, substantially as described.

5. The combination of the cylinder having the discharge-openings, the rotating worm conveyer arranged in the said cylinder, and the shaft F', having the feed disks or wheels S' arranged over the said openings and geared to the worm conveyer, substantially as described.

383,077. SHUTTLE-MOTION FOR LOOMS. LEWIS R. ROSS, St. Paul, Minn., assignor to the Ross Loom Company, Nashua, N. H. Filed Jan. 5, 1888. Serial No. 259,946. (No model.)



Brief.—An improvement on the devices of Letters Patent No. 233,551, dated October 19, 1880. The substitution of the compression-springs under one edge of the spring-cover for the torsional springs shown in the Letters Patent referred to removes the necessity for the central rod on which the torsional springs were placed, as well as facilitates the removal and replacement of the separate springs.

383,077.

Claim.—The rigid cross-bar H, the laterally-vibrating spring-cover F, and the arms E and G mounted thereon, in combination with the series of vertical and separately-removable springs J, and the corresponding series of studs, I, serving to hold said springs in place, substantially as set forth.

383,078. FARM-GATE. LEWIS SHEPARD, Hince, Ind. Filed Aug. 20, 1887. Serial No. 247,576. (No model.)

Claim.—The combination, with a gate, of spring-latch C, cord r, lever t, attached to upright B, slotted plate p, secured to the lower part of said upright, cords f m and f' m', levers G G', guides H H', posts F F', and cords N N', all arranged substantially as herein shown and described.

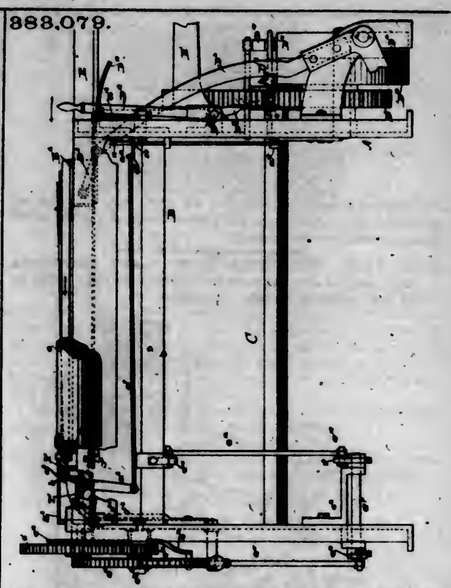
383,079. NEEDLE-LOOM. ALBERT L. SKINNER, Yonkers, N. Y., assignor to the Bigelow Carpet Company, Clinton, Mass. Filed Apr. 15, 1887. Serial No. 234,971. (No model.)

Claim.—1. The shuttle, a shipper, the feeler, intermediate connecting mechanism, substantially as described, between the feeler and shipper-lever, and the weft carrier or needle, combined with a tension device for the weft-thread, and with means, substantially as described, to temporarily increase or augment the tension on the weft-thread as the latter in the weft-carrier is pushed against the feeler, substantially as described.

2. The weft carrier or needle, the shuttle containing a thread to lock the loop of thread held by the said needle, and a shipper-lever handle, combined with a feeler, a^3, and with intermediate mechanism between it and the shipper-handle to effect the release of the shipper-handle when the weft fails, substantially as described.

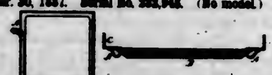
3. The shipper-handle, its notched holding-plate, the lever a^9, and rock-shaft a^{10}, having an arm, a^{12}, provided with a projection to engage the shipper-handle, the loop or slide piece a^6, supported by the lever a^9, the feeler a^3, and means to connect it with the said loop, combined with the hooked bar a^{14} and with means to operate the said hooked bar, substantially as described.

4. The slideway E, the carriage thereon, its attached needle, tension device, and spring-arm b^3, combined with a rod having an arm which is acted upon by the carriage as the latter arrives at the end of its inward movement to effect the temporary nipping of the thread, substantially as described.



5. The combination, with the slideway E, a carriage thereon, a weft carrier or needle, and a shuttle provided with a rigid arm having a nock and a delivery-point, of an arm-holder loosely engaging the rigid arm of the shuttle, to operate substantially as described.

6. The ratchet-wheel c^2 of a take-up mechanism, the pawl c^3 to move it, means to actuate the said pawl, a lever to disengage the said pawl from the said ratchet-wheel, and a rod, f^{12}, combined with the shipper-lever handle to actuate the said rod to release the lever and insure the engagement of the pawl with the ratchet-wheel whenever the shipper-handle is moved to start the loom, substantially as described.

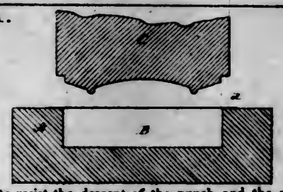


7. The combination, with a guide-bar, a carriage, a weft-carrying needle thereon, a shuttle having a thread to lock the weft-thread, and a shipper-handle and notched plate for holding it, combined with a feeler and intermediate mechanism, substantially as described, forming a weft stop-motion, the feeler being adapted to be moved by the thread held by the weft carrier or needle, substantially as described.

8. The weft-carrying needle provided with the eyes or notches at its inner end to support the weft-thread at two points, a shipper-lever, and a shuttle having an upturned point, combined with a feeler, as a^3, located opposite the point of the shuttle and in the line of movement of the weft carrier or needle, and intermediate mechanism between the said feeler and shipper-lever, whereby the weft-thread carrier or needle is made to act against the feeler preparatory to passing the weft-thread over the point of the shuttle, substantially as described.

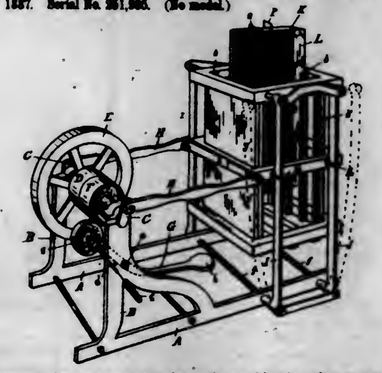
383,079.

383,080. COACH-LAMP. ORRIN W. SWIFT, New Haven, Conn. Filed Mar. 30, 1887. Serial No. 232,948. (No model.)



Claim.—In a lamp or lantern having open panels to be filled with glass, the combination of the glass B, the metal frame A, made from sheet metal without joint, and having an opening corresponding to the glass to be exposed, the said frame substantially concavo-convex shape in transverse section, the inner edge of the said frame adapted to bear upon the edge of the glass and clamp it against the frame of the lamp, and the outer edge of the frame secured to the frame of the lamp, substantially as described.

383,081. DIE FOR SHAPING SHEET METAL. ORRIN W. SWIFT, New Haven, Conn. Filed Aug. 20, 1887. Serial No. 248,106. (No model.)



Claim.—The herein-described improvement in dies for shaping sheet metal, consisting of a die having a cavity in outline corresponding to the outline of the article to be produced, but of a depth greater than such article, combined with a follower or punch, having its under face shaped corresponding to the shape of the reverse or inner side of said article, the said punch adapted to close a cavity of the die and force the sheet metal placed between it and the said cavity into said cavity and upon the air normally in the said cavity, the said air form-

383,081.

ing a cushion to resist the descent of the punch and the metal and cause the metal to conform to the irregular shape of the face of the punch, substantially as described.

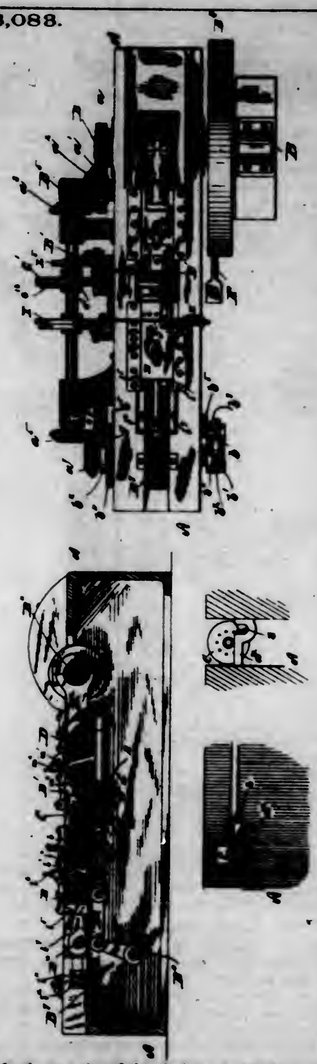
383,082. CREAM-TESTING CHURN. JAMES P. WOOD, Chelsea, Mich., assignor of one-half to George P. Glazier, same place. Filed Oct. 11, 1887. Serial No. 251,995. (No model.)

Claim.—1. In a cream-testing churn, the combination of a supporting-frame, a churn-crate provided with removable bottle-cases, spring-supports attached at the upper corners and passing through guiding-keepers at the vertical center of the churn-crate, and a revolving crank-shaft and pitman-connection between said shaft and the churn-crate, substantially as described.

2. In a cream-testing churn, the combination of a supporting-frame, a churn-crate provided with removable bottle-cases, spring-supports attached at the upper corners and passing through guiding-keepers at the vertical center of the churn-crate, a revolving shaft to which said churn-crate is reciprocatingly connected, a loose pulley, and a fast drive-pulley, substantially as described.

383,083. BOLT-HEADING MACHINE. WILLIAM H. WHITELEY, OSCAR B. PERRIGO, and ALBERT S. PERRIGO, Springfield, Ohio, assignors to said William H. Whiteley. Filed Jan. 6, 1887. Serial No. 223,902. (No model.)

Claim.—1. The combination, with the intermittently-revolving cylinder and a heading-tool adapted to come in contact with the blanks therein, of a striking-lever and mechanism for operating the same, adapted to pass in front of the heading-tool after each stroke thereof, substantially as set forth.



2. The combination, with the intermittently-revolving cylinder provided with a series of dies therein and a heading-tool adapted to reciprocate to and from said dies, of a feeding-cylinder adapted during the movement of the main cylinder to carry the blanks successively in front of one of said dies in a position to be fed into the same, substantially as specified.

3. The combination, with the feeding-cylinder, of an opening or throat above said cylinder, a rock-shaft having projections thereon on one side of said throat, and a retaining-plate adapted to receive and hold the blanks dropped into said throat, said retaining-plate being automatically adapted to close said throat as the projections are moved to carry the blank to the feeding-cylinder, substantially as set forth.

4. The combination, in a bolt-heading machine, of a feeding device having a throat to receive the blanks from the hopper or other source of supply, and a retaining-plate adapted to open and close the inlet to said throat, said retaining-plate being so constructed that its movement in closing said throat will expel all the blanks except one from the said throat, substantially as set forth.

5. The combination, with the feeding-cylinder having a series of grooves therein, of a rock-shaft provided with a series of projections thereon, a retaining-plate adapted to be operated by said projections, and an adjustable slide above said rock-shaft adapted when the retaining-plate is in its normal position to form with said retaining-plate a

383,088.

throat for the reception of the blanks to be fed thereby, said plate being adapted to approach said slide and close the said opening as the rock-shaft is moved to carry the blanks to the feeding-cylinder, substantially as set forth.

6. The combination, with the feeding-cylinder having the grooves therein, of a rock-shaft with the projections above said cylinder adapted to carry the blanks downwardly and deposit them successively in the said grooves, the retaining-plate operated by said projections to open and close the opening above said shaft, and a spring adapted to operate said rock-shaft and a cam to return said rock-shaft to its normal position, substantially as set forth.

7. The combination, with the feeding-cylinder, of the rock-shaft with the projections thereon, and the retaining-plate above said cylinder, means for operating said rock-shaft and intermittently revolving said cylinder, and a retaining-bolt adapted to engage said cylinder and hold it at rest during the movement of said rock-shaft, and means for automatically withdrawing said bolt to permit the cylinder to revolve while the rock-shaft remains at rest, substantially as specified.

8. The combination, with the main cylinder having dies therein, of the cross-head containing a series of plungers adapted to enter the respective dies in said cylinder, and a feeding-plunger supported in a

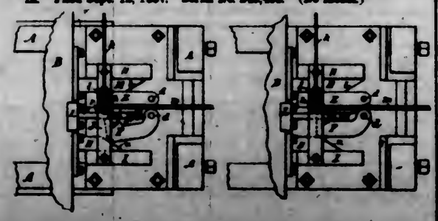
shaft having a bearing in said cross-head, said shaft being adapted to move independently of said cross-head, substantially as set forth.

9. The combination, with the main cylinder and the feeding-cylinder adapted to carry the bolt in a position in front of the dies in said main cylinder, of a sleeve in said feeding device cut away at the central portion to permit the blank carried by the feeding device to enter therein, the cross-head having a feeding-plunger capable of a movement therein, said sleeve being adapted to enter said cross-head, and said plunger being adapted to enter said sleeve, and means for moving said cross-head and feeding-plunger at different speeds, substantially as set forth.

10. The combination, with the main cylinder and the feeding-cylinder, of the cross-head provided with a series of plungers adapted to enter the dies in said main cylinder, a feeding-plunger adapted to move independently of said cross-head and pass through the respective grooves in said feeding-cylinder, a rock-shaft provided with a vibrating arm connected to said cross-head, said arm being extended and connected to said feeding-cylinder, and means for operating said rock-shaft and thus reciprocating said cross-head and feeding-plunger at different speeds, substantially as set forth.

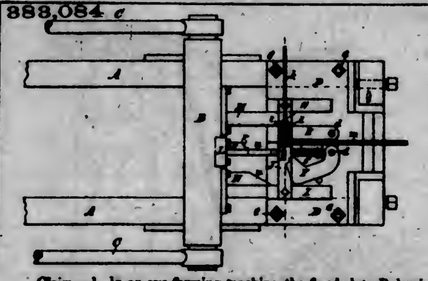
11. The combination, with the main frame and cylinder provided with a series of dies therein, of a cross-head having a supporting-plunger adapted to successively enter said dies, a vibrating arm in the rear of said cross-head adapted, as the cross-head reaches the limit of its forward stroke, to form a connection between said cross-head and the main frame, and means for adjusting the bearing between said arms and main frame, substantially as set forth.

12. The combination, with the movable dies, the heading-tool at one side thereof, and the supporting-plunger at the other, of a movable head in which said supporting-plunger is secured, a variable key in said head for adjusting said plunger, a set-screw for holding said plunger therein, the supporting-arms adapted to form a rigid connection from said head to the main frame, sliding bearings in said main frame against which the supporting-arms rest, and means for adjusting said sliding bearings, substantially as set forth.



13. The combination, with the removable dies and the heading-tool and the supporting-plunger, of the head in which said supporting-plunger is secured, a rock-shaft having a vibrating arm adapted to move said head, a revolving shaft provided at either end with cams adapted to operate upon said rock-shaft and alternately move it in opposite directions, and means for connecting said revolving shaft to the mechanism which drives the heading-tool, substantially as set forth.

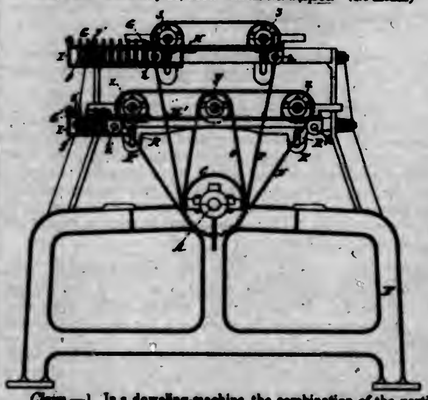
14. The combination, with the cylinder provided with a series of dies therein, of the heading-tool adapted to reciprocate in front of one of said dies, a reciprocating head supporting the series of plungers adapted to enter said dies, a rock-shaft having an extending arm adapted to move said head, one of said plungers being extended through said head and adapted to slide therein, and a connection from the extended portion of said arm to said sliding plunger, and a variable collar on said sliding plunger, to which the connection is made, substantially as specified.



15. The combination, with the intermittently-revolving cylinder having dies therein and the heading-tool adapted to reciprocate in front of one of said dies, of a striking-lever provided at the base with bearings on which lever is adapted to reciprocate, one of said bearings being so constructed that when the lever reaches a given point it leaves said bearing, while the other bearing forms a pivot on which said lever turns to produce a downward striking motion thereof, substantially as set forth.

16. The combination, with the heading-tool, of the striking-lever adapted to reciprocate in front thereof, a bracket adapted to support said striking-lever, provided with tracks on which the lever is adapted to reciprocate, and rollers on said lever adapted to travel on said track, one of said tracks being of such length that when the lever reaches a given point the roller leaves the said track, while the other roller forms a pivot on which the lever is adapted to turn, substantially as set forth.

383,084. MACHINE FOR FORMING EYES OF RODS. CHARLES O. WILSON, South Bend, Ind., assignor to Williams, White & Co., Moline, Ill. Filed Sept. 12, 1887. Serial No. 249,493. (No model.)



383,084 *c*

Claim.—1. In an eye-forming machine, the fixed plate D, having guide-bars H and I, jaws E and F pivoted to said plate, pin A, mounted in fixed bearings between the jaws, the reciprocating cross-head B, die L, secured to said reciprocating head, stud M, having inclined face *t*, and stud N, having inclined face *u*, said studs being also secured to the reciprocating head, all being arranged to co-operate, substantially as and for the purpose specified.

2. In an eye-forming machine, the die L, having the projecting portion *n*, mortise *o*, solid portion *p*, and notch *r*.

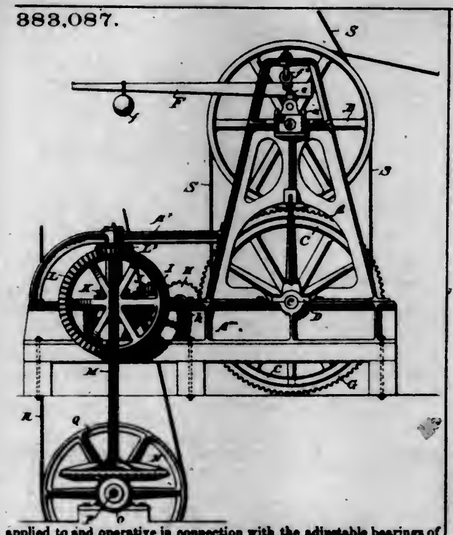
383,085. DOWELING-MACHINE. BENJAMIN B. WILLIAMS, Cincinnati, Ohio. Filed July 30, 1887. Serial No. 245,222. (No model.)

Claim.—1. In a doweling-machine, the combination of the vertically and horizontally adjustable tables arranged one above the other, spring-gages mounted in a suitable frame thereon, said gages being adapted to be operated by the weight of the wood to be bored, and adjustable bits arranged to operate above said tables, substantially as shown and described.

2. In a doweling-machine, the combination, with the adjustable tables H H', vertically-movable gages G G', mounted in suitable supports on said tables, of adjustable bit-shafts arranged above the tables and adapted to operate upon the wood placed upon said tables, substantially as shown and described.

383,086. STAIN OR PAINT. W. HENRY WHEELOW, Boston, Mass. Filed Mar. 3, 1887. Serial No. 229,542. (No specimens.)

Claim.—1. A stain or die containing as ingredients a chloride of iron, preferably a sesquichloride, dissolved in alcohol and intermixed with oil, substantially as described.



2. A stain or dye consisting of a chloride of iron dissolved in alcohol, with or without other coloring-matter, and a vegetable or animal oil and asphalt intermixed, in the manner substantially as described.

383,087. DELIVERING AND STRETCHING MECHANISM FOR MACHINES FOR THE MANUFACTURE OF WIRE ROPE. JAMES WITTENBERG, Chambersburg, assignor to the Trenton Iron Company, Trenton, N. J. Filed Jan. 30, 1883. Serial No. 268,949. (No model.)

Brief.—The invention is of especial applicability in connection with cable-closing machines, and its object is the delivery under tension of a wire cable from the closing-machine and the consequent stretching or taking of the slack out of said cable.

Claim.—1. The combination of a tension-drum rotatable in fixed bearings, fixed bearings for said drum, a tension-drum rotatable in adjustable bearings, adjustable bearings for said drum, driving mechanism for positively driving the first-named drum, and straining-levers

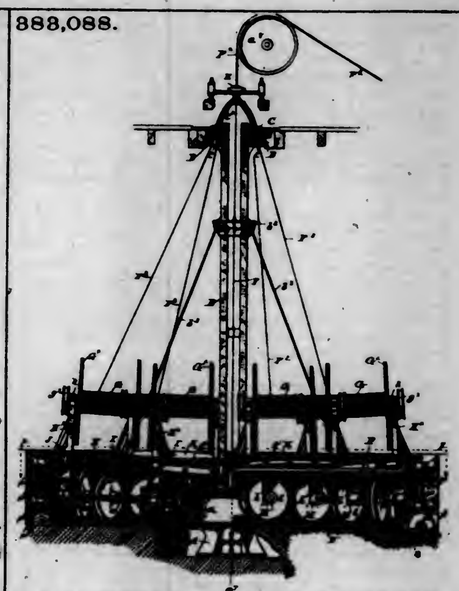
388,087.

applied to and operative in connection with the adjustable bearings of the last-named drum for adjusting its position, substantially as and for the purpose set forth.

2. The combination of a pair of drums, each peripherally circumscribed by grooves and mounted with axes parallel in approximate tangency, a fixed shaft for carrying one of said drums, gearing applied to said shaft for rotating said drum, an adjustable shaft applied to the other of said drums and susceptible of movement radially toward or from the shaft of the first-named drum, adjustable boxings applied to the adjustable shaft, and straining-levers applied to and operative in connection with the boxings of the adjustable shaft for adjusting it, substantially as set forth.

388,088. VERTICAL WIRE-ROPE-CLOSING MACHINE. JAMES WITHINGTON, Chambersburg, assignor to the Trenton Iron Company, Trenton, N. J. Filed Jan. 31, 1888. Serial No. 262,491. (No model.)

Brief.—The object of the invention is the production of a machine for closing about a main core at a single continuous operation the entire lengths of continuous strands of great aggregate length and weight, in which each of the strand-carrying bobbins is supported in entire independence of a central step, and in which friction is reduced to a minimum, the construction of the entire device being simplified and solidified.



Claim.—1. The combination of a central rotatable vertical main shaft, a main step upon which said shaft is mounted and rotates, a cable-laying head connected and rotatable with the main shaft, a series of rotatable carriers for strand core-bobbins circumferentially distributed about the main shaft, and a series of revoluble supports for said carriers, connected with the main shaft, but supported in entire independence thereof, substantially as and for the purposes set forth.

2. The combination of a central rotatable vertical main shaft, a main step upon which said shaft is mounted and rotates, a cable-laying head connected and rotatable with the main shaft, a series of rotatable carriers for strand core-bobbins, a series of wheeled trucks for supporting said bobbin-carriers in independence of the main step, circumferentially disposed with reference to and so connected as to be rotatable with the main shaft, and a circular track concentric with the main step upon which said wheeled trucks travel, substantially as and for the purposes set forth.

3. The combination of a rotatable vertical main shaft, a main step upon which said shaft rotates, a cable-laying head, a series of circumferentially distributed and connected wheeled trucks, also connected to the main shaft and rotatable therewith, a series of rotatable carriers for strand-bobbins mounted respectively upon the trucks, and a fixed circular track concentric with the main step upon which the wheeled trucks travel, substantially as set forth.

4. The combination of a rotatable vertical main shaft, a main step upon which said shaft rotates, a cable-laying head, a series of wheeled trucks connected and rotatable with the main shaft, a series of rotatable carriers for strand-bobbins mounted respectively upon the trucks, friction-rollers interposed between the carriers for the strand-bobbins and the trucks, and a fixed circular track concentric with the main step upon which the wheeled trucks travel, substantially as set forth.

388,088.

5. The combination of a rotatable main shaft, a main step for said shaft, a rotatable cable-laying head, a series of wheeled trucks circumferentially disposed with reference to and connected with the shaft and all similarly inclined downwardly and inwardly, revolubie carriers for strand core-bobbins respectively mounted upon the trucks and possessing corresponding inclinations, and a circular road-bed concentric with the main step, substantially as set forth.

6. The combination of a rotatable vertical main shaft, a series of trucks circumferentially distributed about and connected with said shaft, pairs of wheels of respectively different diameters applied to said trucks, and revolubie carriers for strand-bobbins mounted upon said trucks, substantially as set forth.

7. In combination, a wheeled truck, a carrier for a strand core-bobbin superimposed upon and pivoted with respect to said truck, and a series of radially and circumferentially distributed friction-rolls interposed between the carrier and the truck, substantially as and for the purposes set forth.

388,089. AUTOMATIC STATIONARY WATER-FILTER. WILLIAM WITTEMEYER, Jr., St. Louis, Mo., assignor of one-third to Louis F. Boeckstiegel, same place. Filed Mar. 31, 1887. Serial No. 233,711. (No model.)

Claim.—1. The combination, with a tank and the filtering-wall, of inverted-V shape, placed therein so as to form settling-chambers 20 and 21, the supply-pipe 8, communicating with the chamber 20 at top, pipes communicating with each of said chambers at bottom for carrying off sediment, and a pipe for the escape of the purified water communicating with the top part of said tank, substantially as set forth.

2. The combination, with a tank and a filtering-wall, of inverted-V shape, placed therein so as to form settling-chambers 20 and 21, a valved pipe for the escape of sediment communicating with the bottom of each of said chambers, and the supply and douche pipes 8 42, communicating with the respective chambers 20 and 21 at top, substantially as and for the purposes set forth.

3. The combination, with the tank and the filtering-wall dividing it into settling-chambers 20 21, situated side by side, of the supply-pipe 8, communicating with the top portion of the chamber 20, the douche-pipes 42, communicating with the top portions of the chambers 21, the water-main with which said pipes 8 and 42 communicate, the pipe for conveying away the purified water, and the pipes 39, communicating with the bottom portions of the chambers 20 21 and with the sewer, substantially as set forth.

388,090. SIGM. HERMANN WITTE, Neustadt, Prussia, Germany. Filed Feb 9, 1888. Serial No. 263,670. (No model.) Patented in France Dec. 27, 1887, No. 187,948, and in England Jan. 9, 1888, No. 264.

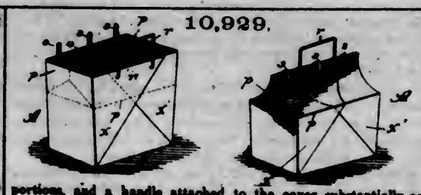
Claim.—1. The combination, with a shoe having a cut on the front of the upper from the top along the instep to some distance back from the toes, of two flaps sewed to the opposite edges of the cut and having the edges opposite the ones secured to the edges of the cut united, and of a curved lever between said flaps, substantially as set forth.

2. The combination, with a shoe having a cut in the front face of its upper from the top along its instep to a point some distance from the back of the toes, of the flaps *a b c d e*, secured to the upper and to the opposite edges of said cut, which flaps have the edges *b c d* united, and the curved lever *f*, having one end secured to one of the flaps, and having the opposite end between the flaps united at their edges, substantially as set forth.

3. The combination, with the shoe having a cut in the front of its upper from the top along the instep to a point some distance back from the toes, of the two flaps *a b c d*, secured along the edges *a c* to the edges of said cut, and said flaps having the edges *b c d* united, the lever *f*, the tongues B C, and the pins b^3 c^3, substantially as set forth.

388,091. SUPPORT FOR SPINNING-SPINDLES. ASHER WOOD, Worcester, assignor to the Sawyer Spindle Company, Boston, Mass. Filed June 20, 1888. Serial No. 306,891. (No model.)

Brief.—The object of the invention is the production of an improved spindle-support capable of yielding to a limited extent with the foot of the spindle as the spindle gyrates under the influence of an unbalanced load, the employment of elastic packing being dispensed with.



Claim.—A sleeve-whirl spindle, combined with a yielding bolster consisting of a solid or rigid sleeve interposed directly between the sleeve-whirl and the pintle of the spindle and constituting the only lateral bearing for the spindle and surrounded only by the sleeve-whirl, and of a spring-arm attached to or forming part of the said sleeve, the said arm being adapted to be attached to a suitable base, thus permitting the said sleeve constituting the bearing portion of the bolster to move to a limited extent in substantially every direction with the spindle, substantially as described.

REISSUES.

10,929. PAPER RECEPTACLE. OLIVER H. HOOD, Chicago, Ill., assignor to the Chicago Manila Paper Works, same place. Filed Mar. 8, 1888. Serial No. 266,941. Original No. 261,886, dated Nov. 2, 1886.

Claim.—1. A paper receptacle having a cover integral with it and comprising defined extensions of the sides of the receptacle, which incline at an oblique angle to the sides when brought together to close the receptacle, means for holding together the inclined cover

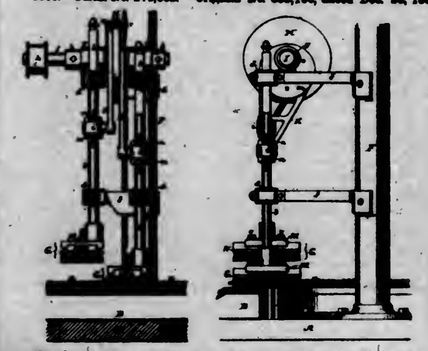
10,929.

portions, and a handle attached to the cover, substantially as described.

2. A paper receptacle having a cover integral with it and comprising defined extensions of the uncovered sides of the receptacle, which incline at an oblique angle to the sides when brought together to close the receptacle, means for holding together the inclined cover portions, and a handle attached to the cover, substantially as described.

3. A paper receptacle having a cover integral with it and comprising defined extensions of the sides of the receptacle which are folded inward from and at an oblique angle to the sides and toward each other at two opposite sides of the article, and as to the two remaining opposite sides are folded inward at an oblique angle to the sides toward each other to close the receptacle, means for holding together the folded cover portions, and a handle attached to the cover, substantially as described.

4. A paper receptacle having a cover integral with it and comprising defined extensions of the sides of the receptacle re-enforced by extended portions of the corner-flaps formed in the shaping of the article, which re-enforced extended sides are folded inward from and at an oblique angle to the sides and secured together to close the receptacle, substantially as described.



5. A paper receptacle having a cover integral with it and comprising extensions of the sides of the receptacle, divided from the receptacle proper by lines or creases, from which the cover-extensions are inclined obliquely toward each other to close the receptacle, means for holding together the inclined cover portions, and a handle on the cover, substantially as described.

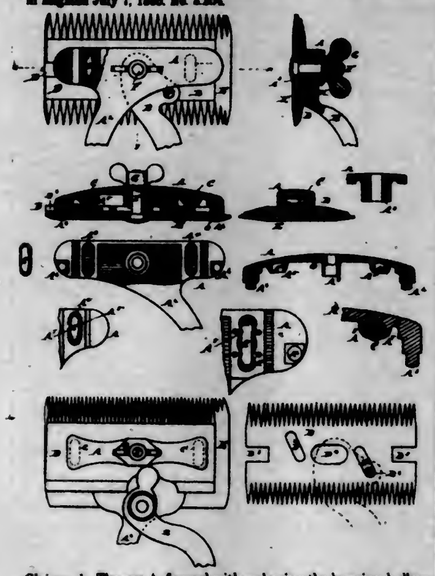
6. A receptacle formed of a folded continuous sheet of paper, having the corners, formed in the shaping, folded and secured upon the receptacle, clamping mechanism, substantially as described, at one side of the receptacle, and a handle at the opposite side of the same, substantially as and for the purpose set forth.

7. A receptacle formed of a folded integral sheet of paper, having the corners, formed in the shaping, folded upon the receptacle, clamps *s* at one side of the opening, and a handle, *r*, at the opposite side of the same, the clamps and handle securing the corners in place, substantially as and for the purpose set forth.

8. A receptacle formed of a folded integral sheet of paper, having the corners, formed in the shaping, folded toward each other on opposite sides of the receptacle, clamps *s* at one side of the opening, and a handle, *r*, at the opposite side of the same, the clamps and handle securing the corners in place, substantially as and for the purpose set forth.

10,980. WOOL-COMBING MACHINE. WILLIAM LEWIS, Philadelphia, Pa., assignor to Hereon Wyman, Worcester, Mass. Filed Apr. 16, 1888. Serial No. 270,862. Original No. 356,196, dated Dec. 28, 1886.

Claim.—1. The combination of the toothed rings of a combing-machine with a dabbing-brush composed of sections working side by side and with means for reciprocating said sections, whereby they are caused to act alternately, all substantially as specified.



2. The combination of the column F of the machine, a dabbing-brush composed of sections located side by side, a short driving-shaft

having bearings carried wholly by said column, eccentrics on said shaft, and mechanism, substantially as described, whereby the movement of said eccentrics is imparted to the sections of the dabbing-brush, all substantially as specified.

3. The combination of the dabbing-brush composed of sections located side by side, a driving-shaft, a pair of eccentrics forming a single structure, means for securing said structure to the shaft, and mechanism whereby the movement of the eccentrics is transmitted to the sections of the dabbing-brush, all substantially as specified.

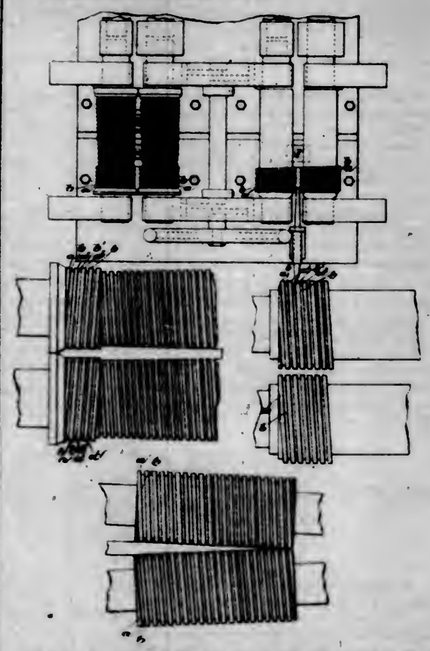
4. The combination of the stem having a grooved plate at the lower end, the slotted brush-block having a portion adapted to said groove, and confining bolts and nuts whereby the brush-block is secured to the plate, all substantially as specified.

10,931. HAIR-CLIPPER. THOMAS L. PHIPPS and WILLIAM BURMAN, Ryland Road, Edgbaston, near Birmingham, County of Warwick, England, assignors to Louis S. Lee, Philadelphia, Pa. Filed Apr. 12, 1888. Serial No. 270,632. Original No. 305,956, dated Feb. 9, 1886. Patented in England July 7, 1885. No. 8,904.

Claim.—1. The cap A, formed with or having the hanging hollow bush or cylinder A^3 and a surrounding collar, in combination with the handle B and the binding-screw F, substantially as and for the purpose specified.

2. In a hair-clipping machine, the combination of the stationary cutter having holes c' near its lateral ends, the reciprocating cutter resting thereon and having guide-slots D^2, a stationary cap having projecting pins A^2 extending down through the slots D^2 and into the holes c, whereby the reciprocating cutter is guided upon the stationary cutter, anti-friction rollers arranged between the cap and reciprocating cutter-plate and close to the pins, a clamping-screw extending through the cutters and cap and arranged in line with the guide-pins A^2 and rollers, a lever to hold the stationary cutter and cap, and a lever to reciprocate the movable cutter, substantially as shown and described.

3. In a hair-clipping machine, the combination of a stationary cutter, a reciprocating cutter resting thereon, a stationary cap, anti-friction rollers arranged between the stationary cap and reciprocating cutter and near the latter ends thereof, and a clamping-screw arranged through the cap and cutter-plates and within the area included between the ends of the anti-friction rollers, whereby the clamping effect shall come within such area and cause the cap to press flat upon the rollers, creating a uniform wear over their surface and their surfaces of contact, substantially as shown and described.



4. In a hair-clipping machine, the cap, in combination with anti-friction rollers, the said cap having retaining-edges which extend over the said rollers and prevent their falling out of the cap when the parts of the clipper are separated, substantially as and for the purpose specified.

5. The combination of the cap A, having pins A^2, and tubular projection A^3, with levers B K, having pin B^2, stationary cutter-plate E, having holes for reception of pins A^2, reciprocating cutter-plate D, having central slot, D^4, oblique slots D^2, and end guide-slots D^3, tightening-screw F, and nut G, substantially as and for the purpose specified.

6. In a hair-clipping machine, the combination of a stationary cutter, a reciprocating cutter, a cap secured to one lever and having a downwardly-extending tubular projection, supports between the ends of the cap and reciprocating cutter to hold the cap-body clear of the cutter, a clamping-screw extending through said tubular projection to clamp the cutters and cap together, and a pivoted lever for operating the reciprocating cutter, journaled on the tubular projection and resting upon the cutter-plate, substantially as shown and described.

7. The reversible cutter-plate for a clipping-machine, having the central slot, D^4, and the two oblique actuating-slots D^2 D^2, the said slots being arranged out of line, substantially as and for the purpose specified.

10,932. MACHINE FOR REDUCING METAL RODS. HENRY A. WILLIAMS, Taunton, Mass., assignor to the H. A. Williams Manufacturing Company, same place. Filed Apr. 17, 1883. Serial No. 271,949. Original No. 307,879, dated Aug. 9, 1887.

Claim.—In a rod-reducing machine, two working-surfaces, each of which is wholly made up of a series of slanting lands, a a' a^2, &c., separated by grooves b b' b^2, &c., substantially as and for the purpose set forth.

NORRIS PETERS

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

YALE LOCK MANUFACTURING COMPANY *v.* JAMES.

Decided April 9, 1888.

YALE—POST-OFFICE BOXES.

The first and second claims of Reissued Letters Patent No. 8,783, granted July 1, 1879, to the Yale Lock Manufacturing Company, declared invalid if construed broadly, and not to have been infringed if construed narrowly. The Court concurs in the views and in the result reached by the court below in this case as reported in 22 Blatchford, 294.

APPEAL from the Circuit Court of the United States for the Southern District of New York.

Mr. Frederic H. Betts for the appellant.

Attorney General of the United States for the appellee.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity brought by the Yale Lock Manufacturing Company, a Connecticut corporation, against Thomas L. James to recover for the alleged infringement of Reissued Letters Patent No. 8,783, granted to the plaintiff, as assignee of S. N. Brooks, administrator of L. Yale, Jr., deceased, July 1, 1879, for an improvement in post-office boxes, on an application for a reissue filed May 23, 1879, (the original patent, No. 119,212, having been granted to Silas N. Brooks, administrator of Yale, September 19, 1871, on an application filed September 30, 1868, and having been reissued to said Brooks, as administrator, July 9, 1872, as No. 4,903, on an application for reissue filed May 7, 1872, and having been again reissued to said Brooks, as administrator, April 24, 1877, as No. 7,625, on an application for reissue filed April 19, 1875.) The circuit court dismissed the bill, and the plaintiff has appealed from its decree.

Among other defenses the answer sets up that each of the three reissues was not for the same invention as the original patent, but contained material new matter, and was therefore invalid.

Reissue No. 8,783 was the subject of a suit in equity brought in the Circuit Court of the United States for the District of Connecticut by the present plaintiff against the Scovill Manufacturing Company, in which Judge Shipman, in June, 1880, gave a decree for the plaintiff as to the first and second claims of the patent. (18 Blatchford, 243.)

The original patent contained the following description of the invention:

[illegible] improvement in the construction of the fronts of post-office boxes; and consists in making said fronts, including the doors and box-frames, of metal, and *in securing the frames to the wooden pigeon-holes by rivets, connecting the frames with each other at top, bottom, and sides.* The body of these boxes is to be made of wood, in the usual manner, namely, a series of pigeon-holes; but the front of the box and the door-frame are made of iron or other suitable metal. Each door-frame or box-front is so made that it aids in covering the edge of the wooden partition or pigeon-holes, and is connected with the other frames above, below, and on each side of it, in such manner that the frames make a continuous frontage, no part of which can be removed (from the outside) without pulling down other parts and breaking the wood-work, *so that a surreptitious removal of the front of any box in order to get possession of its contents is practically impossible.* Each frame, made, as before stated, of metal, has all around it a flange, *a a*, which protects the outside of the wood-work. The sides of the frame *b b* enter and fit closely against the wood forming the pigeon-holes, and may be continuous or notched out at intervals; and each frame has attached to it one leaf of two or more hinges, *c c*. The door *is of iron*, solid *at top*, where the lock *d* is attached, and having an opening, *e*, below, in which a plate of glass is secured. I prefer to locate rods *f f* behind the plate, to prevent the introduction of a hand if the glass be broken, *and so to form* the door that when shut it enters within the frame, (*see g g,*) so that it cannot be lifted from its hinges. When the frames are all in place each frame is riveted through the wood-work to its four neighbors, (see A A, Fig. 2,) and thus a continuous *iron* frontage *is formed*. Each door has a small spring-bolt, *i*, and a lock, *d*, attached to it, the two operating together and forming, in the hands of the post-master, a perfect safeguard against all entrance to the box by means of the key, as is more particularly set forth in *my application for a patent therefor made equal date with this.*

That patent had two claims, as follows:

1. The combination of several box-frames with each other and *with* pigeon-holes, as described, by means of rivets passing through the frames, and the wood-work entering between the said frames, the combination being substantially as described.

2. *The above, in combination with the flanges making part of the frames and protecting and inclosing the exterior of the wood-work, substantially as set forth.*

The first reissue, No. 4,903, contained the following description of the invention:

This invention relates to an improvement in the fronts of post-office boxes; and consists in making said fronts, including the doors and box-frames, of metal, *said box-frames being constructed so as to overlap and cover, in whole or in part, the front edges of the wooden pigeon-holes to which they are affixed.* The body of the boxes is to be made of wood in the usual manner—viz., a series of pigeon-holes—but the front of the box and the door-frame are made of iron or other suitable metal. Each door-frame or box-front is so made that it aids in covering the edge of the wooden partition or pigeon-holes and is connected with the other frames above, below, and on each side of it in such manner that the frames *will* make a continuous frontage, no part of which can be removed from the outside without pulling down other parts. Each frame, made, as before stated, of metal, has all around it a flange, *a a*, which protects the outside *or edges* of the wood-work. The sides of the frames *b b* enter and fit closely against the wood, forming the pigeon-holes, and may be continuous or notched out at intervals, and each frame has attached to it one leaf of two or more hinges, *c c*. The door *may be of any desirable metal*, solid where the lock *d* is attached, and having an opening, *e*, below, in which a plate of glass is secured. I prefer to locate rods *f f* behind the plate, to prevent the introduction of a hand, if the glass be broken. The door *is so constructed* that when shut it enters within the frame so that it cannot be lifted from its hinges. When the frames are all in place each frame is riveted through the wood-work to its four neighbors, (see A A, Fig. 2,) and *in this way form* a continuous *metal* frontage. *The* door *for each frame* has a small spring-bolt, *i*, and a lock, *d*, attached to it, the two operating together and forming, in the hands of the postmaster, a perfect safeguard against all entrance to the box by means of the key, as is more particularly set forth in *Letters Patent granted to me on the 24th day of October*, 1871, *and numbered* 120,177.

That reissue contained two claims, as follows:

1. The combination of several box-frames with each other and with pigeon-holes, as described, by means of rivets passing through the frames and the wood-work entering between the said frames, the combination being substantially as described.

2. *The combination of two or more metallic frames and doors and locks with pigeon-holes, said frames having flanges, which protect and inclose wholly or in part the front edges of said pigeon-holes.*

In order to a comparison of the specification and claims of the first reissue with the specification and claims of the original patent, the parts of each which are not found in the other are above put in italics.

The specification and claims of Reissue No. 8,783 are as follows:

This invention consists in an improvement in the construction of post-office boxes; and its chief feature is the combination of a tier of pigeon-holes made of wood with a continuous frontage of metal, such frontage consisting of doors and their frames, which latter cover the ends of the boards which form the pigeon-holes. A series of wooden pigeon-holes open at the rear and covered at the front or on the outside by a permanent glass front is very old, and such a series was used for post-office boxes and in hotels as a receptacle for keys, cards, letters, &c. There has also been in use a series of wooden pigeon-holes, each provided at one end with a door, as described in the patent granted to Jacob H. Beidler, May 26, 1866; but in this patent the door is described as hinged to the wood, and the construction is, consequently, insecure, as an ordinary pocket-knife or small chisel will, even in inexperienced hands, suffice to cut away the wood or pry off the door, so that the boxes may be entered.

Pigeon-holes made of iron or other metal are difficult to construct and very costly; but such pigeon-holes, each provided with an ordinary metal door, would be sufficiently secure. Such a degree of security at a comparatively low cost is attained by covering the front of a series of wooden pigeon-holes with a continuous metallic frontage—that is, a frontage which presents a continuous surface of metal, or, in other words, a surface which covers the ends of the wooden pigeon-holes in such manner that those portions of the wood to which the metallic frames are attached cannot be attacked when the doors making part of the frontage are closed. In constructing YALE's invention the body of the boxes or the series of pigeon-holes is to be made of wood in any usual manner, and the fronts thereof—viz., the doors and their frames—are to be made of iron or other suitable metal.

Each door-frame is of such size that it aids in covering the ends of the wooden partitions that form the pigeon-holes to which it is applied, and these frames (see Fig. 1) are of such size and shape that where a series of them are combined with a series of pigeon-holes they cover the whole of the ends of the wood.

Each door-frame is a plate of metal, *a a*, which, when in place, overlaps a part of the ends of the wood-work surrounding the pigeon-hole, the outside of the frame inclosing a greater area than the orifice of the pigeon-hole, and each frame has an ear, *b b*, which enters the pigeon-hole; but this ear may be either continuous or notched out at intervals. The door is of iron or other metal, solid at top, and having an opening, *e*, below, in which a plate of glass is secured, and is hinged to the frame, as at *c c*. It is preferable to locate rods *f f* behind the plate, so as to prevent the introduction of a hand if the glass be broken, and so to form and hinge the door that when shut it enters within the frame, so that it cannot be lifted from its hinges when shut.

When the frames are all in place each frame is riveted or bolted to the wood-work to fasten it thereto, and is also riveted or bolted to its four neighbors to secure the frames to each other. (See A A, Fig. 2.) Thus each frame is secured to the wood-work, so that it cannot be removed till the rivet or the wood-work is cut away or broken.

When all the frames are in place a continuous metallic frontage, protecting the wood-work, is presented upon the outside of the series of boxes—that is, the side where the public can approach the boxes.

Each door has a lock attached to it, the bolt of which is actuated through the intervention of an arm, *k*, in the manner and for the purposes set forth in a patent granted for the invention of Linus Yale, Jr., on the 24th day of October, 1871, No. 120,177.

An iron door in an iron frame is not claimed as of YALE's invention, as such doors have been used in safe-vaults and for furnaces.

What is claimed as the invention of said LINUS YALE, Jr., (deceased,) is—

1. The combination, substantially as specified, of a series of metallic door-frames and doors with a series of wooden pigeon-holes, whereby a series of post-office boxes with a continuous metallic frontage is formed.

2. The combination, substantially as described, of a series of wooden pigeon-holes with a series of metallic door-frames and doors, and with rivets or bolts which attach the frames to the wood-work, whereby a continuous metallic frontage secured to the wood-work of pigeon-holes is obtained.

3. The combination, substantially as described, of a series of wooden pigeon-holes with a series of metallic door-frames and doors, and with rivets or bolts which attach the frames both to the wood-work and to each other, the combination being substantially such as described.

4. The combination of a metallic door with a glass panel, and with a frame to which the door is hinged, said frame being so constructed as to cover a part of the ends of the wooden partitions forming pigeon-holes and being applied thereto, the combination being substantially as specified.

5. The combination of a post-office box or pigeon-hole open at the rear, with a metallic frame and door to protect the front end of it.

Claims 4 and 5 were disclaimed by the plaintiff November 30, 1880. Claim 1 of the first reissue was the same as claim 1 of the original patent, while claim 2 of the first reissue was in these words:

2. The combination of two or more metallic frames and doors and locks with pigeon-holes, said frames having flanges, which protect and inclose wholly or in part the front edges of said pigeon-holes.

In the opinion of the circuit court in the present case, (28 O. G., 917; 22 Blatchford, 294,) Judge Shipman says:

The defendant, as postmaster in the city of New York, and not otherwise, used in the post-office, provided and equipped for him by the United States Government, wooden post-office boxes with metallic fronts and doors and open at the rear. They were manufactured by the Johnson Rotary Lock Company. The doors and door-frames made a continuous metallic frontage. The door-frames were secured to each other and to the wood-work as follows: At about the middle of each vertical edge of each door-frame there was a triangular hole, which, with the corresponding hole in the adjoining door-frame, made a rectangular hole, through which the metal fastening-bolt, completely filling such hole, was passed, the heads of such bolts overlapping the contiguous edges of adjoining metallic fronts, and the bolt itself passing through the wooden partition between the adjoining pigeon-holes, and being secured at the back thereof, within the post-office room, by a nut screwed upon the end of the bolt. There were other boxes constructed substantially as above described, excepting that the metal front of each pigeon-hole was fastened to the wood-work by means of flanges and screws; but the screws which attached the frames to the wood-work did not attach the frames to each other. Neither series of boxes would have infringed either claim of the original patent. Each series infringes the first and second claims of the present reissue, unless these claims are to receive a construction which shall compel the metallic frontage to be made continuous by rivets, bolts, or fastenings which shall attach the frames both to the wood-work and to each adjoining frame. The plaintiff insists that these claims should not receive such a construction, because it has been found that the invention of the specification of the reissue, although a broader one than was described in the original patent, is the invention which the history of the art and the patent show should have been described, and because the first reissue was promptly applied for, and, as issued, included in its second claim, in the view of the plaintiff, the same invention which is described in the first and second claims of the reissue. The defendant says, among other things, that since the cases of *Miller* v. *Brass Co.* (104 U. S., 350) and *James* v. *Campbell*, (Id., 356,) it has been settled by the Supreme Court that the Commissioner of Patents in allowing the first and second claims exceeded his jurisdiction, because the invention which was first applied for and was "complete in itself," was clearly, specifically, and fully described in the original specification and in the claim, and an expanded claim would necessarily include an invention which was not sought to be described in the original patent; and, furthermore, that there could have been no inadvertence or mistake, because the original patent and the accompanying documents show that the patentee "did not intend it" (the patent) "to embrace any such broad invention" as was described in the reissue. The defendant also says that the patentee in his application for the first reissue ineffectually endeavored to alter the description of the invention, so as to omit the fastening of the door-frames to each other as a necessary integral part of the invention, and that the second claim of the first reissue cannot fairly be construed to permit such omission, and, therefore, that the patentee is estopped from insisting upon a broad construction of the first and second claims of the present reissue, and that these claims are objectionable on account of the lashes of the patentee. The "file-wrapper and contents" of the first reissue were not a part of the record in the Scovill case.

In order to show the changes made in the specification and claims of the first reissue as they passed through the Patent Office, the specification and claims of that reissue as granted, and the specification and claims of the same as applied for, are here placed in parallel columns, the parts of the latter which are not contained in the former being in italics and brackets and being numbered severally from 1 to 8.

As applied for.	*As granted.*
This invention relates to an improvement in the fronts of post-office boxes, and consists in making said fronts, including the doors and box frames, of metal, said box frames being constructed so as to overlap and cover, in whole or in part, the front edges of the wooden pigeon holes to which they are affixed [*and in securing said frames to said pigeon holes by rivets or screws*]. The body of the boxes is to be made of wood in the usual manner, viz., a series of pigeon holes, but the front of the box and the door frame are made of iron or other suitable metal. Each [*door frame or box frame is so*]	This invention relates to an improvement in the fronts of post-office boxes; and consists in making said fronts, including the doors and box-frames, of metal, said box-frames being constructed so as to overlap and cover, in whole or in part, the front edges of the wooden pigeon-holes to which they are affixed. The body of the boxes is to be made of wood in the usual manner—viz., a series of pigeon-holes—but the front of the box and the door-frame are made of iron or other suitable metal. Each

made that it aids in covering the edge of the wooden partition or pigeon holes and [*may be*] connected with the other frames above, below, and on each side of it in such manner that the frames will make a continuous frontage, no part of which can be removed from the outside without pulling down other parts, [*or the several frames may be secured or otherwise fastened directly to the wooden pigeon holes, each one independent of the other, if desired.*] Each frame made, as before stated, of metal, has all around it a flange, *a a*, which protects the outside or edges of the wood-work. The sides of the frame *b b* enter and fit closely against the wood forming the pigeon holes, and may be continuous or notched out at intervals, and each frame has attached to it one leaf of two or more hinges, *c c*. The door may be of any desirable metal, solid where the lock *d* is attached, and having an opening, *e*, below, in which a plate of glass is secured. [*Cast with the door and over the opening e for glass may be a network or ornamental open work, admitting light, and at the same time preventing the introduction of a hand if the glass be broken, or rods f f may be located behind the plate for the same purpose.*] The door is so constructed, that, when shut, it enters within the frame, *b* [*see g g,*] so that it cannot be lifted from its hinges. When the frames are all in place, each frame [*may be*] riveted through the wood-work to its four neighbors, (see A A, Fig. 2,) and in this way form a continuous frontage, [*or each separate frame may be screwed or otherwise fastened to the wood-work independent of its neighboring frames.*] The door for each frame has a small spring-bolt, *i*, and a lock, *d*, attached to it, the two operating together, and forming, in the hands of the postmaster, a perfect safeguard against all entrance to the box by means of the key, as is more particularly set forth in letters-patent granted to me on the 24th day of October, 1871, and numbered 120,177.	wooden partition or pigeon-holes and is connected with the other frames above, below, and on each side of it in such manner that the frames will make a continuous frontage, no part of which can be removed from the outside without pulling down other parts. Each frame, made as before stated of metal, has all around it a flange, *a a*, which protects the outside or edges of the wood-work. The sides of the frame *b b* enter and fit closely against the wood forming the pigeon-holes, and may be continuous or notched out at intervals, and each frame has attached to it one leaf of two or more hinges, *c c*. The door may be of any desirable metal, solid where the lock *d* is attached, and having an opening, *e*, below, in which a plate of glass is secured. I prefer to locate rods *f f* behind the plate, to prevent the introduction of a hand, if the glass be broken. The door is so constructed that when shut it enters within the frame so that it cannot be lifted from its hinges. When the frames are all in place each frame is riveted through the wood-work to its four neighbors, (see A A, Fig. 2,) and in this way form a continuous metal frontage. The door for each frame has a small spring-bolt, *i*, and a lock, *d*, attached to it, the two operating together and forming, in the hands of the postmaster, a perfect safeguard against all entrance to the box by means of the key, as is more particularly set forth in Letters Patent granted to me on the 24th day of October, 1871, and numbered 120,177.
What I claim as the invention of the said LINUS YALE, Jr., deceased, is— First. The combination of several box frames with each other and with pigeon holes, as described, by means of rivets passing through the frames and the wood-work entering between the said frames, the combination being substantially as described. Second. The combination of two or more metallic frames and doors and locks with pigeon holes, said frames having flanges, which protect and enclose, wholly or in part, the front edges of said pigeon holes. [*Third. The combination of several metallic box frames with each other and with pigeon holes, said box frames being secured to said pigeon holes independently of each other, by means of screws or other similar fastening, as described.*]	What I claim as the invention of the said LINUS YALE, Jr., deceased, is— 1. The combination of several box-frames with each other and with pigeon-holes, as described, by means of rivets passing through the frames and the wood-work entering between the said frames, the combination being substantially as described. 2. The combination of two or more metallic frames and doors and locks with pigeon-holes, said frames having flanges, which protect and inclose, wholly or in part, the front edges of said pigeon-holes.

On the 8th of May, 1872, the Patent Office examiner called the attention of the applicant to the fact that the following matters in the new specification [illegible] by the original patent, namely, [illegible] words "may be" in the parts marked "2" and "6," the parts marked "3," "4," and "7," and the third claim, being the part marked "8."

On the 9th of May, 1872, the applicant appealed to the Commissioner of Patents in person, because the examiner had refused to examine the case on its merits, in view of the introduction of such new matter; but on the next day the applicant virtually withdrew his appeal by amending his application as follows: He erased part "1;" he erased the words "may be" in parts "2" and "6," and substituted in each case the word "is;" he erased parts "3" and "4" and substituted for the latter the words, "I prefer to locate rods *f f* behind the plate to prevent the introduction of a hand, if the glass be broken." He also erased part "7," and claim 3, part "8," and submitted the case for further action. The application was then reconsidered, and twice rejected, and from the second rejection the applicant appealed to the Examiners-in-Chief, who reversed the decision of the examiner, and the reissue was granted July 9, 1872. In view of these facts, Judge Shipman in his decision in the present case said:

It is unquestionable that the patentee, when he made his original application, intended to say that his invention did not consist simply in making, by his combination of metallic doors, door-frames, and wooden boxes, a continuous metallic frontage, but that it also consisted in the way in which the frontage was made continuous—viz., by the connection of the adjoining frames with each other. His definite and exact specification shows that he supposed that his patentable invention was thus limited. He described with precision and clearness that his metallic frontage was to be so constructed that the frames were to be fastened to each other at top, bottom, and sides, and not merely to the wood-work. A specific invention, complete in itself, was described, "fully and clearly, without ambiguity or obscurity." Under the definitions which are given in the decisions which have been referred to, and in *Manufacturing Co.* v. *Ladd*, (102 U. S., 468,) of the inadvertence, accident, or mistake which permits a reissue, when a patent is said to be inoperative on account of a defect or insufficiency in the specification, which arose through such inadvertence or mistake, and also of the nature of the defectiveness or insufficiency which is meant by the statute, there was no mistake, although the patentee might have fallen into an error of judgment, or into an erroneous conclusion of fact; and, furthermore, the original patent, according to the definitions contained in the recent, and perhaps in the earlier, cases, was not defective nor insufficient either in its descriptive portion or in its claims. The second claim of the first reissue, construed in the light of the contemporaneous facts which are shown in the "file-wrapper and contents," cannot be fairly construed to mean a metallic frontage irrespective of the fastening of the frames to each other through the wood-work. Were this claim to be construed without study of the history of the application as it made its way through the Patent Office, and of the amendments which it was compelled to undergo, it would probably receive the construction which naturally belongs to the first claim of the present reissue; but the patentee abandoned, under pressure from the Patent Office, the clauses in the application which made the fastening of the frames to each other to be optional, and abandoned also a proposed third claim, which described the box-frames as secured to the pigeon-holes "independently of each other by means of screws or other similar fastening." In view of the fact that the Patent Office excluded from the descriptive part of the specification suggestions of any other method of fastening than that by which the frames were to be fastened to each other, it would be singular if the intent of the Office was to include in the second claim such other method of construction. If this claim has properly, and the applicant knew that it was intended to have, a narrow construction—and of this knowledge I think there can be little doubt—the plaintiff would not insist that the first and second claims of the present reissue ought, in view of the decision in *Miller* v. *Brass Co.*, (*supra,*) to be so construed as to be any broader than the third claim, which requires the combination of door-frames, doors, and pigeon-holes to be by means of rivets or bolts which attach the frames both to the wood-work and to each other.

It was held that there was no infringement, and on that ground the bill was dismissed.

We concur in these views of the circuit court and in the result which it reached. In view of the numerous recent decisions of this Court on the subject of reissued patents, it would serve no good purpose to expand or amplify the views so well expressed by the judge of circuit. They are supported by the decisions in *Miller* v. *Brass Co.*, (104 U. S., 350;) *Mahn* v. *Har-*

wood, (112 U. S., 354;) *Parker & Whipple Co.* v. *Yale Clock Co.*, (123 U. S., 87;) *Matthews* v. *Iron Clad Manufacturing, Co.*, (123 U. S., 347.)

Our conclusion makes it unnecessary to consider the defense raised in the answer and urged in argument that the post-office boxes used by the defendant were used by him as postmaster of the United States at the city of New York; that the boxes were the property of the United States and were rented by it to sundry persons; that the rent was a part of the postal revenue of the United States and was not a source of personal emolument to the defendant; that it was not within the power of the defendant to remove or alter the boxes, and that the use of such boxes at the post-office while the defendant was postmaster was not an infringement of the patent by him and did not make him liable to this suit.

Decree affirmed.

U. S. Circuit Court—District of Maryland.

VAN CAMP *v.* THE MARYLAND PAVEMENT COMPANY.

Decided April 4, 1883.

1. CONSTRUCTION OF CLAIM—PROCESS—INFRINGEMENT.

A claim in the following words, namely: "In a concrete pavement, the use of crushed and pulverized rock, when the same is heated and saturated with dead-oil, crude petroleum, or the residuum of petroleum, and mixed with natural asphaltum, Cuban, Trinidad, or California, previously dissolved to a pitch by crude petroleum or the residuum of petroleum, substantially as described, and for the purpose set forth," construed as for a *process*, and also as for a process in which the previous saturation of the rock with dead-oil, crude petroleum, or the residuum of petroleum is one of the essential steps. *Held* that the omission of such step averts the charge of infringement.

2. PROCESS AND PRODUCT.

Under a proper construction of the language such a claim as the foregoing cannot be held to cover both a process and also a composition of matter.

3. COMPOSITION OF MATTER—OLD ELEMENTS—INVENTION.

When a mechanically-combined material composed of particular ingredients is old, a person who has merely altered the proportions of ingredients or the process of combining them has not discovered a new composition of matter in the sense of the patent law. To be a new composition of matter the product must have some distinctly new property or be applicable to some new use.

4. ERROR IN CLAIM FATAL.

It is fatal to a patent that a patentee claims as essential a step which is unnecessary.

5. HAVING CLAIMED A PART OR STEP ESSENTIAL IT CANNOT BE TREATED AS NON-ESSENTIAL.

When a patentee emphasizes in his specification and makes a part of the claim allowed by the Patent Office a particular step in a particular process, which step in the process the defendant does not use, it is not allowable for him to disregard that step or to contend that it is not essential.

6. CONSTRUCTION OF PATENTS.

While a patent is to be liberally construed, so as to sustain it as a grant of the invention actually made and actually claimed, it can never by judicial construction be made to cover an invention nowhere claimed in it, and which the public has had no fair notice that the patentee intended to claim.

7. CONSTRUCTION OF CLAIM—INFRINGEMENT.

Even in a good claim for a composition of matter which is not described otherwise than by the process of making it nothing can be in infringement which is not made by the process described.

8. ABANDONMENT OF ONE FORM OF PRODUCT NO PROOF OF ABANDONMENT OF PROCESS.

The fact of the [illegible] of the [illegible] patent by [illegible] the date of the complainant's invention of asphalt blocks composed of a composition containing the same ingredients as the alleged infringing blocks, presumably because the blocks were not a commercial success, proves nothing, it not appearing that the composition of matter produced by the practice of the complainant's process had ever been tested to prove its possession of new or useful qualities which similar compositions had not before possessed.

BILL of complaint for infringement of patent.

Mr. John E. Bennett and *Mr. H. Arthur Stump* for the complainant.

Messrs. Brown & Brune, Messrs. Upham & Proctor, and *Messrs. Strawbridge & Taylor* for the defendant.

MORRIS, *J.*:

The complainant seeks relief for the alleged infringement by defendant company of Patent No. 174,648, granted to complainant March 14, 1876, as the inventor of an improvement in concrete pavements, the specifications and claim of which are as follows:

To all whom it may concern:

Be it known that I, AARON VAN CAMP, of Washington city, in the county of Washington and District of Columbia, have invented certain new and useful Improvements in Concrete Pavements for Streets and Sidewalks; and I do hereby declare that the following is a full, clear, and exact description thereof, which will enable others skilled in the art to which it appertains to make and use the same.

I take crushed and pulverized rock, sixty per centum of the finer pulverized portion, and forty per cent. of the coarser. The crushing and pulverizing process should be continued until the even or naturally smooth surface of the stone is entirely destroyed. The object of crushing and pulverizing the rock is to obtain sharp angles and rough surfaces. I use the blue limestone; but it is evident that any hard rock, bowlder, or gravel, when crushed and pulverized, will answer my purpose. The rock thus crushed and pulverized I subject to heat, so as to expel the moisture. I then add dead-oil, crude petroleum, or the residuum of petroleum until the rock becomes perfectly saturated. While thus heated I add about twenty per cent. of natural asphaltum, Cuban, Trinidad, or California, that has been previously dissolved by crude petroleum, or the residuum of petroleum, until it has assumed the consistency of bitumen or pitch.

I have found by experience that by saturating the crushed pulverized rock, as above stated, it will absorb more asphaltum and produce a more perfect concretion and cementation.

What I desire to claim and secure by Letters Patent is—

In a concrete pavement, the use of crushed and pulverized rock, when the same is heated and saturated with dead-oil, crude petroleum, or the residuum of petroleum, and mixed with natural asphaltum, Cuban, Trinidad, or California, previously dissolved to a pitch by crude petroleum or the residuum of petroleum, substantially as described, and for the purpose set forth.

The defendant denies the alleged infringement, and that is the question which will be first disposed of.

The use of crushed limestone, or other similar crushed material, combined with an asphaltic cement, to form a concrete paving material, was not in itself new at the date of Van Camp's alleged invention; nor was the heating of these materials, either separately or together, for the purpose of causing them to form a more perfect union at all new in practice. Many of the patents for improved concrete pavements put in evidence by the defendant were granted prior to Van Camp's application, and they describe concretes made of petroleum and products of petroleum mixed with asphalt and combined crushed rock in various proportions and when in a heated state. The object sought for by all the experimenters in this field was a perfect union of proper proportions of the stone with the cementation or binding ingredients, so as to form a hard and durable concrete, and each patentee claimed to have accomplished an improvement in this respect, either by some variation in the proportion of the ingredients, or the introduction of some new ingredient, or by some improved method of preparing them, or some improved process in the art of combining them.

stone or similar material with asphaltic cements are the patents granted to Foye, No. 100,697, November 29, 1870; to De Smet, No. 108,868, May 31, 1870; to Matthews, No. 114,172, April 25, 1871; to Hawes, No. 119,607, October 3, 1871; to Vandermark, No. 117,946, August 8, 1871, reissued, No. 4,501, October 10, 1871; and the British patent to Newton, No. 935, October, 6, 1871, and the British patent to Skinner, No. 1,795, January 2, 1872. These patents, together with the testimony showing the process of making asphaltic paving-blocks at Stony Point, on the Hudson, in 1872, and at Sing Sing in 1873, prove conclusively that at the date of complainant's alleged invention there was nothing new in the use of crushed stone and asphalt variously softened or tempered, nor in heating these materials to aid in effecting their combination. The claim of Van Camp, therefore, to stand at all, must be strictly confined to the proportions of the materials specified by him and to his precise process for combining them. Looking to the state of the art as disclosed by these patents and the evidence above adverted to, there was nothing else that he could lawfully claim to as a new discovery. This he seems to have been aware of, for as all crushed rock consists of some pulverized portions and some coarser parts he first specifically directs that there shall be used for his composition—

sixty per centum of the finer pulverized portion and forty per cent. of the coarser.

The next step in this process is the treatment of this crushed and pulverized material to prepare it for combination with the asphaltum, the importance of which step he states his experience has demonstrated. That the next step after first heating the crushed and pulverized rock is to perfectly saturate it with dead-oil, crude petroleum, or the residuum of petroleum. When this has been done, then the material thus prepared is to be mixed with asphaltum which has been dissolved to the consistency of pitch. He claims to have discovered that the previous saturation with oil of the crushed and pulverized stone enables it to absorb more asphaltum, and for that reason makes a more perfect combination. By no allowable construction of this patent can the previous saturation of the stone be considered as unessential, nor can the proportions so definitely stated of the finer and crushed stone be considered as immaterial, for if these are to be disregarded all that could possibly sustain the novelty of the patent would be disclaimed. In neither of these particulars does the defendant in its manufacture use the process described in the patent. It does not use the specified proportions of the stone, but uses sixty per cent. of the coarser and forty per cent. of the finer or pulverized limestone, thus reversing the proportions of the patent; and it omits entirely the previous saturation of the stone as hurtful and injurious to the special character of concrete it requires for molding under pressure into blocks, and for the same reason it does not use twenty per cent. of the softened asphaltum, but only twelve per cent.

The complainant contends that he is not confined to the proportions indicated in his specifications, but that any substantial use of the same materials in the same way is an infringement, and contends that, although the defendant may not [illegible] [illegible] sequently does so, because when the heated dry particles of stone come into contact with the asphaltum and the mass is then subjected to great pressure the oil in the asphaltum permeates into the stone. But it seems to me plain that, even if it were allowable to disregard the specified proportions of material in a patent which must be so narrowly construed, it certainly cannot be allowable to disregard the previous saturation of the stone with oil which the patentee emphasizes in his specification and makes a part of the claim allowed by the Patent Office, and which step in the process the defendant does not use. If the previous saturation of the stone is not essential to the result, but a subsequent and incidental permeation with oil is sufficient, which it would seem must always before have taken place, then the complainant claimed as essential a step which is unnecessary, and this would be fatal to his patent.

The permeation of oil into the stone must always have happened whenever heated crushed stone and asphaltum tempered with oil were combined, as was the case in nearly all the patents above mentioned. The permeation may take place in defendant's process to a somewhat greater extent, because, after the mixing is complete, it is put into a mold and subjected to a pressure of ninety tons; but I cannot see how this incidental permeation, under the pressure resulting from improved molding machinery, can be the equivalent of the previous saturation which complainant describes as necessary before the stone is brought into contact with the binding cement.

The witnesses who explained defendant's process of manufacture state that the object is to use as little oil and as little asphalt as possible, so that the paving-block when molded may contain the greatest possible per centum of stone and the least possible per centum of bituminous cementing material, relying very much upon the pressure in the mold to make the small amount of binding-cement effective. These witnesses also testify that their experience leads them to believe that the previous saturation with oil, described in the patent, and the use of the amount of asphaltum there specified, result in a material too soft and sticky to be used in defendant's machinery. I am clearly of opinion that the defendant does not infringe the process claimed in the complainant's patent. Complainant's counsel, however, urge that the patent should be construed as claiming the invention not only of a process, but also as claiming a new combination of matter—that is to say, a new paving concrete not before discovered. It is difficult to see how this contention can be supported either as a construction of the language of the patent or, if it could be shown as claimed in the patent, how it could be maintained that the process there described results in a new product. The patent does not anywhere use words which can be construed to mean that the patentee has discovered a new substance for use in pavements, or that he has discovered a new paving material. The patentee simply, and by apt and appropriate words, claims that he has invented an improvement in concrete pavements. As before shown, concrete pavements made of the same materials variously compounded were old and in common use. The result of his combination [illegible] [illegible] different in anywise from former

combinations, except that it contained a little more or less of some of the same ingredients mechanically combined, and differing from others only as the proportions of the ingredients differed, when such a mechanically-combined material is old and in common use, and has already been the subject of numerous patented improvements, both as to the proportions of ingredients and the process of manufacturing and methods of laying the pavements made of it. To say that a person who has merely altered the proportions of the ingredients or the process of combining them has discovered a new composition of matter in the sense of the patent law is to trifle with language. To be a new composition of matter the product must have some distinctly new property or be applicable to some new use. Of this there is no testimony whatever, and it is not alleged or claimed or suggested either in the bill of complaint or the patent.

With respect to the qualities or merits of the concrete made according to complainant's process, there has been no practical test. The complainant never obtained any opportunity of putting his concrete into actual use as a pavement. He only made a few experimental blocks, and produces as an exhibit one of them made by him in 1876. To all outward appearance the material of this block is not distinguishable from the material made at Stony Point on the Hudson in 1872, a specimen of which was also exhibited by the complainant. It was endeavored to be shown chemical analysis that the Stony Point material contained less mineral substance than the Van Camp block and more bituminous matter, and therefore could not have contained the same ingredients. The chemical experts differed from each other in the results obtained, and nothing convincing to support complainant's contention was established by the chemical tests. That the manufacture of asphalt blocks at Stony Point was abandoned, presumably because the blocks were not a commercial success, proves nothing, because the Van Camp material has never been put into use—never subjected to any test to prove whether or not it does possess any new or useful quality or use which similar compositions had not before possessed. The testimony tends to show that whatever reputation the defendant's manufactured blocks have obtained has resulted rather from the improved machinery and powerful presses used by defendant and the skill in manipulating the material adapted to being molded in defendant's machinery, rather than from any combination of materials differing from that used in 1872.

While a patent is to be liberally construed, so as to sustain it as a grant of the invention actually made and actually claimed, it can never, by judicial construction, be made to cover an invention nowhere claimed in it, and which the public has had no fair notice that the patentee intended to claim.

If it were necessary to say more, it might well be suggested that, even in a good claim for a new composition of matter which is not described otherwise than by the process of making it, nothing can be an infringement which is not made by the process described. (*Cochrane* v. *Badische Anilin and Soda Fabrik*, 111 U. S., 310.) The defense of non-infringement and the rejection of the claim for a new composition of matter make it unnecessary to consider other defenses set up in the answer and urged at the argument.

A decree dismissing the bill will be signed.

U. S. Circuit Court—Southern District of New York.

THOMPSON *et al.* *v.* GILDERSLEEVE.

Decided February 27, 1888.

1. SHOREY—MACHINES FOR FORMING STAPLE-SEAMS IN LEATHER.
The third claim of Patent No. 136,340, dated February 25, 1873, granted to Samuel W. Shorey, for an improvement in machines for forming staple-seams in leather, adjudged valid and to have been infringed.

2. DIFFERENCE OF PURPOSE—WHEN NO DEFENSE IN INFRINGEMENT.
It is no defense in a suit for infringement that the defendant's machine was used for forming staple-seams in paper, and not in leather, both machines operating in the same way.

3. INFRINGEMENT—WHEN NOT AVOIDED.
A claim is not avoided because the specification does not describe details of construction in elements of the claims well known in the particular art and employed only by the defendant.

4. COMBINATION CLAIM—WHAT IT INCLUDES.
A combination claim includes whatever is made a part of the combination by the words of the claim, or by necessary inference is a material part in the construction of the patent.

5. SAME.
Where the elements of a combination in a claim co-operate in a result, these parts constitute the combination claimed, and all the other parts of the machine which make these parts operate in this way to produce the result required are for that purpose equivalents of the parts of any other machine, (however different they may be in themselves,) which also make these parts operate in the same way to produce the same result.

6. INFRINGEMENT—WHEN NOT AVOIDED.
Where the defendant's anvil was made in separate parts, while the complainant's was a single piece, if the operation and results of each were the same, one construction was the equivalent of the other.

Mr. Horace Barnard for the complainants.
Mr. M. B. Philipp for the defendant.

WHEELER, *J.*:

This suit is brought for an alleged infringement of the third claim of Patent No. 136,340, dated February 25, 1873, and granted to Samuel W. Shorey, assignor to Arza B. Keith, for an improvement in machines for forming staple-seams in leather, and which is now owned by the orators.

The principal defense is non-infringement. There were such machines prior to Shorey's invention. The wire of which the staples are formed is made to pass across a bar called an "anvil," in width equal to the length of the crown of the staple, until the end projects beyond the anvil to an extent equal to a prong of the staple. Then the machine cuts the wire at an equal distance from the other side of the anvil for the other prong. A bender-foot, with a projection on each side of the anvil having a groove on the inside next to the anvil, then comes down and presses the ends of this piece of wire over the edges of the anvil, forming the staple with its crown across the top of the anvil and its prongs down the sides of the anvil in the grooves of the bender-foot. Then a driving-bar follows the bender-foot until it strikes the crown of the staple, when the anvil is withdrawn and the prongs of the staple are pressed through the sheets of leather beneath the bender-foot by the force of the driving-bar on the crown. The wire used is too fine to be stiff enough to be forced through the material by pressure on the crown of the staple without support, and until Shorey's invention holes for the prongs of the staple were punched. Shorey made the end of the anvil inclined, and had it withdrawn so that the driving-bar would strike the crown of the staple at the top of the incline and the crown would follow down and be supported by the incline as it was driven home, so that the prongs would be pressed through the material to be stapled without having holes previously prepared for them. This claim is for this inclined and retreating anvil, in combination with the bender-foot and driver, operating substantially as described. The patent describes a lever moved by a cam to so withdraw the anvil as to make the crown of the staple coincide with the incline in its descent and a spring working against the cam to return the anvil to its place for the next operation. In the defendant's machine the bender-foot forms the staple over an anvil, which is forced from beneath the crown of the staple by the driver, leaving the crown of the staple on an incline that supports the crown as it is driven home, so that the prongs are forced through the material operated upon without having holes previously made for them. The incline is moved away by the action of the driver forcing the crown of the staple down it against a spring in a direction opposite to that in which the anvil is moved, and is brought back to its place for the next operation by the action of the spring. The defendant uses his machine wholly on paper for stapling together the sheets of books and pamphlets.

One point made in behalf of the defendant is that his machine is used in forming staple-seams in paper and not in leather. The machine of the patent unites the leather by driving successive staples through the parts to be united, twisting together the prongs on the other side of the work, and forming thereby a continuous seam. The machine of the defendant does the same with sheets of paper. Either machine will operate upon either kind of material in the same manner as upon the other. The material is operated upon, and the kind of it has no effect upon the mode. The patent covers the exclusive right to the use of that part of the machine patented without restriction, and as much for new purposes as for old. (*Roberts* v. *Ryer*, 91 U. S., 150.)

Another point is that grooves in the bender-foot are necessary to support the prongs of the staple and prevent them from crippling while being driven, that such grooves are not described in the patent, and are employed for that purpose in the defendant's machine, making a different machine from the patented one. These grooves were, however, well known and in use as parts of a bender-foot for this purpose at the time of the patent. This claim is for the inclined and retreating anvil, in combination with the bender-foot and driver, and not for the bender-foot or driver. These grooves are no part of the anvil and have no share in supporting the crown of the staple while it is being driven. It was not necessary to describe them in describing the operation of the anvil for the purposes of this claim any more than it would be to describe any other parts of this intricate machine and their operation. The new part was to be described. Those parts which were old and well known would be understood without description. (*Webster Loom Co.* v. *Higgins*, 105 U. S., 580.)

Another point is that the cam and lever for withdrawing the anvil are taken by the specification into the combination of this claim, and that as the defendant does not make use of such a cam and lever he does not use that combination. Many cases are referred to which show that a patent covers only what is described in the claims, and that when a claim is for a combination whatever is made a part of the combination by the words of the claim itself or by necessary inference is a material part in the construction of the patent. (*Keystone Bridge Co.* v. *Phœnix Iron Co.*, 95 U. S., 274; *Fay* v. *Cordesman*, 109 U. S., 408; *White* v. *Dunbar*, 119 U. S., 47; *Hartshorn* v. *Saginaw Barrel Co.*, 119 U. S., 664; *Snow* v. *Railway Co.*, 121 U. S., 617.) There can be no question about this. The only question on this part of this case is whether it comes within the principles of those and other similar cases. The anvil as a former of the staple, and retreating after it is formed out of the way, was not new. The inclined part as a supporter of the crown of the staple, and retreating to give way to the crown as it is forced downward by the driver, was new. The cam and lever are necessary to draw the forming part of the anvil backward until the crown of the staple is brought to the top of the incline. Then the downward motion of the driver on the crown will force the inclined portion back while it is giving support. The cam and lever are not brought into the combination of this claim by its terms. Neither are they necessary to the operation of the inclined and retreating part of the anvil. Therefore they are not brought in by any necessary implication. This claim appears to be valid to cover this inclined and retreating anvil operating to support the crown of the staple in the manner described while the prongs are being supported by the bender-foot and the staple is being driven home by the driver. While these parts work together in this manner they are the combination of this claim, and all the other parts of the machine that make these parts operate in this way to produce the result required are for that purpose equivalents of the parts of any other machine, however different they may be in themselves, which also make these parts operate in the same way to produce the same result. (*Clough* v. *Barker*, 106 U. S., 166.)

In the defendant's machine what is called in this patent the "anvil" is divided, and the part over which the staple is formed is in one piece, and the inclined part which supports the crown of the staple while being driven is in another. But the inclined and retreating portion operates to support the crown of the staple while the prongs are supported by the bender-foot and the staple is being driven home by the driver precisely as these parts work in the combination of this claim. The forms are somewhat different, but the operation and result are the same. In this manner the defendant appears to make use of Shorey's invention as it was patented by this claim. (*Mason* v. *Graham*, 23 Wall., 261; *Jess* v. *Hamilton*, 98 U. S., 496; *Consoli-*

dated Safety Valve Co. v. *Crosby Steam Gauge and Valve Co.*, 118 U. S., 157.)

Let there be a decree that the third claim of the patent is valid, that the defendant infringes that claim, and for an injunction and an account, with costs.

U. S. Circuit Court—District of Massachusettr.

MOXIE NERVE FOOD COMPANY *v.* VARIOUS DEFENDANTS.

Decided March 14, 1888.

INFRINGEMENT—INJUNCTION.

The use of words which are technically descriptive will be enjoined where it appears that they are used as a means of effecting a fraud.

COLT, *J.:*

I have carefully considered the briefs of counsel in the above cases, and I must decline to modify the injunction order as it now stands. The power and the duty of a court of equity to restrain the use of words which may be considered descriptive where such words are used as a means of effecting a fraud is clear, it seems to me, upon the authorities cited by the plaintiff. In *Kinney* v. *Basch* (16 Am. Law Reg., N. S., 596) the court observes:

If the use of any words, numerals, or symbols is adopted for the purpose of defrauding the public, the courts will interfere to protect the public from such fraudulent intent, even though the person asking the intervention may not have the exclusive right to the use of the words, numerals, or symbols.

Mr. Rowland Cox, in a note to this case, considers this a doctrine which is now fully recognized by the courts. He says:

Words of a descriptive nature are *public juris;* but where a descriptive word is used by a person as a means of effecting a fraud an injunction will issue, especially if it appears that the descriptive word was selected by reason of its being similar to a word in use by another rather than on account of its being appropriate and well understood.

Upon the papers before me on the motions for preliminary injunctions I am satisfied, upon the ground that these defendants used the words "Nerve Food" as a means of effecting a fraud upon the public, that the present order should stand.

Motion to modify injunction order denied.

German Patent Law—Additional Official Rules.

(Translated from an official copy by W. P. Thompson & Co., of Liverpool, Manchester, and London, England.)

Whereas in applications for patents of processes for producing chemical bodies protection is demanded for whole groups of products without full explanation of the production and technical application of the individual members of such groups, and whereas samples of the products which are kept in the Patent Office constitute important evidence in the case of disputes and for the judging of new applications for patents, the following is hereby enacted in accordance with the wishes expressed by the industries concerned:

Applications for patents with reference to the production of new chemical bodies must be accompanied by two samples of these bodies, and also of the intermediate products produced in the working of the process and which at the time may yet be unknown.

These samples should be delivered in quantities of 5 to 10 grams in glass bottles of about 30 millimeters outside diameter and 80 millimeters total elevation, closed with glass stoppers and the seal of the applicant, and provided with the exact description of the contents.

In the case of tar colors, samples of dyed wool, silk, and cotton should be added. These must be attached in a proper manner on card-boards in height 280 millimeters and in breadth 210 millimeters, and must be delivered in duplicate. Three different shades of each dye should be represented. In the case of dyes which allow of quantitative dyeing a sample must be dyed with one per cent. solution, while the two other shades can be stronger or weaker according to the strength of the dye. The samples of dyeing should be accompanied by a description of the process used, with exact statements of the concentration of the vats, the mordants capable of being used, the temperature, &c., and also whether the vat employed was discolored or retained more or less of the dye-stuff.

These directions for dyeing will be printed in the patent only by the desire of the patentee.

These rules have no application to explosives, especially those belonging to Class 78.

(Signed) STÜVE,
The President of the Imperial Patent Office.

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other [illegible] to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given that [illegible] publications must not [illegible] than three copies should be transmitted. In order that the [illegible] may be properly [illegible], [illegible] should be addressed to the Assistant Librarian for convenient [illegible] reference.

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 487 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *Isaac S. McGiehan, No.* 155 *Broadway, New York,* a disbarred attorney, has been practicing under the name of *Alexander Methado.*

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 5, 1888.

Messrs. Horn & Son, No. 606 *Eleventh street Northwest, Washington, D. C.,* having satisfied the Commissioner of Patents that a circular issued by them to the effect that their attention had been directed at the Patent Office to specifications on file was not intended to create the impression that they possessed facilities for acquiring information concerning pending applications, and having assured the Commissioner that they will discontinue the publication of such circular, notice is hereby given that the condemnation of *Messrs. Horn & Son,* published in the OFFICIAL GAZETTE of May 1 and May 8, 1888, is hereby withdrawn, the language used in such circular having been an inadvertence on their part and not a matter of intention.

BENTON J. HALL, *Commissioner.*

Notice.

UNITED STATES PATENT OFFICE,
Washington, D. C., April 13, 1888.

To expedite the distribution of the mail in this Office, and to insure the prompt and certain delivery of communications to the divisions and officials having charge of the matters to which they relate, attorneys and correspondents are respectfully requested to enter upon the upper left-hand corner of amendments and other communications, if known to them, the number of the room and the name of the examiner or designation of the division to which the communication should be sent.

BENTON J. HALL,
Commissioner of Patents.

5,607.—Title: "SANDS' RHEUMATIC SPECIFIC."—*P. A. Sands & Son*, Gallipolis, Ohio. Application filed April 26, 1888.

5,608.—Title: "FLY PAPER."—*Henry S. Winship*, New Haven, Conn. Application filed April 30, 1888.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 6,191 and upward are registered under the act of March 3, 1881.]

15,476.—PLASTER COMPOSITIONS FOR ARCHITECTURAL PURPOSES.—*Adamant Manufacturing Company*, Syracuse, N. Y. Application filed April 16, 1888. Used since January 1, 1887.
"The word 'ADAMANT.'"

15,477.—STARCH, BLUE, AND OTHER LAUNDRY PREPARATIONS.—*Jesse Ascough*, Handsworth, near Birmingham, county of Stafford, England. Application filed February 17, 1888. Used since 1876.
"A label having its surface printed in a design representing crystals."

15,478.—MEDICAL COMPOUNDS FOR CURING SKIN DISEASES.—*Benno Jaffé & Darmstaedter*, Charlottenburg, near Berlin, Germany. Application filed March 16, 1888. Used since February 1, 1888.
"The word 'ANTHRAROBINE.'"

15,479.—PREPARATIONS OF COCOA AND CHOCOLATE.—*Benedorp & Co.*, Amsterdam, Holland. Application filed March 29, 1888. Used since November 16, 1881.
"The letters and character 'B & Co' inclosed within a dotted oval frame, which is surmounted by a royal crown."

15,480.—SALVE.—*Augustus Berthold*, St. Louis, Mo. Application filed March 14, 1888. Used since December 1, 1887.
"The representation of a wolf's head."

15,481.—SALVE.—*Augustus Berthold*, St. Louis, Mo. Application filed April 19, 1888. Used since December 1, 1887.
"The word 'WOLF.'"

15,482.—STAINS FOR MORTARS AND CEMENTS.—*S. Bowen's Sons*, Philadelphia, Pa. Application filed April 2, 1888. Used since February 15, 1888.
"The representation of a triangle."

15,483.—HARD SOAP.—*Butler Brothers*, Chicago, Ill., and New York, N. Y. Application filed April 12, 1888. Used since January 7, 1888.
"The words 'BASE BALL.'"

15,484.—WOVEN COTTON AND WOOLEN FABRICS.—*China and Japan Trading Company*, (*Limited*,) New York, N. Y. Application filed April 24, 1888. Used since April 7, 1888.
"The representation of a moose."

15,485.—MEDICAL POWDERS.—*Charles F. Cleaveland*, Indianapolis, Ind. Application filed April 16, 1888. Used since June 15, 1886.
"The word 'DESICCATOR.'"

15,486.—COTTON UNDERWEAR.—*Abraham Cohen*, Boston, Mass. Application filed April 11, 1888. Used since January 1, 1888.
"The words 'THE SUBSTANTIAL LADIES' UNDERWEAR MANUFACTORY' and a monogram of the letters 'A' and 'C.'"

15,487.—PERFUMERY.—*The Dousson French Perfumery Company*, New Orleans, La. Application filed March 5, 1888. Used since December 1, 1887.
"The words 'THE SUNNY SOUTH.'"

15,488.—RUBBER BOOTS, SHOES, UMBRELLAS, AND COMBINATIONS THEREOF.—*Dunlap, Lennox & Field*, Chicago, Ill. Application filed February 24, 1888. Used since January 1, 1887.
"The picture of a duck with the word 'BRAND' thereon."

15,489.—PILLS, LIVER-PAD, TONIC, COUGH-SYRUP, AND FEMALE REGULATOR.—*David R. Fly & Co.*, Galveston, Tex. Application filed March 8, 1888. Used since February 1, 1887.
"The representation of a domestic fly."

15,490.—METAL TABLE-WARE.—*The Holmes & Edwards Silver Company*, West Stratford, Conn. Application filed April 5, 1888. Used since March 12, 1888.
"The word 'ORIENTAL.'"

15,491.—TOILET APPLICATION FOR THE SKIN.—*Louise H. Gordon*, Boston, Mass. Application filed March 12, 1888. Used since January 1, 1888.
"The name 'PONCE DE LEON.'"

15,492.—SMOKING AND CHEWING TOBACCO.—*Gradle & Strotz*, Chicago, Ill. Application filed April 19, 1888. Used since November 9, 1888.
"The representation of a steam fire-engine drawn by horses in full run."

15,493.—CORSETS.—*Catharine A. Griswold*, New York, N. Y. Application filed April 12, 1888. Used since December, 1887.
"The word 'JOSITA.'"

15,494.—CORSETS.—*Catharine A. Griswold*, New York, N. Y. Application filed April 12, 1888. Used since December, 1887.
"The letters 'H. J.'"

15,495.—HARNESS-SOAP.—*John M. Gwinnell*, Newark, N. J. Application filed April 2, 1888. Used since January 1, 1888.
"The word 'CRESWICK.'"

15,496.—RUBBER HOSE.—*Harper & Reynolds Company*, Los Angeles, Cal. Application filed March 29, 1888. Used since May 1, 1888.
"The letters 'I X L.'"

15,497.—TOOTH POWDER OR PREPARATION.—*The Horsey Manufacturing Co.*, Utica, N. Y. Application filed December 13, 1887. Used since November 12, 1887.
"The word 'PURITY.'"

15,498.—RIBBONS.—*Johnson, Coudin & Co.*, New York, N. Y. Application filed April 20, 1888. Used since February 1, 1884.
"A monogram consisting of the letters 'J C Co.' and the character '&.'"

15,499.—RIBBONS.—*Johnson, Coudin & Co.*, New York, N. Y. Application filed April 20, 1888. Used since February 1, 1884.
"The word 'LEADER.'"

15,500.—ILLUMINATING AND LUBRICATING OILS.—*Kosmic Oil Co.*, New York, N. Y. Application filed March 9, 1888. Used since March 7, 1888.
"The word 'KOSMIC.'"

15,501.—KNIT WEARING-APPAREL.—*The Lackawanna Mills*, Scranton, Pa. Application filed April 12, 1888. Used since 1887.
"The word 'LACKAWANNA.'"

15,502.—HORSE-NAILS.—*Livingston Nail Co.*, New York, N. Y. Application filed April 3, 1888. Used since 1878.
"The word 'ANCHOR,' or the representation of an anchor."

15,503.—TOILET-SOAP.—*Maine Balsam Fir Co.*, Boston, Mass. Application filed February 13, 1888. Used since September 1, 1886.
"The words 'BALSAM FIR,' imprinted upon a landscape-picture comprising a hill covered with trees, with a female figure in the foreground and a body of water at the foot of the hill."

15,504.—TIN PLATES AND TERNE PLATES.—*Merchant & Co.*, Philadelphia, Pa. Application filed April 17, 1888. Used since July 1, 1887.
"The word 'ALASKA.'"

15,505.—COTTON FABRICS OF ALL KINDS.—*Lancaster Mills*, Clinton and Boston, Mass. Application filed March 28, 1888. Used since August 1, 1888.
"The word 'NORMANDIE.'"

15,506.—SHIRTS AND HOSE.—*Joseph Carlos Moore*, Montreal, Quebec, Canada. Application filed March 12, 1888. Used since January 1, 1888.
"The words 'NEROLINE, SANSREGRET BOUDOIR.'"

15,507.—WORSTED, WOOLEN, SILK, AND COTTON YARNS.—*Newmarket Worsted Company*, Newton and Boston, Mass. Application filed March 12, 1888. Used since January 1, 1888.
"The words 'FORGET ME NOT.'"

15,508.—WORSTED, WOOLEN, AND SILK YARNS.—*Newmarket Worsted Company*, Newton and Boston, Mass. Application filed March 14, 1888. Used since November 15, 1887.
"The word-symbol 'FLEUR DE LIS.'"

15,509.—POTATO-FLOUR AND POTATO-STARCH AND ALL POTATO-STARCH PRODUCTS, INCLUDING DEXTRINE.—*The Norddeutsche Kartoffelmehl Fabrik*, Cöstrin, Germany. Application filed February 8, 1888. Used since October 16, 1875.
"The representation of an anchor."

15,510.—LEATHER BELTING.—*W. S. Nott Company*, Minneapolis, Minn. Application filed April 9, 1888. Used since January 1, 1888.
"The word 'DIAMOND' and a figure of diamond shape."

15,511.—REFINED COPPER.—*Oxford Copper Company*, New York, N. Y. Application filed November 30, 1887. Used since January 1, 1888.
"The letters 'O. A.'"

15,512.—FRESH OYSTERS, FRUITS, AND VEGETABLES IN CONTRADISTINCTION TO CANNED OR PRESERVED GOODS.—*C. H. Pearson & Co.*, Baltimore, Md. Application filed January 27, 1888. Used since 1881.
"The word 'PERISHABLE.'"

15,513.—MORTAR COLORS OF ALL SHADES AND TINTS.—*Ricketson Mineral Paint Works*, Milwaukee, Wis. Application filed February 24, 1888. Used since December 1, 1887.
"The words 'RED BRICK.'"

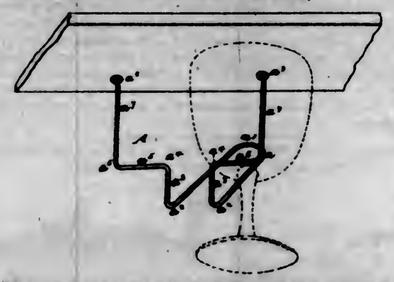
15,514.—EXPECTORANT MEDICINE.—*William H. Riker*, New York, N. Y. Application filed February 2, 1888. Used since October, 1883.
"The representation of a man in a standing attitude looking upward, with the hands clasped and raised as in prayer."

15,515.—CORSETS AND OTHER WHITE UNDERWEAR.—*Rosenthal, Fletscher & Co.*, Göppingen, Germany. Application filed April 10, 1888. Used since July 8, 1887.
"The letters 'R F C' in conjunction with the words 'A LA PRINCESSE.'"

15,516.—SHIRTS.—*V. Henry Rothschild & Co.*, New York, N. Y. Application filed March 1, 1888. Used since October, 1887.
"The representation of a dog's head and the word 'RESOLUTE.'"

15,517.—SHIRT-BOSOMS.—*Joseph Schloss*, New York, N. Y. Application filed April 28, 1888. Used since April 1, 1886.
"The word 'PROTECTION.'"

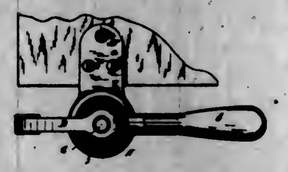
15,518.—SHIRT-BOSOMS.—*Joseph Schloss*, New York, N. Y. Application filed April 28, 1888. Used since April 1, 1888.
"The words 'TARIFF FOR REVENUE.'"



15,519.—PERFUMED SOAPS, COSMETICS, HAIR-OILS, AND PERFUMES.—*William Sparks Thomson*, London, England. Application filed April 28, 1888. Used since November 1, 1887.
"The word 'ORCHIDEA.'"

15,520.—RADIATORS.—*Thomas H. Williams* and *Samuel D. Tompkins*, Jersey City, N. J. Application filed April 13, 1888. Used since February 15, 1887.
"The word 'ELITE.'"

PATENTS



GRANTED MAY 22, 1888.

383,092. GOBLET-HOLDER. Rasmus C. Bates, Newport, R. I. Filed Nov. 14, 1887. Serial No. 255,070. (No model.)

Claim.—A new article of manufacture consisting of a goblet-holder made of a single piece of wire bent on a right angle at a^2 a^3 a^4 to form arms a^2 a^3, bent at a to form the U-shaped seat a', and provided with the right-angled end eyes, a^4 a^4, as shown and described.

383,093. CORK-EXTRACTOR. Ebenezer J. Brown, Cleveland, Ohio, assignor of one-half to Robert H. Beggs, same place. Filed Oct. 31, 1887. Serial No. 253,544. (No model.)

Claim.—1. The combination of standard A, provided with yoke-arm B and having a central opening, said yoke-arm provided with a slot, b', located in the same vertical plane with opening in said standard, corkscrew G, having loose bearing at its upper portion in said slot b', and at its lower portion in the opening in said standard, lever C, pivotally connected with said yoke-arm and corkscrew, and nut b^2, through which said corkscrew has thread engagement, substantially as set forth.

2. The combination of standard A, having opening f, and provided with yoke-arm B, said arm provided with slots b b', the latter slot located in the same vertical plane with the opening in the standard, nut A, fitting loosely in said opening, lever C, pivoted in slot b and having a slot, d, and corkscrew G passing through slot d, and provided with shoulders d' d^2, with which said lever engages, said cork-screw having loose bearing in its upper portion in slot b', and at its lower portion in the opening of the standard, and having threaded bearing in nut A, substantially as set forth.

3. The combination of standard A, provided with flange a, central bore, f, and yoke-arm B, said arm provided with slots b b', the latter slot located in the same vertical plane with the opening in the standard, nut A, fitting loosely in said opening, lever C, pivoted in slot b at right angles to flange a, and having a slot, d, and corkscrew G passing through slot d, and provided with shoulders d' d^2, with which said lever engages, said corkscrew having loose bearing in its upper portion in slot b', and at its lower portion in the opening of the standard, and having threaded bearing in nut A, substantially as set forth.

383,094. CULTIVATOR. Hiram Bond, Wilmot, Ind. Filed Nov. 19, 1887. Serial No. 255,610. (No model.)

Claim.—In a plow substantially as described, the combination, with the jointed standard having the attaching-flange T formed thereon and provided with apertures, the wing A, and the point g, of the form shown, respectively secured to the said flange flush with each other, substantially as specified.

383,095. DIFFERENTIAL EXPANSION DEVICE FOR GALVANOMETERS. William H. Bristol, and William H. Smith, Rahway, N. J. Filed Feb. 24, 1888. Serial No. 265,146. (No model.)

Claim.—1. A compound or differential expansion bar or device composed of two parts secured together in series, and both having the same coefficient of expansion, but differently susceptible to the heating effect of an electric current passed through them, as set forth.

2. A compound or differential expansion device composed of two strips or conductors secured together in series, and both composed of the same metal, but differing in cross-section, or radiating-surface, or both, as set forth.

3. In a compound or differential expansion bar or device, the combination, with two metal strips or parts having each the same coefficient of expansion and united at one end, of insulated fastenings securing at intervals the two parts together and electric terminals for passing a current through the parts in series, as set forth.

4. A differential expansion device consisting of two conductors, both having the same coefficient of expansion secured together but insulated, except at one end, one being in the form of a flat strip and the other in the form of a rounded bar or wire, as set forth.

5. The combination, with a differential expansion-bar composed of two conductors connected in series and having the same coefficient of expansion, but differently susceptible to the heating effect of an electric current passed through them, of a scale and pointer, and intermediate mechanism for imparting movements of the bar to the pointer, as set forth.

383,096. ANTI-INDUCTIVE COMPOSITION FOR ELECTRIC CABLES. David Brooks, Jr., Philadelphia, Pa., assignor to the Electric Cable Constructing and Maintenance Company, same place. Filed Dec. 4, 1886. Serial No. 220,643. (No specimens.)

Claim.—1. A composition, for the purpose set forth, consisting of plumbago, gum-copal, linseed-oil, and turpentine, substantially as described.

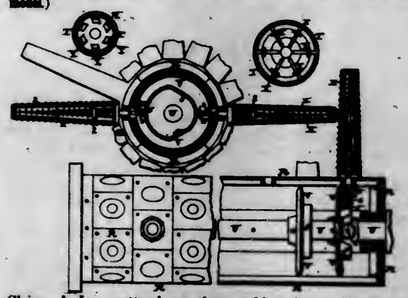
2. A composition, for the purpose set forth, consisting of a carbonaceous gum composed of a powdered electrical conducting material, gum-copal, linseed-oil, and turpentine, substantially as described.

383,097. SUPPORT FOR ELECTRIC WIRES. DAVID BROOKE, Jr., Philadelphia, Pa., assignor to the Electric Cable Construction and Maintenance Company, same place. Filed Dec. 4, 1886. Renewed Mar. 3, 1888. Serial No. 266,100. (No model.)

Claim.—1. A support for an electric cable, formed of a hanger having a bed with a hook at the top and an eye at the bottom, said eye being adapted for the attachment of a tie-wire, the parts being combined and operating substantially as described.

2. A support for an electric wire or cable, having a hanger formed of a hook at the top and a bed with shoulders on its under side, substantially as described.

3. A hanger for an electric wire or cable, formed with a bed having an eye for attaching a tie-wire, substantially as described.



383,098. COVERING FOR ELECTRIC WIRES AND CABLES. DAVID BROOKE, Jr., Philadelphia, Pa., assignor to the Electric Cable Construction and Maintenance Company, same place. Filed Dec. 4, 1886. Renewed Mar. 3, 1888. Serial No. 266,101. (No specimens.)

Claim.—1. The process of covering electric wires, consisting in first covering the wires with a fibrous tape saturated with an insulating compound, then inclosing the same in a plastic rubber preparation with interlying canvas wrappings and powdered sulphur, and then placing the wires thus covered in a vulcanizing-furnace and subjecting the same to a heat of 265° Fahrenheit until the rubber is vulcanized, all substantially as described.

2. An electric cable formed of wires covered with fibrous material saturated with an insulating compound and a vulcanized-rubber coating with interlying canvas wrappings, all substantially as and for the purpose set forth.

3. An electric cable consisting of wires each of which is covered with a wrapping of fibrous material saturated with an insulating composition, the whole covered with layers of vulcanized rubber and canvas, all substantially as described.

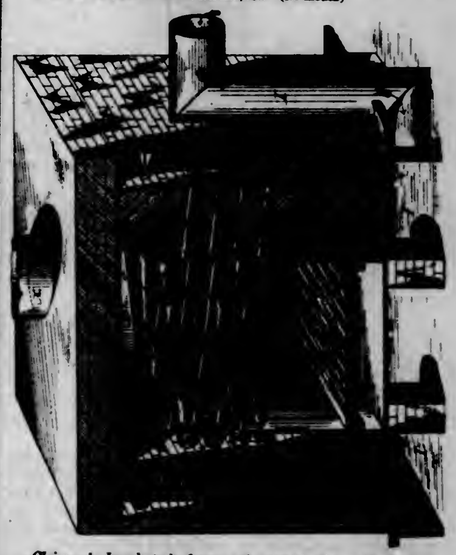
383,099. COTTON-HARVESTER. OWEN T. BOSS, Louisville, Ky., assignor, by mesne assignments, to the United States Cotton Harvester Company, of New York. Filed Sept. 16, 1882. Serial No. 108,742. (No model.)

Claim.—1. In a cotton-harvesting machine, the combination of revolving cylinders provided with revolving perforated fingers, barbs placed within the fingers, and mechanism for retracting the barbs at certain points, substantially as specified.

2. In a cotton-harvesting machine, the combination of revolving cylinders, revolving perforated fingers mounted thereon, means for causing the fingers to revolve, barbs placed inside of the fingers, a spring-actuated rod provided with an expanding or contracting device for operating the barbs, and mechanism for imparting an endwise movement to the rod, substantially as specified.

3. The combination, in a cotton-harvesting machine, of revolving cylinders, perforated fingers provided with inclosed barbs adapted to be projected and withdrawn and mounted on the cylinders, a stationary rod placed inside of each cylinder, a series of annular gears on the rod, and pinions connected to the fingers to cause them to revolve while the cylinder is in motion, substantially as shown and described.

4. In a machine for harvesting cotton, the combination of the revolving cylinders, the mechanism for operating them, the stationary rods placed inside of the cylinders and provided with stationary gears having the cam-flanges 5, the rotating fingers having pinions for engaging the stationary gears, barbs placed within the fingers, and endwise spring-actuated rods for moving the barbs, the rods being moved in one direction by means of the springs and in the other direction by means of the cam-flanges, substantially as described.



5. In a cotton-harvesting machine, the combination of a series of revolving perforated fingers, a suitable moving body or bodies to which the fingers are attached, barbs placed inside of the fingers, means by which the said barbs are forced out and then retracted, and mechanism for cleaning the cotton from the fingers after the barbs have been retracted, substantially as set forth.

6. The combination of the fingers of the plates Y, carrying the barbs X, the rods 1, and the expanding and contracting mechanism, substantially as specified.

7. In a machine for harvesting cotton, the combination of a revolving cylinder, a series of revolving fingers mounted thereon, a series of barbs inside of said fingers adapted to be projected and withdrawn, and a series of cars, cams, and springs inside of said cylinder for revolving the fingers and operating the barbs, substantially as specified.

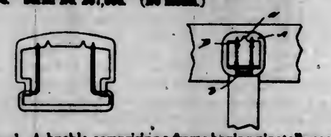
8. The combination of the revolving cylinder provided with a series of revolving barbed fingers, the belts *a*, and revolving shafts 6, the belts being passed around the cylinders and shafts for the purpose of stripping the adhering cotton from the fingers, substantially as shown.

383,100. HOT-AIR FURNACE. HENRY CALLAHAN, Dayton, Ohio. Filed Nov. 16, 1887. Serial No. 255,347. (No model.)

Claim.—1. In a hot-air furnace, the combination, with the fire-box, of the compartment above the same, the walls A, inclosing the said fire-box and compartment and forming a hot-air chamber, the outer cold-air flues, B, and the pipes D, extending from said flues and diagonally upward through said upper compartment and opening at a higher point into the hot-air chamber upon the opposite side of the furnace, substantially as set forth.

2. In a hot-air furnace, the combination of the fire-box, an upper compartment above said box, walls inclosing the fire-box and upper compartment and forming a hot-air chamber, the outer cold-air flues, the pipes extending through said upper compartment from one side to the other and opening into the hot-air chamber, and separable pipe-sections connecting the cold-air flues with the ends of the first-mentioned pipes, substantially as set forth.

3. In a hot-air furnace, the combination, with the fire-box and the upper compartment, of the walls A, inclosing said fire box and compartment and forming a hot-air chamber, the outer walls, C, forming with the first-mentioned walls cold-air flues, and pipes extending from said flues diagonally upward through the said upper compartment and to the hot-air chamber upon the opposite side of the furnace, substantially as set forth.

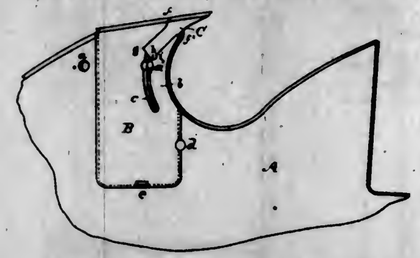


4. In a hot-air furnace, the combination, with the fire-box and the compartment above the same, of the heavy heating-pipes B, extending across said compartment, the separable sections E, of light material, forming extensions of said pipes, the inclosing-walls A, and the cold-air flues communicating with the outer ends of said sections, substantially as set forth.

383,101. WATER AND FIRE PROOF COMPOSITE ROOFING. WILLIAM CRAIG, Wilkes-Barré, Pa. Filed Dec. 8, 1887. Serial No. 257,373. (No model.)

Claim.—The improved roofing and siding herein described and shown, consisting of sheets formed of alternating layers of paper and white lead and provided with overlapping edges, a coating of shellac to secure the same to the base, and a fire-proof coating on the outer faces of the sheets, as specified.

383,102. BUCKLE. NELSON CLEMENT, Chicago, Ill. Filed Mar. 19, 1888. Serial No. 267,668. (No model.)

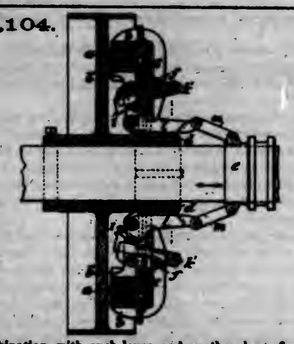


Claim.—1. A buckle comprising a frame having pivotally secured to one side thereof a double flexible tongue, and having a slot or opening in the bar of the buckle opposite the pivot of the tongue and adjacent to its ends, whereby to permit the passage of the tongue from one side of the frame to the other, substantially as described.

2. In a buckle, the combination of a frame, A, and a double flexible tongue formed of a single wire pointed at each end and bent into a U form, pivotally secured to one side of the frame, said frame having a notch or opening, *a*, to permit the passage of the tongues from one side of the frame to the other, substantially as described.

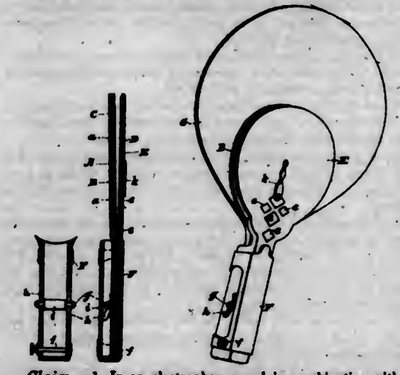
3. In a buckle, the combination of a frame, A, provided with notch *a*, tongue B, pivotally secured thereto, and extension C, having transverse slots *c* in said extension, substantially as described.

383,103. INSERTED SAW-TOOTH. FRANCIS W. OTIS, San Francisco, Cal. Filed Oct. 7, 1887. Serial No. 251,771. (No model.)



Claim.—The inserted saw-tooth herein described, consisting, essentially, of the holder B, oblong in shape, fitted in a recess in the saw-plate and set lengthwise upon an approximately radial line, the upper half of the forward edge of the holder extending beyond the recess and having a spring, *b*, to hold the cutting-bit in place, adapted to spring forward unobstructed by the saw-plate, a cutting-bit, C, inserted in the upper forward corner of the holder in a recess cut diagonally therein, and a saw-plate with recesses to receive the bit-holders, the edges of which extend the entire length of the back edge of the holder along the bottom and up the forward edge to the root of the spring *b*, all combined as and for the purpose described.

383,104. FRICTION-CLUTCH. HELEN C. (NEWELL) CRAYHANGER, Cuyahoga Falls, Ohio. Filed Jan. 23, 1888. Serial No. 262,182. (No model.)



Claim.—In a friction-clutch having reversely-moving jaws and a lever for moving such jaws pivoted upon an arm moving with the shaft,

383,104.

the combination, with such lever and another lever for moving the first-named lever, also moving with the shaft, of an inclined piece interposed between said two levers and provided with means of adjustment, substantially as described.

383,105. ELECTROPHORUS. JAMES D. GILP, San Felipe, Cal. Filed Sept. 10, 1885. Serial No. 176,666. (No model.)

Claim.—1. In an electrophorus, and in combination with the inducing and induced plates thereof, the sole provided with an insulating plate or cover on the opposite side from the inducing-plate, substantially as described.

2. An electrophorus having two pins extending from the sole through the inducing-plate, substantially as described, in contradistinction to an electrophorus with a single pin, or with more than two pins, arranged at the corners of a triangular or other figure.

3. In an electrophorus, and in combination with the sole and the inducing-plate, the induced plate formed of a thin metal sheet or foil and the non-conducting backing to the same, substantially as described.

4. In an electrophorus, and in combination with the sole and the inducing-plate, the induced plate formed of a thin metal sheet or foil and the non-conducting backing to the same, having a handle insulated from the induced plate formed on said backing, substantially as described.

5. An electrophorus having the two parts thereof, one containing the induced plate and the other the inducing-plate and the sole, hinged together, and provided with a non-conducting plate, with which said hinge is connected, and whereby the induced plate is insulated from the sole, substantially as described.

6. An electrophorus comprising the inducing-plate, the sole, the insulating plate or cover on the opposite side of the sole from the inducing-plate, the induced plate, and the backing of said induced plate, substantially as described.

7. An electrophorus having the two parts, whereof one part comprises the induced plate and the other the inducing-plate and sole, provided each with a lateral extension which serves or may serve as a handle, that on the induced plate being insulated therefrom, and that on the other part having an exposed conductor connected with the sole, substantially as described.

8. An electrophorus having the two parts, whereof one part comprises the induced plate and the other the inducing-plate and sole, provided one with a hollow handle and the other with an extension into

said handle, and having a hinge between said parts, substantially as described.

9. An electrophorus provided with a handle and having the two parts hinged together, one part being free to move toward and away from the other when the instrument is wagged, substantially as described.

10. An electrophorus having the two parts provided each with a lateral extension which may serve as a handle, and detachably connected by a hinge-joint, so that said electrophorus may be used with the parts detached or connected, the handle or extension on the one part being insulated from the induced plate and on the other provided with an exposed conductor electrically connected with the sole, substantially as described.

11. An electrophorus having two parts, each provided with a lateral extension which may serve as a handle, one part comprising the induced plate and the backing therefor and having the handle insulated from the induced plate, and the other part comprising the inducing-plate, sole, and cover, and having in the handle an exposed conductor electrically connected with the sole, substantially as described.

12. The combination, with the two parts of an electrophorus hinged together, of an adjustable stop for limiting the motion of said parts away from each other, substantially as described.

13. The combination, with the two parts of an electrophorus, of a hollow handle on one part, an extension of the other part into said handle, and the adjustable stop or pin, substantially as described.

14. An electrophorus having one of the two parts provided on the back or outside with two or more points or electrodes separated by a suitable space to be leaped by the spark when the induced plate is discharged, substantially as described.

15. The combination, with the electrophorus, of two or more sparking points or electrodes and a switch, all in the discharging-circuit of the electrophorus, substantially as described.

16. An electrophorus having in the discharging-circuit points or electrodes arranged to leave two at the least paths of about equal resistance for the sparks to pass, substantially as described.

17. In combination with a fan, an electrophorus having a portion free to vibrate under the to-and-fro motion of the fan for the generation of ozone or production of sparks or other purpose, substantially as described.

18. The method of working an electrophorus for the generation of ozone by applying at intervals the induced plate of a suitable electrophorus to the inducing non-conductor thereof and removing said plate from said non-conductor after each application, and causing the electrical charges thus repeatedly induced to be discharged slowly or as brushes, substantially as described.

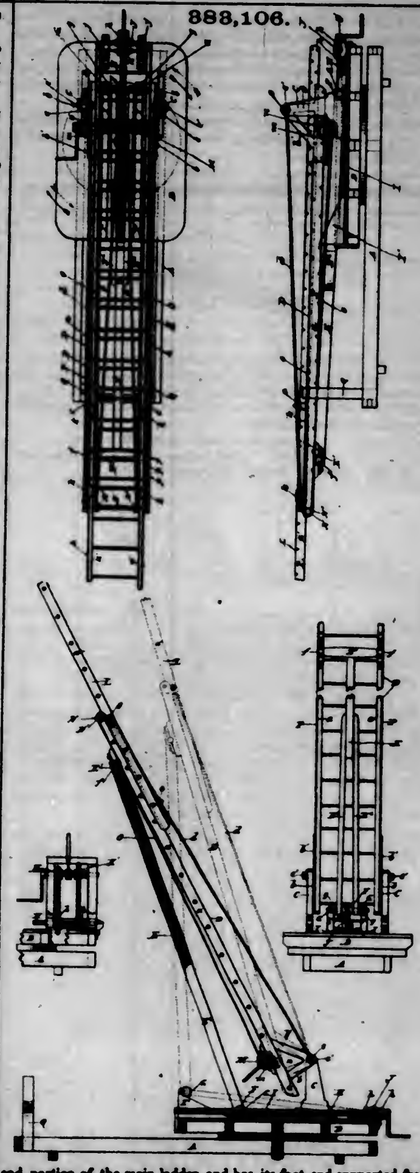
19. An electrophorus having the two parts hinged together and provided with an inducing-plate disconnected from sparking points or electrodes, substantially as described.

20. An electrophorus having the two parts provided each with a lateral extension which may serve as a handle, and the induced plate disconnected from sparking points or electrodes, substantially as described.

21. An electrophorus having the two parts hinged together and provided on the back or outside with sparking points or electrodes, substantially as described.

22. An electrophorus having the two parts hinged together and provided on the back or outside with sparking points or electrodes, and provided also with a switch or circuit-changer in circuit with said points or electrodes, substantially as described.

23. An electrophorus having a non-conducting backing on the induced plate and sparking points or electrodes on the said backing in the discharging-circuit of said induced plate, substantially as described.



388,106. EXTENSION FIRE-LADDER. LEVI DEMAREST, Albany, N. Y. Filed Apr. 5, 1887. Serial No. 233,606. (No model.)

Claim.—1. In an extension fire-ladder, the combination, with a platform and posts projected from its upper side, of a ladder provided at its foot end with the angular suspension-brackets projected above the plane of its face side, and the pivot-connections between said brackets and posts, substantially as and for the purposes set forth.

2. In an extension-ladder, the combination, with a platform, supporting-posts rigidly secured to said platform, and a ladder which is pivoted to said posts at the outer-end portions of its brackets *b b*, and adapted to be raised and set at any selected angle, of the truss-rods *d d*, arranged at an angle in relation to the side rails of said ladder and securely connected with the upper ends of the side rails and with the outer ends of brackets *b b*, which are secured to the foot-end portions of said side rails, and the tie-loops *e e* between the upper ends of said side rails and said brackets, substantially as and for the purposes set forth.

3. In an extension fire-ladder, the combination, with the main ladder, on which a sliding ladder is supported when extended, and a supporting-prop, R, which is jointed at its upper end with the upper-

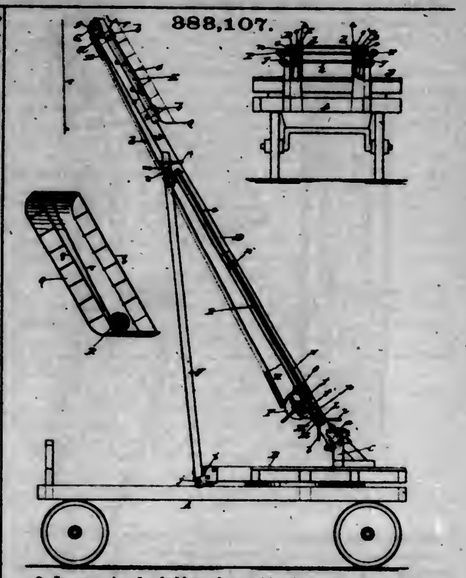
388,106.

end portion of the main ladder and has its foot end supported from the platform the main ladder is pivoted to, of the truss-rods *d d*, suspension-brackets *b b*, and tie-loops *e e*, having each secure connection with said ladder, as shown and described, whereby the strain on the main ladder from the leverage of the sliding ladder will be sustained by said brackets, rods, and loops, substantially as and for the purposes set forth.

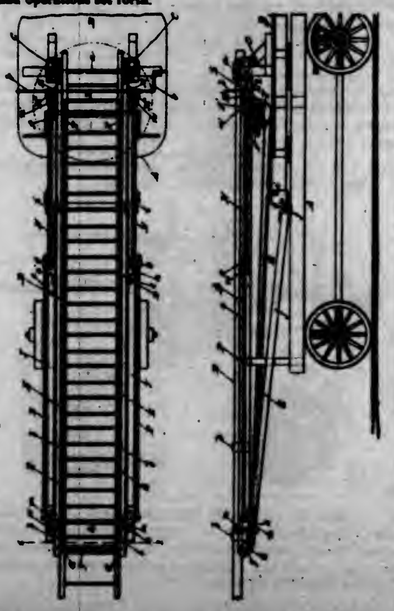
4. In an extension fire-ladder, and in combination with the lower ladder and its sliding or upper ladder, the former suspended by angular brackets secured to its foot-end, a windlass provided with a ratchet-wheel and pawl on the foot-end portion of the lower ladder, sheaves at the upper end, and ropes over said sheaves connecting with the windlass at one end and with the lower-end portion of the sliding ladder by its opposite end, substantially as and for the purposes set forth.

5. In an extension fire-ladder, and in combination with a main ladder which is jointed by means of suspension-brackets with supporting-posts which are stationary in relation to the platform of the apparatus, a supporting-prop which is jointed with the main ladder and provided on its foot end with a screw-threaded nut, and the screw-threaded shaft held with the platform from moving endwise and adapted to be revolved at will within said nut, whereby the foot end of said supporting-prop will be moved away from the jointed and stationary foot end of the main ladder when the latter is being elevated, substantially as and for the purposes set forth.

6. In an extension fire-ladder, the combination, with the propping-piece jointed with the main or lower ladder, of the trucks secured to the platform, roller-nut provided with flanged rollers and jointed with the foot end of the said propping-piece, and the screw-shaft operated at will with its screw-threads holding with said nut and its head end holding with a block secured to said platform, substantially as and for the purposes set forth.



7. In an extension fire-ladder, the combination, with the propping-piece of the main or lower ladder, and flanged rollers secured to the foot end of said propping-piece, and the horizontal plain tracks and inclined tracks connecting with the horizontal tracks, of a screw-shaft which holds with a nut attached to the foot end of the said propping-piece and with a block secured to the platform, substantially as and for the purposes set forth.



388,107. EXTENSION FIRE-LADDER. LEVI DEMAREST, Albany, N. Y. Filed Apr. 11, 1887. Serial No. 234,269. (No model.)

Claim.—1. In an extension fire-ladder, the combination, with a main ladder which has a jointed connection at its foot, and with a platform or pieces secured to the same, of a prop-lever which has its base end also jointed with the said platform and its opposite end extended rearwardly or upwardly, and serving by a sliding connection with the main ladder to support the rearward or upper end or portion of said main ladder at different points on the same, accordingly as said prop-lever has its rearward or upper end elevated by force applied to the same, substantially as and for the purposes and operations set forth.

2. In an extension fire-ladder, the combination, with a main ladder which is jointed at its foot end with the platform or posts secured to the same, of prop-levers which have their foot ends jointed with said platform at a point at a distance rearward of the point of joint of the said main ladder with the platform, and have their rearward or upper ends connected by a sliding connection with the main ladder and in normal idle position elevated to a plane relatively above the plane of the center of motion of said levers, and having connections with draw-rods, or their described equivalents, which operate to pull on the said ends to elevate the same, substantially as and for the purposes and operations set forth.

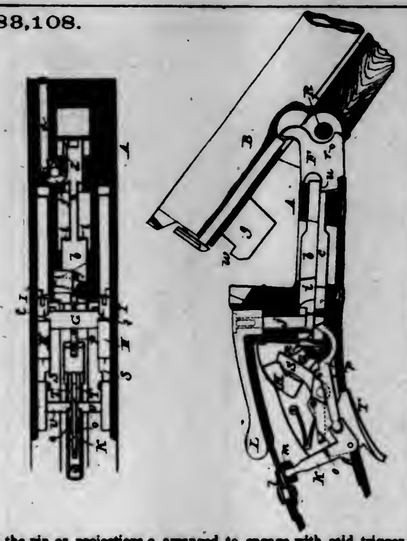
388,107.

3. In extension fire-ladders, the combination, with a main ladder jointed at its foot end with a platform or posts secured to the same, and the prop-levers which have their foot ends also jointed to said platform and at a distance from the connecting-joint of said ladder with the platform, and have their rearward ends supporting the rear end portion of the main ladder, and also free to be moved upwardly and forwardly to elevate the said ladder to different angles of inclination, of the revolving screw-shafts, and nuts which hold said screw-shafts in connection with draw-rods which are connected with the rearward ends of said prop-levers, substantially as and for the purpose set forth.

4. In extension fire-ladders, the combination, with prop-levers which are jointed with a platform at a point rearward to the point of joint of the main ladder with the same, and which have their free rearward or upper ends supporting the rear end portion of the main ladder, and draw-rods P, connected with nuts which work on the screw-shafts N, of gear mechanism which can be operated at will for revolving said screw-shafts, substantially as and for the purpose set forth.

5. In extension fire-ladders, the combination, with the side rails of the main ladder and ropes of the windlass moving the sliding ladder on said main ladder, of the protecting-cases H, containing the portions of said ropes which are below said main ladder, substantially as and for the purposes set forth.

6. In extension fire-ladders, the combination, with the ropes of the windlass which moves the sliding ladder on the main ladder, of the grooves A, made in the lower side of the side rails of the sliding ladder, substantially as and for the purposes set forth.

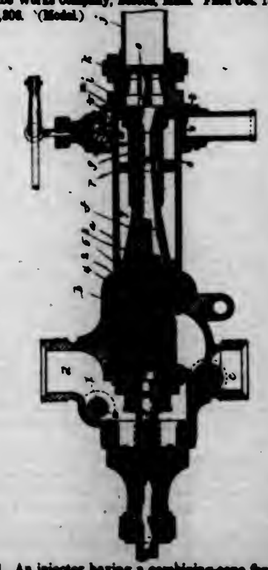


388,108. BREECH-LOADING GUN. LOUIS P. DEB, Ilion, N. Y. Filed Feb. 15, 1888. Serial No. 264,473. (No model.)

Claim.—1. The combination, in a tip-barrel gun, of the frame A, provided with the central longitudinally-sliding locking-bolt, *b*, provided with the shoulder *d*, the pivoted rocker *f*, provided with the shoulders *e* and *d'*, and the longitudinally-sliding stop-pin *a*, with the pawl F, pivoted to the under side of the barrels and arranged to fit in the recess in the frame in front of the locking-bolt, whereby the movement of the locking-bolt is limited and the dismounting of the barrels prevented until the fore-arm of the stock is detached, the said parts being arranged in relation to each other, substantially as shown and described.

2. The hammer H, provided on its inner side with a curved rib or projection having the notches 1 and 2 formed therein, in combination with the pivoted rear *a*, having its front end provided with the hook-shaped point arranged to bear against the under side of the curved projection on the side of the hammer and engage in the notches therein, whereby the hammers may be held at full or at half cock at will, as set forth.

3. In combination with the triggers T, provided on their upper edges with a notch or recess, the pivoted elbow-lever K, provided

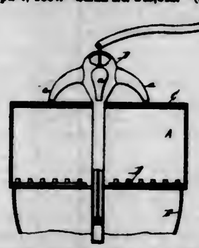


388,108.

with the pin or projections *e*, arranged to engage with said trigger in rear of said notch, and connected at its upper end with the slide *l*, and the pivoted lever *p*, having its rear end connected to the elbow-lever K and its front beveled end arranged in line with the locking-bolt *b*, so as to be depressed thereby in the rearward movement of said bolt, all arranged in relation to each other substantially as shown, whereby the triggers are automatically locked whenever the hammers are cocked and can be released for firing whenever desired.

4. The combination, in a tip-barrel gun, of the barrels B, having the pawl P pivoted to their under side, the frame A, having the locking-bolt *b* and cocking-bolt *c* both mounted centrally therein, the rocker G, or equivalent cross-head, at the rear end of the cocking-bolt, and the hammers H H, all being constructed and arranged in relation to each other, substantially as and for the purposes herein set forth.

388,109. INJECTOR. WALTER R. DODGE, Everett, assignor to the National Tube Works Company, Boston, Mass. Filed Oct. 19, 1887. Serial No. 252,808. (Model.)

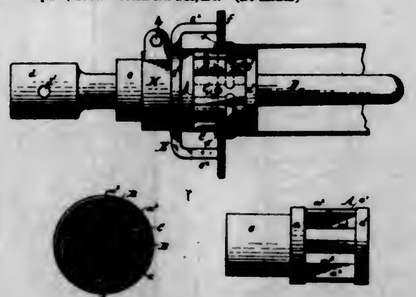


Claim.—1. An injector having a combining-cone formed to receive the steam-cone and made in separable sections not positively connected with each other, one of said sections being positively secured directly to the casing of the injector, and the other to a coupling or connecting end detachably secured to said casing, the last-mentioned section including the surface which is subjected to the greatest wear, as set forth.

2. In an injector, the combination, with the casing and the other operative parts, of a combining-cone formed to receive the steam-cone, and composed of a section, 2, screwed directly to the casing, the section 3, fitted to but having no positive connection with the section 2, and detachably connected to the delivery-cone, and the coupling or connecting end to which the delivery-cone is detachably secured, said coupling being detachably secured to the casing of the injector, said section 3 including the surface which is subjected to the greatest wear, as set forth.

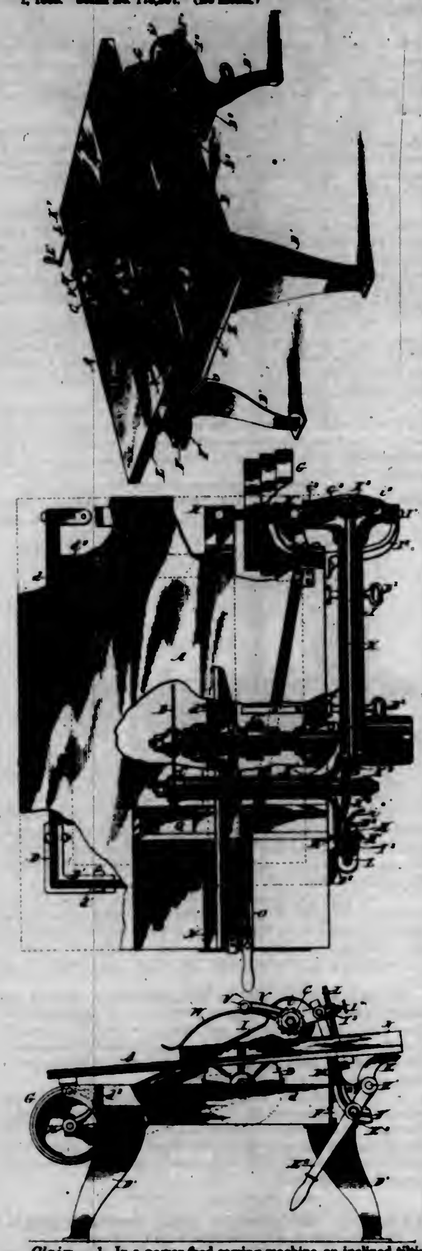
3. In an injector, the combination, with the casing having the overflow-passage and the steam combining and delivery cones, of the flange or partition *r* on the delivery-cone, whereby the space within the casing containing the combining and delivery cones is divided and the overflow-water is confined to the space 8 surrounding the delivery-cone and excluded from the space 7 surrounding the combining-cone, substantially as and for the purpose specified.

4. The combination, with the steam combining and delivery cones of an injector, of a casing having one or more capped orifices, *w*, communicating with the space containing the receiving end of the steam-cone, whereby oil may be introduced into said space to be carried by the steam along the surfaces of said cones, as set forth.



388,110. WASHING-MACHINE. JOHN C. DRAKE, Alton, Ark. Filed Sept. 7, 1887. Serial No. 249,012. (No model.)

Claim.—1. In a washing-machine of the character herein set forth, the hand-pump, combined with the vessel for receiving the clothes or materials, the pump passing through the bottom of said vessel, which bottom is provided with a perforation through which water may descend, the pump being arranged to deliver water from a second vessel below the first and upon the top of the materials and said second vessel, substantially as shown, and for the purposes set forth.



2. The herein-described washing-machine composed of the vessel A, hand-pump, top cross-bar, and false bottom, the bottom of vessel A being perforated for the passage of the pump-barrel and for drainage, the perforation being larger than the pump, and the parts being combined substantially as set forth and arranged for operation in connection with any water-heating vessel separate from and independent of vessel A, as explained.

388,111. TUBE-EXPANDER. JAMES DUFFY, Buffalo, N. Y. Filed Sept. 1, 1887. Serial No. 247,630. (No model.)

Claim.—The combination, with the holder A, provided with a series of tapering openings, a^3, of the pressure or swaging rollers B, arranged in said openings, and springs C, secured to the holder and partly covering said openings, whereby the rollers are retained in the openings, substantially as set forth.

388,112. POWER-FEED SEWING-MACHINE. GEORGE B. DUNNE, Chicago, Ill., assignor to Joseph W. Tell, same place. Filed Aug. 1, 1888. Serial No. 279,997. (No model.)

Claim.—1. In a power-feed sewing-machine, an inclined tilting support for the feed-wheel, hinged at one end below the level of the table at a point back of the saw, and extended above and over the table to bring the feed-wheel in front of the saw, substantially as described.

2. The inclined tilting feed-wheel support hinged at one end below the level of the table and at a point back of the saw, and extended above and over the table to bring the feed-wheel in front of the saw, combined with the feed-wheel and power-transmitting devices carried by the tilting feed-wheel support, substantially as described.

3. The bent hollow feed-wheel support pivoted at one end below the level of the table and at a point back of the saw and extended above and over the table to bring the feed-wheel in front of the saw, in combination with the feed-wheel and geared shafting carried by the said hollow support, substantially as described.

4. The inclined tilting feed-wheel support hinged at its lower end, in combination with a standard rising from the main frame and constituting a guide for the upper free end portion of the tilting feed-wheel support, and means for adjusting the said feed-wheel support at its upper free end portion laterally to the guide-standard, whereby the feed-wheel can under all circumstances be kept in line with the saw and at the same time a free tilting movement on the part of its support be admissible, substantially as described.

5. The tilting feed-wheel support hinged at its lower end, in combination with the guide-standard rising from the main frame and constituting a guide for the upper free end portion of the inclined tilting feed-wheel support, and the slide-block supported between a pair of adjusting-screws carried by the tilting feed-wheel support and fitted to slide upon the guide-standard, substantially as described.

6. In a power-feed sewing-machine, the tilting feed-wheel support carrying a feed-wheel and a power-transmitting mechanism, such as described, in combination with the two belt-connected speed-pulleys arranged below the table, the axle of one speed-pulley being provided with the saw and an ordinary belt-pulley, and the axle of the other speed-pulley being provided with a gear engaging a gear which is carried by the tilting feed-wheel support, and which forms a member of the power-transmitting mechanism with which said tilting feed-wheel support is provided, substantially as set forth.

7. In combination with the saw and feed-wheel, the hollow bent feed-wheel support I, expanded at its bend and at one end, geared shafting carried by said hollow support, with the gears situated at the expanded portions thereof, and means, substantially as described, for driving the geared shafting.

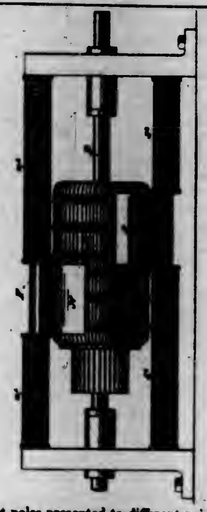
8. The combination, with the table A, of a rectangular bed-frame, D, provided with a longitudinal division-bar, d^3, the rotary saw, and a pair of belted speed-pulleys, the saw-shaft being journaled upon the bar d^3 and one side of the frame, and the cone-pulleys being mounted between said side of the frame and the bar d^3, substantially as described.

9. In a sewing-machine, the table hinged at or near one end upon a bed-frame on which the circular saw is mounted in position to extend up through an opening in the table, in combination with a rock-shaft provided with cams arranged to sustain the free end portion of the table, and means, substantially as described, for operating the rock-shaft and holding it in adjustment, for the purpose set forth.

10. The combination, with the bed-frame D, arranged below the hinged table, of the two speed-pulleys on shafts supported by the bed-frame, one of said shafts being provided with a circular saw which extends up through the table, the tilting feed-wheel support, the feed-wheel, power-transmitting devices connecting the feed-wheel with the shaft of the other one of said cone-pulleys, and one or more belt-shifters operative between the two speed-pulleys, substantially as described.

388,118. DYNAMO-ELECTRIC MACHINE. JAMES W. RANDS, New York, N. Y. Filed Mar. 18, 1887. Serial No. 231,309. (No model.)

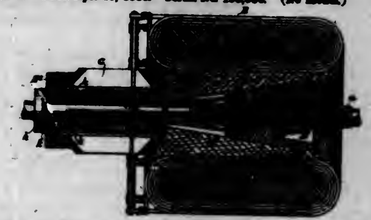
Claim.—1. The combination, with the armature of a dynamo-electric machine, of a consequent-pole field-magnet having its poles presented to different points in the length of said armature, each convolution of the coils of said armature extending across the face of each of the field-magnet poles.



2. The combination, with the armature of a dynamo-electric machine, of a field-magnet having two poles facing the axis of the armature and presented to said armature at points diagonally opposite with reference to its axis, the separate convolutions of the armature-coils extending through the field of each pole.

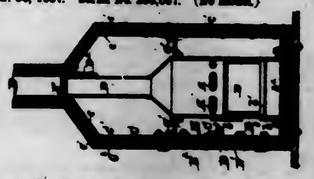
3. In a dynamo-electric machine, the combination, with a ring-armature, of pole-pieces of opposite character presented to the periphery of the armature at different points in its length, the separate convolutions of the armature-coils extending across the face of each pole-piece.

4. In a dynamo-electric machine, the combination of a single continuous core of soft-iron wire wound upon the same, forming a cylindrical armature, and a field-magnet having consequent poles located in different transverse planes with reference to the axis of the armature.



5. In an electric machine, the combination of a continuous armature-core, its axis, wire wound upon said core parallel with said axis,

888,118.



and two field-magnet poles presented to different points in the length of the armature and upon opposite sides thereof.

888,114. AUTOMATIC TIGHTENING DEVICE FOR ARMATURES OF DYNAMO-ELECTRIC MACHINES. JAMES W. EASTON, New York, N. Y. Filed Apr. 13, 1886. Serial No. 198,606. (No model.)

Claim.—The combination of the armature-shaft of an electric machine, an armature movable thereon, an automatic tightening device coupling the armature to the shaft, whereby the normal movement of the shaft during its operation tends to tighten the grip of the armature upon the shaft, and a commutator coupled to and moving with the armature independently of the shaft.

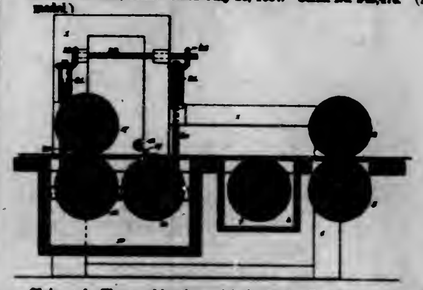
888,115. CAR-HEATER. JOHN H. EDWARD, Whitewater, Wis., assignor of one-half to J. F. Mitchell and J. A. Partridge, same place. Filed Mar. 30, 1887. Serial No. 233,067. (No model.)

Claim.—1. In an apparatus for heating cars, the combination, with the stove or furnace, of the surrounding shell, rigidly secured by bolts to the said furnace, which has upon all sides of the stove walls of non-conducting material and walls of sheet metal, which inclose the said non-conducting material, a doorway formed in said shell, and a door situated in the said doorway, also formed of sheets of metal and non-conducting material inclosed thereby, substantially as set forth.

2. In an apparatus for heating cars, the combination, with the stove or furnace and the pipes which convey heat from the furnace to the car, of the surrounding shell, which has two walls of non-conducting material extending entirely around the stove horizontally, and the three metal walls inclosing the said non-conducting walls, and the non-conducting door in the said shell, substantially as set forth.

3. In an apparatus for heating cars, the combination, with the stove, of the surrounding three-walled shell which extends horizontally entirely around the stove, the walls of which are formed of sheets of metal secured together and spaced apart by rivets, the rivets which secure the first and second walls being arranged on transverse lines other than those which secure together the first and second walls, substantially as set forth.

4. In an apparatus for heating cars, the combination, with the stove, of the surrounding three-walled shell, formed with the vertical part which surrounds the stove proper, the inwardly-tapering part above the said vertical part, and a supplemental vertical part above the tapering part and surrounding the smoke-exit, substantially as set forth.



5. In an apparatus for heating cars, the combination of the stove, the surrounding shell of non-conducting walls with inclosing sheets of metal, the door constructed of similar walls and metal sheets, and the cross-bars D^4, fastened independently of the door to the said walls inside of the doorway, substantially as described.

6. In an apparatus for heating cars, the combination, with the stove, of the surrounding shell, the ash-pan-dust for smoke, the automatic valve which closes the said dust, the dust for supplying air to the furnace, the zigzag or staggered plates for preventing the ashes and cinders from escaping through said dust, the pipes *a a'* for conveying heat from the stove to the car, and the spring-actuated valves F^3 and F, substantially as set forth.

7. The combination, with the stove, of the non-conducting shell having two or more sheets of metal spaced apart and the doorway formed therein, and with the inner sheet of metal extended toward the middle of the doorway to form a flange, and the door having its edges outside and adjacent to said flange, as set forth.

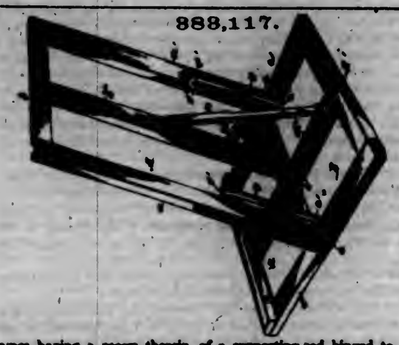
8. The combination, with the stove, of the surrounding shell having several parallel separate metal walls with non-conducting chambers between them, and the braces G' for the stove secured to the shell independently of the outer metal wall thereof, substantially as described.

888,116. MACHINE FOR TINNING COPPER SHEETS. DAVID EVANS, Ansonia, Conn. Filed July 26, 1887. Serial No. 245,473. (No model.)

Claim.—1. The combination, with the feed-rolls, of the swab-roll, the metal-carrying roll, and means, as described, for pressing the plate upon its surface, and a pair of calenders arranged beyond the metal-carrying roll, the lower whereof revolves in the pot of molten metal, substantially as described.

2. In a plate-tinning machine, the combination, with the feeding-rolls and the swab-roll, of the tinning-roll and calender-rolls arranged behind the swab-roll, the tinning-roll and lower calender adapted to have a vertical movement within the tank, whereby the extent of their immersion may be regulated and varied, substantially as set forth.

3. The combination, with the feeding-rolls of the swab-roll, the metal-carrying roll, and the series of pressure bars or fingers arranged above said metal-carrying roll and adapted to forcibly impose the sheet thereon, of the pair of calenders arranged behind the said metal-carrying roll, the lower calender adapted to revolve within the molten metal, substantially as set forth.

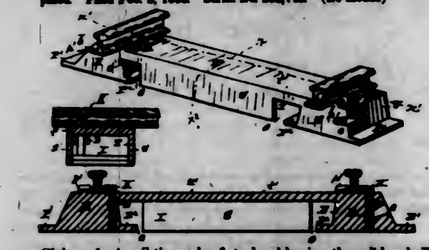


4. The combination, with the journal-frame arranged within the metal-tank, and the metal-carrying roll and the calenders journaled in said frame, of the vertical screw-threaded rods 20 and the shafts 22, adapted through the gears to raise and lower said rods, whereby the journal-frame may be elevated or depressed relative to the metal-tank, substantially as specified.

888,117. DISPLAY-RACK. JAMES A. FITZGERALD, Philadelphia, Pa. Filed June 15, 1887. Serial No. 241,502. (No model.)

Claim.—1. A displaying-rack consisting of a pair of frames having a sliding pivotal connection with each other, one of said frames having a recess therein, and a supporting-rod adapted to enter said recess when the rack is closed, substantially as set forth.

2. In a displaying-rack, the combination, with a pair of frames having a pivotal sliding engagement with each other, one of said

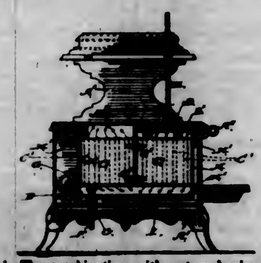


888,117.

frames having a recess therein, of a supporting-rod hinged to one frame and adapted to enter said recess when the rack is closed, and a slotted bar loosely connecting the rod to one frame for holding the latter in braced position, substantially as set forth.

3. A displaying-rack composed of two frames having a sliding pivotal engagement, of a supporting-rod hinged to one frame, and a connecting slotted guide-bar pivoted to one frame and having a sliding connection with the supporting-rod, whereby the several parts may be folded together or have their relative positions varied, substantially as set forth.

888,118. STEEL TIE FOR RAILROAD-TRACKS. MATHEW FITZGERALD, Troy, N. Y., assignor of one-half to Thomas McDonough, same place. Filed Feb. 2, 1888. Serial No. 262,743. (No model.)



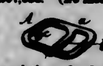
Claim.—1. A rail-tie made of steel and having the solid ends E E made with the tamping-plates F' F^2, the sides S, and the interior I open at the bottom, substantially as shown and described.

2. A rail-tie made of steel, having the solid ends E E made with the tamping-plates F' F^2, the sides S, and the interior I open at the bottom, substantially as shown and described.

3. A rail-tie made of steel, having downward and outward projected ends provided with laterally-projected tamping-plates, said tie having vertical sides, and a hollow interior between said ends and sides that is open at the bottom, substantially as shown and described.

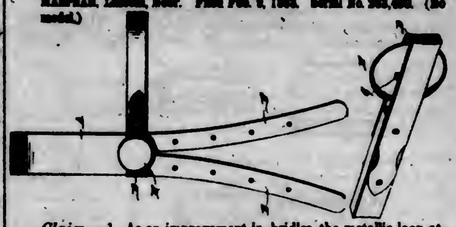
888,119. HOUSE-WARMING APPARATUS AND STOVE. JAMES PRIME, Reading, Pa. Filed June 10, 1886. Serial No. 204,782. (No model.)

Claim.—1. The combination, with a stove having heater inlet-openings from the fire-pot and having outlet-opening communicating with the smoke-flue, of a water-heater consisting of a casing communicating with said openings, and having a partition, O^2, between them, said casing inclosing a tubular water-chamber connected with supply, delivery, and return water-pipes, and extending below the bottom of said tubular chamber, whereby the products of combustion may be conducted downward through said chamber on one side of said partition and upward on the other side before reaching the smoke-flue, substantially as and for the purpose set forth.



2. The combination, with a stove having heater inlet-openings from the fire-pot and heater outlet-opening communicating with the smoke-flue, of a water-heater consisting of a casing communicating with said openings, and having a partition, O^2, between them, said casing inclosing a reservoir, B, placed above said inlet-openings and attached to a tubular water-chamber connected with supply, delivery, and return water-pipes, and extending below the bottom of said tubular chamber, substantially as and for the purpose set forth.

888,120. TWINE GUIDE AND CUTTER. LEWIS GROSTEAD, Tremontsburg, N. Y. Filed Jan. 27, 1888. Serial No. 262,101. (No model.)



Claim.—The herein-described twine guide and cutter, consisting of a plate having an opening, *a*, a longitudinal block formed integrally with the said plate and having recesses *b c*, a transverse guide-pin in the former recess, and a cutter adjacent to the latter recess and over the opening *a*, as set forth.

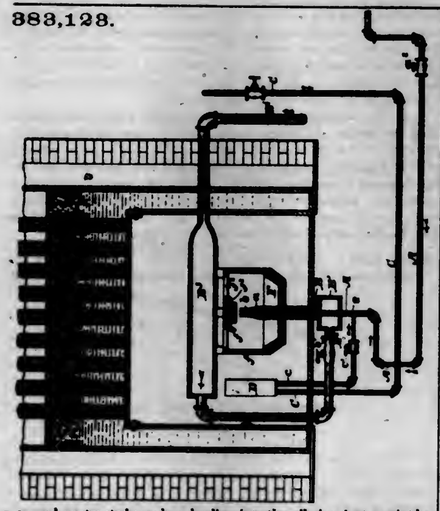
888,121. BUCKLE. FREDERICK C. HALL, Chicago, Ill. Filed Mar. 19, 1888. Serial No. 267,693. (No model.)

Claim.—A buckle consisting of a frame, *a*, the side bars of which are in a straight line and the end bars of which are in the same horizontal plane as the side bars, which frame is provided at one end with the stud or boss *c* and with a central cross-bar, *b*, the upper surface of which is in a plane below that of the upper surface of the frame, substantially as and for the purposes specified.

888,122. ROSETTE ATTACHMENT FOR BRIDLES. JULIUS C. HAMPSON, Lincoln, Nebr. Filed Feb. 9, 1888. Serial No. 263,696. (No model.)

Claim.—1. As an improvement in bridles, the metallic loop attached to the end of the brow-band and adapted to receive the crown-piece, and the transverse rib or parting-plate arranged in the said loop to pass between the tongues or billets on the ends of the crown-piece, substantially as specified.

2. The combination, with the brow-band and the crown-piece, of the clip or loop attached to the end of the brow-band and adapted to receive the crown-piece, and the disk or rosette-plate carried by the clip or loop and adapted to be ornamented in any preferred manner, substantially as and for the purpose specified.

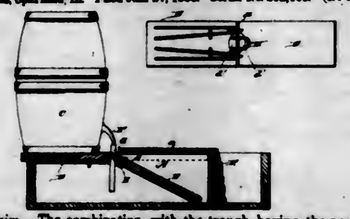


3. The combination of the clip or loop, the transverse rib or parting-plate therein, and the convex disk or rosette-plate carried by the clip or loop, substantially as specified.

4. The clip or loop to be fitted on the end of the brow-band and having a disk or rosette-plate formed integral therewith.

888,123. OIL-FURNACE. ALPHARMUS A. HARWOOD, McKeesport, Pa. Filed Aug. 19, 1887. Serial No. 247,257. (No model.)

Claim.—1. In a hydrocarbon-furnace, the combination, with the oil-pipe A, terminating in a nozzle, *a*, the air-pipe B, terminating at one end in a nozzle, *b*, surrounding the nozzle *a*, and at the other end in a box, F, surrounding the pipe A, said box F being connected with an air-heating chamber, F^2, located directly above the nozzles *a* and *b* and having an air-supply, and the superheating-chamber D, connected with a steam-supply pipe, C, and a pipe, *c*, the pipe *c* terminating in



383,128.

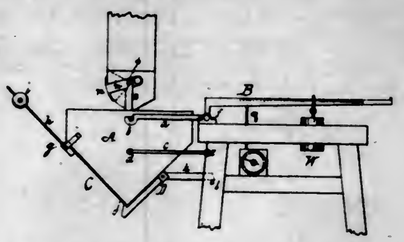
a curved contracted nozzle, *e*, leading into the oil-pipe A at a point below the box B', substantially as shown and described, and for the purpose specified.

2. In a hydrocarbon-furnace, the combination, with the oil-pipe A, terminating in a nozzle, *a*, the air-pipe B, terminating at one end in a nozzle, *b*, surrounding the nozzle *a*, and at the other end in a box, B', surrounding the pipe A, said box B' being connected with an air-heating chamber, B, located directly above the nozzles *a* and *b* and having an air-supply, and the superheating-chamber D, connected with a steam-supply pipe, C, and a pipe, *c*, the pipe *c* terminating in a curved contracted nozzle, *e*, leading into the air-pipe A at a point below the box B', and the oil-pan F, having vertical wall *f*, and spider *f'*, the latter provided upon its under side with lugs which support a fire-brick directly over the nozzles *a* and *b*, the whole being constructed and arranged substantially in the manner shown, and for the purpose specified.

383,124. WATERING-TROUGH FOR CATTLE. WILLIAM R. HASKIN, Sparland, Ill. Filed Jan. 27, 1888. Serial No. 262,103. (No model.)

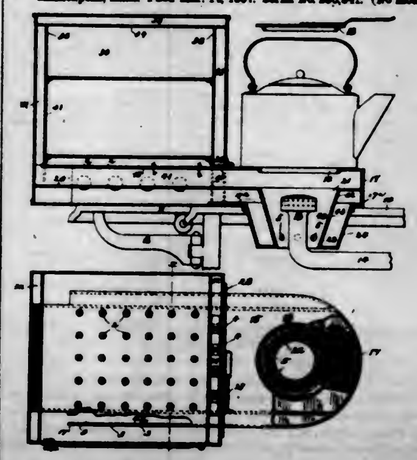
Claim.—The combination, with the trough having the partition E, provided with openings *c*, of the partial covers *a* and B, the latter having its edge notched at *d'* of the tank, the curved tube opening into the same, the rubber tube depending from said tube, and the hinged plank or float having its edge notched oppositely to the notch *d'* of the partial cover B, substantially as specified.

383,125. POP SAFETY-VALVE. ALFRED HATTERSLEY, Fort Wayne, Ind. Filed Nov. 5, 1887. Serial No. 254,247. (No model.)



Claim.—1. A pop safety-valve consisting of a base-section, A, provided with a cylindrical internal portion, *a*, a beveled valve-seat, *b*, at the upper portion thereof, a chamber, C, above the seat *b*, a series of angular steam-ports leading from said chamber, a winged and chambered valve having an enlarged upper end, an adjustable holding-down spring for this valve, the said valve controlling the ports, and a case for this spring provided with steam-outlet apertures, and an enlarged chambered portion, F, said case being applied to the base-section A, substantially as specified.

2. The combination of the screw-threaded base portion A, provided with an annular bore, *a*, adapted to receive the radial wings of a valve, B, an annular seat, *b*, for the beveled portion of this valve, angular steam-ports leading from a chamber, C, and formed in said base portion, a perforated spring-case, E, having an enlarged base forming a chamber, F, adapted to receive the collared portion of valve B, and an adjustable holding-down spring for this valve, the said valve controlling the ports, all substantially as described.

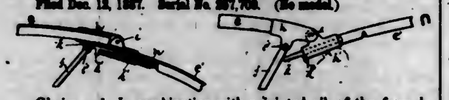


3. The combination, with the base-section A and the spring-section E, constructed as described, of the valve B, provided with an upper collared portion, a lower radially-flanged portion and the intermediate beveled seat and cylindrical portion to control the ports, and an adjustable spring, H, all substantially as and for the purposes described.

383,126. AUTOMATIC GRAIN-WEIGHER. JOHN HURST, Ardoch, Dak., assignor of two-thirds to John George Nelson and William T. Sheppard, both of same place. Filed Sept. 30, 1887. Serial No. 250,191. (No model.)

Claim.—In a grain-weigher, the forked scale-beam having fulcrum *f*, and weight W, the receiver pivotally suspended between the arms thereof and provided with a counterweighted hinged valve, C, closing the discharge-aperture of the receiver, the trip-lever D, pivotally mounted on the receiver, provided with catch *j* on one end, in position to engage with and retain the valve C when closed, and counterweighted opposite end, *k*, for closing said catch, stop *l*, mounted upon the frame-work in position to engage with end *k* of lever D, to release said catch, in combination with a self-closing cut-off on the supply-spout, and the tappet-arm *o* on the receiver, adapted to engage with pin *p* on said cut-off when the receiver is raised, and to release the same when the receiver is lowered, substantially as and for the purpose herein specified.

383,127. OVEN ATTACHMENT. CHARLES R. HOLLINSWORTH, Minneapolis, Kans. Filed Mar. 14, 1887. Serial No. 230,841. (No model.)



Claim.—1. An attachment for ovens consisting of a combustion-chamber, a heat-distributing flue and a return-flue, which first-named flue communicates with said combustion-chamber and which latter flue communicates with the said first-named flue, the top and bottom plates of said heat-distributing flue extending into the oven, the top plate reaching to the lower edge of an inner wall, while the bottom plate reaches to an outer wall, substantially as specified.

2. In an attachment for ovens, the combination, with the combustion-chamber, of a heat-distributing flue, the top plate of which is provided with a series of heat-distributing apertures, which first-named flue communicates with said combustion-chamber and which latter flue communicates with the said first-named flue, the said top plate and the bottom plate extending into the oven, the top plate reaching to the lower edge of an inner wall, while the bottom plate reaches to an outer wall, substantially as set forth.

3. In an attachment for ovens, the combination, with a combustion-chamber, of a heat-distributing flue, a chamber surrounding and communicating with the combustion-chamber, and cold-air flues communicating with the latter chamber, which heat-distributing flue communicates with said combustion-chamber and which return-flue communicates with the heat-distributing flue and with said cold-air flues, the top and bottom plates extending into the oven, the top plate reaching to the lower edge of an inner wall, while the bottom plate reaches to an outer wall, substantially as set forth.

4. In an attachment for ovens, the combination, with a plate, 15, formed with apertures 2 and carrying a flange, 17, formed with apertures 3, of a plate, 20, a curb, 22, formed with apertures 5, an annular flange, 23, and a ring, 24, which is connected to the flange 17, substantially as described.

383,128. UMBRELLA. ALEXANDER S. RUSSELL, Norwich, Conn. Filed Dec. 13, 1887. Serial No. 257,703. (No model.)

Claim.—1. In combination with a jointed rib of the form described, a stretcher hinged thereto at or near the rib-joint, and a spring-pressed bolt located and adapted to interlock the rib-sections, substantially as and for the object specified.

2. In combination with a jointed rib, a stretcher hinged thereto at or near the rib-joint, and a spring-pressed bolt so located in one rib-section that its free end may engage and ride against the said stretcher in the act of opening the umbrella and pass across the end of said stretcher to interlock the rib-sections, substantially as herein described, and for the object set forth.

383,129. VEHICLE-WHEEL. THOMAS B. JEFFERY, Ravenswood, Ill. Filed Aug. 5, 1887. Serial No. 246,572. (No model.)

Claim.—1. In a vehicle-wheel, in combination with the hollow rim flanged to receive the tire, a rubber tire having along each side a separate projecting strip of harder material secured thereto and engaging, respectively, under the said flanges, whereby the tire is secured to the rim, substantially as and for the purpose set forth.

2. In a vehicle-wheel, in combination with the hollow rim flanged to receive the tire, a rubber tire having along each side a separate projecting strip of harder material secured thereto and engaging, respectively, under the said flanges, whereby the tire is secured to the rim, the rubber tire filling the space between the proximate edges of the strips, substantially as and for the purpose set forth.

3. In a vehicle-wheel, in combination with the hollow rim flanged to receive the tire, a rubber tire having along each side a separate projecting strip of harder material secured thereto and engaging, respectively, under the said flanges, whereby the tire is secured to the rim, the rubber tire filling the space between and extending partially under the proximate edges of the strips, substantially as and for the purpose set forth.

4. In a vehicle-wheel, in combination with the hollow rim having an interior shoulder on each side, and a band resting upon each shoulders and flanged to receive the tire, a rubber tire having harder material secured thereto and projecting along each side, engaging under the said flanges, whereby the tire is secured to the rim, substantially as and for the purpose set forth.

5. In a vehicle-wheel, in combination with the hollow rim having an interior shoulder on each side, and a band resting upon each shoulders and flanged to receive the tire, and having its said flanges clasped by the rim bent about them, a rubber tire having harder material secured thereto and projecting along each side, engaging under the said flanges, whereby the tire is secured to the rim, substantially as and for the purpose set forth.

6. In a vehicle-wheel, in combination with the rim, a section of whose inner wall in a radial plane is a scallop comprising a sinuosity on each side of the middle, and which has apertures at the middle for the spokes, washers shaped to embrace said sinuosities and correspondingly apertured for the spokes, whereby the radial tension of the spokes is exerted on the rim at the outer sides, respectively, of the sinuosities, substantially as and for the purpose set forth.

7. In a vehicle-wheel, in combination with the rim, a section of whose inner wall in a radial plane is a scallop comprising an abrupt sinuosity on each side of the middle, and which has apertures at the middle for the spokes, washers shaped to embrace said sinuosities and correspondingly apertured for the spokes, whereby the radial tension of the spokes is exerted on the rim at the outer sides, respectively, of the sinuosities, substantially as and for the purpose set forth.

8. In a vehicle-wheel, in combination with the rim, a section of whose inner wall in a radial plane is a scallop comprising a sinuosity on each side of the middle, and which has at the middle a depression to receive the heads of the spokes, and apertures for the spokes, washers shaped to embrace said sinuosities and correspondingly apertured for the spokes, whereby the radial tension of the spokes is exerted on the rim at the outer sides, respectively, of the sinuosities, substantially as and for the purpose set forth.

383,130. VEHICLE-WHEEL. THOMAS B. JEFFERY, Ravenswood, Ill. Filed Aug. 5, 1887. Serial No. 246,571. (No model.)

Claim.—1. In a vehicle-wheel, a felly comprising a rim formed of one piece bent so that its edges approach, and a band secured upon its outer circumference overlapping said edges, substantially as and for the purpose set forth.

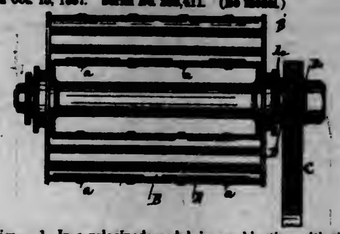
2. In a vehicle-wheel, a felly comprising a hollow rim formed of one piece bent so that its edges approach but do not meet, and a band secured upon its outer circumference overlapping said edges and flanged to receive the tire, substantially as and for the purpose set forth.

3. In a vehicle-wheel, in combination with the rim flanged to receive the tire, a rubber tire having on each side a row of pins embedded firmly therein projecting through corresponding holes in the flanges, whereby the tire is secured to the rim, substantially as and for the purpose set forth.

4. In a vehicle-wheel, in combination with the rim flanged to receive the tire, a rubber tire having on each side a row of pins, whose enlarged heads are embedded firmly therein, and which project through corresponding holes in the flanges, whereby the tire is secured to the rim, substantially as and for the purpose set forth.

5. In a vehicle-wheel, in combination with the rim flanged to receive the tire, a soft-rubber tire having on each side a row of pins of harder material embedded firmly therein and projecting through corresponding holes in the flanges, whereby the tire is secured to the rim, substantially as and for the purpose set forth.

6. In a vehicle-wheel, in combination, the rim, a band secured upon its outer circumference and flanged to receive the tire, and a rubber tire having on each side a row of pins, whose enlarged heads are firmly embedded therein and whose smaller ends project through corresponding holes in the flanges, whereby the tire is secured to the rim, substantially as and for the purpose set forth.



7. In a vehicle-wheel, in combination with the rim, the rubber tire secured thereabout, having on each side beyond the rim a row of projections thereon and extending laterally, substantially as and for the purpose set forth.

8. In a vehicle-wheel, in combination with the rim, the rubber tire secured thereabout, having on each side beyond the rim a row of pins, whose enlarged heads are firmly embedded therein and whose smaller ends project laterally, substantially as and for the purpose set forth.

9. In a vehicle-wheel, in combination with the rim, a soft-rubber tire secured thereabout, having on each side beyond the rim a row of pins of harder substance firmly embedded therein and projecting laterally, substantially as and for the purpose set forth.

10. In a vehicle-wheel, in combination with the rim flanged to receive the tire, the rubber tire secured thereabout and having on each side two rows of pins lying in the same radial planes, embedded firmly in the tire and projecting laterally, substantially as and for the purpose set forth.

388,131. VELOCIPEDE. THOMAS B. JEFFERY, Ravenswood, Ill. Filed Oct. 15, 1887. Serial No. 252,411. (No model.)

Claim.—1. In a velocipede-pedal, in combination with the end pieces, polygonal trough-shaped foot-supports secured rigidly thereto, each support having two or more edges exposed to the foot, substantially as set forth.

2. In a velocipede-pedal, a foot-support trough-shaped and having its trough extending above and below the medial horizontal plane of the pedal and having two or more of its edges exposed to the foot, substantially as and for the purpose set forth.

3. In a velocipede-pedal, in combination with the end pieces, trough-shaped foot-supports secured rigidly thereto and having projections upon two or more edges of each support for engaging the shoe of the rider, substantially as set forth.

4. In a velocipede, a pedal having trough-shaped foot-supports, having projections at the angle or angles for engaging the shoe of the rider, substantially as set forth.

5. In a velocipede, a pedal having trough-shaped foot-supports, each support having projections at two or more of its edges for engaging the shoe of the rider, substantially as set forth.

6. In a velocipede, a pedal having trough-shaped foot-supports, having projections at the edges and angle or angles for engaging the shoe of the rider, substantially as set forth.

7. In a velocipede, a pedal having trough-shaped foot-supports, having projections at the angle or angles projecting from one side and struck up out of the other, substantially as and for the purpose set forth.

8. In a velocipede, a pedal having trough-shaped metal foot-supports whose edges are provided with projections for engaging the shoe of the rider, the inner of said edges being lower than the outer, substantially as and for the purpose set forth.

9. In a velocipede, a pedal having metal foot-supports standing edgewise to the foot, strengthened by longitudinal corrugations, substantially as set forth.

10. In a velocipede, a pedal having trough-shaped foot-supports whose sides are strengthened by longitudinal corrugations, substantially as set forth.

11. In a velocipede-pedal, a yielding foot-block having an interior air space or spaces, and supported upon two or more of its outer faces, substantially as and for the purpose set forth.

12. In a velocipede-pedal, a yielding foot-block secured within a polygonal trough-shaped foot-support, substantially as set forth.

13. In a velocipede-pedal, a polygonal yielding foot-block having an interior air space or spaces and secured upon two or more of its outer faces to a polygonal trough-shaped foot-support, substantially as and for the purpose set forth.

14. In a velocipede-pedal, in combination with a foot-support which extends below the medial horizontal plane of the pedal, a yielding foot-block having an interior air space or spaces and secured upon two or more of its outer faces to the support, substantially as set forth.

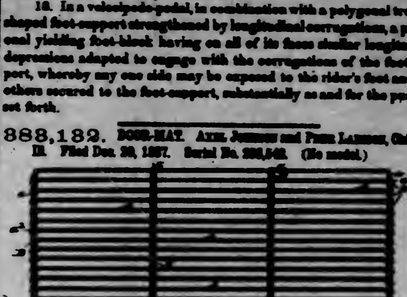
15. In a velocipede-pedal, in combination with a foot-support which extends above and below the medial horizontal plane of the pedal, a polygonal yielding foot-block having an interior air space or spaces, and secured by two or more of its faces upon the support, substantially as set forth.

16. In a velocipede-pedal, in combination, a polygonal trough-shaped foot-support and a yielding foot-block, one having a projection or projections, and the other having a corresponding depression or depressions, whereby the foot-block is secured to the foot-support, substantially as set forth.

17. In a velocipede, in combination, a polygonal trough-shaped foot-support and a yielding foot-block, the latter having longitudinal depressions in two or more of its outer faces, and the former strengthened by inwardly-projecting longitudinal corrugations corresponding to the depressions in the foot-block, whereby the block is secured to the support, substantially as set forth.

18. In a velocipede-pedal, in combination with a polygonal trough-shaped foot-support strengthened by longitudinal corrugations, a polygonal yielding foot-block having on all of its faces similar longitudinal depressions adapted to engage with the corrugations of the foot-support, whereby any one side may be exposed to the rider's foot and the others secured to the foot-support, substantially as and for the purpose set forth.

388,132. DOOR-MAT. AXEL JOHNSON and PEHR LARSSON, Chicago, Ill. Filed Dec. 20, 1887. Serial No. 258,542. (No model.)

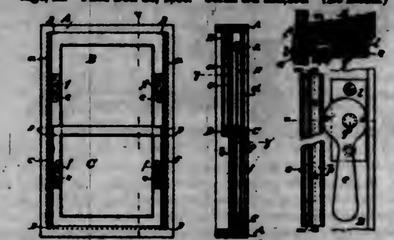


Claim.—1. As a new article of manufacture, a door-mat formed of approximately parallel bars, the ends of each bar being integral with the bar and being bent at approximately right angles and pivoted to the ends of its neighboring bar to permit of the mat being rolled, substantially as specified.

2. A door-mat formed of approximately parallel bars, the ends of each bar being bent at approximately right angles to the main bar to form a recess for the ends of its neighboring bar to lie in, and then bent outwardly and again at right angles to the main bar to lie within the recess of the bar next before it, to which it is pivoted, for the purpose of permitting the mat to be rolled while maintaining the ends of all the bars in the same plane, substantially as described.

3. In a door-mat formed of approximately parallel bars, the ends of each bar being bent at approximately right angles and pivoted to the ends of its neighboring bar, substantially as shown, the combination of said bars with one or more flexible fastenings, C, of woven wire or analogous material by which the bars are held together, and washers of resilient material upon the said rivets, whereby the bars are maintained in their position, but permitting the mat to be rolled, substantially as specified.

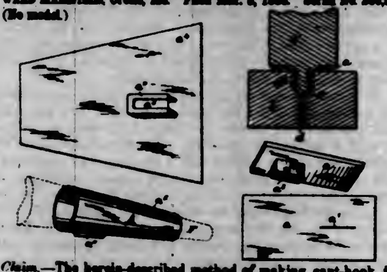
4. In a door-mat formed of approximately parallel bars, the ends of each bar being bent at approximately right angles to the main bar and pivoted to the ends of its neighboring bar to permit of the mat being rolled, the combination of the bars A', A^2, and A^3, the ends of each being formed as described, and all pivoted to the same rivet, substantially as specified.



388,133. DETACHABLE SOLE PLATE AND SPIKE FOR BOOTS OR SHOES. SAMUEL KENNEDY, Boot Bridgewater, and WILLIAM H. MCCONNELL, Brockton, Mass. Filed Mar. 14, 1888. Serial No. 267,260. (No model.)

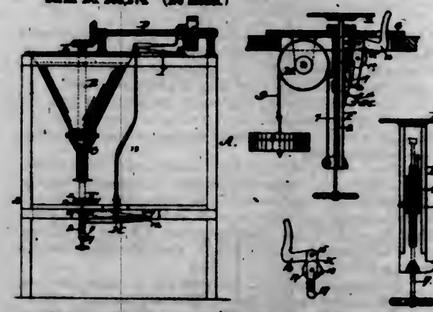
Claim.—1. The sole-plate adapted for attachment to a boot or shoe sole and provided with the sockets *c* and *c*, combined with the spike-plate having the fixed lug *d'*, formed to engage the socket *c*, and the swiveled lug or button *d*, formed to engage the socket *c*, as set forth.

2. The sole-plate provided with the sockets *c*, *d*, and *c*, combined with the spike-plate having the fixed lug *d'*, adapted to engage the socket *c*, the fixed stud *d'*, adapted to fit the socket *d*, and the swiveled lug or button *d*, adapted to engage the socket *c*, as set forth.



388,134. WINDOW SASH AND FRAME. CONRAD KINNE, Chicago, Ill. Filed Dec. 20, 1886. Serial No. 222,159. (No model.)

Claim.—1. The combination, with a window-frame formed with grooved sides, of a sash provided with guides pivoted to the sash and provided with tongues to fit into the grooves, and projecting wings projecting in front of the sash, and means, substantially as described, for operating said guides.

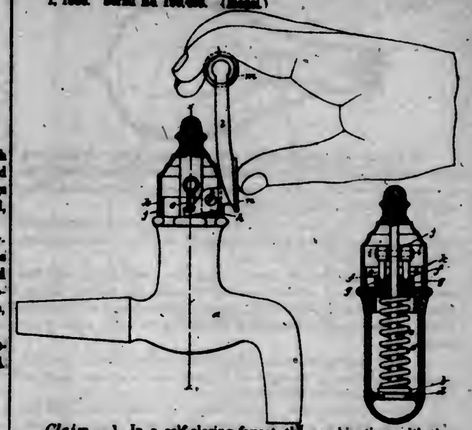


2. The combination, with a window-frame formed with vertically-grooved sides, of a sash having its edges recessed, guides or leaves hinged in said recesses and projecting beyond the face of the sash, and eccentric levers pivoted upon the sash-rail and bearing against the projecting hinged leaf to press it into the groove with the required force, substantially as shown and described.

388,135. METHOD OF MAKING CANT-HOOK FERRULES. EDWARD HAMMERER, Orono, Me. Filed Mar. 3, 1888. Serial No. 266,004. (No model.)

Claim.—The herein-described method of making cant-hook ferrules, consisting in first making a slitted blank, *a a'*, of a thickness greater than the ferrule to be made, afterward expanding the edges of the slitted portion and forming the staple *a'* in one piece with said blank, then reducing it to the thickness of the desired ferrule, and, finally, bending it and welding its overlapping edges together, substantially in the manner and for the purpose set forth.

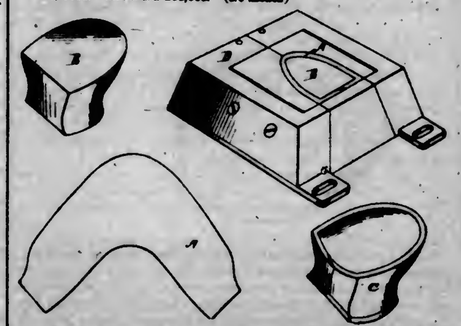
388,136. MACHINE FOR PACKING PULVERULENT SUBSTANCES. CHARLES J. MATTHEWS, Oswego, N. Y. Filed Feb. 7, 1888. Serial No. 263,574. (No model.)



Claim.—In a packing-machine, the combination of a movable support having a shoulder projecting therefrom, an adjustable cam attached to the sliding plate of said movable support, a releasing-lever connected by an intermediate rod to move the operating-lever of a friction-pulley, and a locking-lever provided with a hook and a projection, said hook being fitted to engage said releasing-lever, and the projection being adapted to engage the shoulder on said movable support, as and for the purpose herein specified.

388,137. COMPOSITION FOR CONVERTING INDIA-RUBBER OR ITS COMPOUNDS INTO HARDENED RUBBER. WILLIAM B. MCGARVEY, Rochester, Pa., assignor of one-half to Walter A. Jones, same place. Filed Aug. 26, 1887. Serial No. 248,103. (No specimens.) Patented in Canada July 30, 1887, No. 27,594.

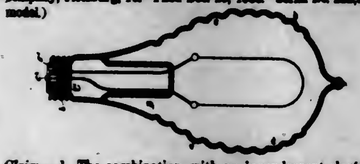
Claim.—The herein-described composition of matter, consisting of oxide of iron and petroleum or rosin-oil, in the proportions specified.



388,138. SELF-CLOSING FAUCET. TIMOTHY MCILVAIN, Boston, Mass., assignor of one-half to W. H. Ward & Co., same place. Filed Feb. 1, 1888. Serial No. 262,662. (No model.)

Claim.—1. In a self-closing faucet, the combination, with the faucet proper and its cap, of a valve and its stem, a spring for forcing the valve down upon its seat, an elbow-lever comprising the arms *k* and *l*, said arm *k* being pivoted or fulcrumed about midway of its length upon said cap, the forward end of said arm *k* being loosely connected to said valve-stem, the other arm, *l*, of said lever projecting substantially at right angles to arm *k*, and provided at its outer or upper end with a finger-grasp, *n*, and having a thumb-plate formed thereon substantially at the point of its junction with arm *k*, substantially as set forth.

2. In a self-closing faucet, the combination, with the faucet-body, of a valve and its stem, a spring for forcing the valve upon its seat, a right-angled lever having one of its arms pivoted about midway of its length and connected loosely to the valve-stem at its forward end, the other arm of said lever provided with a finger-grip at its upper end, and a thumb-plate formed thereon substantially at the point of juncture of the two arms, substantially as described.



388,139. MANUFACTURE OF HEELS FOR BOOTS OR SHOES. ALBERT L. F. HITCHELL, Beachmont, and JOHN P. REYNOLDS, Jr., Milton, Mass., assignors to the Le Gay Heel Company, Portland, Me. Filed Jan. 24, 1888. Serial No. 261,932. (No model.)

Claim.—1. That improvement in the art of making molded heels which consists in covering one side of the flat blank with cement, and, when said cement is in proper condition to use, saturating the blank with a liquid of substantially the kind described, then molding the flat blank about the core, with its cemented face against the core, and by the same operation causing the shaped blank to adhere to said core, thereby forming the rough heel, and then finishing the heel in any desired way, all as set forth.

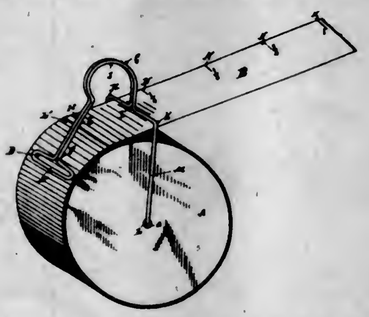
2. That improvement in the art of making molded heels which consists in first covering one side of a flat blank with cement, then molding it about a former which is to be the core of the heel, with its cemented face next said core under pressure, whereby said blank is molded and caused to adhere to said core, then finishing the heel in any desired manner, all as set forth.

388,140. MANUFACTURE OF INCANDESCENT ELECTRIC LAMPS. Otto A. Mohn, New York, N. Y., assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Dec. 20, 1886. Serial No. 222,017. (No model.)

Claim.—1. The combination, with an incandescent electric-lamp globe having a neck of glass integral with the globe and formed with an internal screw-thread, of a contact-supporting block screwing into said thread, substantially as described.

2. A globe for incandescent electric lamps having a neck integral with the globe and having a screw-thread for receiving a holder formed upon the outer surface of the neck.

3. In an incandescent electric lamp, the combination, with the neck of the lamp, of a block entering the neck and secured therein, of the same material as the lamp, a central contact-point sunk into the block, and an annular contact-ring embracing the outer edge of the block.

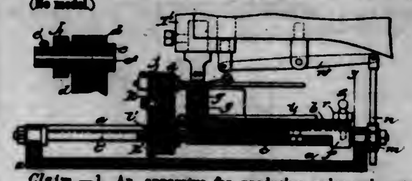


4. The combination, with an incandescent electric lamp, of a solid-glass block secured in the neck of the lamp and a central electrical contact-point sunk into said block

5. In an incandescent electric lamp, the combination, with the neck of the lamp, of a contact-bearing block screwed into the neck, a slot in said block extending from the center to the outer edge of the same, and two contact-points carried by the block, substantially as described.

6. In an incandescent electric lamp, a neck provided with means of attachment to a support, a central contact-point having a perforation through its length, and a leading-in wire of the filament passing through said perforation and secured to the contact-point.

7. In an incandescent electric lamp, the combination, with the globe, of a central contact-point, a leading-in wire passing through the same, and an independent supporting-block of glass surrounding the contact-point.



388,141. RIBBON-SPOOL. John J. Hucker and Cyrus Gifford, North East, Pa., assignors of one-third to John F. Oldach, same place. Filed Jan. 31, 1888. Serial No. 261,556. (No model.)

Claim.—1. The combination, with a ribbon-spool, of the clip C, provided with vertical wire arms having the spool-pivots L, the bow-spring portion J, formed by the conjunction and continuation of the said arms, and the bow forming a continuation of the said spring portion and having the straight wire E, for pressing crosswise upon the ribbon, substantially as set forth.

2. The combination, with a ribbon-spool, of the measuring-strip B, wound upon the spool with the ribbon, and the clip C, provided with vertical wire arms having the spool-pivots L, the bow-spring portion J, formed by the conjunction and continuation of the said arms, and the bow forming a continuation of the said spring portion and having the straight wire E, for pressing crosswise upon the ribbon, substantially as set forth.

388,142. APPARATUS FOR TAPERING METALLIC SHANKS. Charles Ness, Newark, N. J. Filed July 2, 1887. Serial No. 243,288. (No model.)

Claim.—1. An apparatus for producing polygonal metallic brooches, consisting in the combination, with a rotary holder for the blank, of an anvil for supporting the blank, means for moving the blank longitudinally upon the anvil, means, as a pawl and ratchet, for producing an intermittent partial rotation of the blank, and a reciprocating punch or hammer for pressing the blank upon the anvil, the whole arranged and operated as and for the purpose set forth.

2. In an apparatus for tapering metallic blanks, the combination, with a rotary holder for the blank, of an anvil for supporting the blank, a reciprocating hammer or punch for pressing the blank upon the anvil, and means actuated by the reciprocating hammer for intermittently rotating the blank and moving it longitudinally, and the means, substantially as described, for gradually raising the anvil during each longitudinal movement.

3. In an apparatus for tapering metallic blanks, the combination, with a rotary holder for the blank, of an anvil for supporting the blank, a reciprocating hammer or punch for pressing the blank upon the anvil, a carriage for sustaining the rotary holder and movable longitudinally upon a suitable bed, a feed-screw for traversing the carriage upon the bed, means connected with the carriage for gradually raising the anvil, a ratchet-wheel connected with the feed-screw, and a pawl actuated by the same means as the reciprocating hammer and operating upon the ratchet-wheel to rotate the screw and the rotary holder, as and for the purpose set forth.

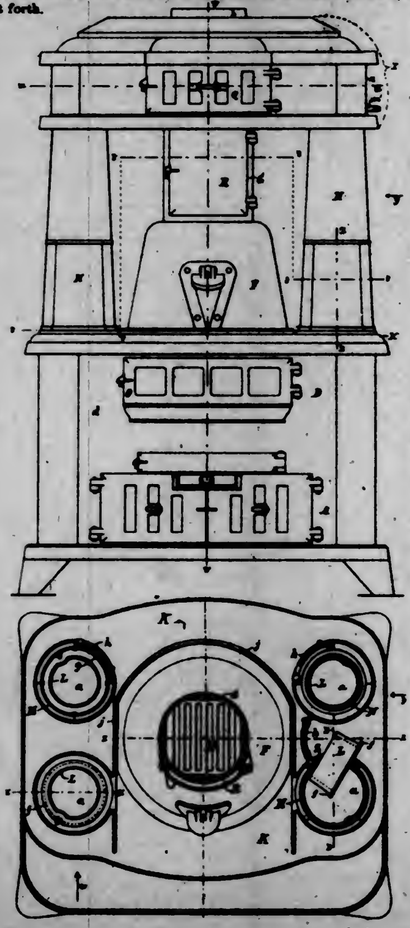
4. In an apparatus for tapering metallic blanks, the combination, with a rotary holder for the blank, of an anvil for supporting the blank, a reciprocating hammer and punch for pressing the blank upon the anvil, a carriage for sustaining the rotary holder and movable longitudinally upon a suitable bed, a feed-screw for traversing the blank upon the anvil, guides for the anvil to move vertically, a wedge sustaining the anvil and moved longitudinally to raise the anvil gradually during the longitudinal movement of the blank, a ratchet-wheel connected with the feed-screw, and a pawl actuated by the same means as the reciprocating hammer and operating upon the ratchet-wheel to rotate the screw and the rotary holder, as and for the purpose set forth.

388,143. HORSE-COLLAR PAD. La Verne W. Noyes, Chicago, Ill. Filed Feb. 24, 1888. Serial No. 265,126. (No model.)

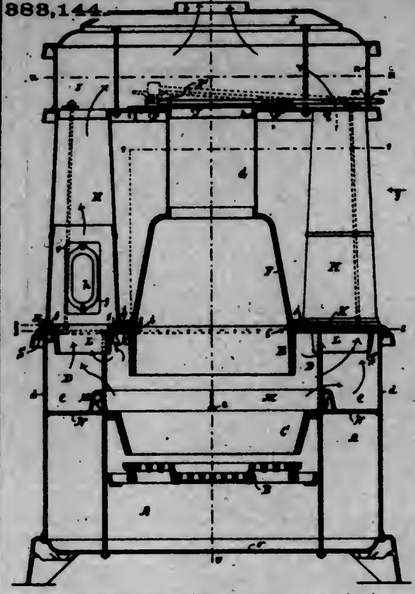
Claim.—1. A horse-collar pad comprising a neck-plate and a collar-plate, the one having a protuberance and the other a cavity, both being in the form of spherical segments, the former fitting into the latter, their spherical surfaces being in contact and forming the bearings of the neck and collar plates upon each other, and a pin connecting said plates at the center of said cavity and protuberance and having play in one of said plates for a small distance about said center, substantially as set forth.

2. A horse-collar pad comprising a neck-plate and a collar-plate, the one having a protuberance and the other a cavity, both being in the form of spherical segments, the former fitting into the latter and neither exceeding a hemisphere in extent, and a pin connecting said plates at the center of said cavity and protuberance and having play in one of said plates for a small distance about said center, substantially as set forth.

3. In combination with the neck-plate and the collar-plate, one having a protuberance and the other a cavity in which said protuberance fits, said protuberance and cavity being each a spherical segment in form, one of said plates having at the center of said spherical portion an opening, and the other having secured to it a pin, which is smaller than said opening and passes through it, and which has a head on the farther side larger than said opening, substantially as set forth.



4. In combination with the neck-plate, whose general form is convex downward longitudinally and concave downward transversely, and which has the upwardly-projecting protuberance A' in the form of a spherical segment, the collar-plate whose general form is also longitudinally convex downward and transversely concave downward, and which has also the upwardly-projecting protuberance B' in the form of a spherical segment and forming the corresponding spherical cavity, *b'*, which fits the spherical protuberance A', the extent of said protuberance being greater than that of the cavity *b'*, and neither being greater than a hemisphere in extent, and a pin which connects the two plates at the center of said protuberances, its connection in one of them being loose and allowing play about the center substantially equal to the difference in spherical extent of the two protuberances, substantially as set forth.



5. In combination with the neck-plate, the saddle-plate pivoted to it and having at the side the hollows *b*, substantially as and for the purpose set forth.

388,144. HEATING-STOVE. Hibbert Freeman, Utica, N. Y. Filed Dec. 24, 1887. Serial No. 258,283. (No model.)

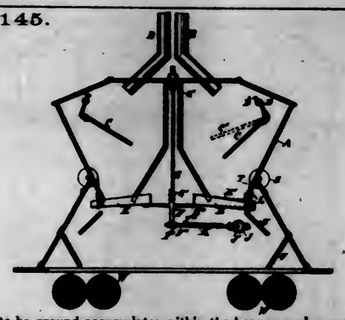
Claim.—1. In a heating-stove, the combination, with its fire-pot, fuel-magazine, flame-chamber extending laterally around the lower portion of the magazine, flame-chamber cover having flue-apertures, and column-flues on said cover and coinciding with its flue-apertures, of the tubular flue-guards coinciding with said flue-apertures and extending downward into the flame-chamber from its cover, as set forth.

2. In a heating-stove, the combination, with its fire-pot, ring M and around and extending above the rim of the fire-pot, flame-chamber extending laterally outside of said ring, flame-chamber cover having flue-apertures over the lateral extensions of the flame-chamber, and column-flues on said cover and coinciding with said apertures, of the tubular flue-guards coinciding with said flue-apertures and extending therefrom downward into the lateral extensions of the flame-chamber, as set forth.

3. In a heating-stove, the combination, with its flame-chamber, its cover having the flue-apertures, and column-flues on the cover and coinciding with said apertures, of the tubular flue-guards within the circuits of the column-flues and extending downward through and below said flue-apertures, and in the casings of the column-flues lateral openings larger than said flue-guards and furnished with doors or covers, as described.

4. In a heating-stove, the combination, with its laterally-extending flame-chamber, its cover, column-flues upon the lateral parts of said cover, and the flue-chamber upon the column-flues, of the fuel-magazine consisting of its lower section suspended by its rim through a central aperture in said cover, middle section supported by said cover, and upper section connected telescopically with the middle section, and the ring-plate P in said flue-chamber, upon its bottom, covering an opening therein, secured to the upper section of the magazine, and movable upward, substantially as shown and described.

5. In a heating-stove, the combination, with its fuel-magazine, column-flues, flue-chamber on the column-flues and having the lateral doorway Q, and the upwardly-movable ring-plate P, connecting the magazine and said flue-chamber, of the valve J, pivoted to said ring-plate and having a handle-shaft extending outward through a socket-aperture in the casing of the flue-chamber, as set forth.



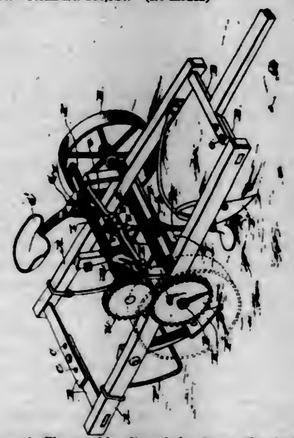
6. A heating-stove having an upper section embracing the supporting-plate K, fuel-magazine, column-flues, flue-guards, and flue-chamber on the column-flues, all mounted together on said supporting-plate, in combination with and removable bodily from a lower section embracing the rim-plate S, upon which the plate K normally rests and fits closely, the draft-chamber, flame-chamber, diaphragm-plate N, and their bottom and lateral inclosing-plates, all mounted together to and with said rim-plate, and the fire-pot C, suspended through the opening in said diaphragm-plate and smaller than the opening through the rim-plate S, and removable therethrough when the upper section of the stove is removed from the lower one, as set forth.

7. In a heating-stove, the combination, with its flame-chamber cover K, having the aperture *a*, of the detachable tubular flue-guard L, extending downward through and below said aperture, and having the flange *f* resting upon said cover, and the column-flue H upon said cover and surrounding said flange, as shown and described.

388,145. AUTOMATICALLY-ADJUSTABLE FEED DEVICE. Chas. J. Pellon, Scranton, Ohio, assignor of one-half to Hollis S. Bennett, same place. Filed Aug. 20, 1887. Serial No. 246,178. (No model.)

Claim.—1. In a grinding-mill, a hopper, in combination with a vibrating feed-shoe hinged beneath the hopper, a rock-shaft connected with the free edge of the vibrating feed-shoe, a second shaft connected with the former by arms and a connecting-rod, a board rigidly connected with the latter shaft and adapted to actuate the same when

388,145.

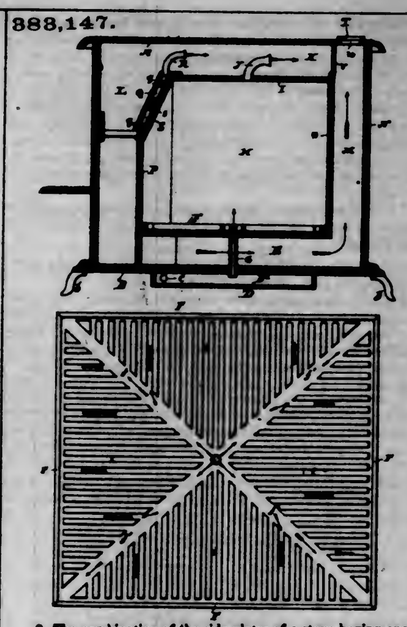


material to be ground accumulates within the hopper, and a counterbalance adapted to automatically return the parts to their normal positions, substantially as set forth.

2. In a mill, a hopper, in combination with a vibrating feed-shoe, a rock-shaft connected with the feed-shoe, and a shaft carrying the regulating-board, a counter-weight connected therewith, slotted arms adjustably secured to the shafts, and a connecting-rod adjustably secured to the slotted arms, substantially as set forth.

3. In a mill, the combination, with a hopper, the vibrating feed-shoe, the rock-shaft actuated by a board within the hopper, of a pulley secured on the rock-shaft, and a cord connecting the face of the wheel or disk with the free edge of the feed-shoe, substantially as set forth.

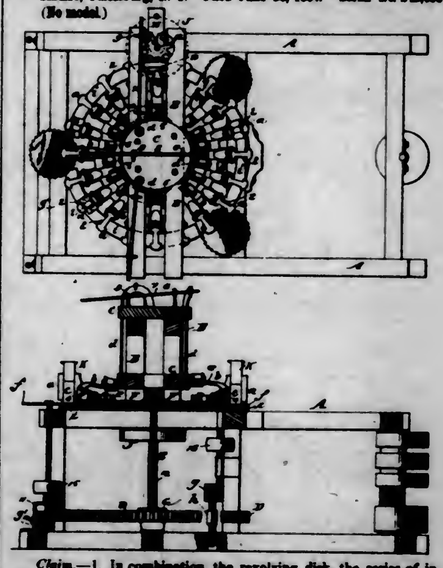
388,146. COMBINED COTTON CHOPPING, PLANTING, AND CULTIVATING MACHINE. DAVID W. PILGRIM, Waxahie, Tex. Filed Mar. 17, 1888. Serial No. 267,227. (No model.)



Claim.—1. The combination of the frame, the shaft journaled therein and having the driving-wheels and the spur-wheel F, the vertical knees or standards on the frame, the transverse shaft I, journaled thereon and having the wheel K, meshing with wheel F, the wheel M, journaled on a spindle projecting from one of the standards at right angles to wheel K and engaging the same, the chopping arm or lever fulcrumed in an opening in the frame, having the chopping-hoes at its lower end, and the pitman X, connecting the wheel M to the chopping-lever, substantially as described.

2. The combination of the frame having the bar P, the chopping-lever fulcrumed in said bar and having the chopping-hoes at its lower end and the slot U in its upper end, the knees or standards on the frame, the guideway N on one knee, wheel M, journaled on the other, the pitman connected to wheel M, having the slot T, through which the upper end of chopping-lever extends, and having the cross-head working in guideways N, pin V, extending through slots Y and U, and the driving-shaft geared to wheel M, substantially as described.

388,147. OVEN FOR COOKING-STOVES. JOHN RAE, Belleville, Ill. Filed Mar. 31, 1887. Serial No. 233,113. (No model.)



Claim.—1. The combination of the bottom plate, B, of a stove, and the pipe G, ascending therefrom, with the bottom oven-plate, F, receiving said pipe substantially in the center thereof, and having grooves in its upper surface radiating from said pipe G, substantially as and for the purpose described.

388,147.

2. The combination of the side plates of a stove having openings *e*, the front plate, P, of an oven, and the fire-pot lining Q, having lugs *q* on the rear thereof, and forming with said plate P an air-passage, S, with a pipe, R, leading from said passage into the upper smoke-passage, K, of the stove, substantially as and for the purpose described.

388,148. MACHINE FOR CUTTING BOX-SECTIONS. PIERRE REMBAUD, Plattsburg, N. Y. Filed June 30, 1887. Serial No. 243,056. (No model.)

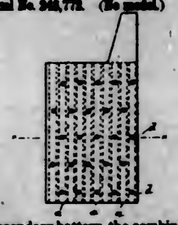
Claim.—1. In combination, the revolving disk, the series of independent block-holders carried thereby, formed with plain smooth holding-surfaces for receiving the block and holding it by direct contact, said surfaces being also arranged vertically, whereby the material is guided accurately and permitted vertical movement by gravity, means for limiting the movement of the blocks, and the saws for cutting the material, substantially as described.

2. In combination, the revolving disk F, the series of independent block-holders arranged thereon having vertical plain smooth holding-surfaces to receive the material and engage the same by direct contact and allow its free vertical movement, each holder having a dog for engaging with the block, and the plates *c c*, substantially as described.

3. In combination, the revolving disk, the block-holders, the dogs for engaging with the material, the plates *c c*, for operating the dogs, said plates being movable vertically, whereby they may be rendered ineffective, and holding devices for said plates, substantially as described.

4. In combination, the disk F, the block-holders arranged with vertical holding-surfaces, and suitable block-weights adapted to rest upon the material, substantially as described.

5. In combination, the disk F, the block-holders, suitable block-weights adapted to rest upon the material, and having teeth to engage with the grooves of the material, substantially as described.



6. In combination, the disk F, the grooved block-holder, the block-weights provided with teeth, and with portions K', adapted to the grooves of the holders, and the double bars *l l*, for adjusting the weights, substantially as described.

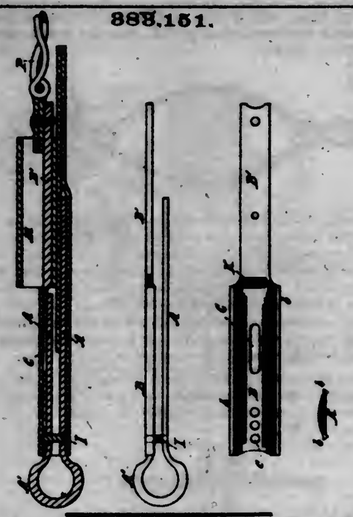
388,149. BRAKE. CLARK RANDOLPH, Hartley, Iowa, assignor of one-half to F. Alonzo Bunger, St. Paul, Minn. Filed Feb 6, 1888. Serial No. 263,293. (No model.)

Claim.—As an improved article of manufacture, a slate-cleaner comprising an elastic bulb having an opening in one wall, a sponge fitted into the opening and held therein by the pressure of the bulb, and a cord or connection secured to the inner end of the sponge, passing out through the bulb and having its end free for attachment to a slate, all substantially as shown.

388,150. SECONDARY BATTERY. SAMUEL RUSSELL, Brooklyn, N. Y., assignor to the Central Electrical Company, of New York. Filed Sept. 5, 1887. Serial No. 249,773. (No model.)

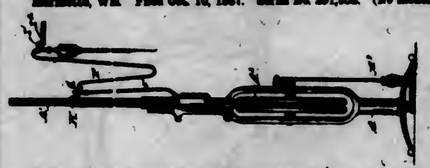
Claim.—1. In a secondary battery, the combination of a plurality of plates having parallel opposing sides, and each having holes made through its body on a plane parallel with its sides and filled with active material or with material to become active, substantially as described.

2. In a secondary battery, the combination of a plurality of plates having parallel sides, each having holes made through its body on a plane parallel with its sides and filled with active material or material to become active, and also having transverse holes entering from the side of the plates to the longitudinal holes containing said material, substantially as described.



3. A secondary-battery element composed of a single continuous metallic plate provided with a series of holes through its body parallel with its sides, substantially as described.

388,151. HAME-TUG. CONRAD SCHMIDT, Cincinnati, Ohio. Filed Sept. 22, 1887. Serial No. 250,302. (No model.)



Claim.—1. In a hame-tug, the combination of a hame-clip, A, and a coupling-plate composed of the portions B and B', the portion B being made concave and with wings *b b*, and fitted externally upon the arm of the hame-clip, whereby their movement laterally with respect to each other is prevented, and a fastening device to hold said parts together, substantially as described.

2. In a hame-tug, the combination of a hame-clip, A, and a coupling-plate composed of the portions B and B', the portion B being made concave, with wings *b b* at its side and a shoulder, K, at its rear end, whereby it is adapted to fit externally upon the arm of the hame-clip, and a fastening device for holding the parts together, substantially as shown and described.

388,151.

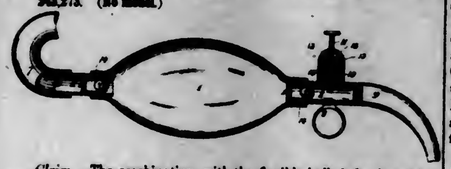
388,152. PNEUMATIC DENTAL PLUGGER. WILLIS S. SHERMAN, Marinette, Wis. Filed Oct. 10, 1887. Serial No. 251,992. (No model.)

Claim.—1. In combination with a dental engine and its standard, a collar mounted upon the standard and carrying a spring-arm, a rigid arm connected with said spring-arm and provided with bearings at its top and bottom, a cylinder mounted on one of the bearings, a friction-roll journaled in the other bearing, and a piston-rod connecting the cylinder and friction-pulley, substantially as specified.

2. The combination, in a dental engine and its standard, of an adjustable collar mounted on the standard and provided with a perforated lug, a U-shaped spring-arm adjustably mounted in said lug and adjustably connected with a rigid arm provided with bearings at its upper and lower ends, a cylinder pivoted for oscillation, the upper bearing, a friction-pulley mounted for rotation in the lower bearing, and a piston-rod carrying a piston mounted in the cylinder and eccentrically connected with the pulley, substantially as specified.

3. The combination, with the frame-work and fly-wheel of a dental engine, of a split collar mounted thereon and formed with a perforated lug having a set-screw, a U-shaped spring-arm mounted in said perforation and adapted to be acted upon by said screw, and having its opposite end adjustably secured in a rigid arm having adjustable bearings at its upper and lower ends, a cylinder the head of which is journaled in the upper bearing, a frictional pulley journaled in the lower bearing, and a piston-rod mounted in the cylinder and eccentrically connected with said pulley, substantially as specified.

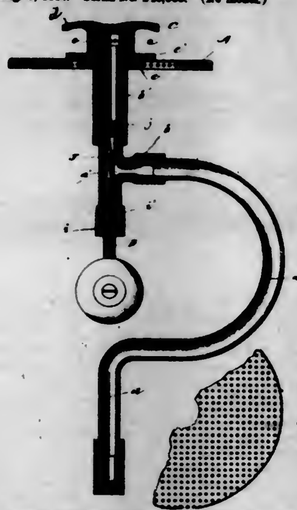
4. In a dental engine, the combination, with its standard having a hook projecting therefrom, of a tube-section coupling formed of metal and provided with an eye adapted to take over said hook, substantially as specified.



5. In combination with two sections of tubes, a metallic elbow-coupling provided with a suspension device and with enlarged ends for the reception of said sections, substantially as specified.

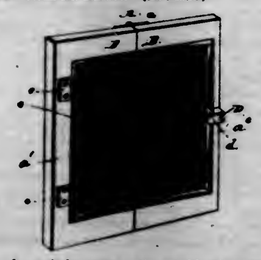
6. The combination, with the piston-rod of a dental plugger, of a tip secured to the end thereof and enlarged for the reception of the tubing, and provided with a suspension-hook, substantially as specified.

7. In a dental plugger, the combination of a piston-rod provided with screw-threads and a fixed piston-head, a cylinder mounted for movement on said rod, and an adjustable nut mounted on the rod above the cylinder to limit the movement of the same, substantially as specified.



8. In a dental plugger, the combination of a screw-threaded hollow rod, a rubber nut or its described equivalent adjustably mounted upon said screw-threads, a fixed piston-head, and a cylinder adapted for movement between said nut and head, substantially as specified.

383,153. SIPHON FOR STARTING THE FLOW OF LIQUIDS. MICHAEL SIEBOLDTS, Louisville, Ky. Filed July 2, 1887. Serial No. 243,273. (No model.)



Claim.—The combination, with the flexible bulb 1, having tubes 2 3 inserted therein, balls 4 in each of said tubes, flanges or valve-seats 5, arranged in said tubes between the bulb and said balls, a cage, 14, partially surrounding said balls for retaining them, a dome or box, 12, on the tube 3, a stem projecting vertically through said dome, a disk, 10, on the lower end of said stem 11, a lug on said stem, a spiral spring surrounding said stem between said lug and tube 3, a strainer, 6, located in one of said tubes, and a ring, 8, on the under side of tube 3, all substantially as and for the purposes set forth.

383,154. GAS-BURNING TORCH. JAMES R. SMITH, Chicago, Ill., assignor to the Standard Natural Gas Burner Company, same place. Filed Aug. 3, 1887. Serial No. 246,063. (No model.)

Claim.—In a gas-burning torch, the combination, with a burner having lateral orifices *c* and flange C, of a single perforated plate as an air-controlling medium, and collars *e* and *e'*, respectively above and beneath said perforate plate, that serve in securing the latter in position, and also serve to exclude the air from the flame-jets near the burner, substantially as set forth.

383,155. WINDOW-SCREEN. HENRY SYMES, Chelsea, Mich. Filed July 7, 1887. Serial No. 243,677. (No model.)

Claim.—1. In a window-screen, the combination of the rectangular frame A, having its bottom and top rails divided centrally and the divided parts connected by the hinges *a*, with the frame C, hinged to one of the divided parts of the frame A, and a latching device attached to the other part of said frame and holding the frame C against the frame A, thereby preventing the latter from folding, substantially as specified.

2. The combination of the rectangular frame A, composed of two equal sections having their upper and lower rails connected together at their central meeting points by the hinges *a*, with the screen-frame C, hinged upon the side rail, *a'*, of the frame A, having its top and bottom rails unsectioned and covered with wire-netting *c*, and the catch D, pivoted on the side rail, *a*², of the frame A, and engaging over the adjacent free edge of the frame C, thereby preventing the frame A from folding, substantially as specified.

383,156. BUTTON. WILLIAM STAMLEY, Coventry, County of Warwick, England, assignor to Albert H. Overman, Newton, Mass. Filed June 27, 1887. Serial No. 243,015. (No model.)

Claim.—A button having a flattened shank, a tapering shoe eccentrically secured, as shown, to one end of the shank and parallel with the longest axis thereof, and a plate or disk having a smooth outer face centrally secured to the other end of the shank, substantially as set forth.

383,157. TWINE-HOLDER. ALBERT B. TOBLIN, Fort Collins, Colo. Filed Jan. 14, 1888. Serial No. 260,695. (No model.)

Claim.—1. In a twine-holder, the combination, with the casing and the handle rising therefrom and having the legs *b b'*, of the weights having the reflex-bends passing around the said legs of the handle, and the eye between the legs, the twine being passed through said bends and eye, as set forth.

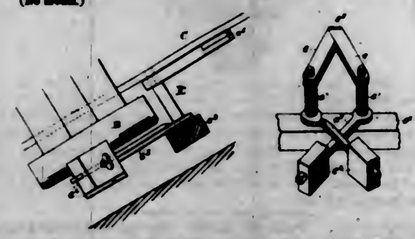
2. The combination, with the twine-holder case and the handle secured thereto and consisting of two wire legs, *b b'*, of the eye C, made on the leg *b*, the wire *d*, secured to the leg *b'*, having the eye D, and the moving wire weight having the central eye and the opposite reflex-bends at its end portions, substantially as specified.

3. The combination, with the twine-holder case, of the handle B, composed of the two legs *b b'* and having the eye C, the wire *d*, secured to the leg *b*, having the eye D, and forming the pointed eye *e* with the leg *b'*, and the wire weight E, having the central eye, *e*, and the reflex-bends *e'*, substantially as specified.

383,158. COMBINED GAS AND ELECTRIC-LIGHT FIXTURE. SAMUEL R. H. VAIL, New York, N. Y. Filed Jan. 31, 1887. Serial No. 225,975. (No model.)

Claim.—1. The combination, with a swing-jointed bracket having one set of jointed containing-arms, of tubular wire-necks on the swing-joints in axial line therewith, lateral wire-passages leading to said tubular wire-necks, and wire-tubes extending from joint to joint with

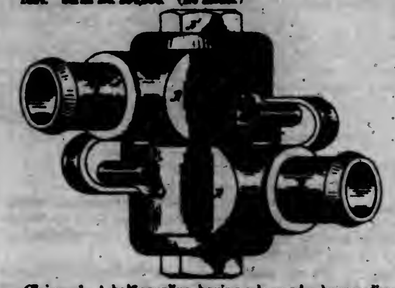
383,158.



one end having a detachable rotating connection with the axial wire-neck, while the other end connects to the lateral wire-passage of the next joint or fitting, substantially as set forth.

2. The combination, with a swing-joint gas-bracket having tubular necks projecting from the joint-fittings in line with the axis of the gas-joints, and a wireway opening on the side of the fitting into said tubular neck, of wire-tubes having at one end a cup or socket to fit over said tubular necks, or vice versa, and connected at the opposite end with the lateral wireway on the next fitting, substantially as set forth.

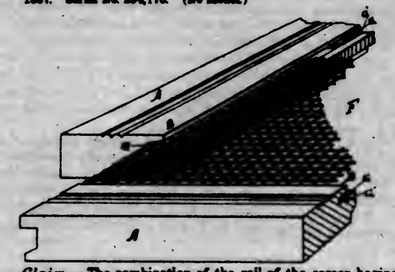
3. The combination, with a swing-joint gas-bracket having tubular necks projecting from the joint-fittings in line with the axis of the gas-joints, and a wireway opening on the side of the fitting into said tubular neck, of wire-tubes having at one end a cup or socket to fit over said tubular necks and connected at the opposite end with the lateral wireway on the next fitting, said neck being formed with circumferential groove, and a set-screw on the cup or socket engaging said groove, substantially as described.



383,159. SAFETY-CATCH FOR CABLE RAILWAYS. CHARLES VOGEL, San Francisco, Cal. Filed Aug. 24, 1887. Serial No. 247,770. (No model.)

Claim.—1. In cable railways, the catch or lock E, consisting, essentially, of the levers *e*, overlapping the slot in the tube, arranged to be opened by the grip-shank passing by and closed automatically by means substantially as described, and for the purpose set forth.

2. In cable railways with underground slotted tubes, the safety device herein described, consisting of the combination of levers *e*, spindles *d'*, arms *e*², and weights *e'*, the whole being arranged in connection with the slot of the tube, substantially as and for the purpose herein described.



383,160. HOSE-COUPLING. HENRY A. WARNER, St. Louis, Mo., assignor to the American Brake Company, same place. Filed Nov. 7, 1887. Serial No. 254,808. (No model.)

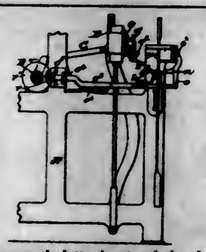
Claim.—1. A half-coupling having a lug and a keeper diametrically opposite and on radial lines of the body thereof, and a stub-tube whose longitudinal axis is coincident with the radius of the body and intersects the radial lines on which the lug and keeper are arranged, substantially as and for the purposes specified.

2. In a hose-coupling, the combination of two half-couplings, each of which has a hollow body, a lug, and a keeper arranged on radial lines of the body and opposite each other, and a stub-tube whose longitudinal axis coincides with a radius of the body and intersects the radii of the lug and keeper, which will cause the lugs and keepers to disengage when the longitudinal axial lines of the stubs substantially coincide, substantially as and for the purposes specified.

383,161. WIRE SCREEN, &c. DEFOREST WHEELMAN, Los Angeles, Cal., assignor of one-half to John J. Jones, same place. Filed Nov. 3, 1887. Serial No. 254,170. (No model.)

Claim.—The combination of the rail of the screen having the grooves G G' therein, the trough T, inserted in the grooves of the frame, and the material of the screen having its edge lapped around one wall, *t*, of the trough.

383,162. NUT-LOCK. ANDREW J. WYLIE, Richland, Mich. Filed Aug. 8, 1887. Serial No. 246,998. (No model.)



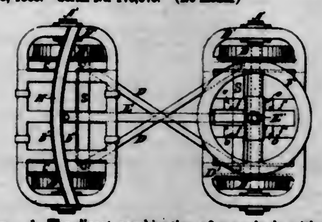
Claim.—The combination, with the bolt and nut, of a washer having a suitable number of right-angled flanges, said flanges having the recesses on the inside, and the end recesses and a forked key adapted for insertion between the flange and nut, one of the prongs of said key being bent outward around the end of the flange and in the end recess, substantially as set forth.

383,163. STOPPING MECHANISM FOR LOOMS. HORACE WYMAN, Worcester, Mass. Filed Apr. 26, 1887. Serial No. 236,127. (No model.)

Brief.—The lay is provided with feelers which feel for the binders at the backward movement of the lay. The presence of a shuttle causes an arm of the feeler to act on a lever pivoted below the breast-beam and to free it from a pin on an arm of a rock-shaft extending across the loom, there being a similar set of devices at each side of the loom. One of the arms of the rock-shaft is extended and connected with a sliding rod which is forced by a spring normally toward a cam on the crank-shaft. The presence of shuttles in opposite boxes at the level of the raceway entirely frees the rock-shaft arms from engagement with the levers and permits the spring to force the sliding rod into

383,168.

a depression in the cam as the latter is rotated, thus forcing the shipper-handle out of its notch by means of a lever pivoted below the breast-beam, which is hit by the arm on the rock-shaft. The continued rotation of the cam resets the mechanism.



Claim.—1. The lay, means to operate it, the shuttle-boxes, their binders, the binder-feelers, the rock-shaft, its arms *o o'*, provided with pins or projections, the shipper-lever, a notched plate to hold it, and means actuated by the rock-shaft to release the shipper-lever, combined with two releasing-levers, and with means to normally move the arms *o* toward the lay, whereby when two shuttles arrive in two boxes located at the opposite ends of the raceway of the lay the said binder-feelers are made to actuate the releasing-levers and effect the release of the shipper-lever.

2. The lay, means to operate it, the shuttle-boxes, their binders, the crank-shaft, its attached cam-disk, the rock-shaft o^3, its attached arms *o o'*, rod o^4, and spring o^5, combined with two releasing-levers and with binder-feelers co-operating therewith, substantially as described.

3. The lay, means to operate it, the shuttle-boxes, their binders, a rock-shaft supported on the frame of the loom, the shipper-lever, and means between them adapted by the oscillation of the rock-shaft to disengage the shipper-lever and stop the loom, combined with two binder-feelers carried by the lay and two notched releasing-levers between them and the said rock-shaft, whereby when either one of the feelers is not actuated by a binder of a shuttle-box in line with the race of the lay just before the picking takes place it will not actuate its co-operating releasing-lever, and thereby will prevent the oscillation of the rock-shaft, substantially as described.

4. The lay, a crank-shaft to operate it and change shuttle-boxes at each end of the lay, and binders attached to the shuttle-boxes, combined with two binder-feelers and with means to actuate them to feel for the binders immediately after the shuttle-boxes arrive in their new position, the binder-feelers returning from the binders to release them from pressure at the time that the picking takes place, substantially as described.

383,164. CAR-TRUCK. WALTER YOUMANS, New York, N. Y., assignor, by mesne assignments, to John W. Emerson, same place. Filed June 20, 1885. Serial No. 170,073. (No model.)

Claim.—1. The direct combination of a car-body with two independent single trucks at each end thereof, the car-body resting directly upon all of the said trucks and being connected with each of them at points above their axles, all substantially as and for the purpose herein set forth.

2. The combination, with a car-body and with two independent single trucks at each end thereof, the car-body resting directly upon and connected with each of said trucks at points above their axles, of the crossed bars D, pivoted at their ends to the said trucks, all substantially as and for the purpose herein set forth.

3. The combination, with a car-body and with two independent single trucks at each end thereof, the car-body resting directly upon and connected with each of said trucks at points above their axles, of the crossed bars D and the reach E, the said bars and reach being pivoted at their ends to the said trucks, substantially as specified.

4. The combination of the platform-springs B C with a top frame, D', base-frame C, axle-boxes A', and axles A, all substantially as and for the purpose herein set forth.

5. The combination, with a car-truck axle, A, base-frame C, and top frame, D', of the side springs, B', the cross-springs C', connected by clips or bolts to the said top frame, and the shackles *d*, connecting the ends of said springs B' C', substantially as shown and described.

6. In combination with the top frame, D', side springs, B', cross-springs C', and axle A, the springs L, interposed centrally upon the side springs, B', between the latter and the superjacent end portions of the top frame, D', in position to support the said end portions upon the ends of the axle A, substantially as and for the purpose set forth.

7. The combination, with the car-body and with two independent single trucks at each end thereof, of a fifth-wheel, F, arranged centrally above the axle of each of the extreme forward and the extreme rearward trucks, and the car-body resting upon the said fifth-wheels and having a suitable bearing upon each of the other two single trucks, substantially as and for the purpose set forth.

8. The combination of two single trucks connected by cross-bars D, each truck consisting of a wheeled axle, a base-frame, C, platform-springs B' C', and a top frame, D', one of the said trucks having directly above its axle a fifth-wheel, F, and a king-bolt, E', and the other truck being provided with a segmental guide, H, with a car-body resting directly upon the said trucks and having upon its under side a slide-bar, K, fitting the said segment H, and having also near its end an annular plate, I, and a socket, E'', fitting the said fifth-wheel F and king-bolt E', respectively, substantially as shown and described.

9. The combination, with the car-body W and the top frames, D', independent of the car-body, and the journal-boxes A', of the springs L, the sleeves *i*, inclosing the said springs, the spring-supports *h*, fitting in the said sleeves, the boxes A', and top frames, D', the said springs L, sleeves *i*, and supports *h* being placed between the journal-boxes and the end portions of the top frames, D', in position to support the said end portions upon the ends of the axle, all substantially as and for the purpose herein set forth.

10. The bar S, in combination with the base-frame C, having axle-boxes A', and the crossed connecting-bars D, substantially as and for the purpose set forth.

11. The combination of the car-body W, provided with the curved bar K and with means for retaining the king-bolt E' in a fixed position, with the two single trucks, the rearmost being provided with the guide-segment H, eccentric with the king-bolt, and the foremost having a sliding block, G, pivoted upon the king-bolt and reciprocally movable transversely to the truck-axis, substantially as and for the purpose set forth.

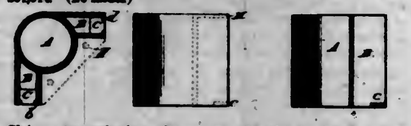
12. In a car connected by a segmental guide with the subjacent truck, the combination, with the body W and the curved bar K, or its substantial equivalent, of intermediate fastening devices, *g*, affording a free space above the said bar between the same and car-body for receiving the brake-rods, substantially as and for the purpose set forth.

383,165. VISE. FRANK ARMSTRONG and NATHANIEL W. VANDERBILT, Bridgeport, Conn., assignors to the Armstrong Manufacturing Company, same place. Filed Jan. 16, 1887. Serial No. 224,470. (No model.)

Claim.—In a pipe or rod vise, the bed-plate A, formed with the longitudinal rail notched or serrated on its top surface and having the upright pin *d*, in combination with downwardly-diverging sockets removably secured to said bed-plate and adapted to receive supporting-legs, a movable jaw working on the rail and operated by a screw, and a stationary adjustable jaw having a pawl engaging the teeth of the rail and provided on one of its sides with the lug or shoulder *l*, substantially as described.

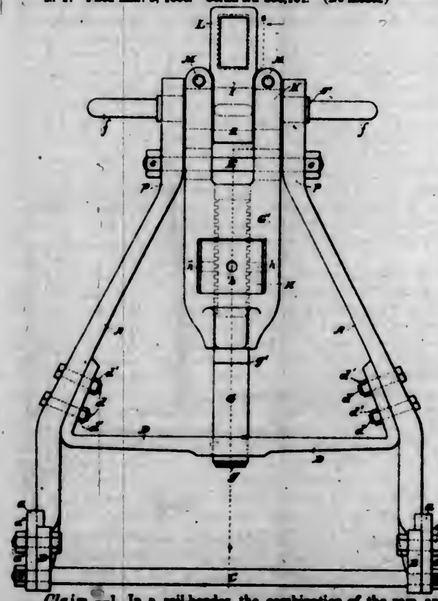
383,166. GRAIN-SEPARATOR. GEORGE B. BAILEY, Council Bluffs, Iowa, assignor of two-thirds to William O'Donoghue, St. Joseph, Mo. Filed Apr. 27, 1887. Serial No. 236,194. (No model.)

Claim.—1. The combination, with the supporting-frame and the rotary sieve mounted in said frame, of the shaft H, mounted in the said frame below the sieve, the double-armed lever K, mounted on the said shaft, and the cord or head secured to the opposite ends of the arms of said lever to reverse the rotary sieve, substantially as specified.



2. The combination, with the main frame, the rotary sieve journaled therein and provided with the longitudinal opening for the passage of the grain, and the shield-plate in the rear of the said opening,

383,166.



of the elevating-plates F and F', forming troughs extending the entire length of the inner surface of the sieve and adapted to elevate the grain therein, the plates F' being arranged at right angles to the screening-surface of the sieve, and the plates F extended and arranged at an acute angle to the plates F', substantially as described.

383,167. ANGLE-CLAMP FOR THE CORNERS OF TABLES, DESKS, &c. DAVID J. BROUGHER, Cincinnati, Ohio, assignor, by direct and mesne assignments, of two-thirds to William Griffith, Covington, Ky., and John Seymour, Oakley, Ohio. Filed May 5, 1886. Serial No. 201,514. (No model.)

Claim.—An angle-clamp for corners of tables, having the circular hole A, in which the legs fit, the sockets B, having projections *b* on their inner sides fitting in grooves cut in the side rails, D, so as to grasp said rails, the horizontal bar C for the side rail to rest on, and the lug H, having a hole in it, through which a screw is passed to fasten the table-top to the clamp, the whole arranged substantially as shown and described.

383,168. RAIL OR BAR BENDER. MORRIS H. BROWN, Yonkers, N. Y. Filed Mar. 5, 1886. Serial No. 203,161. (No model.)

Claim.—1. In a rail-bender, the combination of the ram and means for operating the same, the diverging side frames carrying jaws, and the tie-rod connecting the ends of the side frames beyond the jaws, substantially as described.

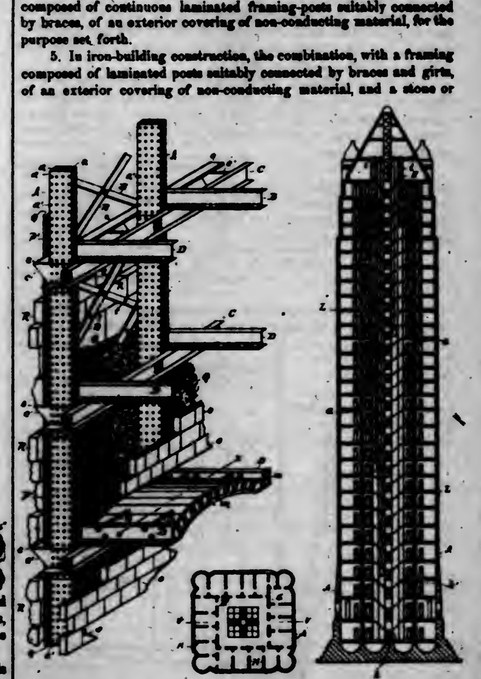
2. The combination, with the side frames provided on their ends with jaws, of the ram having a threaded portion, the bored block in which the ram has a long bearing, and the adjusting-nut working in an opening in said block and engaging the threaded portion of said ram, substantially as described.

3. The combination of the angular side frames, the jaws at the ends thereof, the ram, the block carrying said ram, bifurcated at its upper end, the cross-bolt connecting the side frames and passing through a slot in said block, the eccentric-shaft having bearings in said frames, the eccentric bearing against the grooved end of said block, and the operating-lever working between the branches of said block and keyed to said eccentric, substantially as described.

388,169. KNOCKDOWN RATTAN CHAIR. BENJAMIN J. BOSEMAN, Gardner, Mass., assignor to Heywood Brothers & Co., same place. Filed Aug. 11, 1884. Serial No. 142,204. (No model.)

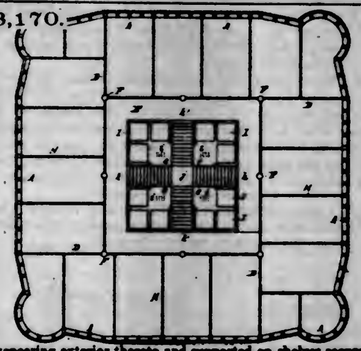
Claim.—In a knockdown rattan chair, the back-frame A and seat C, in combination with the arm-pieces B, the arm-pieces having dowels with tenons to fit in mortises in the seat, and other dowels provided with eyes *b'*, by which the arm-pieces are connected to the back-frame, substantially as and for the purpose set forth.

388,170. IRON-BUILDING CONSTRUCTION. LEROY S. BUFFINGTON, Minneapolis, Minn. Filed Nov. 14, 1887. Serial No. 255,142. (No model.)



Claim.—1. A building having a continuous skeleton of metal, a covering of veneer, and a non-conducting packing between the skeleton and veneer, for the purpose set forth.

2. In a building-frame, a continuous diminishing laminated post formed of layers of metal plates secured together and arranged to break joints and decreasing in number toward the top.



3. In iron-building construction, the combination, with a framing composed of continuous laminated posts suitably connected by braces and girts, of tie-beams secured thereto and to one another, substantially as set forth.

4. In iron-building construction, the combination, with a framing composed of continuous laminated framing-posts suitably connected by braces, of an exterior covering of non-conducting material, for the purpose set forth.

5. In iron-building construction, the combination, with a framing composed of laminated posts suitably connected by braces and girts, of an exterior covering of non-conducting material, and a stone or

388,170.

other veneering exterior thereto and supported on shelves secured to the framing, substantially as set forth.

6. In a frame for a building of two or more stories, a series of tapering posts extending from base to top of the frame and formed of metal plates in layers secured with their flat sides together and arranged to break joints, and braces and girts for connecting and securing the posts, substantially as set forth.

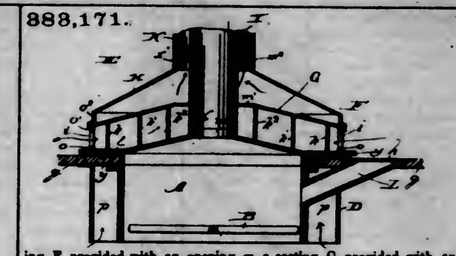
7. In a building-frame, a series of continuous framing-posts composed of metal plates secured with their flat sides together and breaking joints, in combination with girts and tie-beams secured thereto at each floor, substantially as set forth.

8. The combination, with the laminated posts, of the continuous girts secured thereto, and the tie-beams, also secured thereto and to one another, substantially as set forth.

9. The combination, with the framing-posts and braces, of the wire lath or equivalent coverings, the non-conducting packing and the veneering supported by the shelves, and anchor-rods, substantially as and for the purposes set forth.

10. The combination, with the building-frame composed of the laminated posts, girts, tie-beams, and pillars, arranged to form a central well, of the elevator-shafts and stairs arranged therein, substantially in the manner set forth.

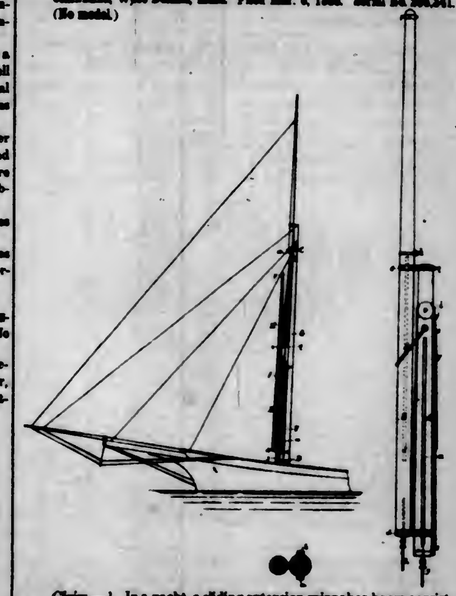
11. The combination, with the building-frame constructed with a central well, of elevator-shafts arranged in the corners of such well and flights of stairs rising from opposite sides of such well to a central landing, and other flights rising from said landing to the other sides of such well, substantially as set forth.



12. The combination, with the posts and girts forming the outer frame, of the beams having their outer ends resting on the girts and secured to the posts, and their inner ends secured to beams that are transverse to them, the pillars therefor, and the diagonal tie-rods, substantially as set forth.

13. The combination, with the posts and girts, of the angle-plates connecting them and forming supports for the veneer shelves.

14. The combination, with the posts and their braces, of the plates forming the shelf-supports, the shelves, the veneer, and the anchor-rods, substantially as set forth.



388,171. AIR-HEATING DEVICE FOR CARS. LYMAN P. CONVERSE, Chicago, Ill. Filed July 22, 1887. Serial No. 244,962. (No model.)

Claim.—1. In an air-heating device, the combination of a fire-pot, A, a jacket, D, surrounding the fire-pot and affording a chamber, *p*, a heater, E, supported directly over the fire-pot, comprising a casting, F, provided with an opening, *m*, a casting, G, provided with an opening, *m'*, and surmounting the casting F, ribs between the two castings about the openings therein, affording a circuitous chamber having communication with the surrounding atmosphere, and a casting, H, surmounting the casting G, and provided with an opening, m^3, a smoke-flue, I, extending through the openings *m*, *m'*, and m^3, and a hot-air flue, K, extending from the casting H around the smoke-flue and opening into the inclosure to be heated, substantially as described.

2. The combination, with a car having an opening, *r*, in its floor, of a heating device comprising a fire-pot, A, and a jacket, D, surrounding the fire-pot underneath the car, and affording a chamber, *p*, a chute, L, having its inlet in the floor of the car and leading from the car-floor into the fire-pot, a heater, E, supported on the upper side of the car-floor directly over the fire-pot, and comprising a casting, F, provided with an opening, *m*, and with openings *n*, leading into the chamber *p*, a casting, G, provided with an opening, *m'*, and surmounting the casting F, ribs between the two castings about the openings therein, affording a circuitous chamber having communication with the surrounding atmosphere, and a casting, H, surmounting the casting G, and provided with an opening, m^3, a smoke-flue, I, extending through the openings *m*, *m'*, and m^3, and car, and a hot-air flue, K, extending from the casting H around the smoke-flue and opening into the interior of the car, substantially as described.

388,172. SPINNAKER-BOOM FOR YACHTS, &c. ALBERT C. CRANDALL, West Dennis, Mass. Filed Mar. 6, 1888. Serial No. 266,241. (No model.)

Claim.—1. In a yacht, a sliding extension spinnaker-boom consisting of two parts, A and B, the main part pivotally secured to the vessel or mast at any suitable part, and the part B adapted to slide on the part A, as and for the purpose set forth.

2. In a yacht, a sliding extension spinnaker-boom, substantially as shown and described, it consisting of the two spars A B, connected to each other by the head and heel bands, the heel-band having bearings to receive and slide on bottoms fixed to the shorter spar, A, as shown, and each spar having tackle connected to it and to the mast-head, a line or pennant, *j*, secured to the heel-band passing through the spar A, and being connected thereto by means of a tackle, F, all as shown, and for the purpose set forth, the boom being supported at its foot, as represented.

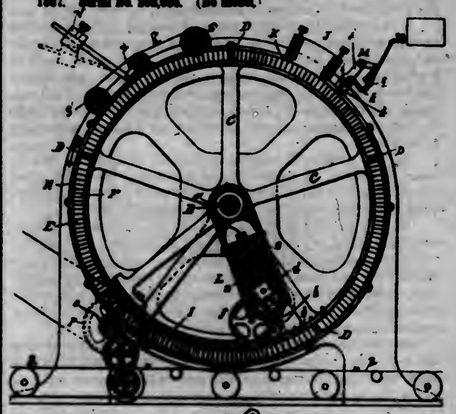
3. In a yacht, a sliding extension spinnaker-boom, substantially as shown and described, it consisting of the spars A B, connected to each other by the head and heel bands *d e* in such manner that the heel-band can slide on one spar and the head-band on the other, or on battens secured to said spars, the spar A having a ball, *f*, and each spar having a tackle connected to it and to the mast-head, all as shown and set forth, the boom being supported at its foot, as represented.

388,173. ASH-SIFTER. JOSEPH H. CHENEY, Westfield, N. J. Filed Sept. 6, 1887. Serial No. 248,903. (No model.)

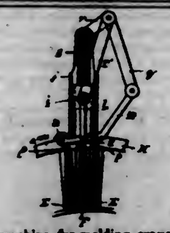
Claim.—1. In an ash-sifter, the combination, with a sieve-box provided with a hinged door and a cylindrical sieve located therein, the bottom of said sieve being pivotally connected with the bottom of said box, and the top of said sieve being open, of a removable top for said sieve, pivotally connected to the hinged door, and means for revolving said sieve.

2. In an ash-sifter, the combination, with a sieve-box having one end hinged to the body thereof, a cylindrical sieve located within said box, the bottom of said sieve being pivotally connected with the flat end of said box and the top of said sieve being open, and projections extending beyond the top of said sieve, of a removable top for said sieve, provided with apertures which engage said projections, a hinged door to which said removable top is pivotally connected, and a crank connected to said top, whereby the sieve may be rotated when the top thereof is closed down upon the same.

3. In an ash-sifter, the combination, with the ash-box A, having an opening in its top, of a sieve-box, B, having an open bottom adapted to register with said opening in the top of the ash-box, said sieve-box being hinged to the top of the ash-box at one edge of the opening therein, and one end, *b*, of said sieve-box being hinged to the top of the sieve-box, a cylindrical sieve, C, having a closed bottom and open top, located within said sieve-box, the bottom of said sieve being journaled in the flat end of said sieve-box, projections *c''*, extending above the open end of said sieve, a cover, C', for said sieve, pivotally connected with the hinged end of said sieve-box, said cover having apertures *c'*, which engage said projections *c''* when it is closed down upon the open end of the sieve, and a crank, *c'*, connected with said cover C' for rotating the same.



4. The cylindrical sieve C, closed at its bottom, and the rods *c''*, secured to said bottom, passing along the sides of said sieve, to which they are secured, and extending slightly above the open top thereof, in combination with the removable top C', having the notches *c'*, adapted to engage the projecting ends of said rods and retained in engagement therewith by a removable end to which said top is pivotally secured.



5. In an ash-sifter, the combination of an ash-box having an open top, a sieve-box having an open bottom and provided with a hinged end and hinged at its opposite end to the ash-box, a sieve having a closed bottom and open top, the closed bottom of said sieve being journaled in the flat end of said box, so that when the sieve-box is turned back the sieve will be raised to a vertical position, and a removable cover for said sieve, substantially as set forth.

6. In an ash-sifter, the combination of an ash-box having an open top, a sieve-box having an open bottom and provided with a hinged end and hinged at its opposite end to the ash-box, a cylindrical sieve having a closed bottom and open top, the closed bottom of said sieve being journaled in the flat end of said box, so that when the sieve-box is turned back the sieve will be raised from a horizontal to a vertical position, a removable cover for said sieve, pivotally connected with the hinged end of the sieve-box, and an ash-pan adapted to fit in the sieve, substantially as set forth.

7. In an ash-sifter, the combination of an ash-box having an open top, a sieve-box having an open bottom and provided with a hinged end and hinged at its opposite end to the ash-box, a cylindrical sieve having a closed bottom and open top, the closed bottom of said sieve being journaled in the flat end of said box, so that when the sieve-box is turned back the sieve will be raised from a horizontal to a vertical position, projections secured to the bottom and extending above the top of said sieve, a cover for said sieve, provided with apertures which engage said projections and journaled in the hinged end of the sieve-box, and an ash-pan adapted to fit in the sieve, substantially as and for the purpose set forth.

388,174. MACHINE FOR THE MANUFACTURE OF CHALK CRAYONS, &c. CHARLES H. PEASE, Sandusky, Ohio. Filed Oct. 11, 1887. Serial No. 252,026. (No model.)

Claim.—1. In a machine for molding crayons, the combination of a rotary drum, molds forming the cylindrical face thereof, a stationary hopper arranged to form a tight joint with the face of the drum, and a knocker to jar or hammer the molds, all arranged substantially as described.

2. In a machine for molding crayons, the combination, with the rotary mold-drum, of a stationary hopper extending the length of the molds, and of adjustable packing secured to the lower edges of said hopper to form a tight joint with the face of mold-drum, substantially as described.

3. In a machine for molding crayons, the combination, with the mold-drum, of a stationary hopper supported above said drum and to one side of the vertical center thereof, and arranged to discharge to one side of said vertical center, substantially as and for the purpose described.

4. In a machine for molding crayons, a rotary mold-drum consisting of a stationary shaft, circular heads journaled upon said shaft, circular flanges upon the inner face of said heads, longitudinal division-plates secured to said heads and dividing the face of the drum into sections, and wedge-shaped molds supported between the division-strips on the circular flanges of the heads, all arranged substantially as described.

5. In a machine for molding crayons, in combination, the rotary mold-drum provided with circular shoulders or flanges on the inner face of the heads on which the molds are loosely supported, a supporting-frame in which said drum is journaled, and guide-rails secured to the stationary frame to retain the molds upon the mold-drum, substantially as described.

6. In a machine for molding crayons, the combination, with the rotary mold-drum carrying sectional molds, of eccentric guide-rails controlling the radial adjustment of said molds on the mold-drum, substantially as described.

7. In a machine for molding crayons, the combination of a rotary mold-drum, a stationary shaft on which said drum is journaled, a sup-

porting-frame, sectional molds carried by the mold-drum, circular shoulders or flanges on the heads of the drum to support the molds on the under side, stationary guide-rails arranged to radially confine the molds upon the outside, eccentric portions in said rails to permit the radial outward movement of the molds, and a stationary segmental inner guide-rail to compel such radial movement, substantially as described.

8. In a machine for molding crayons embodying in its construction a rotary mold-drum, a stationary hopper extending the length of the face thereof and forming a tight joint therewith, an automatically-operating knocker for jarring the molds to remove the crayons, trays to receive the crayons and automatically carry them from the machine, and a lubricator for the molds, all substantially as described.

9. A machine for molding crayons embodying in its construction a rotary mold-drum, sectionally-constructed wedge-shaped molds carried by said drum, an expander for radially expanding the molds on the mold-drum, a hopper arranged on the face of the mold-drum, a knocker to remove the crayons from the mold, an automatically-operating oiler for the molds, and an automatically-moving train of trays to receive the crayons and carry them from the machine, substantially as described.

10. In a machine for molding crayons, the combination, with the rotary mold-drum, of an endless apron arranged to travel over a portion of the face of the mold-drum, with its lower portion run over the molds to close the top of the molds, substantially as described.

11. In a machine for molding crayons, the combination, with the rotary mold-drum, of a radially-reciprocated cross-head carrying a series of oilers corresponding with the molds, an oil-supply tank, a pipe leading from said tank to the oilers, a valve in said pipe, and connections, substantially as described, actuated by the motion of the drum to intermittently reciprocate the oilers and open and close the valve, substantially as described.

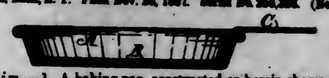
12. In a machine for molding crayons, the combination of a rotary mold-drum, a stationary shaft on which said mold-drum is journaled, and a knocker secured to said shaft within the drum and actuated by the motion of the drum, substantially as described.

13. In a machine for molding crayons, the combination of a rotary mold-drum, a stationary shaft on which said drum is journaled, and a reciprocating hammer having its supporting-frame secured to the aforesaid shaft, and with the hammer operating in an oblique direction to strike the molds at a point past the lowest point, substantially as described.

388,175. BOX OF PLASTIC MATERIAL. MARSHALL GARDNER, Aurora, Ill., assignor of one-half to James Stone, same place. Filed Apr. 11, 1887. Serial No. 234,464. (Model.)

Claim.—A box of plastic material, consisting of a bottom and four sides, the sides being connected to each other at their edges by welded mortise-and-tenon joints, substantially as described.

388,176. ATTACHMENT FOR BRIDLES. ADOLPH GERBER, Beloit, Kans. Filed Feb. 2, 1888. Serial No. 262,722. (No model.)

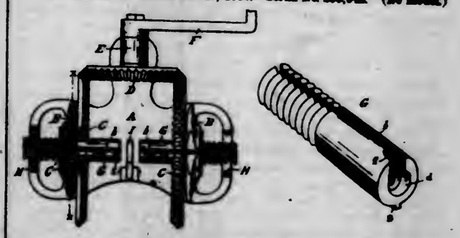


388,176.

Claim.—1. The nose-piece of rigid material, having rings at its ends, and having rings intermediate of its ends connected therewith by the swivel-connections, substantially as set forth.

2. The herein-described nose-piece of cast metal, having eyes at its ends, and rings held in the said eyes, and the rings intermediate of the said ends and held to the nose-piece by swivel-connections, said nose-piece being covered by leather, as and for the purpose described.

388,177. BAKING-PAN. EDWARD F. GERBER and FRANK H. EISENEYX, Bath, N. Y. Filed Nov. 26, 1887. Serial No. 256,266. (No model.)

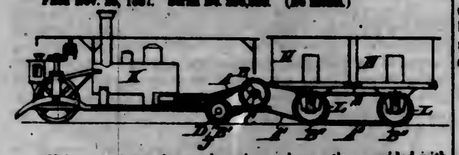


Claim.—1. A baking-pan constructed as herein shown and described, consisting of the sides and permanent bottom, the detachable auxiliary or false bottom adapted to lie upon the permanent bottom, the said detachable bottom being provided with a side handle formed integral therewith and extending up along the inner side of the pan, and thence longitudinally out beyond the pan's edge, the aforesaid detachable bottom and its handle portion being formed from a blank stamped or cut out of one and the same piece of tin or sheet metal, substantially as described.

2. A baking-pan constructed with a fixed or permanent bottom and provided with a removable auxiliary or false bottom adapted to lie upon the permanent bottom, and having connected thereto a side handle that extends up along the inside of the pan's side, and thence longitudinally out beyond the edge or rim of the pan sufficiently to admit of its proper handling, all combined substantially as described and shown, and for the purposes specified.

3. A baking-pan constructed with a permanent bottom and having removably mounted thereon an auxiliary or false bottom provided with a handle portion extending from a side thereof upward and in proximity to the inner surface of the pan's side, and thence extending beyond the top thereof a suitable distance, substantially as described, and for the purposes specified.

388,178. MACHINE FOR SPLICING WIRE. WILLIAM I. HAAG, Lansing, Mich. Filed Nov. 19, 1887. Serial No. 255,642. (No model.)

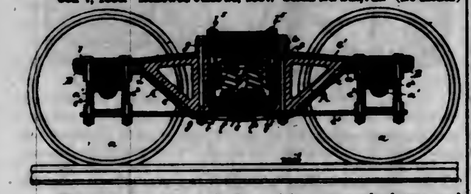


Claim.—1. In a machine for splicing wires, the combination, with a supporting-frame and actuating mechanism, substantially as described, of two oppositely-revolving mandrels slidingly journaled in bearings in axial line with each other and provided with a flanther, a, engaging the twister-wheels, a screw-feed, the enlargements c and d at the inner ends of the mandrels, and the wire clamp I, substantially as described.

2. In a machine for splicing wires, the combination, with the revolving mandrels G, of the frame A, having the standards B, the twister-wheels C, journaled on hollow trunnions in the standards B, and in which the mandrels are slidingly secured, the brackets H, having a screw engagement with the mandrels, the bevel gear-wheel D, and the handle F, all arranged to operate substantially as described.

3. In a machine for splicing wires, the combination of two oppositely-revolving mandrels journaled in bearings in axial line with each other and having an endwise-sliding movement in opposite direction in their bearings, central apertures in said mandrels, the longitudinal

slots b, the enlargements c, and the apertures d at the inner ends of said mandrels, substantially as described.



388,179. TRACTION-ENGINE. DAVID R. JAMES, Vinita, Ind. Ter. Filed Nov. 28, 1887. Serial No. 256,022. (No model.)

Claim.—1. A traction-road engine or locomotive provided with two cylinders containing pistons which connect by suitable rods with a driving-shaft upon which is a double sprocket-wheel to receive two chains, one leading from it to a corresponding sprocket-wheel under floor of engine, on the carrying or traction wheel of same, and the other chain leading to a corresponding sprocket-wheel on the axle of the first car connected to it, and alike to as many cars as the engine has the capacity to move, substantially as and for the purpose shown and specified.

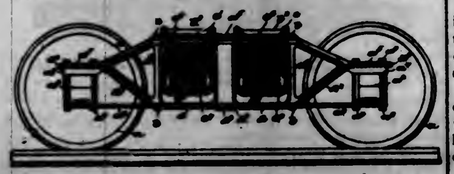
2. In a traction-engine, the combination of two-wheel cars supported by each other at the corners by a coupling that acts as a hinge, connecting engine and train of cars in one continuous line, with side-play in couplings to allow for curves and follow over any reasonable depression on road, substantially as and for the purpose shown and specified.

388,180. CAR-TRUCK. LOUIS K. JEWETT, Boston, Mass. Filed Oct. 7, 1886. Renewed June 20, 1887. Serial No. 242,743. (No model.)

Claim.—1. In a car-truck, the arch-bar, truss, wheel-strap, and clips B, provided with seats, combined with arch-bar-sustaining blocks A, provided with projections, the said sustaining-blocks being placed between the arch-bar and truss and with its projections in the seats of the clips, whereby increased rigidity is obtained, substantially as described.

2. In a car-truck, the arch-bar, truss, wheel-strap, and arch-bar-sustaining blocks, and saddle provided with a recess and with grooves, combined with a rocker having a projection to enter the recess of the saddle, links b^3, and spring-seats and spring, and bolster and transom, the grooves in the saddle being adapted to receive the links b^3 whenever it is desired to change the truck from a swinging truck to a so-called "rigid truck," substantially as described.

3. In a car-truck, the bolster, combined with a center-plate composed of a base, h', and a top portion, h, the base being secured to the bolster, the top being adjustably connected with the base, as and for the purpose described.



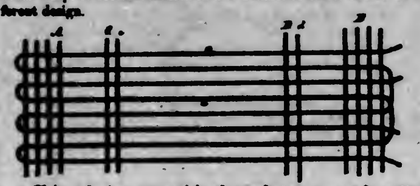
4. In a car-truck, the arch-bar, truss, wheel-strap and bolster, and transom, combined with means, substantially as described, to take up the slack in the truss, as and for the purpose set forth.

5. In an car-truck, the arch-bar-sustaining block A, having a laterally-extended wing, A', combined with a loop or connection, A^2, to support a brake-beam, substantially as described.

6. In a car-truck, an arch-bar, and an arch-bar-sustaining block provided with a projection, combined with a support having a seat for the projection on the arch-bar-sustaining block, substantially as described.

388,181. CAR-TRUCK. LOUIS K. JEWETT, Boston, Mass. Filed Oct. 7, 1887. Serial No. 251,707. (No model.)

Claim.—1. In a car-truck, two metallic transoms, the arch-bar a^3, supporting blocks or castings a^4, and the truss a^5, combined with two



bolsters, springs to support them, rocker-bars and links embracing the rocker-bars, and with the plate c, connecting the said bolsters, substantially as described.

2. In a car-truck, two metallic transoms, the arch-bar a^3, the supporting-blocks or castings a^4, and the truss a^5, combined with two bolsters, springs to support them, rocker-bars, links embracing the rocker-bars, and with the plates c and c^2 to join the said bolsters, substantially as described.

388,182. WARP FOR PATTERN-MAKING. CHARLES H. LAUDENSLAGER, Philadelphia, Pa. Filed Mar. 15, 1888. Serial No. 266,936. (No specimens.)

Brief.—Short warps for pattern-weaving are formed in a broad loom by interweaving the weft-threads carried by the shuttles of such loom with warps placed in groups on opposite sides of the loom and adapted to serve as head-bands, other warps being woven at intermediate intervals to serve as lease-threads. The weft-threads thus interwoven with the head-bands constitute short warp. When one such warp or "section" has thus been produced, it is wound on a warp-beam, and the ends of its threads are joined to those of the threads of other warps or sections formed in like manner of either similar or different design.

Claim.—1. As a new article of manufacture, a warp for pattern-making, having a selvage-band at each end, substantially as and for the purpose set forth.

2. A warp for pattern-making, having selvage-bands and lease-threads, substantially as and for the purpose set forth.

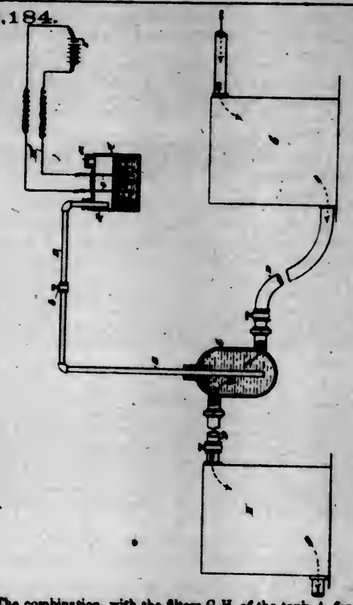
3. A warp composed of continuous threads alternating from one end to the other of its length, and at each end being interlocked with threads crossing the same at right angles and forming a selvage-band at each end, substantially as described.

388,183. TONGUE-SUPPORT. LEONIDAS W. LEAVELL, Jr., and ROBERT H. L. LEAVELL, Kearney, Mo. Filed Jan. 10, 1888. Serial No. 260,266. (No model.)

Claim.—1. As an improvement in tongue-supports, the combination of the pole or tongue, having the corrugated or fluted plate, and the coil-spring having a band or stirrup for adjustable connection with said pole or tongue, as shown and described.

2. As an improvement in tongue-supports, the combination of the pole or tongue, the corrugated or fluted plate secured thereto, the coil-spring, and the band or stirrup encircling the tongue and engaging said plate, substantially as shown and described.

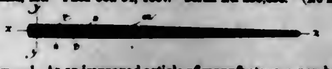
3. The combination, with the wagon-body and the pivoted tongue having the corrugated or fluted plate, of the coil-spring, the rods projecting therethrough, the spring-hooks, and the band or stirrup, substantially as shown and described.



4. In a tongue-support, the combination, with the tongue, of a corrugated or fluted plate secured to the under side thereof, a band or stirrup encircling the tongue and engaging one of the corrugations of the plate, and a spring connected therewith, substantially as set forth.

388,184. ELECTRICAL APPARATUS FOR PURIFYING WATER. ALBERT R. LEEDS, Hoboken, N. J. Filed Sept. 19, 1887. Serial No. 250,003. (No model.)

Claim.—1. The combination, with the closed tank A, for containing the acid or salt solution, of the pipe B, communicating with said tank and the body of water to be purified, and the terminals c of the electric circuit, located in said tank in position to be in the solution, substantially as described.

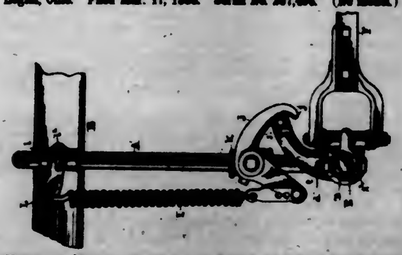


2. The combination, with the filter G, of the closed tank A, for containing the acid or salt solution, the pipe B, communicating with the discharge of the filter, and the terminals c of the electric circuit, located in said tank in position to be in the solution, substantially as described.

383,184.

3. The combination, with the filters G H, of the tank A, for containing the acid or salt solution, the pipe B, communicating with said tank and with the pipe through which the water passes from one filter to the other, and the terminals *c* of the electric circuit, located in said tank in position to be in the solution, substantially as described.

383,185. PERFORATED PEN-HOLDER. FREDERICK M. LIBBY, Portland, Me. Filed Oct. 31, 1887. Serial No. 253,233. (No model.)



Claim.—1. As an improved article of manufacture, a pen-holder of homogeneous material and slitted transversely for a small portion of the length, whereby elasticity is imparted to the said pen-holder at such portion, substantially as described.

2. As an improved article of manufacture, a homogeneous pen-holder made hollow for a portion of its length and provided with a series of short and disconnected transverse saw-cuts in the said hollow portion near its outer end, substantially as described.

3. As an improved article of manufacture, a homogeneous pen-holder made hollow for a portion of its length and provided with short transverse slits, combined with a longitudinally-slitted plug to fit into the outer end of the said hollow portion, substantially as and for the purpose set forth.

4. As an improved article of manufacture, a homogeneous pen-holder made hollow for a portion of its length and provided with independent transverse slits, combined with a corrugated or milled cylindrical plug to fit into the outer end of said hollow portion, substantially as and for the purpose set forth.

383,186. CULTIVATOR. DAVID HOSTERWELL and ELI B. CORLY, Logan, Ohio. Filed Mar. 17, 1888. Serial No. 267,498. (No model.)

Claim.—1. In a wheel-cultivator, the combination, with the axle the sleeve D, having the arm *d*, mounted on the axle, and the gang connected with the sleeve to turn therewith, of the elbow-lever pivotally supported at the elbow and having one end bearing on the said arm *d*, and the spring I, interposed between the other end of the said elbow-lever and the frame, substantially as set forth.

2. In a wheel-cultivator, the combination, with the axle, the sleeve D, having the arm *d*, mounted on the axle to turn thereon, the sleeve E, adjustable on the sleeve D and held to turn therewith, and the gang secured to the sleeve E, of the elbow-lever J, pivoted at the elbow and having one end bearing on the arm *d*, the spring adjustably interposed between the other end of the lever and the frame, and the arm J', integral with the lever J and having its end forked, substantially as and for the purpose described.

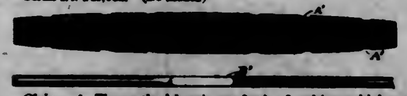
3. The combination, with the axle, the gang, and the arm, of the lever J, having its rear end serrated on its inner edge, and the spring, substantially as and for the purpose described.

4. The combination of the axle, the tongue, the clamp-plate L', the arm L, having a longitudinal slot which is serrated on its lower edge, the bolt connecting the arm, the plate L', and the tongue together, the sleeve K, clamped to the axle, the lever J, pivotally connected with the sleeve, the sleeve D, having the arm *d*, the sleeve E, and the gang connected with the sleeve E, substantially as described.

383,187. WAGON-BRAKE. ROBERT J. HITCHELL, Benson, Me. Filed Mar. 14, 1888. Serial No. 267,163. (No model.)

Claim.—1. In a wagon-brake, the combination, with the two brake-levers C and C', arranged transversely of the vehicle and pivoted near their outer ends, and the two endless cables or chains connected with the brake-levers, respectively, of the pulleys for supporting the said chains at one end, and the rotatable shaft for supporting the chains at their opposite ends and moving them simultaneously for operating both of the brake-levers, substantially as described.

2. The combination, with the two brake-levers and the endless chains or cables, of the rotatable shaft for supporting the chains at one end and imparting motion thereto, and the independent pulleys for supporting the said chains at their other ends and adjustably connected with the vehicle, substantially as described, for the purpose specified.



3. The combination, with the gear-wheel, the hand-lever having a click, and the pawl, of the lifting-rod, and means for connecting the lifting-rod with the hand-lever, substantially as described.

4. The combination, with the gear-wheel, the hand-lever having a click, and the pawl, of the curved lifting-rod concentric with the axis of the gear-wheel, the hand-latch, and the connection between the lifting-rod and the hand-latch, substantially as specified.

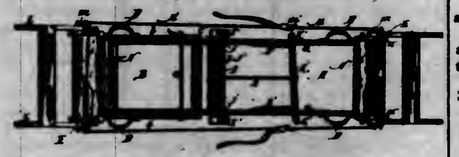
5. The combination, with the gear-wheel, the hand-lever having a click, and the pawl, of the elastic curved lifting-rod connected at one end with the pawl and rigidly connected at its other end with the vehicle-body, of the lifting-arm, the hand-latch, and the rod connecting the hand-latch with the lifting-arm, substantially as specified.

6. The combination, with the vehicle-body, the brake-levers arranged transversely of the body and pivotally supported near their outer ends, the endless cables or chains, the adjustable pulleys, the shaft E, having an angular portion in cross-section, the pinion, the gear-wheel, the hand-lever having a double-ended click and a click-operating lever, the pawl having one end extended and guided in its movements by a keeper, the lifting-rod, the lifting-arm, and the hand-latch connected with the said pawl, substantially as set forth.

383,188. METHOD OF MAKING AXLES OF SHEET METAL. THEODORE C. HOWE, Toledo, Ohio, assignor of one-half to Warren Henry Eldridge and Franklin Hubbard, same place. Filed Sept. 12, 1887. Serial No. 249,662. (No model.)

Claim.—1. The method herein set forth of making vehicle-axles, which consists in constructing a blank of the desired form out of sheet metal and then forming the same into the desired shape by pressure, as and for the purpose set forth.

2. A step in the art of making axles of sheet metal, which consists of forming cut-away portions in the sides of the blanks corresponding to the position of the clip-plates previous to forming the same into the desired shape by pressure, as and for the purpose set forth.



3. A vehicle-axle formed of sheet metal pressed into the desired shape, as and for the purpose set forth.

383,189. IRONING-TABLE. CHRISTOPHER GRELLNER, San Francisco, Cal. Filed Oct. 4, 1887. Serial No. 251,402. (No model.)

Claim.—The combination of the ironing-board having one end provided with the tapered edges *b b*, the bosom-board G, pivoted on the upper side thereof, and the removable spring-clamp P, constructed as described and having the inwardly-directed hooked ends Z Z, to embrace the said tapered edges of the main board, and its body portion adapted to fit snugly around the forward sides and end of the pivoted board, substantially as specified.

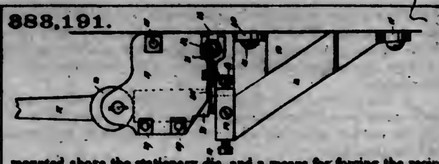
383,190. PIANO-MOVER. WALTER S. RETTENMEYER, De Kalb, Ill., assignor to himself, Samuel S. Bratt, and Leo R. Tomblin, same place. Filed Sept. 14, 1887. Serial No. 249,686. (No model.)

Claim.—1. The combination, with a frame adapted to receive a piano, of a central axle and wheels, and a locking mechanism for the axle for changing the wheels to carry the carriage or run clear thereof, substantially as specified.

2. A frame to receive a piano, having side pieces provided with slots i, in combination with an axle, I, having carrying-wheels I', and a lock for engaging and disengaging the axle to carry the weight on the wheels or allow the wheels to pass out of use, substantially as specified.

3. The combination, with a frame adapted to receive a piano, of a roller, F, at each end, and central carrying-wheels, I', mounted on a movable axle having a lock therefor, substantially as and for the purpose specified.

4. The combination, with the frame A B and supports E, of the rests, and blocks N, having a straight face on one side and a projected face, N', on the opposite side, substantially as and for the purpose specified.



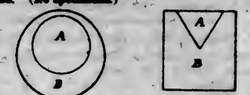
5. The combination, with the frame-sections A B and end pieces *a' b'*, of the rest-blocks O, adjustable in and out on the end pieces *a' b'* for adapting the rest-blocks to the reception of different pianos, substantially as specified.

6. The combination, with the sections A B of a carriage-frame and supports E, of the reversible blocks N N' and rest-blocks O O', substantially as and for the purpose specified.

383,191. SAW-GUMMER. JOHN P. BARNES and DOUGLAS BARNES, Greenville, N. Y., assignors to Barnes Bros. Manufacturing Co., same place. Filed Dec. 7, 1887. Serial No. 257,597. (No model.)

Claim.—1. In a saw-gummer, the combination, with the supporting-frame, of the bracket 31, adjustably secured to the frame, and the gage 34, adjustably secured to the bracket and provided with the toe 37 for engaging the recesses between the teeth of the saw, substantially as described.

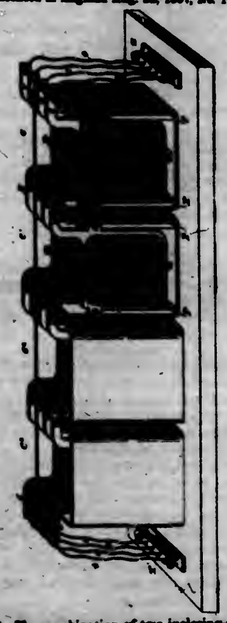
2. In a saw-gummer, the combination, with a main body, of diagonal braces secured to the side faces thereof, a die-holder mounted above said braces and provided with side, front, and rear adjusting-screws, a stationary die carried by the holder, a reciprocating die



mounted above the stationary die, and a means for forcing the reciprocating die downward, substantially as described.

3. In a saw-gummer, the combination, with a main body, of diagonal side braces secured thereto, a die-holder mounted above the braces and provided with side, front, and rear adjusting-screws, a die supported by the diagonal braces and mounted within the holder, a reciprocating bar formed with a die and mounted between side plates that are secured to the body of the gummer, a spring formed with an eye, 24, arranged in connection with the reciprocating bar and mounted as described, guiding and clamping bolts arranged in advance of the bar, and an operating cam and lever, as and for the purpose stated.

4. A saw-gummer frame consisting of the bar 10, provided with the eye 11 at its lower end, and with the laterally-extending and apertured ears 40, the upwardly-extending diagonal plates 12, a die-holder above the upper ends of the said plates, and side plates, 19, secured to bar 10 above the die-holder, substantially as herein shown and described.



383,192. INGOT OR BAR FOR TOOLS. FREDERICK WM. SEAMAN, Sheffield, County of York, England. Filed Sept. 26, 1887. Serial No. 250,269. (No specimens.)

Claim.—1. An ingot or bar composed of a self-hardening steel and a tougher steel, substantially as hereinbefore set forth.

2. The combination, in an ingot or bar, of a self-hardening steel and a tougher steel, the latter surrounding or partially surrounding the former, substantially as hereinbefore set forth.

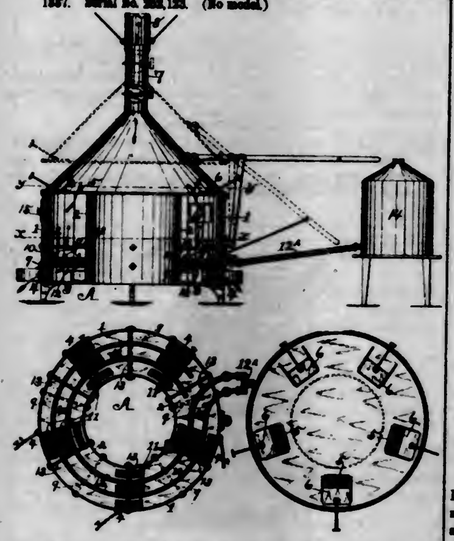
383,193. SECONDARY BATTERY. JOHN S. SHELDON, Sydenham, County of Kent, England, assignor to the Electrical Accumulator Company, of New York. Filed Nov. 5, 1887. Serial No. 254,618. (No model.) Patented in England Aug. 23, 1887, No. 11,443.

Claim.—1. The combination of two inclosing-cells, a positive element consisting of two or more plates, and a negative element consist-

ing of two or more plates alternating therewith in each cell, each negative plate in one cell being independently connected to a positive plate in the adjoining cell, both located in the same plane, whereby any pair of plates may be removed without disturbing the remaining parts of the element.

2. The combination of two inclosing-cells and two or more couples, each couple formed from one integral sheet, plate, or casting of metal, the two sections being located in two cells, respectively, but in one and the same plane.

383,194. TANK. NILS SODERBERG, Chicago, Ill. Filed Nov. 18, 1887. Serial No. 255,511. (No model.)



Claim.—1. The combination, with a tank, of a retaining-hoop and a filling interposed between the two, having its inner side formed with vertical grooves, substantially as and for the purpose set forth.

2. The combination, with a tank, of a retaining-hoop and a wooden filling interposed between the two, formed with an extension over the hoop to protect it from the overflow, substantially as and for the purpose set forth.

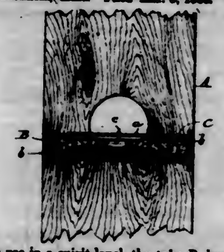
3. The combination, with a tank, of a retaining-hoop and a wooden filling-piece between the hoop and tank, formed with grooves in its inner side, and having its outer edge extended over the hoop to protect it, substantially as and for the purpose set forth.

383,195. TIRE-HEATER. JAMES O. STEBBINS, Oswego Falls, N. Y., assignor of one-half to Edward H. Crandall, same place. Filed Oct. 12, 1887. Serial No. 252,123. (No model.)

Claim.—1. A tire-heater consisting of a circular fire-place, a grate having walled perforations, and perforated fuel-pipes upon the grate, substantially as described.

2. A tire-heater consisting of a circular fire-place, a grate perforated with walled openings, perforated fuel-pipes upon the grate, and draft-doors, substantially as described.

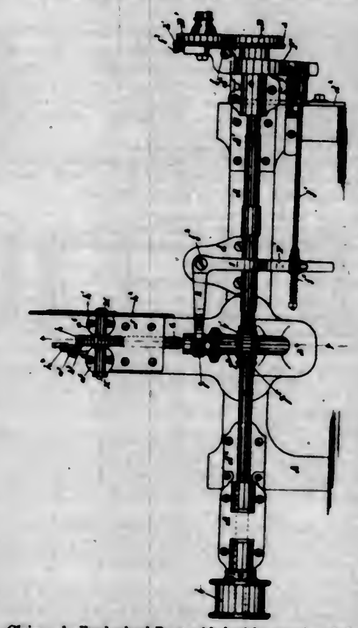
3. A tire-heater consisting of a circular fire-place, a grate having walled perforations, perforated fuel-pipes, draft-doors, and heat-regulating dampers in the cowl, substantially as described.



4. In a tire-heater, the combination of a cowl provided with heat-dampers with the fire-place, substantially as described.

5. In a tire-heater, the combination, with the outer wall, of observation-doors therein above the fire, substantially as described.

6. The combination, with the furnace and cowl, of the lifting-lever, substantially as described.



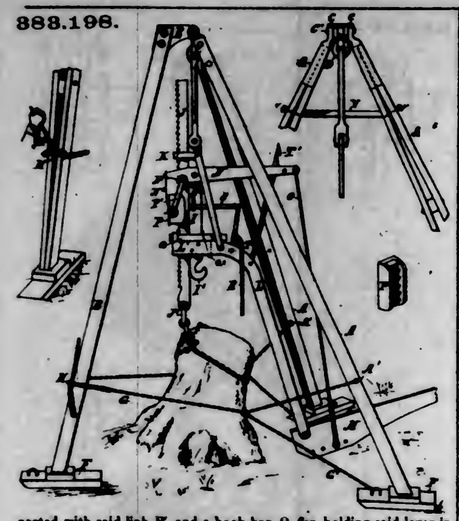
7. A tire-heater provided with two or more perforated fuel-pipes arranged in circular form and having regulating-valves and connecting with a single feed-pipe, substantially as shown and described.

383,196. SPIRIT-LEVEL. EDWIN A. STRATTON and CHARLES H. STRATTON, Greenfield, Mass. Filed Mar. 5, 1888. Serial No. 266,142. (No model.)

Claim.—For use in a spirit-level, the tube B, having the bead *c*, mounted on a wire, *a*, secured to said tube, said bead being made adjustable longitudinally of the tube, substantially as shown and described.

383,197. RATTAN-MEASURING MACHINE. EDWARD L. TAFT and CHARLES L. JONES, Gardner, Mass., assignors to Heywood Brothers & Co., same place. Filed Apr. 11, 1887. Serial No. 234,457. (No model.)

Claim.—1. Feed-wheel D, provided with gear *d*, and feed-wheel *D'*, provided with gear *d'*, in combination with pointer *N*, dial *M*, and means, substantially such as described, for connecting the feed-wheels and pointer, the gears *d d'* meshing together, and all arranged and operating substantially as described.



2. Feed-wheel D, provided with a gear, *d*, in combination with feed-wheel *D'*, provided with gear *d'*, and mounted on a lever, *F*, in combination with pointer *N*, dial *M*, and means, substantially such as described, for connecting the feed-wheels and pointer, all arranged and operating substantially as set forth.

3. Feed-wheels D *D'*, pointer *N*, dial *M*, and means, substantially such as described, for connecting the feed-wheels and pointer, in combination with a bell-hammer, *M'*, all arranged and operating substantially as and for the purpose set forth.

383,198. STUMP-PULLER. ROBERT B. THOMSON and PHILANDO WALKER, Benning, Minn. Filed July 28, 1887. Serial No. 245,203. (No model.)

Claim.—1. In a stump-puller, the combination of a support, a rack-bar, J, and a sliding pawl, Q, for holding the rack-bar in place, with a notched pawl, P, engaging the rack-bar J, a lever, N, connected by a link, P', with said pawl P and having a projecting end, N', provided with a spring, N², which engages with the pawl P, a lever, N, connected with said link P', and a hook-bar, O, for holding said lever in position, substantially as herein set forth.

383,198.

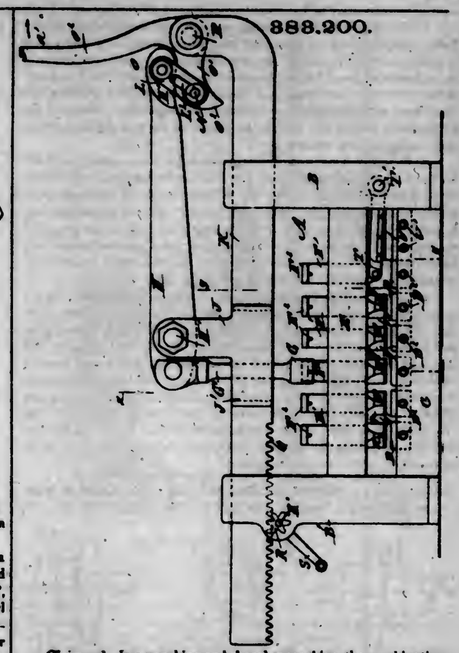
2. In a stump-puller, the combination of a bar, I, supported by a tripod, a rack-bar, J, connected to said bar by suitable keepers, K, and a sliding pawl, Q, for holding the rack-bar in place, with a pawl, P, engaging the rack-bar, a lever, N, connected by a link, P', to said pawl P and having an extension, N', provided with a spring, N², which engages with the notched pawl P, a lever, M, connected with said lever N, and a hooked bar, I, for holding said lever M in any desired position, substantially as herein set forth.

3. In a stump-puller, a support, a rack-bar, J, a sliding pawl, Q, for holding the rack-bar J in place, and a notched pawl, P, engaging with the rack-bar J and supported by a link, P', attached to a lever, N, having a projecting end, N', provided with a spring, N², which engages with the notched pawl P, in combination with a hand-lever, R, having a hinged arm, S, for simultaneously throwing the notched pawl and sliding pawl out of engagement with the rack-bar, substantially as herein set forth.

4. In a stump-puller, the tripod for supporting the pulling mechanism, having suitable shoes, F, in combination with chains G near the bases of the supporting-bars, which pass from one bar to the other and from the shoes, with a hooked lever, H, on one of the bars for tightening the chains, substantially as herein set forth.

383,199. INKSTAND AND FRAME. CHARLES VERRIN, New York, N. Y. Filed Feb. 4, 1888. Serial No. 263,263. (No model.)

Claim.—1. The combination, with the frame B, of the ink-bottle A, spring-catch E, cover G, and the arm D, rigidly secured to the spring-catch E, and projecting into a slot, *f*, in the frame B, substantially as shown and described.



2. The spring-catch E, having the arm D rigidly secured to the said catch, substantially as described.

3. The casing F of the ink-bottle formed with the tongues *g*, in combination with the spring-catch E and arm D, rigidly secured to said catch, substantially as described.

4. The casing F, formed with the tongues *g*, in combination with the frame B, slotted at *f* and beveled at the front edge, the cover G, the spring-catch E, and arm D, rigidly secured to the said spring-catch and projecting into said slot, substantially as described.

383,200. PUNCHING AND SHEARING MACHINE. CLARK WEBER and HENRY SEEMANN, Parker, Dak. Filed Dec. 27, 1887. Serial No. 259,595. (No model.)

383,200.

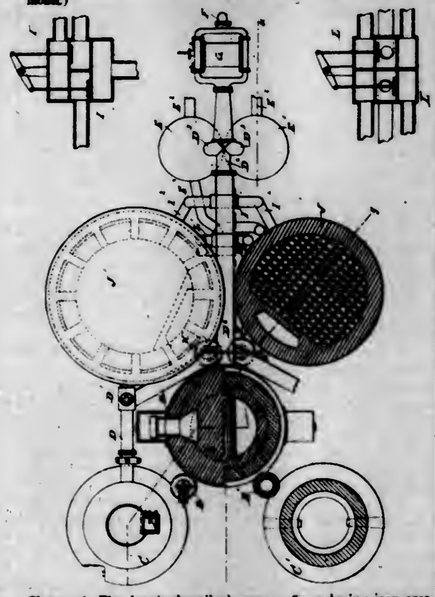
Claim.—1. In a punching and shearing machine, the combination, with a series of different-sized punches and corresponding dies, of a holder adapted to engage successively the heads of the said punches, a lever for operating the said holder, a longitudinally-sliding bar on which the said lever is fulcrumed, and means for operating said bar, substantially as shown and described.

2. In a punching and shearing machine, a series of different-sized punches, corresponding dies, a shear-block, and a shear-arm, in combination with a holder adapted to engage successively the heads of the said punches, and also the head of the shank pivotally connected with the said shear-arm, a lever for moving the said holder up and down, and a bar adapted to slide longitudinally, and on which the said lever is fulcrumed, substantially as shown and described.

3. In a punching and shearing machine, a series of different-sized punches, corresponding dies, a shear-block, and a shear-arm, in combination with a holder adapted to engage successively the heads of the said punches, and also the head of the shank pivotally connected with the said shear-arm, a lever for moving said holder up and down, and a bar adapted to slide longitudinally, and on which the said lever is fulcrumed, and a bell-crank lever fulcrumed on the said sliding bar and connected with the long arm of said lever, substantially as shown and described.

4. In a punching and shearing machine, the combination, with a frame provided with standards, of a bar held to slide longitudinally in the said standards, a bell-crank lever fulcrumed on the said bar, a lever pivotally connected with the said bell-crank lever, and also fulcrumed on the said bar, a link connected with the said lever, and a holder held on the said link and adapted to engage the heads of the punches and the shear-arm to be operated on, substantially as shown and described.

5. In a punching and shearing machine, the combination, with a frame provided with standards, of a bar held to slide longitudinally in the said standards, a bell-crank lever fulcrumed on the said bar, a lever pivotally connected with the said bell-crank lever, and also fulcrumed on the said bar, a link connected with the said lever, a holder held on the said link and adapted to engage the heads of the punches and the shear-arm to be operated on, and a rack formed on the said bar, a pinion meshing into the said rack, and a crank-arm turning the said pinion, substantially as shown and described.



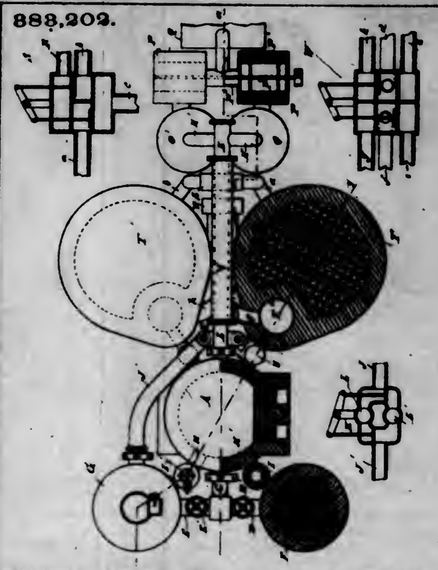
6. In a punching and shearing machine, the combination, with a frame provided with a longitudinal beam having a series of apertures, of shanks held to slide vertically in the said apertures of the said beams and carrying the punches, a shoulder formed on each of the said shanks, and a spring secured on the said beam and engaging with its free end the said shoulder so as to hold the said shank in its uppermost position, substantially as shown and described.

7. In a punching and shearing machine, the combination, with a frame provided with an apertured longitudinal beam, of a shank held to slide vertically in one of the said apertures, a shear-arm pivotally connected with the said shank and fulcrumed on the said frame, a shear-block held on the said frame and operating in connection with the said shear-arm, and a spring secured to the said longitudinal beam and engaging with its free end a shoulder formed on the said shank, substantially as shown and described.

8. In a punching and shearing machine, the combination, with the bar K, a sliding punch-shank, and a holder for engaging said shank, of the lever H, pivoted to the bar K and having its short arm connected to said holder, the bell-crank lever O, pivoted to the said bar K and having its short arm O' projecting under and resting against the long arm of the lever H, and the slotted link L, pivoted to the long arm of the lever H and to the short arm of the bell-crank lever O, substantially as herein shown and described.

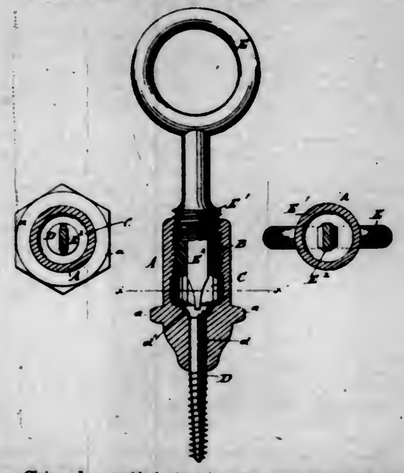
9. In a punching and shearing machine, the combination, with a shank having a head and adapted to slide vertically in suitable bearings, of a holder adapted to engage the said head, a link carrying the said holder, a lever pivotally connected at its short end with the said link, a slotted link pivotally held on the long end of the said lever, a bell-crank lever carrying on one of its arms a bolt engaging the slot of the said slotted link, said arm of the said bell-crank lever being also adapted to engage with its curved edge the curved bottom of the long end of the said lever, and a bar adapted to slide longitudinally and carrying the pivots for the said bell-crank lever and the said lever, substantially as shown and described.

383,201. PROCESS OF REDUCING IRON ORES. GUSTAF M. WERMAN, Stockholm, Sweden. Filed July 22, 1887. Serial No. 245,097. (No model.)



Claim.—1. The herein-described process for reducing iron ores by means of carbonic oxide, which consists in passing heated carbonic oxide through a charge of iron ore, drawing off the gases from the charge and passing them over glowing coke, then superheating these gases, after which they are again passed over or through the ore to be reduced, substantially as shown and described.

2. The herein-described process for reducing iron ores by means of carbonic oxide, which consists in passing heated carbonic oxide through a charge of iron ore, drawing off the gases from the charge and passing them over glowing coke, cooling the gases, as described, then superheating these gases, after which they are again passed over or through the ore to be reduced, substantially as shown and described.

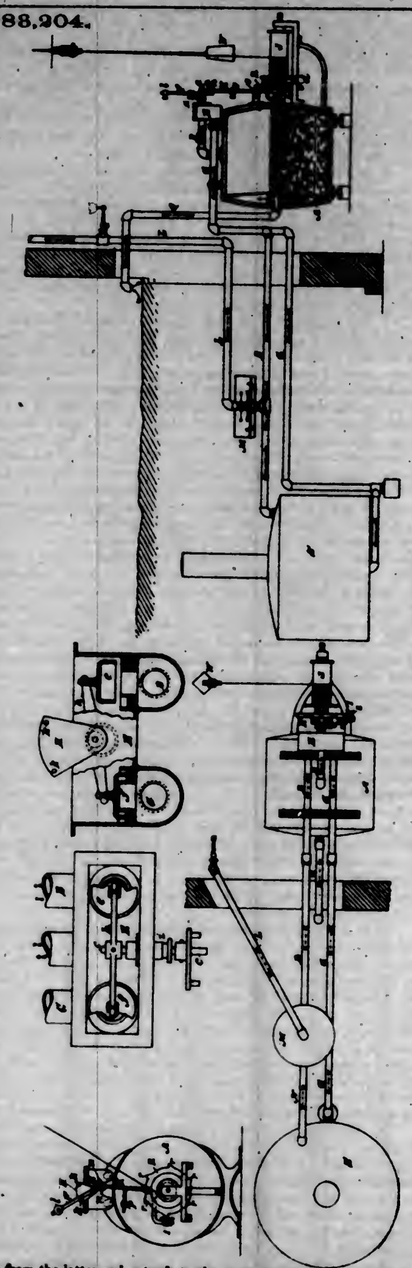


383,202. PROCESS OF REDUCING ZINC ORES. GUSTAF M. WERMAN, New York, N. Y. Filed Oct. 21, 1887. Serial No. 252,974. (No model.)

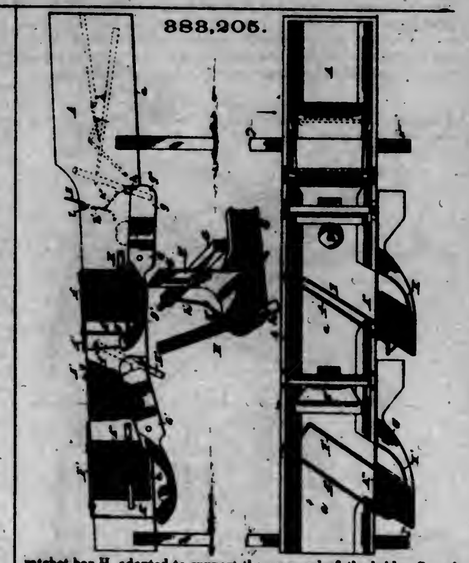
Claim.—The herein-described process of reducing zinc ores, consisting of subjecting the zinc ores in mixture with coal to the action

of highly-heated carbonic oxide, condensing the zinc from the outgoing carbonic oxide, and subsequently reheating and returning the gas through the charge, substantially as shown and described.

383,203. MOLDER'S DRAW-IRON. GEORGE A. WHITE, Sharon, assignor of one-half to William Henry Bunce, Canton, Mass. Filed Apr. 4, 1887. Serial No. 233,582. (No model.)



Claim.—In a molder's draw-iron, the combination, with the internally-threaded thimble having a removable wood-screw projecting therethrough, of the handle having a threaded shank provided with a socket, and a detachable screw-driver fitting in said socket and engaging the screw, substantially as set forth.



383,204. CARBURETOR. JAMES P. WILSON, Newark, N. J. Filed Jan. 18, 1886. Serial No. 189,015. (No model.)

Claim.—The combination of a pumping mechanism, a carburetor or generator, a pipe supplied with air from the pumping mechanism and extending to the carburetor or generator, a mixing-chamber, a pipe extending from the carburetor or generator to the mixing-chamber, a pipe supplied with air from the pumping mechanism and extending to the mixing-chamber, a measuring apparatus arranged between the pumping mechanism and that pipe which is supplied with

383,204.

383,205.

air from the latter and extends to the generator, and a measuring apparatus arranged between the pumping mechanism and that pipe which is supplied with air from the latter and extends to the mixing-chamber.

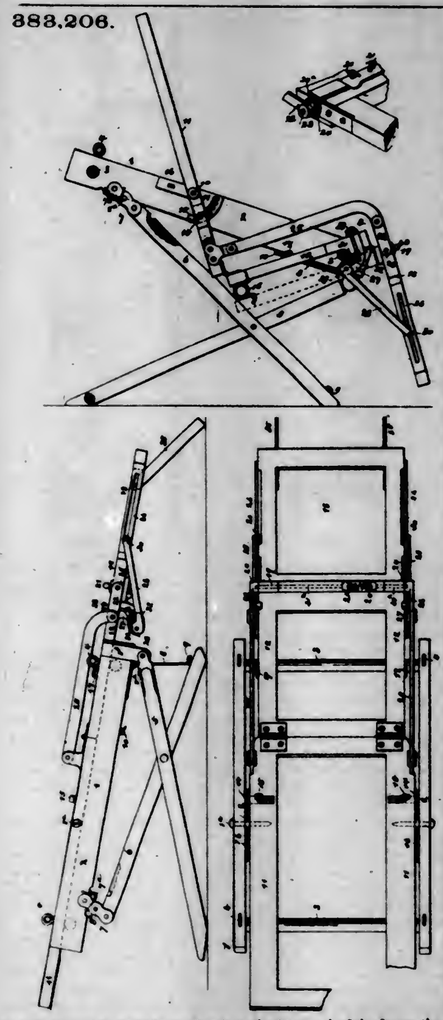
383,205. DEVICE FOR CHASING CRADLES. ALFRED AYER, Lake Weir, Fla. Filed Mar. 14, 1887. Serial No. 230,763. (No model.)

Claim.—1. The combination, with the trough A and the tripping-lever E, pivoted thereto, of the bridge G, pivoted to the side of the trough and having its rear end, *g*, heavier than its front end, *g'*, the ratchet-bar H, adapted to support the rear end of the bridge G, and means, substantially as described, connecting the tripping-lever E with the ratchet-bar H, whereby the forward motion of the lower end of said lever releases the rear end of the bridge and allows the same to drop, substantially as and for the purpose set forth.

2. The combination, with the trough A, having the opening A^1 in its side, of the guard F, pivoted to the trough, the pivoted bridge G, having its front end connected with the guard F and adapted when depressed to raise the guard to a horizontal position, the ratchet-bar H, pivoted to the trough and adapted to support the rear end of the bridge, and the tripping-lever E, pivoted to the trough and connected with the ratchet-bar H, whereby the forward motion of the lower end of the lever releases the rear end of the bridge, raises the lower end thereof, and allows the guard F to drop downward and obstruct the trough, substantially as and for the purpose set forth.

3. The combination, with the trough A, having the opening A^1 in its side, of the guard F, pivoted to the trough, the pivoted bridge G, having its front end connected with the guard and adapted when depressed to raise the same to a horizontal position, and the outer guard, K, adapted to insure the depression of the front end of the bridge upon the passage of an orange through the opening A^1 and over the bridge, substantially as and for the purpose set forth.

4. The combination, with the trough A, having a series of openings, A^1 A^1, &c., in its sides, of a series of pivoted tripping-levers, E, corresponding to said series of openings and having their lower ends separated from the bottom of the trough by spaces decreasing successively from the first to the last of the series, a series of transverse guards, F F', &c., pivoted to the trough and adapted when vertical to obstruct the same, means, substantially as shown and described, whereby each of the guards F F', &c., is held in a horizontal position, and means, substantially as shown and described, whereby the forward motion of the lower end of each of the tripping-levers causes the depression of the corresponding guard, substantially as shown and described.



5. The combination, with the trough A, of the tripping-levers E, placed at unequal distances from the bottom of the trough, the pivoted guards F, the pivoted bridges G, connected with said guards respectively, the ratchet-bars H, adapted, respectively, to support the rear ends of said bridges, and means connecting the tripping-levers with the ratchet-bars, respectively, whereby the forward motion of each tripping-lever releases the rear end of the corresponding bridge and depresses the corresponding guard, substantially as and for the purpose set forth.

6. The combination, with the trough A and the pivot *e*, journaled therein, of the levers E, formed with the longitudinal slots *d'* and bolts passing through said slots and adjustably connecting the levers with said pivots, substantially as and for the purpose set forth.

383,206. ADJUSTABLE CHAIR AND SWING. CHARLES RAHTJEN, New Orleans, La. Filed Oct. 1, 1887. Serial No. 251,205. (No model.)

Claim.—1. The combination, with the supporting-frame, of the

383,206.

legs 5, pivoted at their forward ends to the front end of the frame, the legs 6, crossing the legs 5 and pivoted thereto, and the links 7, pivoted at their outer ends to the rear ends of the legs 6, and pivoted at their opposite ends to the rear end of the said chair-supporting frame, the links being of sufficient length to allow the legs 7 to fold upon the frame when their upper or inner ends are moved outward to their greatest extent, substantially as set forth.

2. In the supporting-frame of a folding chair, the combination, with the side pieces, 2, connecting cross-bars 3, and bow-springs 7ª in the rear under edge of the side pieces, of the legs 5, pivoted to the front of the side pieces, and cross-legs 6, pivoted to said legs 5, provided in their upper edge with a slot adapted to receive the bow-spring, a link, 7, connecting the legs and side pieces, and a transverse bar in said link adapted to engage the said spring, substantially as shown and described.

3. In the supporting-frame of a folding chair, the combination, with the side pieces, 2, connecting cross-bars 3, and a plate, 8, having a slotted extremity hinged to the under forward edge of the side pieces, of the legs 5, pivoted to the front of said side pieces, cross-legs 6, pivotally connected to the said legs 5, a link, 7, uniting the upper end of the legs 6 and the rear portion of the side pieces, and headed pin 9, secured in the lower ends of said legs 6, adapted for engagement with the slotted end of the hinged plate 8, substantially as shown and described, and for the purpose herein set forth.

4. In the supporting-frame of a folding chair, the combination, with the side pieces, 2, connecting cross-bars 3, eyes 4 upon the upper edges near the upper extremities of each side piece, and a bow-spring, 7ª, in the rear under edge of the same, of the legs 5, pivoted to the front edge of the side pieces, cross-legs 6, pivoted to the said legs 5 and provided with a slot to receive the spring 7ª, a link, 7, uniting the legs 6 and the cross-pieces, and a bar, 9ª, extending transversely the link, substantially as shown and described, whereby the legs may be folded upon the frame and the frame be suspended, if desired.

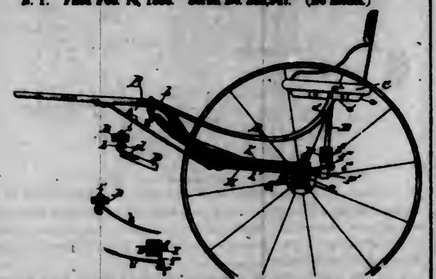
5. In a folding chair, the combination, with the back-section, the seat-section, and the foot-rest section hinged to each other, of a crank-arm, 22, pivoted to the upper edge of the foot-section, means for locking and unlocking the pivot-joint thereof, and a horizontal arm, 25, parallel with and above the side of the seat-section, said arm 25 being provided with one curved extremity pivoted to the crank, and pivoted at the opposite extremity to the base of the back-section, substantially as shown and described, whereby seat and foot-rest are manipulated in unison with the back, as set forth.

6. The combination, with the supporting-frame 1, consisting of the side pieces, 2, and cross-bars 3, and a segmental plate, 14, secured to said side pieces and provided with a series of apertures, of a chair-body consisting of a back-section pivoted in the frame, spring-bolts 15, sliding in said back, adapted to engage the apertures in said plates, a seat-section hinged to the back at the base, and a foot-rest section hinged to said seat, a crank-arm, 22, pivoted to the upper outer ends of the foot-section, means for locking and unlocking the pivot-joint thereof, and a horizontal connecting-arm having a curved end pivoted to the crank, and the opposite straight end pivoted to the back near the base between the locking-bolts and hinging-points of the seat, substantially as shown and described, and for the purpose herein set forth.

7. The combination, with the supporting-frame 1, consisting of the side pieces, 2, and cross-bars 3, and a segmental plate, 14, secured to said side pieces and provided with a series of apertures, of a chair-body consisting of a back-section pivoted in the frame, spring-bolts 15, sliding in said back, adapted to engage the apertures in said plates, a seat-section hinged to the back at the base, and a foot-rest section hinged to said seat, a crank-arm, 22, pivoted to the upper outer ends of the foot-section, a horizontal connecting-bar having a curved end pivoted to the crank, and the opposite straight end pivoted to the back near the base, and means for locking the crank-arm to the foot-rest, substantially as shown and described, and for the purpose herein set forth.

8. In a folding chair-body adapted to be pivoted in a supporting-frame, the combination, with the back-section, the seat-section, and the foot-rest section hinged one to the other, of a crank, 22, pivoted to the upper edge of the foot-section, a horizontal arm, 25, connecting the crank and the back near the base, a slotted rectangular plate, 26, secured to the side edges of the foot-rest, rearwardly-curved brackets 31, attached at the front side edge of the seat, supporting-arms 28, pivoted at one end to the brackets and provided at said end with a toothed edge and at the opposite end with a pin, 30, sliding in the slotted plate, and a spring-actuated pawl, 21, pivoted upon the brackets above the toothed arms 28, all operating substantially in the manner and for the purpose set forth.

9. In a folding chair-body adapted to be pivoted in a supporting-frame, the combination, with the back-section, the seat-section, and the foot-rest section hinged one to the other, of a crank, 22, pivoted to the upper edge of the foot-section, a horizontal arm, 25, connecting the crank and the back near the base, a slotted rectangular plate, 26, secured to the side edges of the foot-rest, rearwardly-curved brackets 31, attached at the front side edge of the seat, supporting-arms 28, pivoted at one end to the brackets and provided at said end with a toothed edge and at the opposite end with a pin, 30, sliding in the slotted plate, a spring-actuated pawl, 31, pivoted upon the brackets above the toothed arms 28, and a sliding rod, 33, pivoted to said pawl, all operating substantially in the manner and for the purpose set forth.



10. In a folding chair-body adapted to be pivoted in a supporting-frame, the combination, with the back, seat, and foot sections hinged one to the other, of a slotted plate, 26, secured longitudinally to the outer side edges of the foot-section, rearwardly-curved brackets secured to the outer and front side edges of the seat-section, supporting-arms 28, pivoted at one end to the brackets and provided at said end with a toothed surface, 29, and at the opposite end with a pin, 30, sliding in the slotted plate, a spring-actuated pawl, 31, pivoted upon the brackets above the toothed arms 28, and a sliding rod, 33, pivoted to said pawl, whereby it is released from the teeth 29, and means for retaining one section folded upon the other, substantially as and for the purpose set forth.

11. In a folding chair-body adapted to be pivoted in a supporting-frame, the combination, with the back-section, the seat-section, and foot-section hinged to each other, of a boxing, 19, inserted transversely the rear upper edge of the foot-section, provided with spring-actuated bolts 20 and 21, projecting from the ends, a crank-arm pivoted upon said ends provided with a slotted bean, 24, adapted to receive the said bolts, and a horizontal arm, 25, provided with one curved extremity pivoted to the crank, the opposing straight extremity being pivoted to the back a distance above the base equal to the length of the crank, substantially as shown and described.

12. The combination, with the frame, of the back pivoted thereto, a laterally-sliding bolt projecting through the side of the back to engage a locking-plate on the frame, operating-knobs extending from the bolt through opposite sides of the back, one knob being hooked, and the seat-frame hinged to the back to fold thereupon and provided with a staple, 17, to receive the said hook or catch-knob of the bolt, substantially as set forth.

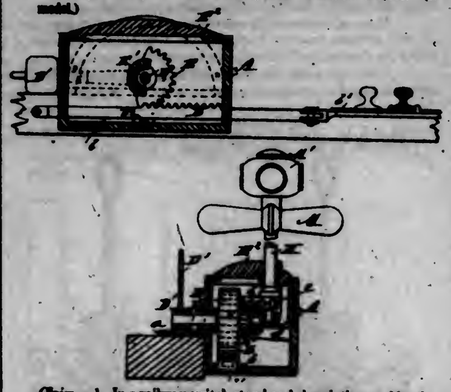
13. The combination, with the frame and its folding legs, of the back pivoted in the frame and provided with laterally-sliding locking-bolts 15, having oppositely-projecting hooked knobs, the seat-frame hinged to the lower end of the back-frame to fold over upon the upper side thereof and having opposite staples 17, to receive said hooked knobs, and a spring-catch, 18, on its under side near its rear end, and the foot-section hinged to the seat-frame to fold against the under side thereof and engage the said spring-catch, whereby the back, seat, and foot frames or sections may all be folded within the frame and locked, substantially as set forth.

383,207. TWO-WHEELED VEHICLE. GEORGE BIRDS, Penn Yan, N. Y. Filed Feb. 14, 1888. Serial No. 263,947. (No model.)

Claim.—1. In a sulky, the combination of the seat, the supporting-bracket having pivot-bearings, the side braces, D, and T-pieces, and the main spring supported at the ends upon the ends of the shafts in the rear of the axle, as described.

2. The foot-board H, supported by bars loosely hooked to the back bar and by other bars loosely hooked to the spring-clips, the other ends of said bars being secured to the top and bottom boards correspondingly, as described.

383,208. DELIVERY. LEHMAN BIRDS, Philadelphia, Pa. Filed Feb. 16, 1888. Serial No. 264,177. (No model.)

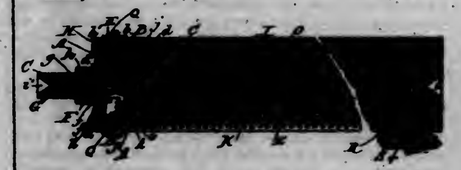


Claim.—1. The tubular bead formed at its ends with disconnected loops of the same thickness at their bends as the body of the bead, substantially as set forth.

2. The tubular bead bent back upon itself and its ends passed within the bend to form disconnected loops, substantially as set forth.

3. As an improved article of manufacture, the tubular bead A, having its ends looped and passed inwardly into the tubular body and an independent fastening to connect said loops, substantially as set forth.

383,209. RAILWAY SWITCH-STAND AND SIGNAL. NATHANIEL W. BOYD, Steelton, Pa. Filed Feb. 24, 1888. Serial No. 265,168. (No model.)



Claim.—1. In a railway switch-stand and signal, the combination, with a covered casing, a bar reciprocating longitudinally in the base of said casing, and a rock-shaft journaled transversely above the rock-bar, provided with a spur-gear and a beveled pinion upon the inner end and a weighted arm upon the outer end, of a vertical signal-shaft provided with a beveled pinion within the casing and a day and night signal upon the upper outer end, substantially as and for the purpose herein set forth.

2. In a railway switch-stand and signal, the combination, with a covered casing provided at the base with longitudinal spaced ribs and a transverse friction-roller, a rack-faced bar sliding upon said ribs and friction-roller, and a rock-shaft journaled transversely above the rack, provided with a spur-gear and bevel-pinion upon the inner end and a weighted arm upon the outer end, of a vertical signal-shaft carrying a bevel-pinion at its lower end and having a polygonal upper and outer end and a day and night signal secured thereon, substantially as and for the purpose herein set forth.

3. In a railway switch-stand and signal, the combination, with a single tie, a covered casing secured thereon, provided at the base with longitudinal spaced ribs and a transverse friction-roller, a rack-faced bar sliding upon said rib and roller, and a rock-shaft journaled transversely above the rack, provided with a spur-gear and bevel-pinion upon the inner end and a weighted lever upon the outer end, of a vertical signal-shaft carrying a bevel-pinion at its lower end, having a polygonal upper and outer end and a day and night signal secured thereon, substantially as shown and described.

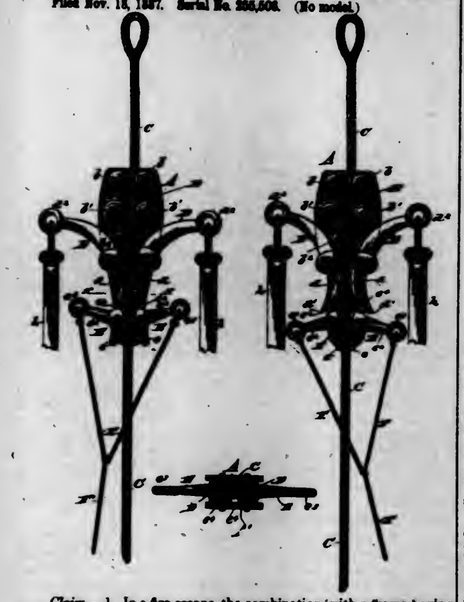
383,210. AUTOMATIC FEED FOR BORING BARS. SAMUEL A. REYNOLDS, Chicago, Ill. Filed Mar. 5, 1888. Serial No. 266,194. (No model.)

Claim.—1. The combination of the disk A, having the teeth *a*, and cam E, with the disk B, having the teeth *b*, and an adjustable contact-pin for the cam E, for engaging and disengaging the disks A B, substantially as and for the purposes specified.

2. The combination of the disk A, having the teeth *a*, and cam E, with the disk B, having the teeth *b*, and sliding rod D, carrying a contact-pin for the face of the cam E, substantially as and for the purposes specified.

3. The combination of the disk A, having the teeth *a*, cam E, sliding block F, with pin *f*, and spring G, with the disk B, having teeth *b*, and sliding rod D, having a contact-pin for the face of the cam E, substantially as and for the purpose specified.

4. The hollow spindle C and sliding rod D, having a pin, *d*, in combination with the clutch-disks A B and cam E, substantially as and for the purposes specified.



5. The hollow spindle C, sliding pin D, with pin *d*, sliding block F, with pin *f*, and spring G, in combination with the clutch-disks A B and cam E, substantially as and for the purposes specified.

6. The combination, with a feed-screw and a driving-gear therefor, of two clutch-disks, a cam, and a contact-pin for the cam for regulating the travel of the feed, substantially as specified.

7. The combination, with a feed-screw and a driving-gear therefor, of a movable rotating clutch-disk and a stationary clutch-disk for giving the desired feed, substantially as specified.

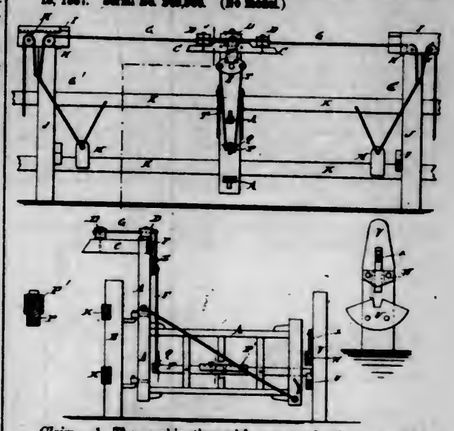
8. A driving clutch-disk and a driven clutch-disk, in combination with a cam and an adjustable contact-pin for the cam for regulating the travel of a feed-screw, substantially as specified.

383,211. FIRE-ESCAPE. HENRY R CALKINS, Hyndsville, N. Y. Filed Nov. 18, 1887. Serial No. 255,503. (No model.)

Claim.—1. In a fire-escape, the combination, with a frame having a series of friction-rollers pivoted therein near the upper end, of curved carrying-arms pivoted in said frame below the friction-rollers, with their convex edges inward, and angle trip-levers pivoted in said frame below the arms, each provided with a toe engaging the lower end of said arms, substantially as described.

2. In a fire-escape, the combination, with a frame having a series of friction-rollers pivoted near the upper end, of aligning curved carrying-arms pivoted below the friction-rollers, having their convex edges inward, and provided with a groove in said convex edges, and an eye at the outer ends, angle-levers pivoted below said arms, and a boss integral with the horizontal member, adapted to engage the lower end of the arms, substantially as described.

3. In a fire-escape, the combination, with a frame having a series of friction-rollers pivoted at the top, and a rope passing around said rollers and through the frame, of curved aligning carrying-arms pivoted at each side of the rope below the friction-rollers, having their convex sides inward, and provided with a groove in said edges adapted to receive the rope, and eyes at their outer extremities to receive the harness, angle-levers pivoted below said arms, a boss integral with the vertical members of said levers engaging the lower ends of the arms, said levers provided with an eye at the extremity of their horizontal members, and a rope secured to said eyes, substantially as and for the purpose herein set forth.



383,212. NUT-LOCK. ORLANDO I. CASTLE, Upper Alton, Ill., assignor to the Gordon Nut Lock Association, Lakeport, Cal. Filed Dec. 30, 1887. Serial No. 259,269. (No model.)

Claim.—In a nut-lock for railroad-rails, the combination of the arched spring-plate D, having enlarged apertures *e* at its ends and provided with projections *f* at the sides of the said apertures, the bolts C, the inflexible rings or washers *d*, of greater thickness than the spring-

plate and smaller than the apertures in the said plate, and the nuts *c*, substantially as herein shown and described.

383,213. GATE. JESSE CHANDLER, Red Stone, Kans. Filed Sept. 13, 1887. Serial No. 249,503. (No model.)

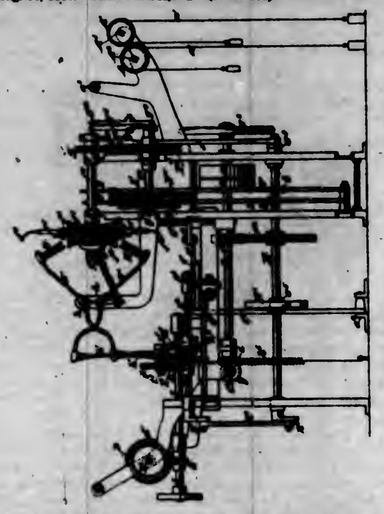
Claim.—1. The combination, with a gate, of a three-armed lever on the end bar of the gate, a sectional latch, rods pivoted to the opposite arms of the said lever and loosely connected to the rear section of the latch, and ropes connected to the other arm of the said lever, substantially as described.

2. The combination, with a gate, of a three-armed lever pivoted to the rear end bar of the gate, a sectional latch provided with an apertured cross-bar on its rear section, rods pivoted to the opposite arms of the said lever and having their lower ends projecting through the apertures of the said cross-bar of the latch and provided with nuts thereon, and ropes attached to the upwardly-projecting arm of the said lever, substantially as herein shown and described.

3. The combination, with the gate A, of the three-armed frame C on the upper end of the end bar of the gate and provided with pulleys D, the lever E, pivoted to the end bar of the gate and provided with the upwardly-projecting arm F, the sectional latch P, provided with the cross-bar Q, having an aperture in each end, rods pivoted to the ends of the lever E and having their lower ends projecting through the apertures of the bar Q and provided with nuts thereon, and the ropes G, substantially as herein shown and described.

4. The combination, with the gate A and the operating cords or ropes G, of the uprights J, provided with the pulleys H, over which the operating cords or ropes pass, the cord G', secured to the operating-rope and to a support, and the weight M on said rope G', substantially as herein shown and described.

5. The combination, with a gate, of the sectional latch P and the slotted cap P', adjustably secured to the rear section of the latch and projecting over the front section of the said latch, substantially as and for the purpose set forth.



383,214. WHEEL FOR HAND-TRUCKS. MICHAEL J. CORRIGAN, New York, N. Y. Filed Jan. 23, 1888. Serial No. 261,662. (No model.)

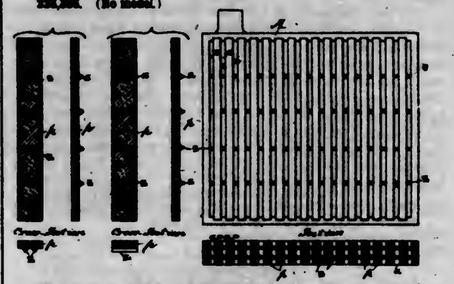
Claim.—A wheel for hand-trucks, casters, &c., consisting of disks B B', provided with annular shoulders *b*, the shoulders having inclined slots or cavities E on their faces, the tapered key D, fitting in the slots

E, and the tire A, having transverse slots *d* on its inner face to register with the slots E and receive part of the key D when the disks are locked.

383,215. LOOM FOR WEAVING LOOM-HARNESS. FRED BECKMANN, Paterson, N. J., assignor to Paul A. Wagner, same place. Filed Aug. 30, 1887. Serial No. 248,304. (No model.)

Claim.—1. The combination, with the warp-carriers, harness, and the beaters or lays at opposite sides of the loom, of a centrally-arranged weft-carrier and rotary looper-arms, a pin around which the weft-threads from their spools or bobbins are carried and looped one into the other, shuttles carrying locking-threads at each side of the loom, and shuttle-carriers by which said locking-thread shuttles are advanced into the open shed, looped over the last weft-thread, and then withdrawn to pull the weft-thread into the shed, and mechanism, substantially as described, for operating the harness, the beaters or lays, the weft-carrier and its looper-arms, and the shuttle-carriers, substantially as herein set forth.

2. The combination, with the warp-carriers, harness, and beaters or lays at opposite sides of the loom, of a centrally-arranged rotary shaft carrying the weft-spools and looper-arms, a central head and pins protruding therefrom, around which the weft-threads are alternately looped one into the other, a rocker and a cam and cam-actuated lever for alternately withdrawing and projecting the pins, a pinion and sector through which the shaft is operated, and a crank and connecting-rod for rocking the sector, shuttle-carriers at the opposite warps, each having a shuttle adapted to carry a thread for looping around the weft-threads and drawing them into the warps, and mechanism, substantially as described, for operating the harness, the lays, the said crank, and the shuttle-carriers, substantially as herein set forth.



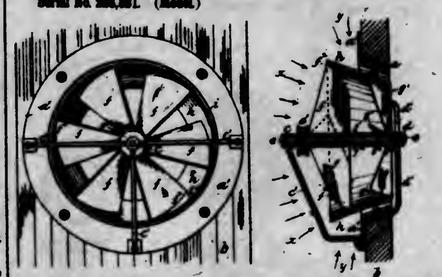
3. The combination, with the warp-carriers, the harness, and the lays at opposite sides of the loom, of the shaft with its looper-arm and weft-spool spindles, the pinion *g*, having a locking shoe or block, g^3, projecting beyond its periphery, and the sector F^3, having the locking-surface terminating in the notches g', the central head and its alternately-presented pins g', the shuttle-carriers at opposite warps, each having a shuttle adapted to carry a locking-thread for looping around the weft-threads and drawing them into the warps, and mechanism, substantially as described, for operating the harness, the lays, the said sector, the pins, and the shuttle-carriers, substantially as herein set forth.

4. The combination, with the warp-carriers, the harness, and the lays at opposite sides of the loom, of a center head and its alternately-presented pins, a rotary weft-carrier and looper-arms provided with tubes through which the weft-threads are conducted to their guides at the ends of the arms, shuttle-carriers at the warps, each containing a shuttle adapted to carrying a locking-thread for looping around the weft-threads and drawing them into the warps, and mechanism, substantially as described, for operating the harness, the lays, the reciprocating pins, the weft-carrier and looper-arms, and the shuttle-carriers, substantially as herein set forth.

5. The combination, with the warp-carriers, the harness, and the lays at opposite sides of the loom, of a center head and its alternately-presented pins, a rotary weft-carrier and looper-arms, shuttle-carriers at the warps, each containing a shuttle adapted to carry a locking-thread for looping around the weft-threads and drawing them into the warps, levers at opposite ends of which the shuttle-carriers are placed, each lever connected, as described, with shuttle-carriers which enter the two warps in opposite directions, rockers and a rock-shaft for operating said levers, and mechanism, substantially as described, for operating the harness, the lays, the pins, the weft-carrier, and the said rock-shaft, substantially as herein set forth.

6. The combination, with the warp-carriers, the harness, and the lays at opposite sides of the loom, of a center head and its alternately-presented pins, a rotary weft-carrier and looper-arms, shuttle-carriers at the warps, each consisting of a fork and each containing a shuttle having its opposite ends oblique in substantially parallel planes, and mechanism, substantially as described, for operating the harness, the lays, the reciprocating pins, the weft-carrier, the looper-arms, and the shuttle-carriers, substantially as herein set forth.

383,216. SECONDARY BATTERY. LUDWIG ELWERS, Martinikenfelde, near Berlin, Prussia, Germany. Filed Feb. 21, 1887. Serial No. 228,228. (No model.)



Claim.—1. An improved electrode for secondary batteries, the same consisting of a series of composite strips formed of the active material and metallic lead, as specified, the said strips being arranged at a suitable distance apart and connected by suitable means to form a grid, which is adapted to permit the free circulation of the electrolyte, as described.

2. An improved electrode for secondary batteries, the same consisting of a series of strips formed of the active material and metallic lead, suitably connected to form a grid, each such strip having lateral projections *s*, which serve to space it from its neighbor, as shown and described.

3. The improved electrode for secondary batteries hereinbefore described, the same being formed of a rigidly-connected series of cakes or plates composed of a foraminous body of active material and a filling of metallic lead, such composite electrode having a suitable non-conducting covering, such as varnish, as specified.

383,217. VENTILATING-WHEEL. EDWARD FOX, Brooklyn, N. Y., assignee of one-half to Patrick Reilly, same place. Filed Feb. 25, 1887. Serial No. 228,821. (Model.)

Claim.—1. The combination, with a fan-wheel composed of a peripheral shell and vanes located thereon, of a frame having an opening in which the wheel rotates, larger than the wheel, thereby forming an independent annular passage through which the air is drawn by the action of the column of air forced through the fan-wheel.

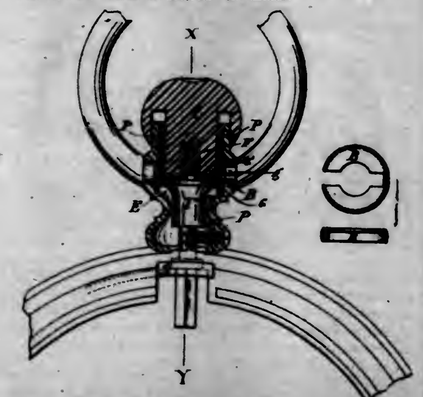
2. The combination, with a fan-wheel composed of a series of radially-inclined vanes and a casing surrounding them, of a frame of less depth than the wheel and provided with bearings in which the shaft of the wheel is held, said wheel being so located that the front or entrance end of the same projects beyond the frame and the rear or exit end is about in line with the rear end of the frame.

3. A fan-wheel composed of a series of inclined radial vanes and

a conical shell surrounding the vanes, in combination with a frame having a conical opening, said opening being considerably larger than the wheel, thus leaving an annular space between them, and bearings on the frame in which the wheel is held and rotated, substantially as set forth.

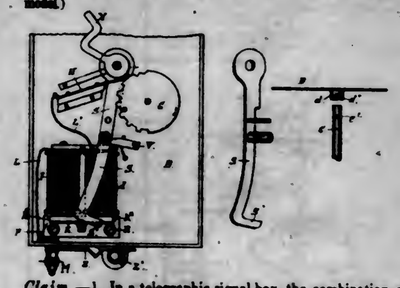
4. In a fan-wheel, in combination, a central shaft, two sets of vanes, and a shell surrounding them, the front or entrance set of vanes being formed with their central parts less inclined to the axis than their outer edges, and the rear or discharging vanes being formed with their outer edges less inclined to the axis than their central parts, substantially as set forth.

5. A fan-wheel composed of two sets of vanes secured to a central shaft, the rear set of vanes being of less diameter than the front set, and a conical shell secured to the outer edges of the two sets of vanes, in combination with a frame having an opening corresponding in shape with but larger than the conical shell and provided with bearings in which the shaft of the wheel is held, substantially as set forth.



6. The combination of a conical fan-wheel having a set of vanes at its front or entrance end extending outside the wheel and having their working-angles greater at the center of the wheel than at the periphery, so as to concentrate the air in the central parts of the wheel, and a set of vanes located at and in line with the exit end of the wheel and having their working-angles greater at the periphery of the wheel than at the center, so as to spread out the column of air or discharge it laterally as it leaves from the wheel, with a frame having a conical opening larger than the outside of the conical wheel and provided with bearing-supports in which the wheel is held and rotated, substantially as set forth.

383,218. HOG-TRAP. JOSHUA H. GENTRY, Sheldon, Mo. Filed Dec. 21, 1887. Serial No. 258,663. (No model.)

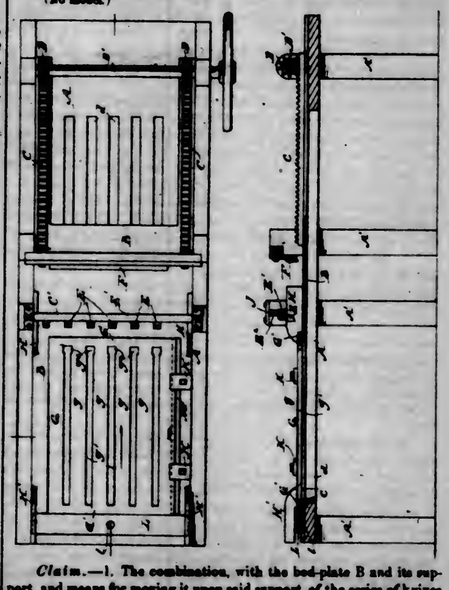


Claim.—A stock trap and holder consisting of the base-piece 1, having the recess 11 and perforations 15, slotted vertical bar 4, the inclined bar 3, having curved portion 14, the slotted cross-bar 5, connecting the bars 3 and 4 and having teeth 6, and the lever 8, having curved portion 14 and pawl 7, and the pivoted sliding bars 12, substantially as described.

383,219. WATCH-CASE PENDANT. HENRI GERBER, St. Trond, Switzerland, assignor to Ernest Francillon & Co., same place. Filed Dec. 16, 1887. Serial No. 258,093. (No model.)

Claim.—The combination, with the tubular pendant P, having the circular grooves G G', the stem T, having a head-piece, T', and neck E, and the crown C, connected to said stem, of the spring B, formed as a disk with a rim around its edge, the exterior surface of which is rounding, and having a transverse slot passing through the rim on one side, and having a central opening for the neck E, so that the parts are free to move as the spring is pressed by the crown endwise of the tubular grooved pendant, substantially as specified.

383,220. DISTRICT-TELEGRAPH CALL-BOX. JAMES R. GILL, San Francisco, Cal. Filed Sept. 30, 1887. Serial No. 250,966. (No model.)



Claim.—1. In a telegraphic signal-box, the combination of an electro-magnet in a closed circuit, the shunting-circuit consisting of the connections P P, and armature K K, and mechanism under control of and actuated by the transmitting mechanism consisting of movable lever S, having foot S^{x}, the projecting hammer on the armature, and the knob W with its latch V, all arranged to enable the armature to be thrown away from the magnet and the circuit broken when the box is set in operation.

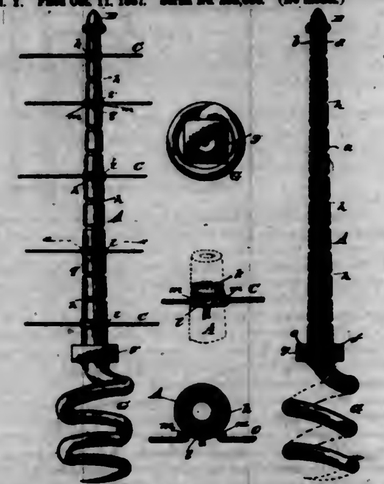
2. A telegraphic signal-box having an electro-magnet in a closed circuit, and a shunting-circuit consisting of connection P, plate R, and armature K, adapted to take the coils normally out of the main circuit, in combination with means described, consisting of movable lever S, having foot S^{x}, the projecting hammer on the armature, and the knob W with its latch V, whereby the shunting-circuit is broken and the magnet energized.

3. In a telegraphic signal-box, the combination of the magnet-armature K in a circuit, and the stop-lever S, of the transmitting mechanism having the bent end S^{x} set for operation with relation to the armature, as described.

383,221. MACHINE FOR PLANING STEREOTYPE-PLATES. LUCIUS GOSS, New York, N. Y. Filed Feb. 20, 1886. Serial No. 253,069. (No model.)

Claim.—1. The combination, with the bed-plate B and its support, and means for moving it upon said support, of the series of knives E for trimming the edges of the columns, substantially as described.

2. The bed-plate B, formed or provided with an offset or straight-edge, *m*, in combination with several trimming-knives, E, and means for moving the bed-plate, substantially as described.



3. The cross-bar F, provided with several knives, E, held in vertical slots and acted upon by springs J, in combination with the bed-plate B, means for moving the same, and the cams H, substantially as and for the purposes set forth.

4. The cross-piece E, provided with several knives, E, in combination with the bed-plate, and means for moving the same, and the planing-knife F, substantially as described.

5. The bed-plate B, provided with clamps K and cams H H', in combination with the cross-bar F and several knives, E, substantially as described.

6. The combination, with the bed-plate B, several knives, E, and means for moving the bed-plate, of the shutting plate L, centrally pivoted to the bed-plate, substantially as and for the purposes described.

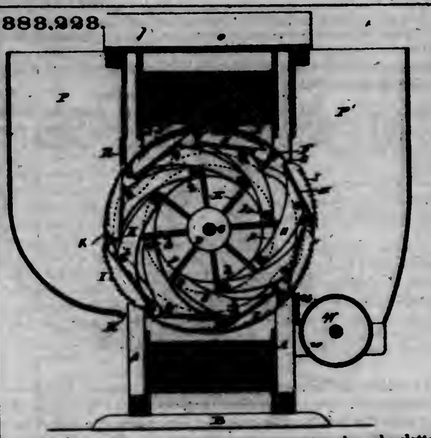
383,222. METALLIC FENCE. GEORGE H. GOSS, Three Mile Bay, N. Y. Filed Oct. 11, 1887. Serial No. 252,022. (No model.)

Claim.—1. An improved fence-post, consisting of the pillar or standard A, having a series of annular grooves, *k*, and the helical-shaped point G, secured to the lower end of the pillar or standard, substantially as described.

2. In the metallic fence, the combination of the pillar or standard A, having the series of grooves *k*, and provided with the helical-shaped point G, the wires C, having the loops or eyes *k* in the grooves of the pillar, and the loops *l*, connecting the necks of the said loops or eyes *k*, substantially as described.

383,223. COTTON-GIN. DANIEL R. HARRISON, Charleston, S. C. Filed Feb. 8, 1887. Serial No. 227,070. (No model.)

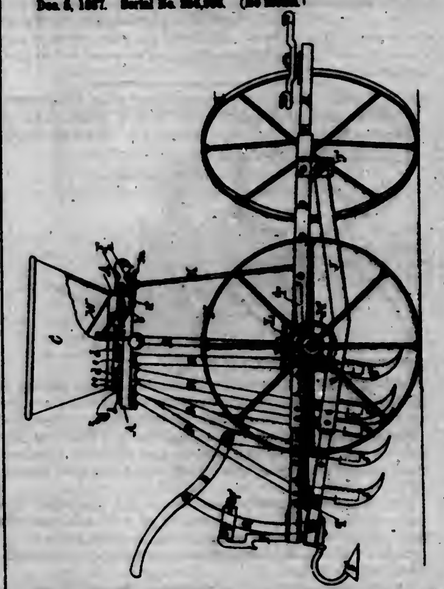
Brief.—The gin has two hoppers, between which revolves a cylinder carrying pivoted within it a series of frames provided with teeth, and the teeth are protruded while in the hoppers, then gradually withdrawn while passing the seed-bars, and then fully withdrawn to drop the cotton. The pivoted frames are connected by rods, which at each end extend into cam-grooves in plates at the ends of the gin, the frames being thereby actuated.



Claim.—1. A ginning-cylinder of slotted sheet metal, a shaft and ends for such cylinder, in combination with frames within the cylinder, pivot-bars for connecting the frames to the cylinder ends, ranges of teeth connected with the frames and in line with the slots, and stationary cams acting upon the frames to swing them and project and withdraw the teeth, substantially as specified.

2. The shaft C, slotted cylinder G, and the ends thereof, in combination with the frames H, pivot-bars A, to connect the frames to the cylinder ends, and ranges of teeth I upon the frames, the cross-bars L in the respective frames, and the cams M for acting on the ends of the cross-bars, substantially as specified.

3. The combination, with the slotted ginning-cylinder, the ranges of teeth, the frames carrying the same, the cams for projecting and withdrawing the teeth, and the two supply-hoppers, of the belts S' and T' to carry away the cotton as the teeth are withdrawn from the same and the chute T, substantially as specified.



4. The combination, with the slotted cylinder, its ends and shaft, of frames within the cylinder, ranges of teeth thereon that are projected through the slots, the frames extending forwardly at their ends, and pivot-bars for connecting the end pieces of the frames, and cams for moving the frames and ranges of teeth, substantially as specified.

383,223.

5. The combination, with the breast in a cotton-gin, and a slotted ginning-cylinder having a shaft and ends, of frames pivoted to the cylinder ends, and ranges of teeth on the frames, and cams having three sets of steps that project the teeth to take the cotton and partially withdraw the same as they pass the breast and then completely withdraw the teeth to discharge the cotton, substantially as specified.

383,224. DRILL-PLOW. CHRISTIAN HERRMANN, Langen, Switzerland, assignor to himself and Arnold Doherty, San Francisco, Cal. Filed Dec. 6, 1887. Serial No. 256,956. (No model.)

Claim.—1. The head-piece A, with conical bottom A', circular groove *c*, in combination with a stirring-wheel, B, moved by means of a connection to the wheels H, and with a hopper, C, and cover W, substantially as shown and described, and for the purpose specified.

2. The combination of head-piece A with the tubes E, frame D, removable prolongation-tubes S, connected to the frame D, and movable frame J, and the hollow shares S', connected to the frame J and corresponding to the tubes S, substantially as shown and described, and for the purpose specified.

3. The combination of frame J with bolts J' and Q', rod Q, lever O, bearing P, loop *p*, and screw *p'*, substantially as shown and described, and for the purpose specified.

4. The combination, with the seed-tubes E and shares S', of the hopper C, the revolving stirring-wheel B within the hopper, the bottom

A' below the stirring-wheel, and the cover W above the same, there being an opening between the cover and the inside of the hopper, and holes through the base of the hopper and above the seed-tubes R, substantially as set forth.

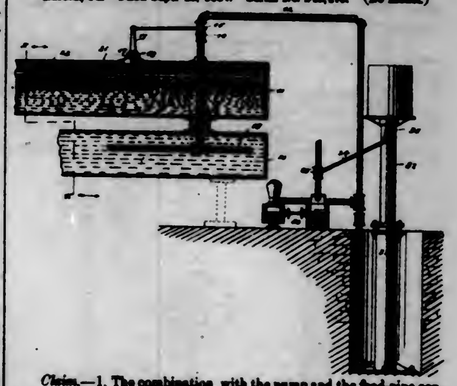
383,225. PRESSURE-REGULATOR. ARNIM G. HOHENSTEIN, Brooklyn, N. Y., assignor to the Hohenstein Manufacturing Company, Newark, N. J. Filed Sept. 10, 1887. Serial No. 249,294. (No model.)

Claim.—1. The combination, with a pair of integrally-formed communicating cylinders, one cylinder being connected with a supply pipe or main and the other cylinder with a service-pipe, of a shut-off valve in one cylinder and a pressure-regulator in the other, substantially as set forth.

2. The combination, with a pair of integral cylinders having a communicating passage, one cylinder being connected with a supply pipe or main and the other cylinder with a service-pipe, of a shut-off valve in one cylinder and a pressure-regulator in the other, the latter having an annular chamber therein adjacent to the communicating passage, substantially as set forth.

3. The combination, with a pair of integrally-formed cylinders having a communicating passage, one cylinder being connected with a supply-pipe and the other cylinder with a service-pipe, of a shut-off valve in one cylinder, a pressure-regulator in the other, and screw-caps in each of these cylinders, whereby they may be opened and cleaned, substantially as set forth.

383,226. AUTOMATIC PRESSURE-REGULATOR AND SAFETY-VALVE. ARNIM G. HOHENSTEIN, Brooklyn, N. Y., assignor to the Hohenstein Manufacturing Company, Newark, N. J. Filed Sept. 13, 1887. Serial No. 249,563. (No model.)



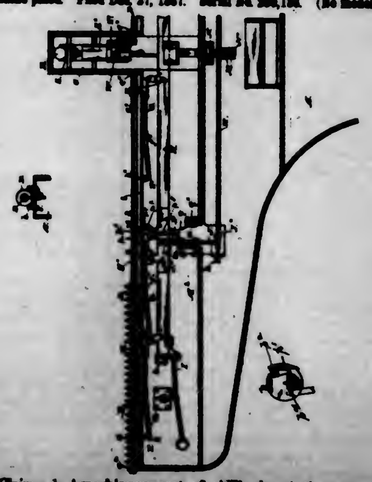
Claim.—1. The combination, with a balanced valve adapted to move away from its seat by its gravity, of a safety-valve located between the supply-pipe and balanced valve, and constructed and arranged to automatically shut off the supply of gas to the balanced valve when the pressure in the supply main or pipe falls below a predetermined amount and remain closed until opened manually, substantially as set forth.

2. The combination, with a gas main or pipe, of a safety-valve constructed to be upheld by the pressure of gas in the main, said valve being provided with suitable passage or port to convey gas to the upper ends of the valve to hold it against its seat when the valve is closed, substantially as set forth.

3. The combination, with a valve-chamber having inlet and outlet ports, and a balanced valve adapted to move away from its seat by its gravity, and having a conical valve at one end and an annular chamber at a point above said conical valve, the said annular chamber adapted to register with the inlet-port, of a safety-valve interposed between the supply-pipe and inlet-port to balanced valve and adapted to automatically shut off the supply of gas to the balanced valve when the pressure in the supply main or pipe falls below a predetermined amount and remain closed until opened manually, substantially as set forth.

4. The combination, with a single casting having two communicating cylinders, of a balanced valve located in one of said cylinders and adapted to move away from its seat by gravity, and a safety-valve located within the other cylinder and between the supply-pipe and balanced valve, and constructed and arranged to automatically shut off the supply of gas to the balanced valve when the pressure in the supply main or pipe falls below a predetermined amount, substantially as set forth.

383,227. BOILER-FEEDING ATTACHMENT. MORRIS P. JARNEY, Boston, Pa. Filed Sept. 12, 1887. Serial No. 249,473. (No model.)



Claim.—1. The combination, with the pump and the feed-pipe connected with the pump and provided with a cock or valve at one side of its connection with the pump, of an accumulator connected with the throttle of the pump and with said feed-pipe at its end opposite the cock or valve, whereby when the feed-pipe valve or cock is closed the force of water in the feed-pipe causes the accumulator through its connections to operate the pump-throttle, substantially as set forth.

2. The combination, with the boiler, the pump and the feed-pipe connected between its ends with the pump and having a valve near its delivery end and a float within the boiler for operating the valve, of an accumulator connected with the throttle of the pump and with the opposite end of the feed-pipe, whereby after the float has automatically closed the feed-pipe valve the force of water in the feed-pipe will cause the accumulator to operate the pump-throttle, substantially as set forth.

3. In a boiler-feeding attachment, the combination, with an accumulator and a pump, of a connection between the accumulator and the throttle of the pump, a feed-pipe, a valve located in the feed-pipe and provided with a lever-arm, a lever, 17, mounted upon a rock-shaft, connection between said lever and the valve-lever, a bifurcated lever connected to the rock-shaft and extending downward within the boiler, and a float pivotally mounted between the arms of the bifurcated lever, substantially as described.

383,228. COIN-ACTUATED BILLIARD-MARKER. EDWARD C. JONES, San Francisco, Cal., assignor of one-half to William J. Gleason, same place. Filed Dec. 27, 1887. Serial No. 259,136. (No model.)

Claim.—1. A marking apparatus for billiards and other games having sliding counters or buttons movable on a rod in a grooved run or way, and a locking mechanism in combination therewith, consisting of locking-dogs B on the ends of levers working through slots in the run, a balanced bar to which said levers are attached to be moved and locked by it, a rock-shaft, K, connected with and adapted by its movement to depress said bar, the balanced lever M, which is adapted, when depressed, to turn the rock-shaft, and a set of actuating-balls, and mechanism whereby the same are released one by one and caused to overbalance and depress the said lever by gravity, substantially as hereinbefore described.

2. The combination, with a string of buttons or markers, of the slotted run *b*, locking-dogs B on levers G, balanced bar H, rock-shaft K, connecting crank-arm and slide-bolt, tilting lever M, and means, substantially as described, for operating said lever and its rock-shaft, consisting of a set of balls in a trough or chute above the lever, a ball-tray on the end of the lever, and mechanism acted upon by a coin and set in motion by its weight to release one ball and drop it into the lever-tray at each time of action, substantially as described, to operate as set forth.

3. In combination with locking-levers G, the balanced bar H, its operating rock-shaft K, and the holding-down device, consisting of the disk *p*, with yielding dog *p'*, and the spring-lever P, having a boot foot and the notched bolt or rod, substantially as described, to operate as set forth.

4. The combination, with the run or way for the sliding buttons, of the locking-dogs having inclined faces on pivoted levers G, the balanced bar H, and the rock-shaft K, connected to said balanced bar and adapted by its movement to depress said bar and draw in the dogs below the run *b*, substantially as described.

5. The balanced lever $W^{\times}$, having the coin-receiver W and the stops w^2 and w^3, and the pivoted gate T, having the slot t^2, in combination with the inclined ball trough or chute S, substantially as herein described, to operate as set forth.

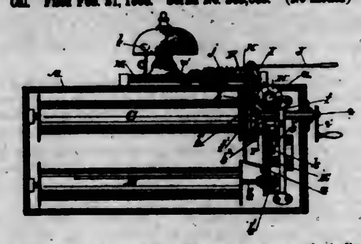
6. The combination, with the pivoted gate T, having the slot t^2, of the balanced lever $W^{\times}$, having stops w^2 w^3, substantially as described, to operate as set forth.

7. In combination with the tilting lever M, which is part of mechanism to be actuated or set in motion, a set of balls, R, in an inclined trough, the ball-controlling gate T, the stop-gate U and operating-lever, and the coin-actuated lever $W^{\times}$, adapted to lock the gate T when elevated and to release it when depressed to a given point, substantially as described, for operation as set forth.

8. The combination of a suitable case having a coin slit and chute, S, the coin-actuated lever W $W^{\times}$, having the stops w^2 w^3, ball-trough S, gate T, having the slot t^2, stop-gate U, and lever adapted to control the discharge of the balls and release one at a time from a given movement of the coin-actuated lever, substantially as described.

9. The combination, with the chute S and balls R and the coin-receiver W, of a coin-ejector consisting of the push-plate rod having its end set in the path of the discharged ball to be struck by it, and the spring, substantially as described, for operation as set forth.

383,229. TWO-WHEELED VEHICLE. HENRY W. JOHNS, Ottawa, Ill. Filed Feb. 7, 1888. Serial No. 263,241. (No model.)



Claim.—1. In a two-wheeled vehicle, the combination, with a vehicle-body, an axle, and shafts attached to the axle, of two elliptical plate-springs and two compensating springs that are secured to the shafts by their front ends, to the elliptic springs by their rear ends, and between these ends to the body of the vehicle, substantially as set forth.

2. In a two-wheeled vehicle, the combination, with an axle that is provided with spindles on its ends and shafts that are attached by their rear ends to the body of the axle, of a vehicle-body, two elliptical plate-springs secured fixedly to the vehicle-body, and also to the axle, and two curved compensating springs which are adapted to give elastic support to the body by their attachment to said body, and also to the cross-bar of the shafts and the forward ends of the elliptic springs, substantially as set forth.

3. In a two-wheeled vehicle, the combination, with a body, an axle, a pair of shafts, and a cross-bar fixed to these shafts, of two elliptical plate-springs, two elastic compensating springs, two pair of mated links that are pivoted to the ends of the compensating springs, and also to the forward ends of the elliptical springs, and two scroll-springs, which are each attached by one end to the top surface of a compensating spring and by the other end to a side sill of the vehicle-body, substantially as set forth.

4. In a two-wheeled vehicle, the combination, with a body, a pair of shafts that are clipped by their rear ends to an axle, a cross-bar affixed to the shafts, and a transverse axle, of two elliptical plate-springs mounted on and secured to the axle, and also to the vehicle-body, two mated links pivoted to each elliptic spring at the front ends of these springs, two curved plate-springs secured loosely to the cross-bar of the shafts, and also to the lower ends of the links, and two scroll-springs that bear against and are attached to the side sills of the vehicle-body, and two side sills, substantially as set forth.

383,230. STATION-INDICATOR. JAMES C. LEWIS, San Francisco, Cal. Filed Feb. 21, 1888. Serial No. 265,088. (No model.)

Claim.—1. In a station-indicator, the drums, the indicating-ribbon, and the power mechanism applied to one of the drums by which the travel of the ribbon is effected, in combination with the releasing and stopping mechanism, whereby the operation is rendered intermittent, consisting of the disk connected with one of the drums and having the pins or stops, and the oscillating trip-hub in the path of the pins or stops, and having the offset or shoulder by which they are relieved, substantially as herein described.

2. In a station-indicator, the drums, the indicating-ribbon carried thereby, and the power mechanism applied to one of the drums, whereby the travel of the ribbon is effected, in combination with the releasing and stopping mechanism consisting of the disk connected with one of the drums and having the pins or stops projecting from its outer face, the oscillating trip-hub located in the path of the pins or stops and having the shoulder or offset for releasing them, the arm projecting from the trip-hub, the pull-rod by which the trip-hub is operated, and the spring by which it is returned to position, substantially as described.

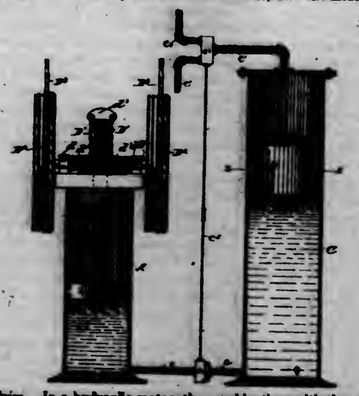
3. In a station-indicator, the drums, the indicating-ribbon carried thereby, and the power mechanism applied to one of the drums, whereby the travel of the ribbon is effected, and the crank-shaft of the upper drum for winding the ribbon back to the initial point, in combination with the releasing and stopping mechanism consisting of the sleeve on the upper drum-shaft, the disk on the sleeve having the projecting pins or stops, the pawl-and-ratchet mechanism between the disk and the upper drum, and the oscillating trip-hub in the path of the pins or stops and having an offset or shoulder, whereby they are released, substantially as herein described.

4. In a station-indicator, the drums, the indicating-ribbon, and the power mechanism applied to one of the drums, in combination with the releasing and stopping mechanism consisting of the disk connected with the other drum and having the projecting pins or stops, and having a shoulder or offset by which they are released, and the hold-back mechanism consisting of the rock-shaft, the spring by which it is held in position, and the bent arm in the path of the pins or stops, substantially as herein described.

5. In a station-indicator, the drums, the indicating-ribbon, and the power mechanism applied to one of the drums, in combination with the releasing and stopping mechanism consisting of the disk connected with the other drum and having the projecting stops or pins, and the oscillating trip-hub having the shoulder or offset, and the alarm mechanism comprising the gong, the hammer, the spring-actuated rock-shaft, and the downwardly-extending arm on said shaft, located in the path of the pins or stops, substantially as herein described.

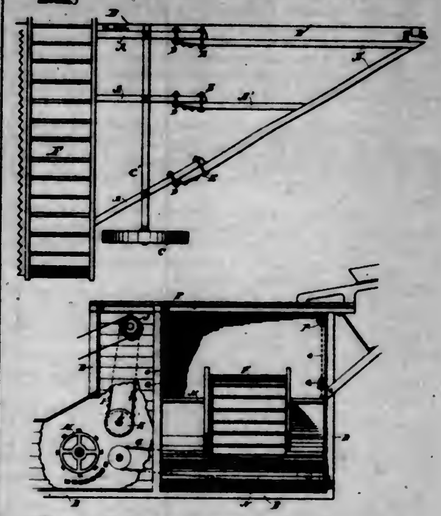
6. In a station-indicator, the rotary disk F, connected with the indicating mechanism and having pins P, in combination with the oscillating trip-hub H, having a shoulder, *h*, in front and a reversed shoulder, *h'*, behind, whereby the pins are released and caught, substantially as herein described.

383,281. CHAIR. ANDREW D. MARR, Boston, Mass. Filed Feb. 3, 1868. Serial No. 308,693. (No model.)



Claim.—1. In a chair of the character described, the combination of the seat A, provided with the standards F and legs C, the base D, secured to said legs and extending rearward of the same, the back B, provided with the arms E, pivoted to said standards, a bar, as H, hinged to said back, and means for securing the bar to the seat when the back is arranged to form a table, said seat being extended to the rearward of the rear legs of the chair to provide room for the lower end of the back, and thereby enable a longer back to be used, substantially as set forth.

2. In a chair of the character described, the seat A, provided with the standards F, stop *g*, legs C, and stud *k*, the base D, secured to said legs and provided with the elongated portion *h*, the back B, provided with the arms E, pivoted to the standards F, the bar H, jointed to the plate J, and provided with the sockets *v* and perforated plate *t*, and the plate N, having the stud *d*, provided with the nut *f*, said plate being fitted to slide in a groove, *r*, in the back B, all constructed, combined, and arranged to operate substantially as described.



3. In a chair of the character described, the seat A, provided with the legs C and standards F, the base D, connected with said legs and provided with the elongated portion A, the back B, provided with the arms E, pivoted at their forward ends to the upper ends of said standards, and the bar H, jointed to the back B, in combination with means for adjusting said bar with respect to said back, and means for adjustably connecting it to said seat, substantially as set forth.

383,282. HYDRAULIC ELEVATOR. WILLIAM H. MARSH, New York, N. Y. Filed July 2, 1867. Serial No. 343,513. (No model.)

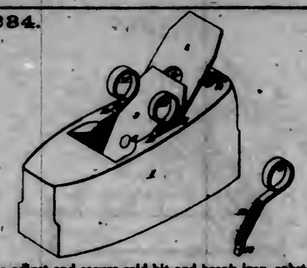
Claim.—In a hydraulic motor, the combination, with the water-cylinder and its piston and the water-reservoir, of a steam-supply pipe leading to said reservoir and a water-pipe leading from said reservoir to said cylinder, a three-way valve in the steam-pipe, and a three-way valve in the water-pipe, the entrance and exhaust ports of the steam-valve being nearer the line of the port leading to the reservoir and the length of the plunger thereof being less than the inlet and outlet ports of the water-valve are to the port leading to the cylinder, and than the length of the plunger thereof, respectively, together with a rod or stem common to and giving concurrent motion to both valves, as and for the purpose set forth.

383,283. COMBINED HARVESTER AND THRASHER. DAN C. MATTHEWS, Stockton, Cal. Filed Oct. 5, 1867. Serial No. 351,862. (No model.)

Claim.—1. In a combined header and thrasher, a header-frame detachably hinged to the side of the thrasher, said header-frame composed of two parts, the rear portion being hinged to the front portion, so that it may be folded upon and above the forward portion to permit the header when detached to be drawn endwise through gates, substantially as herein described.

2. In a combined header and thrasher, a header-frame detachably hinged to the side of the thrasher, said header-frame composed of two parts, the bolts E uniting said parts, whereby they may be rigidly secured together or made separable, and a hinged connection at the rear of the front part of the header-frame, whereby the rear part of said frame may be folded upon and above the forward part, to permit the header when detached to be drawn endwise through gates, substantially as described.

3. In a combined harvester and thrasher, the combination of the thrashing-cylinder, the feeder-belt mounted in the thrasher, the header-belt F on the header-frame and projecting into the thrasher-frame, by which the straw is carried to the thrashing-machine, and the vertically-moving gate M, mounted in the side of the thrasher-frame and the counterbalance weights and cords, substantially as described.



4. In a combined harvester and thrasher, the combination of the thrashing-cylinder, the feeder-belt mounted in the thrasher, the header-belt F on the header-frame and projecting into the thrasher-frame, by which the straw is carried to the thrashing-machine, the vertically-moving flexible gate or apron M, mounted in the side of the thrasher-frame and extending beneath the discharge end of the header-apron, the cords connected with said gate, guide-pulleys for said cords, and the counterbalance-weights Q, attached to said cords, substantially as described.

383,284. PLANE-PLATE. THOMAS H. B. MILLSAP, Harper, Kans. Filed Apr. 13, 1867. Serial No. 304,672. (No model.)

Claim.—1. In a bench-plane, the combination, with the bit-iron and brake-iron secured thereto, of spring-friction side wedges and pivoted abutment-pedestal having a center-pointed thumb-screw

383,284.

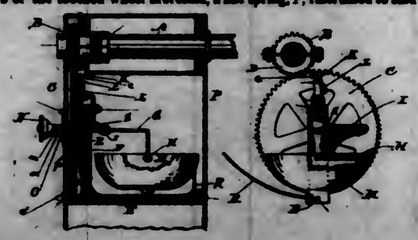
adapted to adjust and secure said bit and break iron, substantially as set forth.

2. In a bench-plane, the combination, with the bit-iron, break-iron, and the stock having abutment-shoulders, of friction-wedges having spring-arches fastened at their apices and adapted to engage with the abutment-shoulders of the stock, and an abutment-pedestal having a center-pointed thumb-screw, which, in conjunction with the said wedges, is adapted to adjust and hold the plane-irons in their place in the stock, substantially as set forth.

3. The combination, with the stock having abutment-shoulders and the bit and break iron, of a pivoted abutment-pedestal having a thumb-screw adapted to engage the bit-iron, and spring-wedges engaging between the plane-irons and the abutment-shoulders of the stock, said wedges being so arranged that there will be no intrusion on the chamber of the stock, to allow free vent for the shavings, substantially as set forth.

4. The combination, with the stock, bit and break irons, of spring friction-wedges adapted to clamp the bit and break irons in front, a pivoted abutment-pedestal having a pointed projection adapted to engage the stock, and a pointed thumb-screw engaging in the end of said pedestal and adapted to adjust their bearing and lengthen the lever-hold of said irons in the bed of the stock, and thereby steady their cutting action, substantially as set forth.

5. The combination, with the stock and its abutment-shoulders and the bit and break irons, of spring friction-wedges engaging between the front of the irons and the abutment-shoulders of the stock, leaving free vent between them for the escape of shavings, and a pivoted abutment-pedestal having a center-pointed rotary screw adjustable as an abutting support to the back of the irons, substantially as set forth.

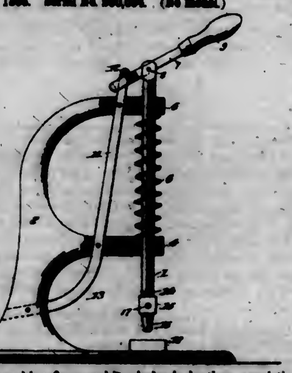


383,285. CAPTIVE-FASTENER. WILLIAM J. BOBLE, New York, N. Y. Filed Jan. 21, 1868. Serial No. 351,867. (Model.)

Claim.—The combination, with a plate attached to the edge of the casket-body, said plate being provided with a depressed channel or way, a shoulder at one end of said channel, an eye or opening at the other end of the channel, and a ledge adjoining said opening, a tapering catch attached to the lid, and a spring-actuated locking-piece pivoted to said catch and provided with a lateral finger-piece, substantially as set forth.

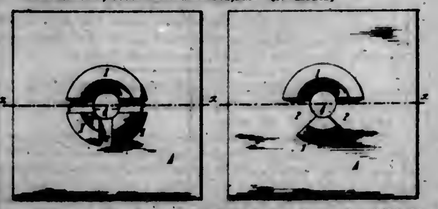
383,286. AUTOMATIC BELL. CHARLES M. O'LEARY, Washington, D. C. Filed Jan. 31, 1868. Serial No. 359,869. (No model.)

Claim.—1. In automatic bells, the combination of an ordinary axle or revolving shaft, A, having a cog, B, at some convenient place on the periphery thereof, with a toothed wheel, C, geared with said cog and having pins *c d* on the interior face of said wheel, a bracket, E, having a projecting shaft, D, extending through and outside the hub of the toothed wheel aforesaid, a flat spring, F, fulcrumed to said



383,286. [duplicate]

bracket and collared upon said projecting shaft, and a ball, M, a lever, G, pivoted to the bracket aforesaid and having a ball-striker, H, a spiral spring, I, one end of which is attached to the aforesaid bracket, a door-foot, K, pivoted to said lever at one end thereof, and a spring, L, connected likewise to said door-foot, a screw-nut, N, fitted to the projecting end of the shaft D and having recesses *a* formed in a shank constituting part of said screw-nut, and a catch, O, pivoted to the ordinary frame-work or casing inclosing the bell mechanism in such relation to said screw-nut to enable said catch to be fitted to the recesses aforementioned, all substantially in the manner hereinbefore described and shown, for the purpose of adjustably and automatically sounding the bell by the forward revolution of the aforesaid ordinary axle or revolving shaft.

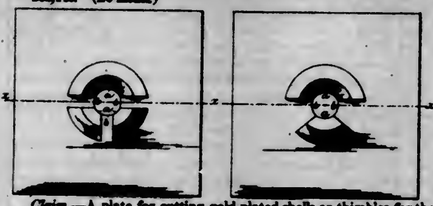


2. In automatic bells, the combination of an ordinary axle or revolving shaft, A, having a cog, B, at some convenient place on the periphery thereof, with a toothed wheel, C, geared with said cog and having pins *c d* on the interior face of said wheel, a bracket, E, having a shaft, D; extending through the hub of the aforesaid toothed wheel, and a ball, M, and a lever, G, pivoted to said bracket and having a ball-striker, H, a door-foot, K, pivoted to said lever at one end thereof, and a spring, L, connected likewise to said door-foot, all substantially in the manner hereinbefore described and shown, for the purpose of automatically sounding the ball by the forward revolution of the aforesaid ordinary axle or revolving shaft.

383,287. BELT-PUNCH. ENOS I. T. OVERMEY, Summerville, Ga. Filed Jan. 6, 1868. Serial No. 359,694. (No model.)

Claim.—A machine for punching holes in leather, consisting of a frame, 2, mounted on the base 3, having a bearing-block, 18, and arms 4 5, with a brace-rod, 11, passing through the arms 4 5 and into the frame 2, and rivoted thereto, and having an extension provided with a stop-pin, 12, in combination with the vertically-reciprocating rod 1, having a spring, 8, a screw-threaded end, 14, securing-nut 15, and punch 16, and the lever 7, with slotted end 10, substantially as described.

383,288. METHOD OF PREPARING HOLLOW STOCK FOR THE MANUFACTURE OF JEWELRY. JOHN S. PALMER, Providence, R. I. Filed Jan. 27, 1868. Serial No. 359,148. (No model.)



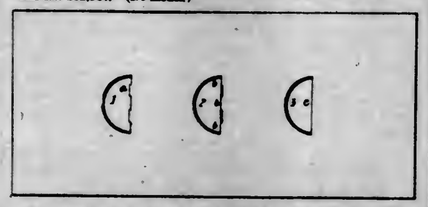
Claim.—1. The described method of imparting to plated thimbles or shells a varying thickness, consisting in submitting the same to the

action of reducing devices adapted for shaving off or otherwise removing the desired portion of the plate at the required parts, substantially as set forth.

2. The described method of imparting to plated thimbles or shells a varying thickness of plate, consisting in passing the thimble or shell through die-plates adapted for shaving off or removing a desired portion of the plate at the required parts, substantially as set forth.

388,239. PLATE FOR SHAVING GOLD-PLATED SHELLS, &c. JOHN S. PALMER, Providence, R. I. Filed Jan. 27, 1888. Serial No. 262,162. (No model.)

Claim.—A plate for cutting gold-plated shells or thimbles for the manufacture of plated jewelry, having a portion of the guiding-edge raised and rounded off for guiding without cutting away or removing any of the gold, and having the remaining portion left sharp and adapted to plane, cut away, or remove a desired part of the gold, all substantially as set forth.

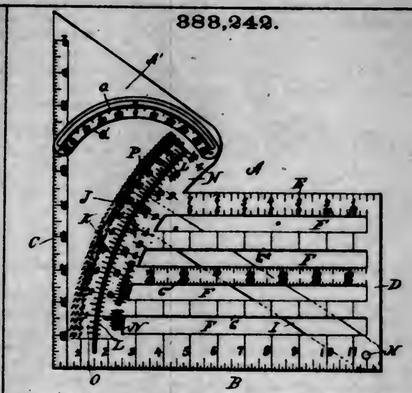


388,240. MANUFACTURE OF GOLD-PLATED-WIRE STOCK FOR JEWELRY. JOHN S. PALMER, Providence, R. I. Filed Jan. 30, 1888. Serial No. 262,516. (No model.)

Claim.—1. In the manufacture of gold-plated-wire stock for jewelry, the described method of reducing the gold-plate to the requisite unequal thickness, consisting in passing the stock through dies adapted for guiding it, and for cutting off, shaving off, or otherwise removing a portion of the gold at the parts desired, substantially as set forth.

2. In the manufacture of gold-plated-wire stock for jewelry, the described method of reducing the gold-plate to the requisite unequal thickness, consisting in passing the stock successively through dies adapted for guiding it and for cutting off, shaving off, or otherwise removing a portion of the gold at the parts desired, substantially as set forth.

388,241. PLATE FOR THE MANUFACTURE OF PLATED-WIRE STOCK. JOHN S. PALMER, Providence, R. I. Filed Jan. 30, 1888. Serial No. 262,517. (No model.)



Claim.—In the manufacture of gold-plated-wire stock, a plate having a series of die-holes provided with one or more sharp edges, as set forth, adapted for removing a portion of the gold.

388,242. COMBINED SQUARE, BEVEL, PROTRACTOR, AND LEVEL. WILLIAM PALMER, Jr., Rincon, N. Mex. Filed June 21, 1887. Serial No. 242,008. (No model.)

Claim.—1. A measuring-instrument formed of a single approximately L-shaped plate, A, having the integral parallel bars G G' G² in one arm and the curved slot K in its other arm, and the straight-edge I, pivoted at H to the plate, and having a set-screw, J, extending through the curved slot, substantially as described.

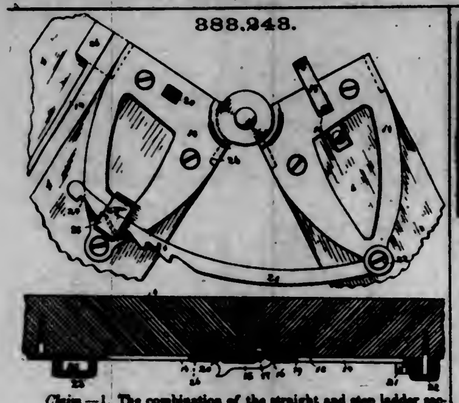
2. A measuring-instrument consisting in the approximately L-shaped plate A, having integral parallel bars G G' G² in one arm, the

388,242.

curved slot K in the other arm, the segmental level Q, extending across the arm of the plate above or beyond the slot K, and the straight-edge I, pivoted at H to the plate, and having a set-screw, J, passing through the slot to hold the straight-edge at the desired angle across the bars, substantially as set forth.

3. In a measuring-instrument, the blade A, provided with the scale L, indicating degrees, and the edges D and C, the graduated edge E, and the graduated parallel bars G; all formed on the said blade, in combination with the straight-edge I, pivoted on the said blade and held adjustably on the same, substantially as shown and described.

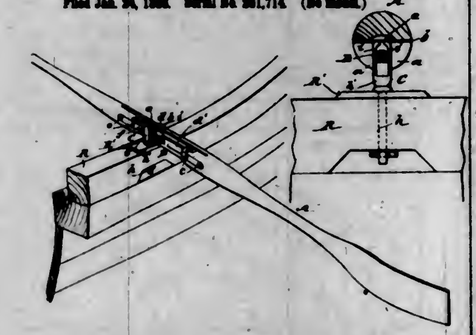
4. In a measuring-instrument, the blade A, provided with the scale P, indicating the length of braces, and the graduated bar G' for measuring the length of the brace, in combination with the straight-edge I, pivoted on the said blade, substantially as shown and described.



5. In a measuring-instrument, the plate A, approximately of L shape, and having the graduated outer edges, B C, at right angles one to the other, and the curved level Q, extending transversely across the upper end of the arm A' of said L-shaped plate, substantially as set forth.

6. In a measuring-instrument, the blade A, provided with the edges B, C, D, and E, the bars G, parallel with the said edges E and B, and the scales L, N, and O, formed on the said blade A, in combination with the straight-edge I, pivoted on the said blade A, and the set-screw J, the shank of which passes through a segmental slot, K, formed in the blade A, the said set-screw serving to fasten the said straight-edge I upon the said blade, substantially as shown and described.

388,243. STEP-LADDER AND BENCH COMBINED. JOHN W. PEACOCK, Cleveland, Ohio, assignor of two-thirds to Clarence B. Britton and Edgar S. Waller, same place. Filed Mar. 1, 1888. Serial No. 265,816. (No model.)



388,243.

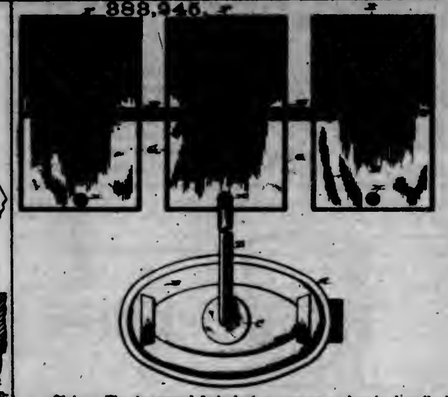
Claim.—1. The combination of the straight and step ladder sections, connected together by hinged braces having pivotal joints in line with the inner edge of the sections, with the broad parts of said hinged braces lapping over and fastened to the sides of the ladder, with legs 26, inclosing the edges of said sections, all arranged to form the pivotal supports and connections, and a stand-board, 12, hinged to said sections, substantially as and for the purposes described.

2. In a combined step and straight ladder, the hook 16, having one end inserted in a slot, 16, in one section of the hinged brace 14, forming a pivotal connection therewith, and the opposite end adjusted to engage with the slot 20 in the other section of the hinge-brace, in combination with the spring 19, attached to the ladder-section, and its free end in contact with the hinged end of the hook arranged to co-operate with hinged braces in jointed relation with the ladders, in the manner substantially as herein set forth.

388,244. CAR AND CAR-LOCK. GEORGE K. PERATT, Toledo, Ohio. Filed Jan. 24, 1888. Serial No. 261,714. (No model.)

Claim.—1. The car A, having the rod B attached thereto and adapted to enter a suitable car-lock, the rod being longitudinally attached to the car, substantially as described.

2. The car A, having the longitudinally-attached rod B, formed with the round portion *d* and flat portion *d'*, and adapted to enter a suitable car-lock, substantially as described.



3. The car-lock C, formed with members *i i*, which approach each other at the top to form a narrow space, *e*, in combination with the car A, provided with the longitudinally-attached rod B, formed with the round portion *d* and flat portion *d'*, substantially as and for the purposes set forth.

4. The car A, cut away at *a*, and provided with the rod B, set into the space formed in the car, in combination with the lock C, formed with spaced members *i i* to retain the said rod, substantially as described.

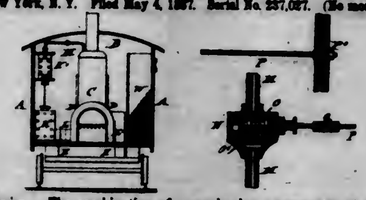
5. The car A, cut away at *a* and provided with the plate *b*, set into the said cut-away place, and the rod B, set into the car adjacent to said plate *b*, in combination with the car-lock C, formed with spaced members *i i*, to receive and retain the said rod B, substantially as described.

388,245. FRUIT-DRIER. JAMES L. PERLEY, Monticello, Fla. Filed Mar. 29, 1887. Serial No. 232,932. (No model.)

388,245.

Claim.—The improved fruit-drying apparatus herein described, consisting of the boiler A, adapted to be placed on a cook-stove, and the independent evaporating-trays having the diaphragms E, whereby a steam-space, F, is formed between the diaphragms and the bottom of the tray, the nozzles H near both the sides and the ends of the trays, the said trays being all arranged in the same horizontal plane and entirely separated from each other, and having independent supports, the steam-pipe L, having one end connected to the boiler and the other end attached to one of the nozzles H, and the U-shaped coupling-pipes K, having their ends connected to the nozzles H of adjacent trays, whereby the coupling-pipes K can be connected to the nozzles H either near the ends or the sides of the trays, and thus the latter may be placed end to end or side to side, as may be desired.

388,246. UPRIGHT-SAW MACHINE. GEORGE PHELPS, Mishawaka, Ind., assignor to the Dodge Manufacturing Company, same place. Filed Sept. 20, 1887. Serial No. 250,391. (No model.)



Claim.—1. In an upright-saw machine, the combination of the table and saw thereof with a frame having a pivotal connection with said table, and a longitudinally-movable carriage on said frame, provided with a clamp to hold the edge of the board to be cut, and a fixed-spacer with adjustable stops, whereby the length of the feeding-space may be changed.

2. In an upright-saw machine, the table A, the frame F, having

a longitudinally-moving carriage, and a clamp mounted on the latter, combined with a pivot-pin and slots in table and frame, respectively, whereby said pivot-pin may be adjusted in said slots and fixed at any desired point.

3. In an upright-saw machine, the combination, with the pivoted frame, of the carriage mounted thereon and having a rack, a segment or gear mounted on the frame and engaging said rack, a lever and ratchet engaging the gear, and an adjustable stop for regulating the swing of the lever.

383,247. APPARATUS FOR HEATING RAILWAY-CARS. WILLIAM H. PLIMER, Lake City, Colo., assignor of one-half to P. P. Dickinson, New York, N. Y. Filed May 4, 1887. Serial No. 237,027. (No model.)

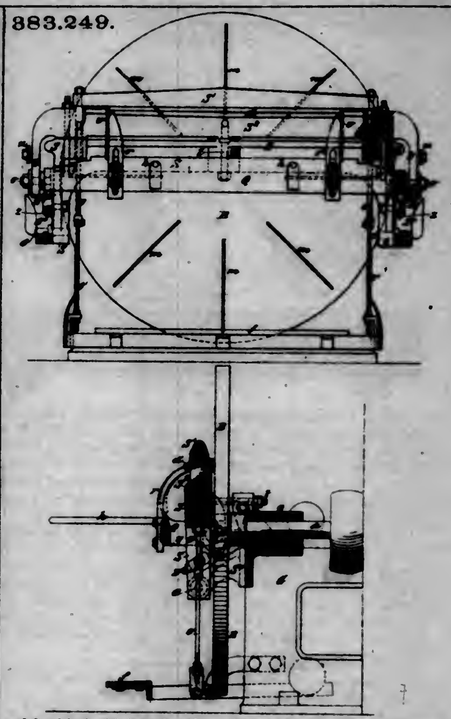
Claim.—The combination of a car having a compartment provided with an opening to the outside air, a device for changing the temperature of the air admitted to said compartment, an air-forcing apparatus for forcing said air through said device, an air-pipe connecting said device with the air-forcing apparatus, a distributing-pipe leading from said temperature-changing device, a steam-engine for driving said apparatus, a steam-boiler, a steam-pipe connecting the steam-boiler with the cylinder of the engine, a valve-box in said pipe provided with a valve-face having a series of ports, a channeled valve in said box, an expansible rod exposed to the air admitted to said compartment and connected at one end to the wall thereof, and an adjustable coupling connecting the other end of said rod to the stem of said valve, substantially as described.

383,248. DRILL-CHUCK. HENRY M. PERRON, New Haven, Conn., assignor to Hiwood Bardsall, Port Chester, N. Y. Filed Feb. 20, 1888. Serial No. 265,594. (No model.)

Claim.—1. A drill-chuck provided with an independent adjustable holding device adapted to move with the drill, to permit the same to be centered by the chuck-jaws after it has been clamped upon the drill, substantially as set forth.

2. A drill-chuck provided with a dog located behind its jaws in a chamber in which it is movable, so as to permit it to respond to the jaws in centering the drill held by it, substantially as set forth.

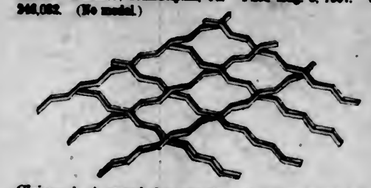
3. A drill-chuck having a holding device located behind its jaws, flexibly coupled with one of them, and adapted to grip and hold a drill by the end thereof and to move to permit the drill to be centered by the chuck-jaws, substantially as set forth.



4. A drill-chuck provided with an independent clamping-dog having an opening between its ends, furnished with a set-screw, located in a chamber behind the chuck-jaws, and adapted to be moved so as to permit the drill to be centered by the said jaws while it is held against twisting by the dog, substantially as set forth.

5. A drill-chuck provided with a tapering circular dog having an opening between its ends, and furnished with a set-screw, located in a chamber situated behind the chuck-jaws, and adapted to be moved so as to permit the drill to be centered by such jaws while it is held against twisting by the dog, substantially as set forth.

383,249. JOINTING-MACHINE FOR BARREL-STAVES. WILHELM RITTER, Altona, Prussia, Germany. Filed Feb. 20, 1888. Serial No. 265,603. (No model.)



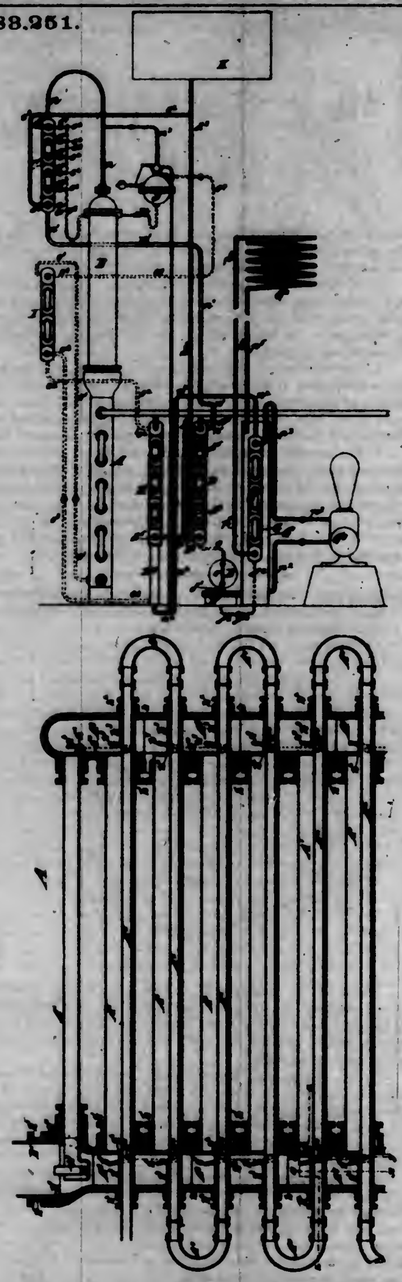
Claim.—1. The combination, with the rotary cutter-disk and cutters, of a stave-support capable of moving bodily toward and from the said disk, and a stave clamp or holder pivoted to the said support at or near the middle of said support to advance either end of the stave clamp or holder toward the disk, substantially as and for the purpose herein described.

2. The combination, with the rotary cutter-disk, of the pivoted swinging main stave support S, the stave clamp or holder S S', pivoted to the main support by a pivot perpendicular to the pivots of the said support, the yoke Q, having arms r r, for receiving the ends of the stave

and furnished with lever-handles and pivoted to the ends of the stave-holder, the stops x, provided on said yoke, and the adjustable set-screw z in the said main support S, all substantially as and for the purpose herein set forth.

383,250. REticulated OR OPEN WORK OF METAL BARS. THOMAS ROBINSON, Philadelphia, Pa. Filed Aug. 2, 1887. Serial No. 246,082. (No model.)

Claim.—1. A guard, fence-section, or screen composed of metal edge-crimped flat bars or strips woven or connected together, substantially as set forth.



2. Reticulated or open work composed of edge-crimped flat bars connected together, substantially as set forth.

383,251. APPARATUS FOR REFRIGERATING AND ICE-MAKING BY THE USE OF AMMONIA. RAYMOND F. BOSWALD, New York, N. Y. Filed July 16, 1883. Serial No. 208,222. (No model.)

Claim.—1. In a generator for ammonia-gas, the combination, with a series of substantially parallel and horizontal outer tubes for strong liquor, and a header from which the tubes extend and which is constructed to afford a single upright passage with which all said tubes communicate, and which is independent of and separate from the passages for liquor, and serving for the escape of gas delivered from the several tubes without compelling its successive passage through the tubes, of a series of inner tubes connected at the ends to form a continuous passage for heating fluid and extending across the gas-passage of the header, substantially as herein described.

2. In a generator for ammonia-gas, the combination, with a series of substantially parallel and horizontal outer tubes for strong liquor, and headers A^2 at opposite ends of the tubes, each constructed with a free passage entirely independent of and separate from the passages for liquor, and with which all the tubes communicate, and serving for the escape of gas delivered from the several tubes without passing

383,251.

through the tubes in succession, of a series of inner tubes extending across the gas-passages of the headers and connected beyond the passages to form a continuous passage for heating fluid, substantially as herein described.

3. The combination, with the outer generator-tubes for strong liquor, of a header from which said tubes extend and which is constructed with dams or partitions at the ends of the tubes to control the depth of liquor in the tubes, and with supplemental dams to prevent the escape of liquor into the gas-space of the header when under violent ebullition, and steam-heating tubes extending through the outer tubes, substantially as herein described.

4. The combination, with the outer parallel and horizontal generator-tubes, of a header from which the tubes extend and which has a single open gas-passage with which all the tubes communicate, a pipe and conductor for introducing liquor to the header and for conducting the liquor to the upper tube and preventing its free passage through the gas-space, and inner heating-tubes extending through the outer tubes and across the gas-space of the header, substantially as herein described.

5. The combination, with the outer parallel and horizontal generator-tubes for strong liquor, of gas-headers A^2 at the ends of the tubes, and each of which is constructed with curved passages for the descent of liquor from one tube to another and with a gas-passage common to all the tubes and entirely separate from and independent of any passage for liquor in the header, a pipe and conductor for introducing liquor directly to the upper tube without its free passage through the gas-space, and steam-heating tubes extending through the outer tubes and across the gas-passage of the header and connected beyond the header to form a continuous passage for steam, substantially as herein described.

6. The combination, with the outer generator-tubes A', for strong liquor, of a gas-header, A^2, constructed with a main passage for gas and with dams at the end of the tubes, and steam-heating tubes extending through the outer tubes, the header being constructed with curved passages extending from the dams to its outer wall to receive through them the steam-heating tubes, substantially as herein described.

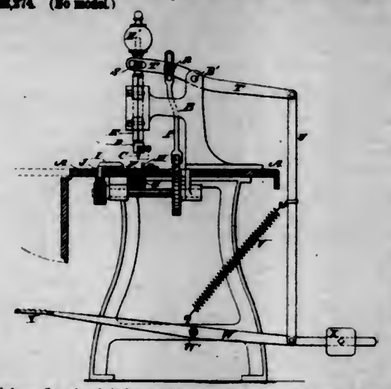
7. The separator or analyzer herein described, consisting of the upright chamber or casing containing two contiguous and alternated but separate spiral passages of substantially equal length, and serving one for the descent of strong liquor to the generator and the other for the escape of gas from the generator, in combination with an inlet for strong liquor at one end of one passage and an inlet for gas at the opposite end of the other passage, substantially as herein set forth.

8. The separator or analyzer herein described, consisting of an upright chamber or casing and a filling of intermatching sections, forming, when superposed one on another, two separate spiral passages which alternate one with the other and serve one for the descent of strong liquor to the generator and the other for the escape of gas from the generator, substantially as herein set forth.

9. The separator or analyzer herein described, consisting of an upright chamber or casing and a filling of intermatched sections, B^3, each forming part of a spiral and having a passage cored within it, and having flanges b^2 b^2 at top and bottom, whereby the sections when superposed one on another will form two alternating but separate passages of substantially equal length, substantially as herein set forth.

10. The combination, with the separator or analyzer chamber, of the cast-metal sections B^3, each having cast within it a portion of a spiral passage, and having flanges which enable the sections when placed one on another to form another and contiguous spiral passage, and each section having a downwardly-projecting nipple or throat, b^3, and an annular groove or depression, b^4, wherein the nipple or throat of the section next adjacent is trapped to prevent the direct upward flow of gas, substantially as herein described.

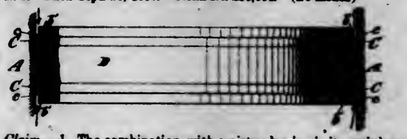
11. The combination, with the separator or analyzer chamber, of the spiral sections B^3, arranged therein one above another and constructed, as described, so as to form contiguous but separate spiral passages, each section being provided at the lower end of its passage portion with a projecting lip, b^5, entering a corresponding socket or recess in the upper end of the next lower section, substantially as herein described.



12. The combination, with the separator or analyzer chamber, of spiral sections B^3, arranged therein one above another and constructed, as described, so as to form contiguous but separate spiral passages, the upper surface of the sections being ribbed or having a serpentine or zigzag profile around their circumference, substantially as herein described.

13. The combination, with a tank for brine or other liquid to be cooled, of a cooler arranged therein and to be immersed in said liquid, and composed of a system of outer tubes and connecting-headers for expanding gas, and a system of inner tubes and connecting-bends for the liquid to be cooled, a pump for taking liquid from the tank and delivering it to the inner tube system at one end thereof, whereby the liquid after preliminary cooling in the tank is passed through the inner tube system, and pipes through which said liquid is conducted from the other end of the inner tube system and after performing useful effect in cooling is returned to said tank, substantially as herein described.

14. In an ammonia refrigerating apparatus, the combination, with a generator wherein gas is generated by heat and an absorber wherein the weak liquor is made to absorb the spent gas, of an automatic trap for returning strong liquor from the absorber to the generator, and

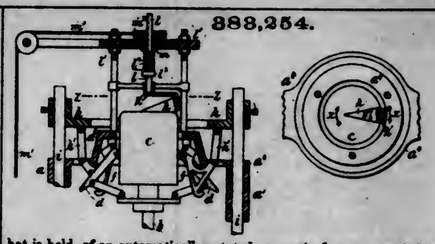


a pipe for conducting gas to the trap for producing its operation, substantially as herein described.

383,252. BOOK-INDEX-CUTTING MACHINE. ARCHIE ROYER, New York, assignor, by mesne assignments, to William W. Cotton and Clifton H. Cotton, both of Brooklyn, N. Y. Filed June 23, 1887. Serial No. 242,374. (No model.)

Claim.—In a book-index-cutting machine, the combination, with the table A, provided with the stationary adjustable guide H, the frame B, the pivoted lever T, the adjustable feed-bar P, the screw R, the weighted reciprocating bar E, the knife-holder D, the knife C, and with the weighted treadle W, adapted to operate the parts, substantially as described, of the movable adjustable guide I, the rack-bar K, the pinion N, the ratchet-wheel M, the dog Q, and the pawl O, as and for the uses and purpose set forth.

383,253. PISTON-PACKING. MICHAEL J. RUSSELL, Jersey City, N. J. Filed Sept. 26, 1887. Serial No. 250,691. (No model.)



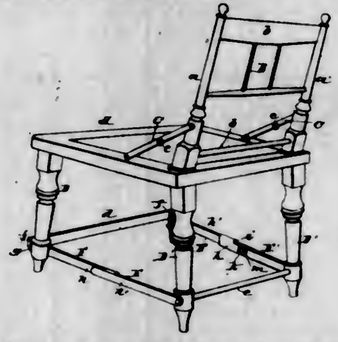
Claim.—1. The combination, with a piston having in its periphery a groove the opposite faces or walls of which are parallel with each other and oblique to the axis of the piston, of a packing-ring having its opposite sides also parallel and correspondingly oblique and fitting in said groove, substantially as herein described.

2. The combination, with a piston having in its periphery a groove the opposite faces or walls of which are parallel with each other and oblique to the axis of the piston, of a packing-ring having its opposite sides parallel and correspondingly oblique and fitting in said groove, the ring having that portion of its side on which the fluid acts and which projects beyond the piston a substantially flat surface in a plane at right angles to the axis of the piston, substantially as herein described.

3. The combination, with a piston having in its periphery a groove the opposite faces or walls of which are parallel with each other and oblique to the axis of the piston, and having a slightly greater diameter on one side than on the other side of said groove, of a packing-ring having its opposite sides parallel and correspondingly oblique and fitting said groove, and having that portion of its side which is exposed beyond the portion of the piston which is of smallest diameter a flat surface in a plane substantially at right angles to the axis of the piston, substantially as herein described.

4. The combination, with a piston-body and a follower or ball ring of smaller diameter, forming between them a peripherical groove the faces or walls of which are parallel with each other and oblique to the axis of the piston, of a packing-ring having its sides parallel and correspondingly oblique and fitting the groove, and having that portion of its side which is exposed beyond the follower or ball ring a flat surface in a plane at substantially right angles to the axis of the piston, substantially as herein described.

383,254. HAT-STRETCHING MACHINE. WILLIAM SIMMONS, Yonkers, N. Y., assignor of two-thirds to Lydia B. Bullmap and William H. Bullmap, same place. Filed Nov. 20, 1887. Serial No. 256,417. (No model.)



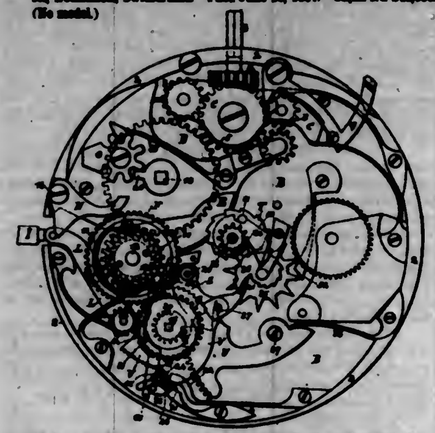
Claim.—1. The combination, substantially as set forth, with a machine for stretching hat-bodies, containing a former upon which the hat is held, of an automatically-rotated crown-tip flattener carried by the machine and arranged to bear and act upon the crown-tip of the hat, its axis of rotation being at right angles to the crown-tip.

2. In combination, a machine for stretching hat-bodies, containing a former upon which the hat is held, an automatically-rotated spring-acting shaft held in the machine perpendicular to the crown-tip of the hat on the former, and a roller carried by the shaft and arranged to bear on the hat.

3. The combination, with the former of a hat-stretching machine, of a conical roller automatically rotated on a center coincident with the axis of the former and arranged to bear on a radial line of the crown-tip of a hat held upon the former from the edge thereof to a point beyond the center, substantially as and for the purpose set forth.

4. In a machine for developing and stretching hat-bodies, in combination, a former upon which the hat is held, expanding ribs projecting therefrom, pivoted fingers for stretching the brim, a vertically-moving finger-plate connected to the fingers, a vertical shaft arranged perpendicularly to the top of the former, a roller carried by the shaft arranged to bear on the crown-tip of a hat placed upon the former, and a rotating shaft of the machine connected to the roller-shaft.

383,255. FOLDING CHAIR. JOSEPH F. A. SPAHR, WILLIAM F. BERRY, and JAMES T. SHIRLEY, Mount Pleasant, Iowa. Filed Nov. 30, 1887. Serial No. 256,808. (No model.)



Claim.—1. In a folding chair, a locking stretcher-bar constructed of two pieces pivoted at its opposite ends to the front and rear legs of the chair, and provided with a lantern-lock and guard-lip at their meeting ends to lock the two portions of the stretcher-bar together, substantially as set forth.

2. In a folding chair, the combination, with a seat and front and rear legs hinged to the lower side of the seat at its corners, of two stretcher-bars, each formed of two pieces pivoted to the front and rear legs, and provided at their adjacent ends with lantern-locks and overhanging lips or flanges to lock the front and rear legs apart, substantially as set forth.

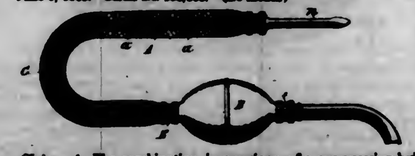
3. In a folding chair, the combination, with a seat, front and rear legs hinged to fold upon this seat, and an offset metal brace or stretcher secured to the outer face of the front legs, of two stretcher-bars, each formed of two pieces which are pivoted at their ends to the front and rear legs, and provided with lantern-locks and overhanging lip-flanges to lock the pieces together and brace the front and rear legs apart, substantially as set forth.

4. In a folding chair, the combination, with a seat, a back hinged to the top surface thereof, and diagonal jointed braces for supporting the back in an upright position, of hinged legs, a brace attached to the outer face of the front legs, and two pivoted stretchers, each composed of two sections pivoted together, and provided with a lantern-lock and guard-lip at their meeting ends to lock the two portions of the stretchers together, substantially as set forth.

383,256. REPEATING-WATCH. HENRI G. SCHARPFF, Porte-Marteau, Neuchâtel, Switzerland. Filed June 13, 1887. Serial No. 241,602. (No model.)

Claim.—1. The combination, with the spring-barrel and winding-stem, of the swinging lever C and intermediate wheels, the wheel 11, gearing into the wheel upon the arbor of the spring-barrel, the gear-wheel F, connected therewith, and the ratchet-wheel 13, pawl 14, and spring 15 upon the said wheel F, substantially as set forth.

2. The combination, in a striking-watch, of a spring-barrel and the train of gearing for the time mechanism receiving its motion from the spring-barrel, a train of gearing and striking mechanism receiving its motion from the axis of the spring-barrel, and a stop mechanism to prevent the striking mechanism being brought into action before the power of the spring is exhausted, so that the time-movement of the watch can continue the desired number of hours after the striking mechanism has been stopped, substantially as set forth.

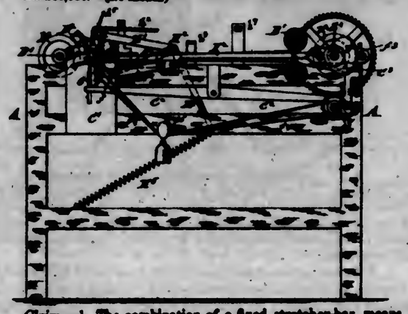


3. The combination, with the spring-barrel and the wheel D, of the gear-wheels 11 and F, ratchet-wheel and pawl, the gear G and the arbor 16 driven by the same, the train of gearing to regulate the speed of the striking mechanism, a tubular arbor around the arbor 16, and a wheel, R, corresponding to the wheel G, a segmental ratchet and striking mechanism, a push-lever, and pinion 32 on the same, connecting the wheels G and R, substantially as set forth.

4. In a striking-watch, the combination, with the bell and hammer, of a stud and two spring-pawls upon the stud and two segmental ratchets acting upon the respective spring-pawls one after the other, whereby the hour is struck upon the bell and then strokes are made by the same hammer and bell to indicate the minutes, substantially as set forth.

5. The combination, with the hammer and the spring-pawls for acting upon the same, of a snail moving with the minute-hand, an hour-snail moved at the end of each hour, swinging levers and fingers acting with the respective snails, a segmental ratchet, S, pinion 30, gear R, and pin 31, substantially as specified, for striking the hour and then striking the minutes after a pause by the revolution of the wheel R and pinion 30, substantially as set forth.

6. The combination, with the spring-barrel and the train of gearing for the time mechanism receiving motion from the spring-barrel and the train of gearing and striking mechanism from the axis of the spring-barrel, of the stop-wheel having a projection at one side and a tooth on the arbor of the spring-barrel for moving the stop-wheel, the detent N and push-pin, and the spring-pawl with an inclined end acting against the teeth of the stop-wheel and against the projecting stop to allow the wheel to move as the finger passes by the stop-wheel in completing the winding of the spring, substantially as set forth.



383,257. SYRINGE. BENJAMIN F. SUTTON, Brooklyn, N. Y. Filed June 9, 1886. Serial No. 205,162. (No model.)

Claim.—1. The combination, in a syringe, of a compression-bulb and suction-tube, a self-acting admission or discharge valve at the outlet-opening from the bulb, and a discharge-tube having a constricted outlet, the wall of which tube is of a thickness and elasticity to freely stretch in its circumference under the ordinary pressure produced in working the bulb while the discharge-tube is open, substantially as herein described.

2. A cylindrical dilatable elastic tube for syringes or like purposes formed integrally with one or more restricting-rings, for the purpose set forth.

383,258. MACHINE FOR PLUCKING FURS. JOHN W. SEVERS, New York, N. Y. Filed May 12, 1887. Renewed Mar. 3, 1888. Serial No. 266,097. (No model.)

Claim.—1. The combination of a fixed stretcher-bar, means for intermittently feeding the skin over said stretcher-bar, a stationary card above said stretcher-bar, and a vertically-reciprocating knife and a rotary knife, substantially as set forth.

2. The combination of a fixed stretcher-bar, means for intermittently feeding the skin over said stretcher-bar, a stationary card above the stretcher-bar, a vertically-reciprocating knife, a rotary knife, and a card applied to arms of the rotary knife back of the same, substantially as set forth.

3. The combination of a fixed stretcher-bar, means for stretching and intermittently feeding the skin over said stretcher-bar, a stationary card above said stretcher-bar, a rotary separating-brush below the stretcher-bar, mechanism for moving said brush in front of the stretcher-bar at the proper moment, an oscillating guard below the stretcher-bar, and a vertically-reciprocating knife and a rotary cutting-knife, substantially as set forth.

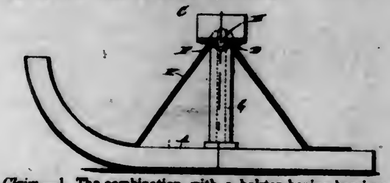
4. The combination of a fixed stretcher-bar, means for intermittently feeding the skin over said bar, a stationary card above the stretcher-bar, vertically-oscillating and laterally-reciprocating rubbers moving in front of the edge of the stretcher-bar, a rotary separating-brush, an oscillating guard below the stretcher-bar, and a vertically-reciprocating knife and a rotary cutting-knife, substantially as set forth.

5. The combination of a fixed stretcher-bar, means for intermittently feeding the skin over said bar, a stationary card above said stretcher-bar, an oscillating guide-bar, laterally-reciprocating rubbers on said guide-bar, a rotary separating-brush, an oscillating guard, and a vertically-reciprocating knife and a rotary knife, substantially as set forth.

6. The combination of a fixed stretcher-bar, means for intermittently feeding the skin over said bar, a stationary card above said bar, an oscillating guide-bar, and laterally-reciprocating rubbers on said guide-bar, substantially as set forth.

7. The combination of a fixed stretcher-bar, means for intermittently feeding the skin over the same, a guide-bar above the stretcher-bar, means for oscillating said bar, two pairs of rubbers guided on said bar, and means for imparting laterally-reciprocating motion to said rubbers, substantially as set forth.

8. The combination of a fixed stretcher-bar, means for intermittently feeding the skin over the same, a stationary card above the stretcher-bar, a rotary separating-brush below the same, and mechanism, substantially as described, whereby the rotary brush is moved upward and forward into a position in front of the stretcher-bar, substantially as set forth.



9. The combination of a fixed stretcher-bar, means for feeding the skin intermittently over the same, a fixed card above the stretcher-bar, a rotary separating-brush, pivoted arms for said brush, slotted guide-plates for said arms, connecting-rods having cam-yokes, and a driving-shaft having cams, whereby an upward and forward motion is imparted to the rotary separating-brush, substantially as set forth.

10. The combination of a fixed stretcher-bar, means for feeding the skin over the same, a stationary card above the stretcher-bar, a rotary brush below the same, mechanism for moving the brush forward and in front of the stretcher-bar, an oscillating guard having wipers, guide-plates having arc-shaped slots for said guard, pivot-links attached to the guard, connecting-rods having cam-yokes, and a driv-

ing-shaft having cams for engaging said cam-yokes, substantially as set forth.

11. The combination of a fixed stretcher-bar, B, an oscillating guide-bar, H, above the same, a shaft, H^2, having arms H^3 H^3, a spring, H^6, rubbers h h', having slotted keepers h^2, fulcrumed arms h^3, connecting-link h^4, spring h^5, rods h^6 h^7, and shaft S^2, having cams H^4 and h^8, substantially as set forth.

383,259. SLEIGH-KNEE. HERMAN P. TITUS, Lisbon, N. H. Filed Jan. 26, 1888. Serial No. 261,570. (No model.)

Claim.—1. The combination, with a bolster having bearings on its lower side, of the casting having trunnions mounted in the bearings and the runner pivotally attached to the lower end of the casting, whereby a horizontal rotary motion is allowed the runner, substantially as specified.

2. The combination of the vertical shaft mounted at opposite ends in bearings in the runner and bolster, and the casting mounted on the said shaft and pivoted at its upper end to the bolster, whereby a rocking and a rotary motion are allowed the runner, substantially as specified.

3. The combination of the plate secured to the under side of the bolster and having bearings thereon, the vertical shaft mounted at its lower end in a socket in the runner and at its upper end in a socket in the bolster, and the casting mounted on the vertical shaft and having lateral trunnions operating in the bearings on the said plate, substantially as and for the purpose specified.

4. In a sleigh-knee, the combination of the plate secured to the bolster, the vertical shaft mounted in sockets in the runner and bolster, the casting mounted on the said shaft and having trunnions on its upper end which are mounted in bearings on the said plate, and the strap passing over the casting and attached at its ends to the runner, substantially as specified.

5. The combination, with the runner, of the casting mounted on a vertical spindle on the runner, and the bolster pivoted to the upper end of the casting, substantially as specified.

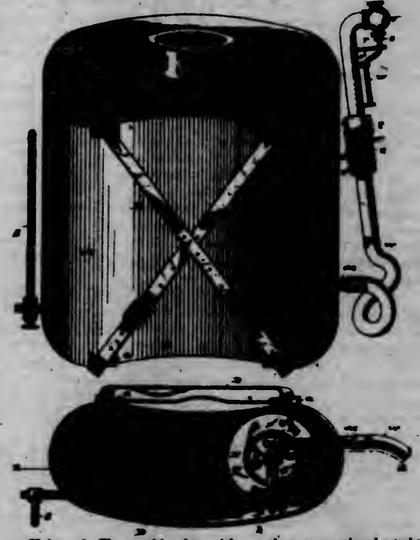
383,260. STRIKING-WATCH. JOSEPH WALSER, Chaux-de-Fonds, Switzerland. Filed Dec. 20, 1888. Serial No. 292,070. (No model.) Patented in Belgium May 31, 1888, No. 73,178.

Claim.—1. In a stem winding and setting watch, the combination, with the stem A^4 and the wheels B, C, and D, of the wheel E, the swinging plate O, wheels P and G, hammer-tail O', and hammer and pin O^2, means, substantially as specified, for moving the plate O, the clutch-lever W, the hour-cannon L^2, a stop upon said cannon, the wheels H and M, the pawl K, and spring J, carried by said wheel H, the spring-barrel I and pin upon the spring-barrel, and stops for limiting the rotation of the barrel, substantially as specified.

2. In a stem winding and setting watch, the combination, with the stem A^4 and the wheels B, C, and D, of the wheel E, swinging plate O, wheels P and G, hammer-tail O', and hammer and pin O^2, the clutch-lever W, the hour-cannon L^2, a stop upon said cannon, the wheels H, M, and N, the pawl K and spring J, carried by said wheel H, the spring-barrel I, stops for limiting the rotation of the barrel I, the swing-plate X, hammer-tail X', and hammer, the button T, cam S, levers R Z, and links Q Y, substantially as specified.

3. The combination, in a stem winding, setting, and repeating watch, of the stem A^4, wheels B, C, and D upon said stem, the wheel E, swinging plate O, wheels P and G, and pin O^2, the wheel H, loose upon the cannon of the hour-hand, the clutch-lever W, the button T, cam S, lever R, and link Q, whereby the partial rotation of the button and cam separates the wheel B from C and connects the wheels G and H, so that the stem can be turned for operating the repeating mechanism without actuating the winding or setting mechanism, as set forth.

4. The combination, with the swinging plates O X and parts carried by them, the levers R Z, and links Q Y, of the button T, cam S, having notches therein, and the safety-spring S^2, having a hooked end to enter one of said notches, according to the position of said cam, and prevent accidental displacement of said cam, as set forth.



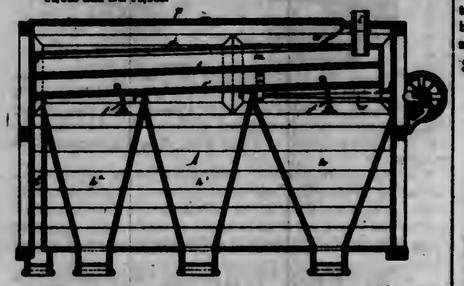
5. The combination, with the hour-cannon L^2 and its stop l, of the wheel H, fitted to turn loosely upon said cannon, a circular flange upon said wheel H, the pawl K and spring J, carried by the wheel H, the plate F, having a circular opening to receive the flange H', and the wheels M N, secured to the flange H' of the wheel H, substantially as and for the purpose specified.

6. The combination, with the spring-barrel and intermediate gear and the setting and repeating mechanism in a watch, of the stem A^4, the wheels B, C, and D upon said stem, and mechanism, substantially as set forth, for moving the gear B so that the winding, setting, and repeating mechanism are operated by the one stem, as set forth.

7. The combination, with the stem winding and setting mechanism, of the striking mechanism, gearing for actuating the striking mechanism, and mechanism, substantially as specified, for shifting the ratchet-pinion to an intermediate position out of contact with both the winding and setting mechanism and simultaneously bring the striking mechanism into gear to be actuated by turning the stem, substantially as set forth.

8. The combination, with the striking mechanism, of a stop upon the arbor of the hour-hand and a spring to turn the striking mechanism back to its normal position, and a pawl to come into contact with the stop on the arbor of the hour-hand, so that the number of strokes on the striking mechanism is determined by the distance the striking mechanism is moved by hand before it is arrested by the stop on the arbor of the hour-hand, substantially as set forth.

383,261. SPRAYING-PUMP. ADAM WEAVER, Vineland, N. J. Filed Feb. 16, 1888. Serial No. 264,242. (No model.)



Claim.—1. The combination, with a tank or reservoir adapted to be carried on the back, of an inverted pump-cylinder secured to the bottom of the said reservoir and connected with its interior by means of a valve-port, an air-chamber surrounding the pump-cylinder and connected therewith by means of a valve-port, a discharge-pipe connected with the air-chamber, a plunger-rod in the pump-cylinder and depending from the bottom of the main reservoir, a horizontal rock-shaft connected with the said plunger-rod, and a hand-lever connected with the opposite end of the said rock-shaft, substantially as specified.

2. The combination, with a reservoir adapted to be carried on the back and having a skirt-flange, as described, and also an aperture in its floor, of the casting E, removably secured in the said aperture and having valve-ports and a discharge-pipe, a pump-cylinder, and an air-chamber, respectively secured to the said fastening, whereby the whole may be removed from the reservoir for repair or the like, substantially as specified.

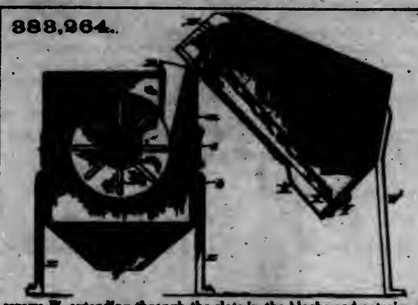
3. The combination, with spray-pipe having its forward end curved laterally, of the nozzle secured thereto, and the valve arranged in the said nozzle and having a reduced forward end adapted to clear the discharge-aperture, substantially as specified.

383,262. MIDDLINGS-PURIFIER. RUD. WEISS and LOUIS FRANKEL, Berlin, Germany. Filed Nov. 13, 1886. Serial No. 218,709. (No model.) Patented in Germany Apr. 1, 1886, No. 36,337; in France June 30, 1886, No. 177,116; in England July 30, 1886, No. 9,965; in Belgium Oct. 29, 1886, No. 74,971; in Sweden Oct. 29, 1886, No. 606; in Italy Dec. 31, 1886, XX. 20,773; in Spain Jan. 29, 1887, No. 10,459; in Norway Feb. 9, 1887, No. 366, and in Austria-Hungary Mar. 26, 1887, No. 44,449 and No. 11,189.

Claim.—1. In a middlings-purifier, the combination, with a reciprocating screen-frame open at its tail end, and screens in the frame, of a flexible cover applied to the screen-frame above the screen and approximately parallel with the same, substantially as herein shown and described.

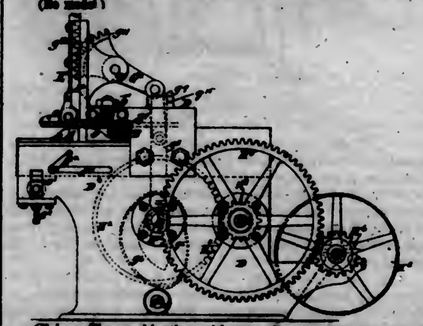
2. In a middlings-purifier, the combination, with a closed casing, of a reciprocating screen-frame open at its tail end, a screen in said frame, a flexible cover applied to the screen-frame above the screen and approximately parallel therewith, a supply-pipe and a sheet of canvas secured across the top of the screen-frame and to the under side of the top of the casing, substantially as herein shown and described.

383,263. GALVANIC-BATTERY ELEMENT. THOMAS P. WHITTIER, Asst. Engineer, Mich. Filed Feb. 11, 1886. Serial No. 191,666. (No specimens.)



Claim.—An exciment for galvanic batteries, composed, essentially, of a solution of the residual salts from natural brine, substantially as described.

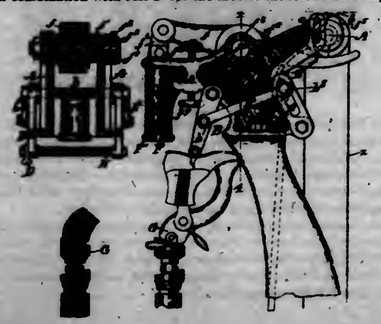
383,264. ELEVATOR FOR COTTON-CLEANING MACHINES. RANSOM E. WHEELER, New Haven, Vt. Filed Feb. 20, 1887. Serial No. 227,999. (No model.)



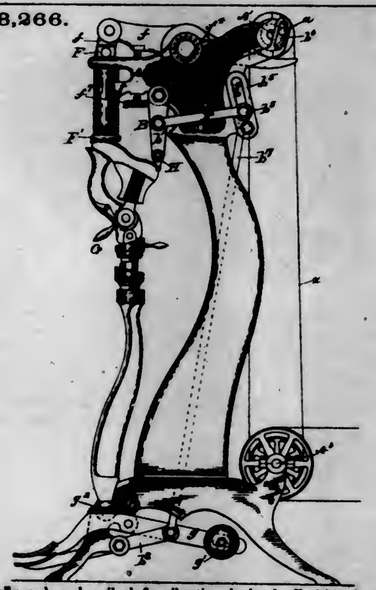
Claim.—The combination of the elevating-trough having the hinged screen X' on its lower side and the hook to secure the screen when closed, the guideways C on the sides of the trough, near the upper end thereof, the slotted blocks B', secured in the guideways, the

383,264.

screws E', extending through the slots in the blocks and entering the sides of the trough, the roller X, journaled in the lower end of the trough, the roller A', journaled in the movable blocks B', the endless belts connecting the said rollers, and the cross-slats connecting the said belts and having the spurs H', substantially as described.



383,265. MACHINE FOR MAKING TIMBER-HANGERS. CASEY H. WILLIAMS, New York, N. Y. Filed July 20, 1887. Serial No. 245,091. (No model.)

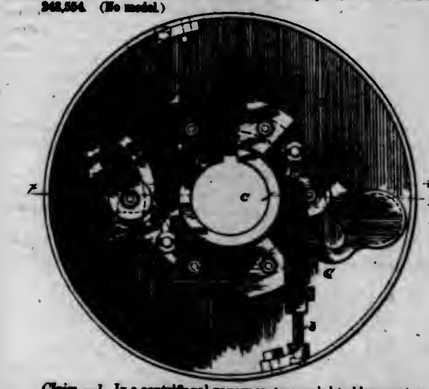


Claim.—The combination, with two rollers mounted upon stationary but adjustable pivots and having their peripheries in part straight and parallel with their axes and in part oblique or angular, of a slide movable between said rollers and geared by a rack and pinion with them, a former having its end wall and portions of its sides adjacent thereto vertical, and having its sides beyond said vertical portions made flaring or oblique to form the twist in the iron, the said former being fitted to a cavity in the slide and vertically movable in such cavity, so as to depress the former below the top of the slide when desired, the end of said slide serving as a former over which to bend the hooked ends of the bar, a roller past which said end of the slide moves in opposite directions, and a vertically-movable plunger carrying a bending roll or rolls, and which is movable downward past the end of the slide when the latter is in its inward position, substantially as herein described.

383,266. SOLE-MACHINE. HENRY S. AMERY, Boston, Mass., assignor to the Bradford Manufacturing Company, same place. Filed June 28, 1887. Serial No. 242,478. (No model.)

Claim.—1. In a machine substantially such as described, leveler F, in combination with rest F' for the face of the sole and means, sub-

388,266.

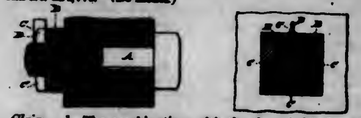


stantially such as described, for vibrating the leveler F within the rest for the face of the sole, substantially such as described.

2. Leveler F, cylindrical rest F' for the face of the sole, and means, substantially such as described, for reciprocating the leveler within the rest for the face of the sole, in combination with a stop, f' f'', for breaking the force of the leveler's blow, substantially as and for the purpose set forth.

3. In combination, spring tool-carrier B, one or more levers, b^3, fulcrumed to the head A, and slotted at b^4 to receive a cross-head, b^5, sliding in the slot and secured to the treadle-rod b^7, the tool-carrier being connected to lever b^3 by rod b^6, and lever b^3 being oscillated on its fulcrum, all substantially as set forth.

388,267. GOVERNOR FOR GAS-ENGINES. JAMES B. ALLFREE, Indianapolis, Ind., assignor of one-half to Robert Shriver and Harrison Swartzwelder, Cumberland, Md. Filed Sept. 1, 1887. Serial No. 248,594. (No model.)



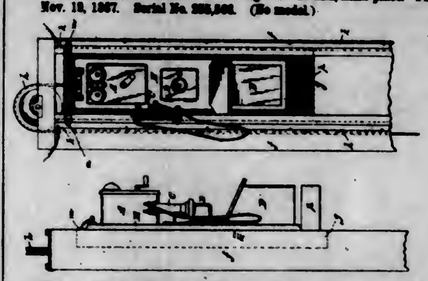
Claim.—1. In a centrifugal governor, two weighted levers pivoted to a suitable casing on opposite sides of its center and provided with eccentrically-curved slots, in combination with counteracting-springs, a valve-actuating eccentric, and suitable means of connection, whereby the said eccentric may be actuated and the valve regulated by the centrifugal force of the weights, substantially as described.

2. In a centrifugal governor, the valve-actuating eccentric fitted, as described, to an actuating-plate, M, in combination with two cam-levers pivoted in the web on opposite sides of the shaft and suitably connected with the actuating-plate to secure its movement automatically, as and for the purpose set forth.

3. In a centrifugal governor, the valve-actuating eccentric, in combination with the two cam-levers D, provided with curved slots E, the correspondingly-curved blocks P, the connecting-pins passing through said blocks and securely fastened to the actuating-plate, the web B, provided with slots H, weights E, and springs G.

4. A centrifugal governor comprising a suitable casing attachable to the driving-shaft, two cam-levers pivoted in the web of said casing on opposite sides of the shaft, weights adjustably attached to said cam-levers, adjustable counteracting-springs attached to the weighted cam-levers and to the casing, a movable plate sliding in suitable guides and carrying a valve-actuating eccentric, and suitable studs or pins attached to said plate and adapted to slide in slots in the web of the casing and in the cam-levers, all substantially as described, so arranged and combined as to operate as set forth.

388,268. NUT-LOCK. HENRY B. BAKER, Helmsville, Ohio, assignor of one-half to William R. Dewire, same place. Filed Jan. 19, 1887. Serial No. 224,776. (No model.)



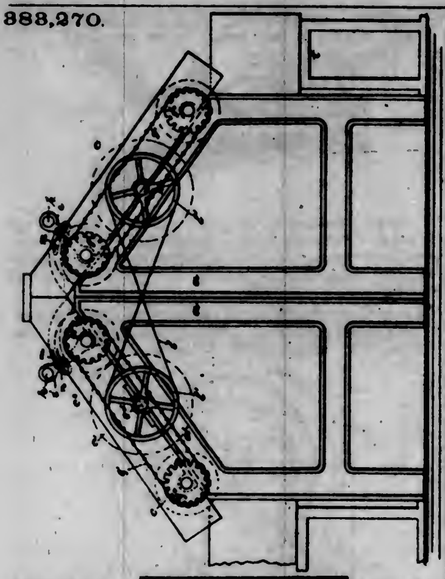
Claim.—1. The combination, with the threaded bolt and the nut having a radial slot in the outer face thereof, of the chisel or slip driven through said radial slot into the threads of the bolt, and having portions of the nut upset against the faces of the slip at the outer end of the slot and inside of the outer end of the slip, substantially as specified.

2. The combination, with the threaded bolt, its bearing, and a nut having a radial slot in the outer face thereof, of the chisel or slip driven through said radial slot into the threads of the bolt, and having portions of the nut at the outer end of the slot upset against the faces of the chisel or slip inside of its outer end, substantially as specified.

3. The combination, with the threaded bolt, its bearing, and a nut provided with radial slots, of the steel slips or chisels placed in the radial slots and driven into the threads on the bolt, and having the material of the nut at the outer ends of the radial slots upset against the faces of said slips inside of their projecting ends, substantially as specified.

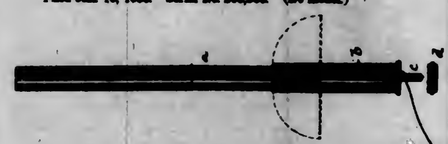
388,269. TELEPHONE-CONVEYER. SAMUEL R. BALLARD, Pittsburg, Pa., assignor of one-half to George V. Marshall, same place. Filed Nov. 18, 1887. Serial No. 255,562. (No model.)

Claim.—The combination of the elevator-ways traversing two or more floors of a building, a carriage guided in said ways, a telephone transmitter, receiver, magneto call-bell, and battery mounted thereon, and having automatic switch, line, and ground connections constantly connected to said switch, a counter-weight for the carriage and its contents, and an operating-rope attached to said counter-weight at one end and at the other to the movable carriage, substantially as described.



388,270. HAT-STARTING MACHINE. RICHARD BARRETT, Harrison, N. J. Filed Jan. 9, 1888. Serial No. 260,212. (No model.)

Claim.—1. The combination, in a hat-starting machine, with a large central roller or starting-cylinder, c', of smaller cylinders or rollers, c c^2, the said rollers being arranged to form pockets c' c^2 for the hat-bodies and being geared to operate simultaneously in one direction, substantially as and for the purposes set forth.



2. The combination, in a hat-starting machine, with a large roller, c', of smaller rollers arranged in inclined series with the said larger roll, substantially as and for the purposes set forth.

3. The combination, in a hat-starting machine, of the larger cylinder, c', a lower cylinder, c, and a higher cylinder, c^2, and a guard-cylinder, A, adapted to prevent the hat from being thrown from off the cylinder c^2, substantially as described.

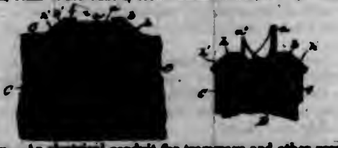
388,270.

388,271. BATTERY-ZINC. JOHN BRAYER, Jr., Fall River, Mass., assignor to the Beattie Battery Zinc and Electrical Company, same place. Filed Jan. 10, 1883. Serial No. 260,262. (No model.)

Claim.—1. A re-enforce and connection for battery-zincs, consisting of a cap or shell of conducting material adapted to fit over the head of the zinc and extend down upon its body, as set forth.

2. A re-enforce and connection for battery-zincs, consisting of the combination, with a metallic cap or shell, of a screw passing through the head of the cap to receive a tightening-nut, as set forth.

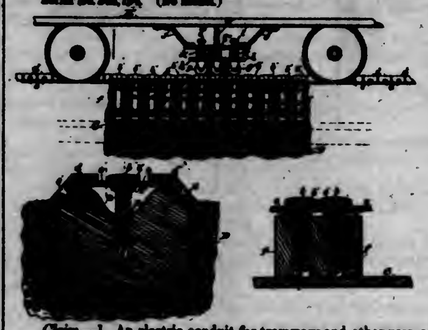
3. As a new article of manufacture, a battery-zinc provided with a cap or shell of metal and a screw or rod, as *c*, for connection, substantially as described.



4. The combination, with a battery-zinc, of the cap or shell provided with a screw to receive a clamping-nut having a conical head, the screw being connected with the zinc by a dovetail or mortised connection.

5. The combination, with the zinc, of the cap or shell slitted, as described, and provided with the screw *c*.

388,272. PROCESS OF ORNAMENTING CELLULOID SURFACES. ADOLPH BERNHARD, Hanauerland, Baden, Germany. Filed Jan. 13, 1888. Serial No. 260,994. (No specimens.)



Claim.—The process of producing designs in colors upon a surface of celluloid, which consists in first producing the desired design upon paper or other like material with a suitable ink or inks, then moistening the celluloid surface with a solvent of the same and of the ink employed, and then transferring the design on the paper upon the moist celluloid surface under pressure, substantially as described.

388,273. ELECTRICAL TRAMWAY. HENRY T. BLAKE, New Haven, Conn. Filed June 2, 1887. Serial No. 240,169. (No model.)

Claim.—An electrical conduit for tramways and other uses, consisting of a base of wood or other suitable non-conducting material, having a metallic conductor-strip attached along its upper surface, in combination with a flexible flap or covering of non-conducting material overlying such conductor-strip, resting upon the same and its supporting-base, so as to be substantially in contact with said strip, in the manner and for the purpose hereinbefore set forth, said flap being arranged in the manner described, so as to be lifted and replaced in position to permit the passage of the trolley or other contact-making device, in the manner and for the purpose set forth.

388,274. ELECTRICAL TRAMWAY. HENRY T. BLAKE, New Haven, and CLARENCE STORRS, Bridgeport, Conn. Filed June 30, 1887. Serial No. 243,324. (No model.)

Claim.—1. An electric conduit for tramways and other uses, consisting of a sleeper, of wood or other suitable non-conducting material, having a channel cut in its upper surface and a primary or main conductor laid in the bottom of said channel, in combination with a diaphragm of flexible non-conducting material secured along the upper surface of such conduit across such channel, a secondary conductor attached along the outer surface of said diaphragm over said channel and having a series of projections extending through said diaphragm into said channel, which projections approach nearly to said main conductor, but not to the point of electrical connection therewith, and blocks or strips of elastic rubber or other similar non-conducting elastic material supporting said secondary conductor in its normal position, all as described.

2. The combination of the channeled conduit, constructed substantially as described, having the main conductor at the bottom of the channel, the flexible diaphragm covering said channel, the secondary conductor placed upon said diaphragm, and the flexible flap over said secondary conductor having stiffening-plates which extend across said channel and form a bridge over the secondary conductor, in the manner and for the purpose described.

388,275. GUITAR. GEORGE W. DOWNE, Somerville, Mass. Filed Mar. 28, 1888. Serial No. 268,966. (No model.)

Claim.—1. In a stringed musical instrument, an additional adjustable tuning device for changing the vibrating length of each string independent of the other strings and of the usual means for tuning the strings, substantially as and for the purpose set forth.

2. In a stringed musical instrument, an adjustable tuning-bearing for one end of the vibrating portion of the string, the same being independent of the other strings and of the usual means for tuning the string, substantially as and for the purpose set forth.

3. A compound bridge or bearing for guitars or like musical instruments, the same consisting of a series of adjustable attachments in addition to and independent of the usual tuning devices, so that the virtual or vibrating length of each string may be separately varied, substantially as and for the purposes set forth.

4. A compound bridge or bearing for guitars or like musical instruments, the same consisting of a series of bearings or supports for the strings, to which the strings may or may not be attached, each support being independently adjustable in the direction of the string, the said devices being in addition to the usual tuning devices, whereby the length of the vibrating portion of each string can be varied, as and for the purpose set forth.

5. The herein-described bridge for guitars or like musical instruments which have tuning devices for the strings, the same consisting of a device provided with adjustable attachments independent of the tuning devices, to which the strings are connected, so that the length of each string may be separately varied, for the purpose set forth.

6. In a stringed musical instrument, the combination of a stationary bearing for supporting the strings at one end, together with tuning devices for the strings, a finger-board having fixed frets thereon, and a bridge provided with adjustable bearings or supports for the strings, substantially as and for the purposes set forth.

7. In a stringed musical instrument, the combination of a sta-

383,275.

tionary bearing for supporting the strings at one end, together with tuning devices for the strings, a finger-board having fixed frets thereon, and a bridge provided with adjustable bearings or supports for the strings, and means for locking the adjustable bearings, substantially as and for the purpose set forth.

8. In a bridge for guitars or like musical instruments, an adjustable device having means for the attachment of a string and a bearing for the string in front of the point of attachment, substantially as and for the purpose set forth.

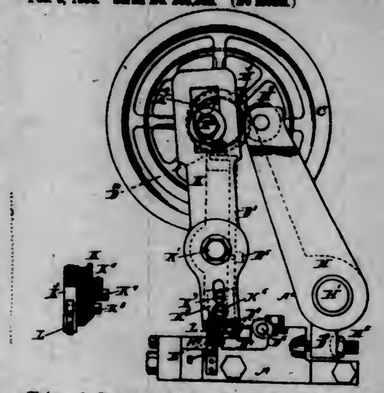
9. In a bridge for guitars or like musical instruments, the combination, with the base plate or block having the projection *c*, of one or more screws, G, passing through the projection, each having one or more adjusting-nuts, and a head provided with means for the attachment of a string, together with a bearing, A^2, for the string, and a block, A^3, substantially as and for the purpose set forth.

10. In a bridge for guitars or like musical instruments, the combination, with the base plate or block having one or more grooves in its upper face, of a corresponding number of bearings for the strings sliding in the grooves, together with means for locking each bearing when adjusted, substantially as and for the purpose set forth.

383,276. TAIL-PIECE FOR STRINGED INSTRUMENTS. SAMUEL M. DUNKIN, Hanoverton, Ohio. Filed Dec. 10, 1887. Serial No. 257,544. (No model.)

Claim.—1. The combination, with a tail-piece for violins, guitars, banjos, and other stringed instruments, having an elliptical recess or socket therein, of the elliptical spool mounted in the recess or socket and adapted to have the strings wound thereon, substantially as specified.

2. A tail-piece for violins, guitars, banjos, and other stringed instruments, having the slots B B and the elliptically-shaped recess or socket E therein, and the spool H, disposed in the recess and having the lower flange, I, fitting snugly therein, and the upper flange, K, bearing on the upper side of the tail-piece around the recess or socket, substantially as specified.



3. A tail-piece for violins, guitars, banjos, and other stringed instruments, having the recess or socket E therein, the legs F F, adjacent to said recess or socket, and the spool H, provided with the lower flange, I, fitting snugly in the recess or socket, and the upper flange, K, having notches L L to engage the said legs, substantially as and for the purpose specified.

383,277. BOTTLE-STOPPER. GEORGE E. CHAMBERLAIN, New York, N. Y. Filed Nov. 30, 1887. Serial No. 256,502. (No model.)

Claim.—A bottle-stopper comprising the sleeve A, upright B, and cover C, the upright being slotted and adjustably secured to the sleeve by a set-screw passing through the slot, and the cover being hinged to the upright and provided with a spring, whereby it is normally held in a closed position, as set forth.

383,278. STRIP-TACK-HEADING MACHINE. GEORGE W. COPELAND, Malden, Mass., assignor to Daniel T. Copeland, same place. Filed Feb. 6, 1888. Serial No. 263,262. (No model.)

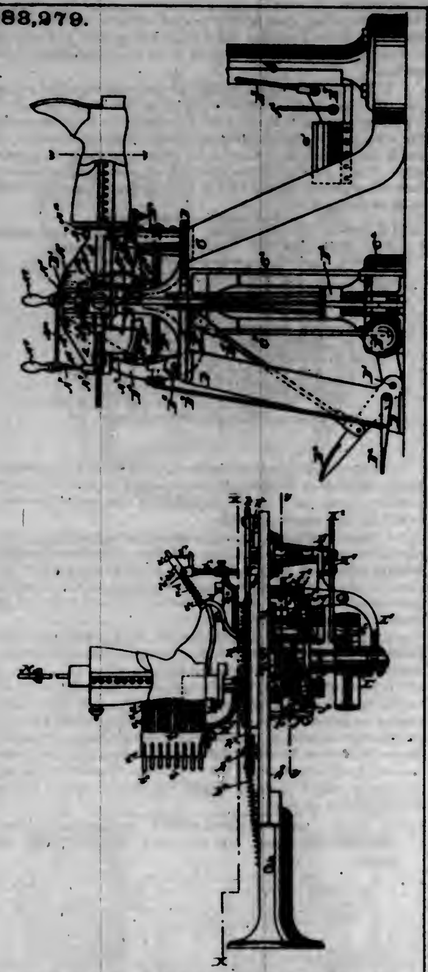
Claim.—1. In a strip-tack-heading machine, the combination of gripping-jaws for holding the blank, an oscillating operating-tool for bending the head in one direction, and a roller for bending or swinging the point or end of said head back upon itself in the reverse direction, substantially as described.

2. In a strip-tack-heading machine, the combination of gripping-jaws for holding the blank, an oscillating tool-holder carrying a tool for bending the head in one direction, and a roller for bending or swaging the point or end of said head back upon itself in the reverse direction, substantially as described.

3. In a strip-tack-heading machine, the combination of the gripping-jaws H^3 H^7 with the oscillating tool-holder K^3, provided with a bending-tool, and a flattening-roller, L, substantially as described, and for the purpose set forth.

4. In a strip-tack-heading machine, the combination of the gripping-jaws H^3 H^7 with the feeding-pawl D^2, block D^7, and its actuating mechanism, substantially as described, and for the purpose set forth.

5. In a strip-tack-heading machine, the combination of the fixed gripping-jaw H^7 and the movable gripping-jaw H^3 with the swinging lever D^2 H, roller H^9, and a suitable bending-tool and roller for bending or swaging the heads, and cam H^8, all substantially as described, and for the purposes set forth.



383,279. MACHINE FOR TRIMMING SHOES. GEORGE W. COPELAND, Malden, and JOSEPH R. CRAIG, Somerville, assignors, by mesne assignments, to Daniel T. Copeland, Malden, Mass. Filed Feb. 8, 1888. Serial No. 263,502. (No model.)

Claim.—1. In a shoe-trueing machine, the yielding toe and back rubbing tools mounted on pivoted shafts, and adapted by mechanism, substantially as described, to be automatically adjusted to and from each other, and to be oscillated substantially as and for the purpose set forth.

2. In a shoe-trueing machine, the mechanism for rubbing the sides and front of a shoe, comprising a series of adjustable spring-actuated rods or arms with proper rubbing tools or faces mounted on reciprocating heads, and mechanism for giving said heads differential motion, substantially as set forth.

3. A shoe-trueing machine comprising a revolving turret carrying shoe-trees, mechanism, substantially as described, for rotating the same and expanding the trees, a stand carrying toe and back rubbing tools mounted on pivoted shafts and adapted to be adjusted toward and

383,279.

from each other and oscillated, and an independent stand carrying side and front part rubbing mechanism supporting a series of adjustable spring-actuated rods provided with tools or faces mounted on reciprocating frames or slides having differential motion, and suitable operating mechanism, substantially as described.

4. In a machine for trueing shoes, in combination with the turret, the swinging bars A^5, and a pawl and ratchet to spread and carry spread the trees mounted on the sections of the turret.

5. In a machine for trueing shoes, in combination with the turret carrying one or more shoe-trees, the counterbalanced treadle D^6, its rod D^8, and the bell-crank lever D^4, operating as described.

6. In a machine for trueing shoes, the combination of the tool-carrier and tool-governing heads operated by differential cranks B^4 E^2, revolving around a common center.

7. In a machine for trueing shoes, the rand-guide F, constructed and operating substantially as shown and described, and for the purpose set forth.

8. In a shoe-trueing machine, a thin metal sole-plate, which acts as a rand-guide, attached to a swinging frame, in combination with partial disks to hold the swinging frame in operative position when they are revolving, substantially as described, and for the purpose set forth.

9. In a shoe-trueing machine, a time-ratchet provided with one more tooth than the feeding-ratchets for the tool-carrying slides or frames, and operative mechanism therefor, substantially as described.

10. In a machine for trueing shoes, cranks B^4, shafts G, clutches G^2, pawl A, ratchet A', lanthorn A^2 A^3, wedges A^4, and springs A^5, in combination with the clutch-gears G^3 and lanthorn G^4, operating as described.

11. In a machine for trueing shoes, the spring G^5, in combination with the clutches G^2, substantially as set forth.

12. In a machine for trueing shoes, the lever A^7, the spring-pawl A^6, and the spring A^5, in combination with the ratchet A', for the purposes set forth.

13. In a machine for trueing shoes, the tool-carriers H^3 H^7, having the line of the pivots around which they oscillate located for operative position by the rests H H' at a predetermined distance from the heel and toe ends of the shoe, substantially as described.

14. In a machine for trueing shoes, the tool-carriers H^3 H^7, carrying toe and back rubbing tools, and oscillated by mechanism, substantially as described.

15. In a machine for trueing shoes, the tool-carriers H^3 H^7, reciprocated horizontally by mechanism, substantially as shown and described.

16. In a machine for trueing shoes, a ratchet-wheel and operative mechanism for timing its operation, provided with a blank space, for the purposes set forth.

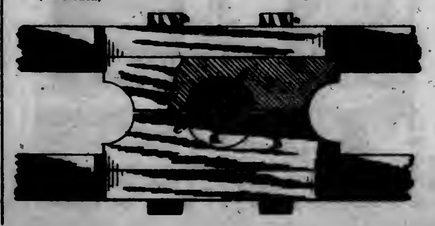
17. In a machine for trueing shoes, a ratchet, K^4, for timing its operation, in combination with the feeding-ratchets or the cams J^2 J^3, as set forth.

18. In a machine for trueing shoes, the elevated arc K^2, the clutch-lever L^2, having the inclined end L^3, and the spring I^3, in combination with the clutch L^1 and pulley L', all operating as described, and for the purposes set forth.

19. In a machine for trueing shoes, the eccentric L^4 and the pawl L^5, in combination with the ratchet K^3 and the lever K^4 K^7 and spring I^4, substantially as described, and for the purposes set forth.

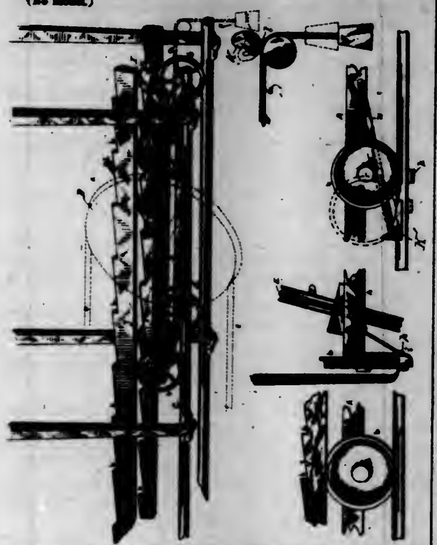
20. In combination with a machine for trueing shoes, a tree provided with springs N^3, operating substantially as described, and for the purposes set forth.

21. In a machine for trueing shoes, the carriers for the trueing-tools, mounted upon pivots upon which they oscillate, adjusted automatically by means of heel and toe rests at predetermined distances from the heel and toe ends of the shoe, substantially as described.



383,280. SASH-BALANCE. JAMES H. GRAHAM, Hartsell's, Ala., assignor of one-half to Milton J. Sparks, same place. Filed July 16, 1887. Serial No. 244,262. (No model.)

Claim.—1. In a sash-balance, the combination, with the casken having suitable pulleys thereon, of the fastener L, secured to one of the sashes and comprising the block M, having the wedge-shaped recesses N N' therein, the openings *n n'* in the ends of the block and communicating with the said recesses, and the wedges Q Q', arranged in the recesses N N', and having serrated upper sides, and the cords S S', operating around the said pulleys and passing through the openings *n n'*, and recesses N N' in opposite directions over the said wedges, substantially as specified.



2. In a sash-balance, the combination, with the casken having suitable pulleys arranged thereon, of the fastener L, comprising the block M, having the wedge-shaped recesses N N', the end openings, *n n'*, and the shallow recesses O O', communicating with the recesses N N', and the serrated wedges Q Q', operating in the recesses N N', and having pins or handles R R', operating in the recesses O O', and the cords S S', passing around the said pulleys and extending through the openings *n n'* in opposite directions, the said cords being adapted to be clamped within the block M by the wedges Q Q', substantially as and for the purpose specified.

383,281. MEANS FOR SECURING PULLEYS ON SHAFTS. WALLACE H. DUNCH, Mishawaka, Ind. Filed Sept. 5, 1887. Serial No. 248,513. (No model.)

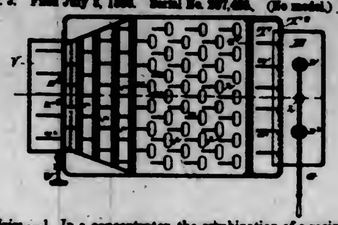
Claim.—The separable pulley having a central bearing portion of soft material, in combination with the shaft having a recess formed therein, a key piece or pin adapted to fit the recess and having a sharp outer end, and clamping devices as the screws *h*, for forcing together the parts of the pulley and causing the outer end of the pin to cut itself in the pulley at the desired point, substantially as set forth.

383,282. SLACK-TAKE-UP FOR ROPE TRANSMISSION. WALLACE H. DOUGLASS, Hitchcock, Ind. Filed Oct. 1, 1887. Serial No. 251,159. (No model.)

Claim.—1. In combination, the transmission-rope, the take-up wheel, the carriage to support said wheel, and the track C, with a catch adapted to engage and automatically arrest said carriage when moved in one direction, but let it slide freely in the other direction.

2. The transmission-rope, the take-up wheel, the carriage A, and track C, combined with a rail, and a catch attached to said carriage and adapted to engage said rail and automatically arrest the carriage when moved in one direction, but let it go freely when moved in the other direction, as set forth.

3. The transmission-rope, the take-up wheel, the carriage A to carry said wheel, and the track C, combined with the rail J, provided with ratchets A, and arm I, hinged to the carriage and in engagement with said ratchets, as set forth.

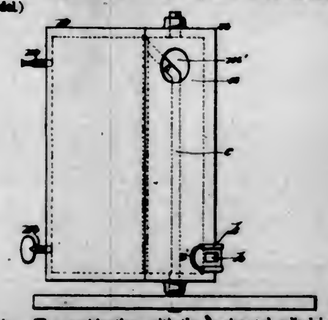


383,283. EXTINGUISHING FIRES IN STOVES. ALBERT DOREMUS, Nyack, N. Y. Filed Mar. 30, 1887. Serial No. 232,594. (No model.)

Claim.—1. The car, the stove A, and the grate and ash-pan therein, each supported near its rear edge upon a pivot, in combination with the bar E, having studs projecting into the stove, upon which the forward edges of said grate and ash-pan are supported, vertical tube F, disposed in front of said bar, and a chain passing down said tube and connecting said bar with the next car of the train, substantially as described.

2. The stove having a grate and ash-pan, each supported near its rear edge upon a pivot, said stove being provided with openings for permitting access to both said grate and ash-pan, in combination with the water-tank J, entirely below and independent of said ash-pan, the bar E, having studs projecting into the stove, upon which the forward edges of said grate and ash-pan are supported, and a chain whereby both the grate and ash-pan may be dumped simultaneously, substantially as described.

383,284. CONCENTRATOR. JOHN J. DRUCKENER, East Newark, N. J. Filed July 2, 1888. Serial No. 307,488. (No model.)



Claim.—1. In a concentrator, the combination of a reciprocating pan having stops or arresters and depressions or pockets and grooves *p* and *r*, a pump, and a hopper, arranged and operating substantially as and for the purposes set forth.

2. In a concentrator, the combination of a reciprocating pan having a pocketed or recessed bottom, and stops or arresters arranged laterally adjacent to the pockets therein, to produce a whirl or eddy over the pockets, substantially as set forth, and a pump for providing said pan with water, and a lever connected with said pump and pan for actuating the two simultaneously.

3. In a concentrator, the combination of the reciprocating pan having wings w^2 and an amalgamating-pan receiving said wings, substantially as and for the purposes set forth.

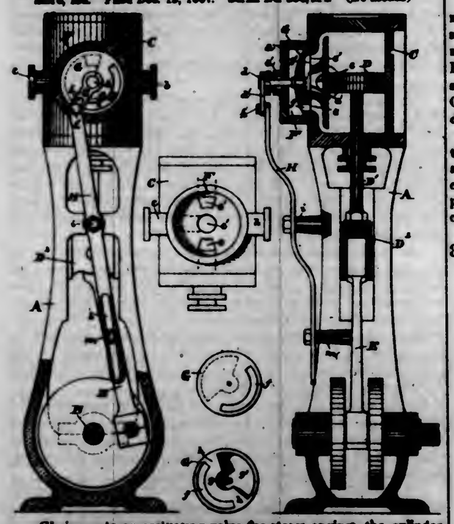
4. In combination, a concentrating-pan, reciprocating water and ore supply devices disposed at one end of said pan, exits for water and washed ore disposed at the opposite end, the bottom of said pan being provided with a series of pockets or recesses and stops, arresters, or wings disposed on or above said bottom laterally adjacent to said pockets at right angles to the line or direction of motion of said pan, whereby an eddy is produced directly over each of the said pockets, substantially as set forth.

383,285. RICE-HULLING MACHINE. EVARISTO CONRADO RIBEIRINHA, Pirahinha, Brazil. Filed Oct. 8, 1886. Serial No. 215,708. (No model.)

Claim.—The combination, with the horizontal cylindrical casing having a hulling-surface, a feed-opening at one end, and a discharge-opening at the other end, said discharge-opening being provided with a sliding plate having an opening to control the pressure and discharge of the material, of the horizontal hulling-cylinder *c*, having the projecting bars *c*, arranged parallel with its axis throughout the greater part of their length, and inclined at one end at an angle of about forty-five degrees directly beneath the feed-opening of the cylindrical casing, substantially as described.

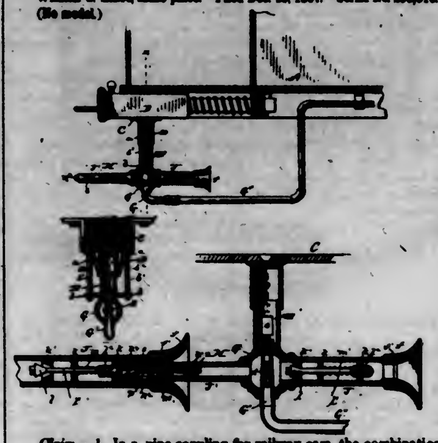
383,286. COMBINED REVOLVING HARROW AND CULTIVATOR. LEWIS S. EVANS, Alvarado, Tex. Filed Feb. 20, 1888. Serial No. 265,096. (No model.)

Claim.—1. The combination, with the frame, of the adjustable hangers, the shaft L, journaled in said hangers and provided with the



383,286.

revolving blade and bevel-pinion, the cross-shaft Q, carrying bevel-wheel R and journaled in the boxes U, the oscillating box P on the shaft Q and receiving the end of shaft L, and the drive-chain connecting the cog-wheel on shaft Q with the gear on the driving-wheel, substantially as described.

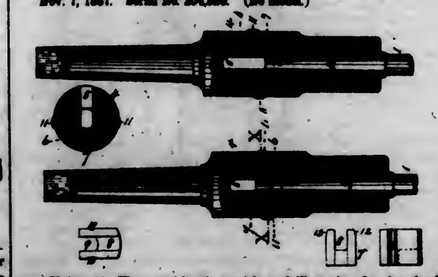


2. The combination, with the frame extending in front of the axle of the adjustable hangers carrying the shaft L, provided with the harrow-blade and bevel-pinion, the cross-shaft Q, operated from the main drive-wheel, carrying the main bevel-wheel meshing with the pinion on the harrow-shaft, the oscillating box in which fits the end of the harrow-shaft, the hinged bars carrying the cultivating-teeth, and the hangers N, depending from the frame and serving both as the support for the forward ends of the cultivator-bars and for the journal-bearings of the cross-shaft Q, substantially as and for the purposes described.

383,287. VALVE FOR STEAM-ENGINES. JOHN D. FISER, Baltimore, Md. Filed Dec. 19, 1887. Serial No. 258,414. (No model.)

Claim.—In an condensing valve for steam-engines, the cylinder G, provided with ports *e e'*, in combination with the recess *f* and the port *f*, the area of said port *f* being less than the inlet-port of the cylinder, substantially as and for the purposes set forth.

383,288. AUTOMATIC PIPE-COUPLING FOR RAILWAY-CARS. WILLIAM F. GRAMLEY, Williamsport, Pa., assignor of three-fourths to William G. Hiltz, same place. Filed Dec. 16, 1887. Serial No. 258,010. (No model.)



Claim.—1. In a pipe-coupling for railway-cars, the combination of the main conducting-pipe terminating in an upwardly-directed tapering extension, G', provided with openings in its opposite sides, means for supporting the main pipe, the globe G, fitted closely upon the extension G' and inclosing its recessed portion, the globe being adapted to rotate freely upon the vertical extension and provided with screw-threaded openings in its opposite sides, and the oppositely-projecting valved male and female branches screwed into the openings in the opposite sides of the globe, whereby either the male or female branch may be directed toward the adjacent car, substantially as herein set forth.

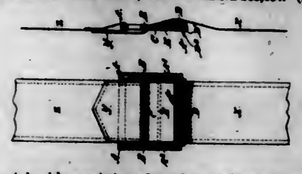
2. In a pipe-coupling for steam-pipes, the combination of the main steam-pipe provided with a perforated tapering vertical portion, G', a vertical yielding suspension device to which the upper end of the portion G' is adjustably secured, a globe, G, vertically perforated for the passage of the vertical portion G', this portion G' forming a vertical pivot for the globe to turn upon, and the male and female branches attached to opposite sides of the globe G and communicating with the interior thereof.

3. In a coupling device for steam-pipes, the combination of the main steam-conducting pipe provided with a vertical perforated extension, as at G', a vertically-yielding suspension device for suspending the main pipe to the car, and the reversible horizontally-arranged coupling H, comprising, essentially, the valved male and female branches, the said reversible coupling H being pivotally supported upon the extension G' of the main pipe and communicating therewith, substantially as described.

4. The combination, with a rigid tubular guide depending from the stirrup of a car-coupling, a cylinder working vertically in said guide and suspended by springs, a male and female reversible steam-pipe coupling having valves in its branches, and a conical perforated steam-pipe nozzle rigidly but adjustably secured to said vertically-movable cylinder, substantially as described.

383,289. DRILL-SOCKET. PETER GRAMLEY, St. Louis, Mo. Filed Nov. 7, 1887. Serial No. 254,892. (No model.)

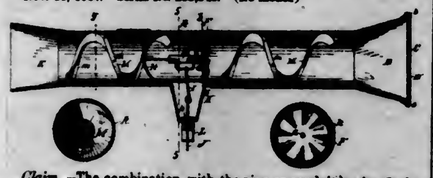
Claim.—1. The combination, with a drill-stock, of a longitudinally-adjustable grip-block, substantially as and for the purposes specified.



2. The combination, with a drill-stock, of a longitudinally-adjustable grip-block having a vertical and a horizontal open slot, substantially as and for the purposes specified.

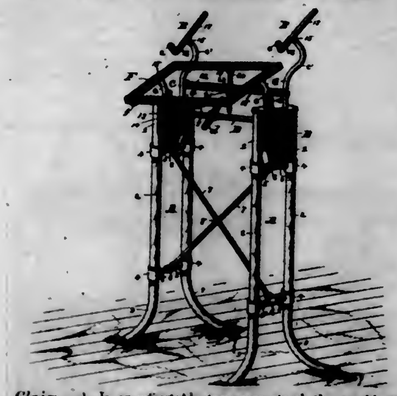
3. The combination, with a drill-stock, of a longitudinally-adjustable grip-block having the vertical side grooves for the reception of the ends of the set-screws, and set-screws for securing the adjustable drill-block, substantially as and for the purposes specified.

4. The combination, with a drill-stock having an elongated slot or chamber for the reception of an adjustable grip-block, of a longitudinally-adjustable grip-block arranged therein, and set-screws arranged in different transverse planes of the stock for securing the adjustable grip-block, substantially as and for the purposes specified.



5. The combination, with a bit-stock having a grip-block cavity, of a longitudinally-adjustable grip-block having spring-tongues arranged in the cavity of the stock, substantially as and for the purposes specified.

383,290. BUCKLE OR CLASP. WILHELM GRIM, Commerstaedt, Prussia, Germany. Filed Feb. 4, 1888. Serial No. 263,007. (No model.)

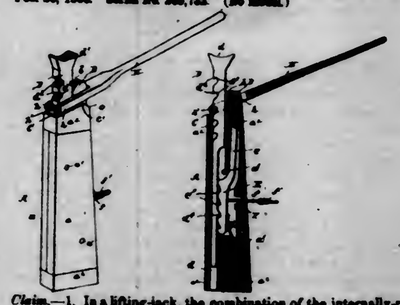


Claim.—A buckle consisting of the front and rear pins, A' A, connected by side bars, a transverse bridge-piece, B, secured to the side bars between the front and rear pins, and the flap C D, pivoted by a pin, E, in the space between the bridge-piece and the front pin to bind a strap when stretched against the bridge-piece, substantially as and for the purpose described.

383,291. WATER-POWER. ABRAM GUSTLER, Boone, Iowa. Filed Nov. 16, 1887. Serial No. 255,346. (No model.)

Claim.—The combination, with the pipe or conduit having flaring ends, one side of one end being removed and a gate for closing the other end, and a wheel journaled within the pipe on a crank-shaft arranged parallel with the bore of the pipe, of the dome, the bracket, the rod having bearings in the dome and bracket, and the pitman connecting the crank-shaft and rod, substantially as described.

383,292. TYPE-CASE STAND. WILLIAM P. HARMONY, Sidney, Ohio. Filed Sept. 13, 1887. Serial No. 249,461. (No model.)



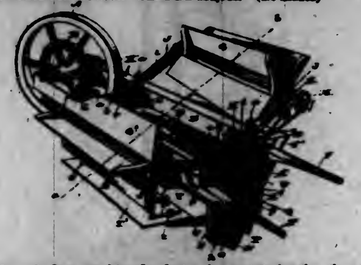
Claim.—1. In an adjustable type-case stand, the combination, with a transverse shaft journaled in the upper portion of the stand, and provided with a pinion near each end and an operating-handle, of a two-arm standard at each side of the stand, supports secured to the rear arms of said standards for holding the upper case, and a frame pivoted to the front arms for supporting the lower case, a rack-bar secured to one of the arms of each standard, with which the pinions engage, and mechanism, substantially as described, for holding the standards elevated.

2. In an adjustable type-case stand, the combination, with the legs, rounds, and cross-braces, constructed substantially as described, of the side blocks, grooved as at 9 and 10, clamped between the upper ends of each pair of legs, and provided with pins for taking into the tops of the legs, a transverse shaft journaled in said blocks, and provided with a pinion near each end and an operating-handle, a two-arm standard at each side of the stand, each formed from a single piece of metal bent so as to fit and work in grooves 10 in the side blocks, supports secured to the rear arms of said standards for holding the upper case, and a frame pivoted to the front arms for supporting the lower case, a rack-bar secured to one of the arms of each standard, with which the pinions engage, and mechanism, substantially as described, for holding the standards elevated.

3. In an adjustable type-case stand constructed as described, the combination, with a cross-brace uniting the rear arms of the standards which support the upper case, and provided with a loop, of a rectangular frame on which the lower case rests, pivoted to the front arms of the standards, a staple secured to the rear part of said frame, a screw-threaded rod hung to said staple and passing through the loop on the cross-brace, and screw-threaded nuts on said rod, above and below said loop, whereby the lower case may be adjusted to and held at any desired inclination with relation to the upper case.

383,293. LIFTING-JACK. MARCUS HEDGES, Harriotte, Cal. Filed Feb. 20, 1888. Serial No. 265,732. (No model.)

Claim.—1. In a lifting-jack, the combination of the internally-recessed casing having the vertical guide projection at its upper end, the lifting and support bar sliding in said recessed casing and provided on its edge with downwardly-inclined teeth, and the bifurcated lever-handle fitting over the guide projection and upper end of the lifting-bar and provided with a transverse bar between the ends of its bifurcation to engage the said teeth of the lifting-bar, substantially as specified.



2. In a lifting-jack, the combination of the recessed sectioned casing, metal-shod at the ends, and having at its upper end the shoulders C *c*, downwardly inclined from their rounded apex *c'* at about right angles to each other, and the vertical guide projection B, provided with the beveled corner *b*, the lifting-bar D, having the angular head *d'* and the teeth *d²*, forming between them the rounded notches *d³*, and the lever-handle H, having the arms *h* at its bifurcated inner end, and the rounded transverse bar *h'*, connecting the ends of said arms; substantially as specified.

3. In a lifting-jack, the combination of the recessed casing having a vertical guide projection at its upper end, the lifting and support bar having the downwardly-inclined teeth on its outer edge and the downwardly-inclined detent-tooth on its inner edge, the ratchet-bar pivoted at the end of the upwardly-extending arm and provided with upwardly-inclined teeth on its inner edge to engage the detent-tooth on the lifting-bar, and the lever-handle bifurcated at its inner end to fit over the guide projection and having a transverse bar to engage the teeth of the lifting-bar, substantially as specified.

4. In a lifting-jack, the combination, with the recessed casing, the lifting-bar having the lifting and detent teeth, and the bifurcated handle provided with a transverse bar to engage said lifting-teeth, of the pivoted depending ratchet-bar and the spring pressing said ratchet-bar into engagement, substantially as specified.

5. In a lifting-jack, the combination, with the recessed casing, the lifting-bar having the lifting and detent teeth, and the bifurcated handle provided with a transverse bar to engage said lifting-teeth, of the pivoted depending ratchet-bar, the rod secured to the outer edge of the ratchet-bar and looped at its outer end outside the casing, the chain attached to said loop, and the U-shaped spring pressing the ratchet-bar into engagement, substantially as specified.

383,294. MACHINE FOR DESTROYING POTATO-BUGS. WILLIAM HUNT, Toronto, and JOHN W. BAILEY, Cartwright, Ontario, Canada. Filed Oct. 20, 1887. Serial No. 252,913. (No model.)

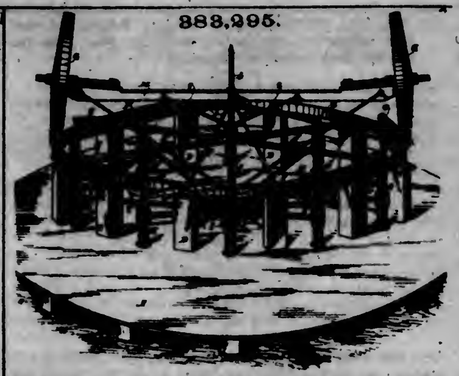
Claim.—1. In a machine for destroying potato-beetles, the combination, with a wheel suitably journaled and provided with a bevel-gear ring, of a spur-pinion adapted to mesh with said gear-ring and to drive a shaft and a pulley thereon, which actuate by means of belting and pulleys inwardly-rotating beaters journaled in arms adjustably connected with the frame of the machine, inclined tables below said beaters, adjustable laterally and radially on said frame, and designed to direct the beetles swept from the plants to two inwardly-rotating rollers driven by spur-pinions meshing into each other, one of which derives motion by pulley and belting connected with a pulley on the main shaft of the machine, substantially as specified.

2. The combination of wheel A, journaled on frame B, cogged ring B on said wheel, spur-pinion C, main shaft D, carrying said pinion, double pulley L on said shaft, rope *g*, pulleys M M', adjustable arms J, attached to said frame B, beaters G G' on spindles H, which are journaled on said arms, inclined table T, with adjustable leaves T', brackets U, adjustable as described, crushing-rollers R and S, gear-pinion P, meshing with gear-pinion O, which latter is driven by power communicated from the main shaft to pulley N, and spring A, formed in slot in end frame-piece, Q, and handles F, substantially as described and specified.

3. In combination with the frame of a machine for destroying potato-beetles, arms J, secured to and extending laterally from the frame, and slotted to receive standards *a*, which are pierced for pins *c*, and above K, rising from the ends of the frame, slotted and similarly pierced for retaining-pins *r*, the beaters G G', journaled on said arms J, and revolving inwardly by power communicated from the main shaft D of the machine, substantially as specified.

4. The combination, with a device for destroying beetles with the crushing-rollers R and S, suitably journaled, of gear-pinions O and P at the discharge of the tables, and spring A, formed in the slot in end frame-piece, Q, pulley N, driven by power communicated from main shaft D, inclined tables T, brackets U, adjustable on said frame, and leaves T', adjustably connected with tables T by set-screws *t* in slots *t'*, substantially as described, and for the purpose specified.

5. In a machine for destroying potato-beetles, the combination of the beveled beater G, journaled in the arm J, adjustably connected to the frame of the machine and adapted to rotate inwardly by power communicated from the main shaft D, which is actuated by bevel-gear connected with the road-wheel A, and inclined table T, adjustable laterally and radially on said frame, and designed to forward the beetles swept from the plants to the crushing-rollers O and P, which are also driven by power communicated from the main shaft D, substantially as specified.



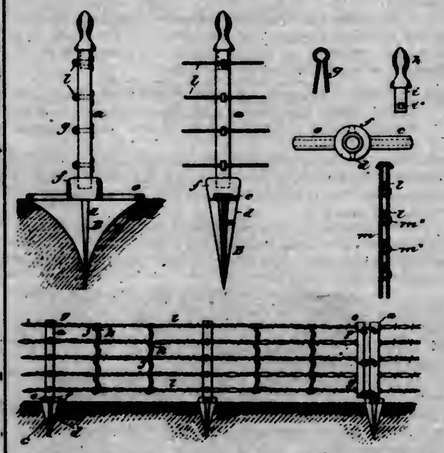
383,295. POWER MECHANISM. WILLIAM A. HOWARD, Petaluma, Cal., assignor of one-half to Charles W. Adamson, same place. Filed Dec. 30, 1887. Serial No. 259,433. (No model.)

Claim.—1. A power mechanism comprising a connected series of pivoted levers, a fixed track alongside of said levers, and oppositely-located wheels adapted to travel on the track and having their rims projecting over into the plane of and to contact with said levers, whereby they are oscillated, substantially as described.

2. A power mechanism comprising connected levers arranged in annular or endless series, an annular fixed track concentric with said lever series, and oppositely-located wheels adapted to travel upon the track and in contact with the levers, whereby adjacent ones throughout the series are oscillated simultaneously in opposite directions, substantially as described.

3. In a power mechanism, the annular series of connected pivoted levers to be connected with the machine or machines to be driven, and the fixed track concentric to and within the series of levers, in combination with the wheels mounted on the track to move in contact with the levers, whereby they are oscillated as described, the axle connecting the wheels, and the pole extending from the axle, substantially as described.

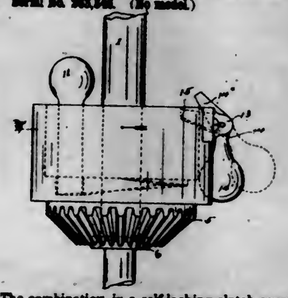
383,295.



4. In a power mechanism, the annular series of standards, the levers pivoted to said standards, and the links connecting the levers in an endless series, in combination with the annular fixed track supported on the standards within the lever series and the beveled wheels adapted to roll on the track and levers, whereby the latter are oscillated, substantially as described.

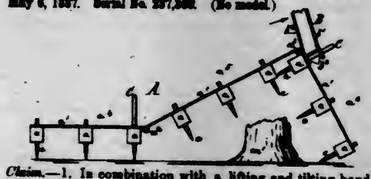
5. In a power mechanism, the annular series of standards, the levers pivoted thereto, and the links connecting the levers in an endless series, in combination with the fixed annular track on the standards, the diametrical braces, and the inclined braces for said track, the fixed center pin, the axle pivoted on said pin, and the wheels on the axle adapted to roll on the track and levers, whereby the latter are oscillated, substantially as described.

6. In a power mechanism, the annular series of pivoted connected levers and the concentric beveled top fixed track, in combination with the axle, and the wheels mounted at an angle and having beveled rims adapted to roll on the track and levers, whereby the latter are oscillated, substantially as herein described.



383,296. IRON FENCE. SAMUEL B. HEMELMAN, Chicago, Ill. Filed Jan. 26, 1888. Serial No. 262,022. (No model.)

Claim.—1. An iron fence consisting of tubular posts provided with holes at right angles to the plane of the fence, in which are secured split keys holding wire rails, said tubular posts being cast into a base consisting of a foot, *f*, placed centrally over the intersecting webs *c* and *d* and united to them, and a cap, *e*, on the webs *c*, substantially as specified.



2. An iron fence consisting of tubular posts provided with caps secured to their places by the same keys which hold the upper strand of wire, and a base consisting of the intersecting webs *c d*, holding centrally over their intersection a foot, *f*, united to them and the cap of the webs *c*, substantially as specified.

383,297. CLUTCH-COUPLING. GEORGE F. HUTCHINS, Worcester, Mass., assignor to the Knowles Loom Works, same place. Filed Feb. 13, 1888. Serial No. 263,846. (No model.)

Claim.—The combination, in a self-locking clutch-coupling, with a driver provided with an inclined circular groove in its bottom and with a pivoted locking-finger on its side, said driver running loose on the driven shaft, of the driven shaft and a collar fast on said shaft and provided with a movable pin adapted to engage the said inclined groove, while the said locking-finger engages a notch in the edge of said collar, substantially as shown and described.

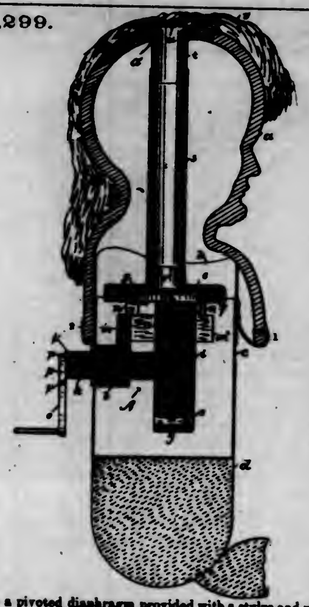
383,298. HARROW. WILLIAM B. JAGGER, Columbus, Ohio. Filed May 6, 1887. Serial No. 237,262. (No model.)

Claim.—1. In combination with a lifting and tilting hand-lever, B, a three-section harrow comprising a middle section, a^2, jointed on either side to side sections, a^1 and a^3, and with the inner beams, a^{10}, of the respective side sections and nearest to the central section provided with vertical pins C to engage at the will of the operator with the lifting and tilting hand-lever, substantially as and for the purpose described.

2. The lifting and tilting lever B, provided with an angular bend, b^1, and an inclined passage, b^2, in combination with the vertical pin C of the side sections, a^1 and a^3, of the three-section harrow a^1 a^2 a^3, substantially as and for the purpose described.

383,299. COMBINED DOLL AND PHONOGRAPH. WILLIAM W. JACQUES, Newton, Mass., assignor to the Edison Phonograph Toy Manufacturing Company, of Maine. Filed Oct. 19, 1887. Serial No. 252,790. (No model.)

Claim.—1. The combination of a phonograph and a doll provided with a body carrying said phonograph, and a head having an orifice therein for the emission of sounds from the phonograph, substantially as described.

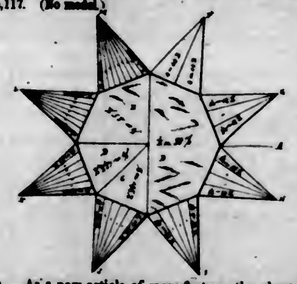


2. The combination of a phonograph having its stylus or tracer supported by the opposing tension of two or more springs, and a doll serving as a receptacle and a support for said phonograph, substantially as described.

3. The combination of a phonograph and a doll having a body provided with a cavity for receiving and a support for holding the phonograph therein, and a resonator contained in a perforated head for conveying and emitting sounds produced by the phonograph within the body, substantially as described.

4. The combination, with a doll provided with a cavity and a support or supports for a phonograph, of a phonograph having a diaphragm held in a frame at one edge and controlled in its movements by a spring upon the upper and under sides of said frame, substantially as described.

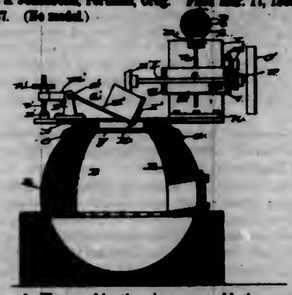
5. In a phonograph, the combination of a traveling record-surface with a pivoted diaphragm provided with a stylus and maintained between two counteracting-springs under tension in operative relation with said record-surface, substantially as described.



6. The combination, with a phonograph, of an automatic shipping device actuated by the reversed motion of the record-surface to withdraw the diaphragm-tracer from the contact with the record-surface, substantially as described.

7. The combination, in a phonograph, of a diaphragm held in a hinged frame cushioned by a spring acting upon one side thereof, with a second spring acting upon the other side of the frame, and having an extension bearing upon the record-surface, so as to disengage the stylus from the record-surface when the motion of the latter is reversed, substantially as described.

8. A record-plate for phonographs, consisting of a foil of metal which is superficially hard upon the side which is to receive the record and is normally soft upon the other side, substantially as described, and for the purpose specified.



9. In combination with a phonograph, a record-plate of oxide foil made superficially hard upon the side which is to receive the record, whereby while the record may be readily impressed thereon it becomes practically permanent, substantially as described.

383,300. DEVICE FOR TEACHING FRACTIONS AND PERCENTAGE. LOUIS W. JOHNSON, Spencer, Mo. Filed Feb. 24, 1888. Serial No. 265,117. (No model.)

Claim.—As a new article of manufacture, the chart herein described, consisting of a polygonal surface, A, divided into any number of fractional parts, and having radial wings F G, &c., laid off as illustrated, whose aggregate value in the form of percentage shall in each case equal that of any other wing, so that a fractional part of the surface A will be indicated in the form of percentage on the stellar wings radiating equally from the center of the polygon, for the purpose herein fully shown and described.

383,301. MACHINE FOR SOLDERING CYLINDRICAL CANS. JAMES B. JOHNSTON, Portland, Oreg. Filed Mar. 17, 1888. Serial No. 267,827. (No model.)

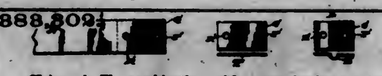
Claim.—1. The combination, in a can-soldering machine, of the bed-plate having a soldering trough or can, the vertically-movable frame, the revolvible shafts Z, journaled in said frame, means to rotate said shafts, and the friction-disks E', secured to said shafts, for the purpose set forth, substantially as described.

2. The combination, in a can-soldering machine, of the frame, the shafts Z, journaled therein, and having their outer ends independently movable in a vertical direction and provided with the friction-disks E', and means, substantially as set forth, to rotate said shafts, for the purpose specified.

3. In a can-soldering machine, the combination of the furnace having the opening in its upper side, the bed-plate fitting on the top of the furnace, having the longitudinal central opening registering with the opening in the furnace and provided with the brackets G, bolted to the upper side of the furnace, and the solder pan or trough fitting in and having supporting-flanges engaging countersunk recesses in the sides of the opening in the bed-plate, substantially as described.

4. The combination, in a can-soldering machine, of the solder pan or trough, the laterally-inclined guide-track having the flange F', and provided at its lower side with the groove or gutter K' and openings L', and devices to vertically adjust said guide-track, substantially as described.

5. The combination of the solder trough or pan, the pivoted laterally-inclined guide-track having the flange F' at its lower side, and the groove K' and openings L', for the purpose set forth, and provided at its upper side with the arms M', and the adjusting-screws engaging said arms and adapted to raise or lower the guide-track in the trough or can, substantially as described.



6. The combination of the bed-plate having the solder trough or pan and vertical standards I, with the vertically-movable frame, the revolvible shafts journaled in said frame and having the friction-disks, for the purpose set forth, the elevating-screws R, engaging the frame and journaled in bearings on standards I, and the shaft N, geared to said screws, substantially as described.

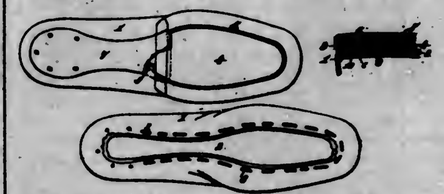
7. The combination of the bar U, having the vertical slots Y, the bar V, the bearings X, pivoted to said bar, the shafts Z, journaled in said bearings and extending through the slots Y, the friction-disks at the outer end of said shafts, the sprocket-wheels at the inner ends thereof, and the endless chain connecting said sprocket-wheels, substantially as described.

383,302. MACHINE FOR MAKING SHEET-METAL BLANKS. CHARLES W. JUDSON, Terryville, Conn., assignor to the Eagle Lock Company, same place. Filed Apr. 28, 1887. Renewed Apr. 5, 1888. Serial No. 269,982. (No model.)

383,303. [redacted]

Claim.—1. The combination, with a press having a gate, of two dies and two punches, a reciprocating feed for feeding the blanks from one die to the other, and an actuating device carried by the gate of the press and positively actuating the feed in one direction, substantially as set forth.

2. The combination, with two dies and two punches, of a reciprocating feed for feeding the blanks from one die to the other, a cam connected with the gate of the press for sliding the feed in one direction, and a spring connected with the feed for moving it in the opposite direction, substantially as set forth.



3. The combination, with two dies and two punches, of a reciprocating feed for feeding the blanks from one die to the other, and provided with an extension and a cross-bar, a cam carried by the gate of the press and engaging with the said extension to slide the feed in one direction, and springs connected with the cross-bar to slide the feed in the opposite direction, substantially as set forth.

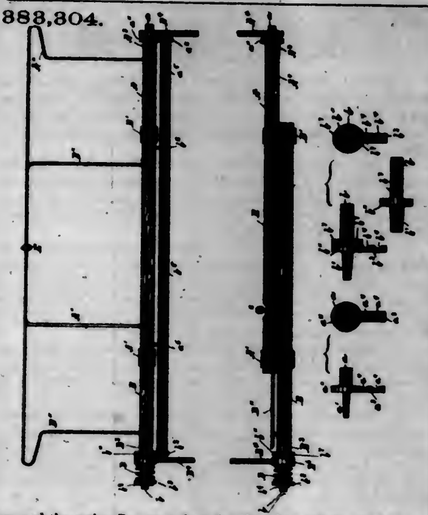
4. The combination, with two dies located side by side, of a reciprocating feed located in line with such dies and transverse to the line on which the stock-strip is fed over the blanking-die, whereby one die is exposed to view, substantially as set forth.

5. The combination, with two dies and two punches, of a reciprocating feed for feeding the blanks from one die to the other, and a spring-actuated follower located in one punch and projecting from the working-face thereof to give right direction to the blanks before the feed and hold them until the same has them under control, substantially as set forth.

6. The combination, with two dies and two punches, of a yielding follower mounted in one of the punches and projecting from its working-face, and a reciprocating feed having its inner end cut away to escape the follower, which gives right direction to the blanks and holds them until they are under the control of the feed, substantially as set forth.

383,303. BOOT OR SHOE. WILLIAM F. KRAMER, Washington, D. C., assignor of one-fifth to George D. Tillman, Edgefield, S. C., and J. Althous Johnson, Howard C. Wall, Louis K. Rowe, and Thomas Parker, all of Washington, D. C. Filed Jan. 14, 1888. Serial No. 260,702. (No model.)

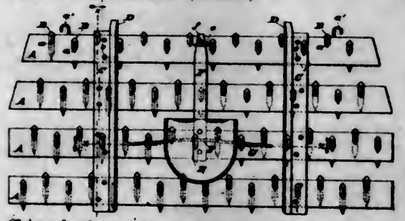
Claim.—1. In a boot or shoe, an insole secured to the upper by a basting carried around the margin of the upper and into but not through the insole, said shoe having a slip-sole and an outer sole attached to the insole and upper in any suitable manner, substantially as described.



2. In a boot or shoe, an insole secured to the upper by a basting carried around the margin of the upper, a slip-sole secured by a line of stitching to the insole and to the turned-in upper, and an outer sole attached by a second line of stitching passing through the slip-sole, the turned-in upper, and insole, substantially as described.

3. A boot or shoe having an upper, an insole having two parallel channels on its inner surface, a slip-sole channeled on its outer surface, a line of stitching uniting the insole, the turned-in upper, and slip-sole, and lying in the channel in the latter and in one of the channels of the insole, and a separate line of stitching lying in the other channel of the insole and passing through the same, through the turned-in upper, the slip-sole, and the outer sole, substantially as described.

383,304. PILLOW-SHAM HOLDER AND LIFTER. DE WITT C. KING, Boston, Mass. Filed Dec. 15, 1887. Serial No. 258,026. (No model.)



Claim.—The combination, with the brackets A^4 B^4, the latter recessed as described, of the extensible bars A B, each carrying a sham-lifter frame, the pivot a, loose in one bracket and having the flange a^2, the depending projection a^3, provided with notches a^4, and the tapering shank a^5, rigidly secured in one extensible bar, the tape a^6, connected to the notched projection and to one extensible bar, the pivot b, loose in its supporting-bracket and having the flange b^2, lateral lugs b^3, the depending projection b^4, provided with notches b^5, and tapering shank b^6, rigidly secured in the other extensible bar, the tape b^7, connected to the notched projection b^4 and to said other extensible

388,304.

bar, and the spring D, mounted on the pivot *b* outside its supporting-bracket, substantially as described.

388,305. HARROW. PETER C. KING, Syracuse, Ohio. Filed Nov. 12, 1887. Serial No. 255,003. (No model.)

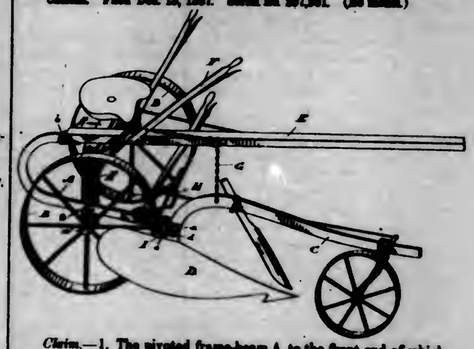
Claim.—In a harrow, the combination, with the beams having the runners secured thereon, of the seat having the end of its standard inserted in a clip, *c*, and secured by a pin, *f*, passing through an opening in the standard and beam forward of the clip, and the downwardly-curved spring-bar G, engaging centrally with the standard below the seat and having its ends provided with the shoulder portion *K*, and turned centrally downward to enter the sockets *h* in the beam, the seat thus being rendered removable, substantially as specified.

388,306. MANUFACTURE OF SALICYLIC-ACID ESTERS. CARL KOLBE, Radebeul, Saxony, Germany, assignor to Dr. F. von Heyden, Radebeur, same place. Filed Dec. 22, 1887. Serial No. 258,941. (No specimens.) Patented in Belgium July 23, 1887, No. 73,316; in France July 23, 1887, No. 176,786; in England July 23, 1887, No. 10,269, and in Italy Sept. 30, 1887, XLIV, 362, and XXI, 23,072.

Claim.—1. The within-described process of producing salol, which consists in mixing together equal molecules of salicylic acid with equal molecules of a phenol, melting this mixture, and then adding thereto a solution of trichloride of phosphorus, substantially as set forth.

2. The within-described process of producing salol, which consists in mixing together equal molecules of salicylic acid with equal molecules of a phenol, dissolving the mixture in a suitable solvent, such as benzole, exposing the solution to the action of trichloride of phosphorus, and after the reaction has taken place removing the solvent, and finally washing the remaining product, substantially as set forth.

388,307. MILK-STRAINER. GEORGE W. KRAFT, Baltimore, Md. Filed Oct. 22, 1887. Serial No. 253,054. (No model.)

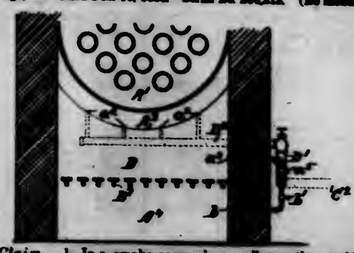


Claim.—A milk-strainer consisting of the vessel A, with bottom *b*, having opening *d*, and flange *f*, surrounding said opening, the wire-cloth *e*, having flange *e'*, the fastening-ring *g*, with flange *g'*, the said flange *g'* being inwardly bent, so as to have its end interlocked between the bottom *b* and flange *f*, and the flange *e'* being held between said interlocked portions of said flanges *g'* and *f*, and the inner edge, *g*, of the ring *g*, with the wire-gauze, being pressed upward, whereby said gauze is flush with said bottom of the strainer, substantially as shown and described.

388,308. PROCESS OF TRANSFERRING PHOTOTYPES TO LITHOGRAPHIC STONES. OTTO KRÜSS, Flensburg, Pa. Filed Nov. 15, 1887. Serial No. 255,203. (No specimens.)

Claim.—The process of transferring phototypes to lithographic stones, consisting in first taking a photograph of the object; second, printing the photographic image of the negative upon a plate which has been suitably prepared; third, taking an impression from the plate upon a sheet of paper which has been saturated with a solution of gelatine, chloride of calcium, glycerine, chromate of alum, and water, and, fourth, transferring the impression from the prepared paper to the lithographic stone, substantially as set forth.

388,309. SULKY-PLOW. HIRAM LAMPMAN, Woodstock, Ontario, Canada. Filed Dec. 10, 1887. Serial No. 257,991. (No model.)



Claim.—1. The pivoted frame-beam A, to the front end of which the plow-beam C is pivoted, and to which the tongue E is pivoted behind the pivot of the said frame-beam A, in combination with the lever F, pivoted on the tongue E and connected to the plow-beam C by the chain G, substantially as and for the purpose specified.

2. The plow-beam C, pivoted to the front of the pivoted frame-beam A, behind which latter pivot the tongue E is connected to the said frame-beam A, in combination with the foot-lever H, pivoted on the hanger I and connected to the plow-beam C, substantially as and for the purpose specified.

3. The plow-beam C, pivoted to the front of the pivoted frame-beam A and having connected to it the pivoted foot-lever H, and the tongue E, pivoted to the frame-beam A, behind the pivot of the latter, in combination with the lever F, pivoted on the tongue E and connected by the chain G to the plow-beam C, substantially as and for the purpose specified.

388,310. SMOKE-CONSUMING FURNACE. JAMES D. LEE, Chicago, Ill. Filed Feb. 16, 1888. Serial No. 264,212. (No model.)

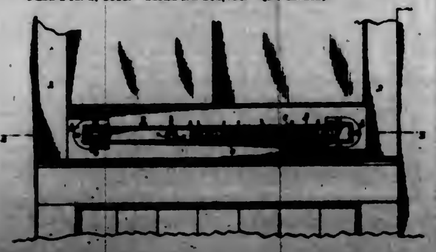
Claim.—1. In a smoke-consuming appliance, the combination, with the stack or smoke-passage, of a fan, a pipe connecting said stack and fan, a delivery-pipe connected to the discharge side of said fan, the branch pipe D', connected with the main delivery-pipe, a number of small angular pipes, *c'*, inserted in and extending upward and inward from the pipe D, terminating flush with the interior surface of the furnace-wall and opening into the combustion-chamber above the line of the grate-bars, the series of companion pipes *b*, inserted in and projecting downward and inward from the pipe D', and passing through the furnace-wall and opening into the ash-pit, and the stop-valves inserted in said pipes, whereby heated air may be supplied above and underneath the grate-bars and at different points simultaneously or independently, as set forth.

2. In a smoke-consuming appliance, the combination, with the smoke-passage, of a fan located intermediate between said passage or stack and the boiler-furnace, a pipe connecting the stack and fan, a supply or delivery pipe connected to the discharge side of said fan, the horizontal pipe D, forming a branch and continuation of the delivery-pipe C, and extending along the outside of the boiler-front, the series of short pipes *c*, extending inward from the pipe D and opening into the front side of the combustion-chamber, the branch pipe D', running along the side wall, the pipe D², connected with the pipe D' and embedded transversely in the bridge-wall, and the series of jet-tubes *c²*, extending upward from the pipe D² and opening on a level with the upper side of the bridge-wall, whereby the heated air and gases drawn from the smoke-stack may be conducted into the front side and back part of the combustion-chamber simultaneously or independently, substantially as and for the purpose set forth.

388,311. CONVEX-FASTENER. THOMAS A. LOVEJOY, Rochester, and JOHN V. HOWLAND, Gaskill, assignors to Chappell, Gunn, Maxwell & Co., Gaskill, N. Y. Filed Jan. 23, 1888. Serial No. 261,691. (No model.)

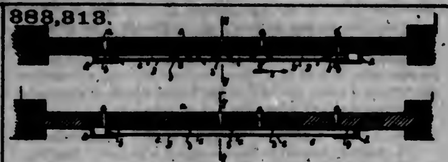
Claim.—1. A casket-lid fastener composed of a fixed plate provided with a slot, a latch arranged movably to and from a position across the slot of said plate, a catch adapted to slide in the said slot lengthwise thereof and engage and release the latch automatically with the movement of the catch into and out of the slot, and a bolt or other suitable fastening device for preventing the longitudinal movement of the lid after the engagement of the aforesaid latch and staple, as set forth.

2. A casket-lid fastener consisting of a fixed elongated plate provided with a longitudinal slot, a latch pivoted to said plate and provided with a plurality of arms adapted to swing successively across the slot of the plate, a staple adapted to slide lengthwise in the slot and turn the latch and thereby throw one of the arms thereof through the staple, and a bolt or other suitable fastening device for preventing the longitudinal movement of the lid after the engagement of the aforesaid latch and staple, as described and shown.



3. In combination with the slotted plate *a* and latch *c*, pivoted thereto, the staple *d*, adapted to slide in the slot of said plate lengthwise thereof, and having its cross-bar *d'* inclined, substantially as and for the purpose set forth.

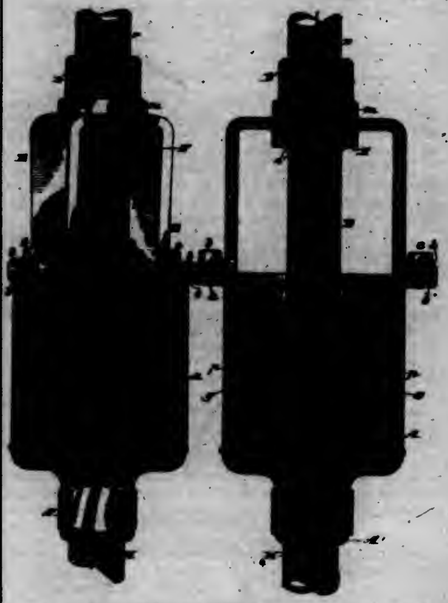
388,312. ASH-SIFTER. MICHAEL LYNCH, Chicago, Ill. Filed Mar. 5, 1887. Serial No. 230,754. (No model.)



Claim.—The combination, with case A, of screen B, inclined hopper D, removable spout F, having flange *f²*, furnished with eyes *f'*, and handle F', said hopper being furnished with hooks *f³*, and said case A being provided with an opening, *f*, substantially as specified.

388,313. VENTILATOR. JAMES W. MCKENNEY, Newark, N. J. Filed Feb. 2, 1888. Serial No. 262,713. (No model.)

388,313.



Claim.—1. The combination, with a base having transverse openings, of a movable hollow ventilator having openings in its back corresponding to the openings in the base, and a perforated front, substantially as shown and described.

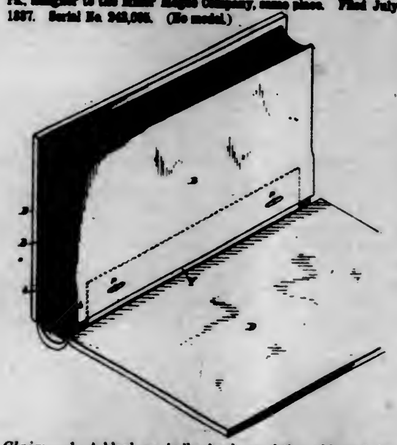
2. The combination, with a base having transverse openings *a*, of a movable hollow ventilator, B, closed at both ends, said ventilator having openings *b* in its back and perforations in its front, and the sockets *d d* affixed to the base for securing the ventilator and permitting a movement of the same in the direction of its length, substantially as shown and described.

3. The combination, with a base having transverse openings, of a movable hollow ventilator having openings *b* in its back corresponding to the openings in the base, and a front having solid portions opposite the openings *b*, and perforated portions between said solid portions, substantially as shown and described.

388,314. SELF-ACTING OR AUTOMATIC PRESSURE-REGULATOR. EDGAR A. MCLAUGHLIN, Horseheads, N. Y., assignor of one-half to Horace J. Weller, same place. Filed Dec. 1, 1887. Serial No. 256,863. (No model.)

Claim.—1. The combination, with a chamber, a high-pressure pipe terminating within said chamber, and a service-pipe leading from said chamber, of a sliding piston mounted on the high-pressure pipe within the chamber and closely fitting said chamber, and a valve carried by said piston for closing the end of the high-pressure pipe.

2. The combination, with high and low pressure pipes and an intermediate chamber, of a piston located within the chamber embracing the discharge end of the high-pressure pipe, and a valve carried by said piston for closing the discharge end of said high-pressure pipe.



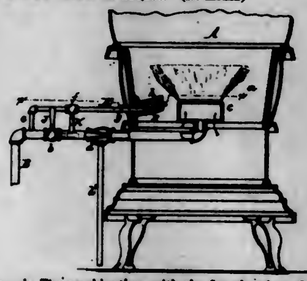
3. The combination, with a chamber, a low-pressure pipe in communication therewith, and a high-pressure pipe discharging into the same, of a piston mounted on the discharge end of the high-pressure pipe and fitting closely within the chamber, and a valve carried by said piston for closing the lower end of the high-pressure pipe.

4. The combination, with high and low pressure pipes and an intermediate chamber, of a piston closely fitting the chamber and loosely mounted on the high-pressure pipe, a hollow perforated stem attached to the piston, and a valve on the end of the stem for closing

the discharge end of the high-pressure pipe, the area of said valve being less than the area of the piston, substantially as set forth.

5. The combination, with high and low pressure pipes and an intermediate chamber, of a piston closely fitting within the chamber, a hollow stem secured to the piston and provided with a closed lower end forming a valve, and with orifices formed therein at a point above said closed lower end, substantially as set forth.

383,315. BINDING OF BOOKS. Andrew J. Myers, Philadelphia, Pa., assignor to the Miller Magee Company, same place. Filed July 1, 1887. Serial No. 243,093. (No model.)

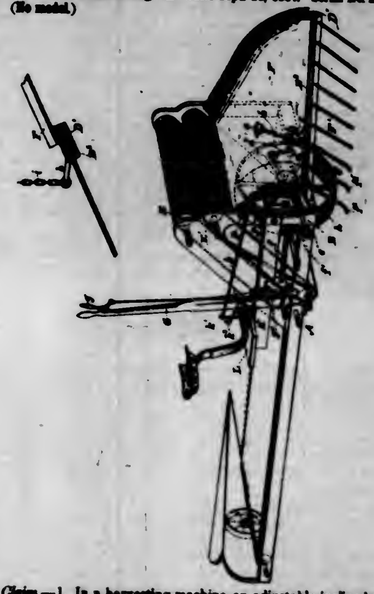


Claim.—1. A blank or similar book consisting of bound signatures, having fly-leaves with flaps, and a binding-cover, also provided with flaps and fasteners for the flaps, whereby the book and its cover are detachably secured to each other, substantially as set forth.

2. A blank or similar book consisting of bound signatures and strengthening-stays stitched to the signatures, fly-leaves secured to the said strengthening-stays, and a binding-cover, to which the said fly-leaves are detachably secured, substantially as described.

3. A temporary binding-cover consisting of a back and cover boards hinged thereto, and flaps made from a strip of textile material folded and having its folded portions secured between the boards of the covers, substantially as set forth.

383,316. GAS-STOVE. Michael J. O'Reilly, Buffalo, N. Y. Filed Sept. 20, 1886. Serial No. 214,009. (No model.)



Claim.—1. The combination, with the fire-chamber of a stove, of a main gas-burner located within the fire-chamber, and a stationary lighter connected with the gas-supply pipe and extending into the fire-chamber, said lighter being provided with an ignition-aperture outside of the fire-chamber and with a communicating flame-aperture within the fire-chamber near the main burner, substantially as set forth.

2. The combination, with the fire-chamber of a stove and a gas-supply pipe, of a gas-burner located within the fire-chamber, and a lighter connected with the gas-supply pipe, and consisting of a gas-pipe provided with perforations extending from the outside to the inside of the fire-chamber, whereby the gas-jets within the fire-chamber are ignited upon lighting one of the gas-jets outside of the fire-chamber, substantially as set forth.

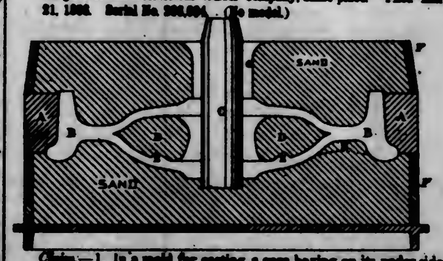
3. The combination, with the fire-chamber of a stove, of a main gas-burner, a lighter provided with perforations, and a shield arranged in the fire-chamber above the perforations of the lighter, whereby the lighter is protected, substantially as set forth.

4. The combination, with the fire-chamber, the main burner, and lighter, of the supply-cocks *b* and *f*, provided, respectively, with stops *j* and *k* and handles J and K, arranged to come in contact with each other and prevent the movement of the handle of the main cock before the lighter-cock has been opened, substantially as set forth.

383,317. SWATHING ATTACHMENT FOR HARVESTERS. Chas. H. Owen, Mechanicsburg, Pa. Filed Sept. 30, 1887. Serial No. 250,876. (No model.)

Claim.—1. In a harvesting-machine, an adjustable inclined spiral chute or swathing device hinged to the outer stubble side of the machine, substantially as described.

2. The combination, with a harvesting-machine, of the inclined spiral chute or swathing device hinged to the stubble side of said machine, and means, substantially as described, for effecting the adjustment of said swathing device while the machine is in operation, for the purpose and substantially as described.

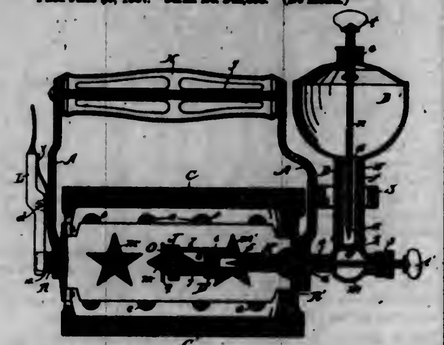


3. The combination, with the inclined spiral chute or swathing device hinged to the stubble side of the machine, as described, of an adjustable cut-off for temporarily stopping the operation of swathing the grain, substantially as described.

4. The combination, in a harvesting-machine, of the hinged swathing device or chute, the adjustable cut-off, and means, substantially as described, for independently adjusting both said chute and cut-off.

5. The inclined spiral chute or swathing device provided with the flexible fingers hinged to its discharging end, substantially as and for the purpose described.

6. The combination, with a hinged swathing device, of an adjustable cut-off having flexible delivery-fingers, and means, substantially as described, for independently adjusting both said swathing device and cut-off.



383,318. MOLD FOR CASTING. Thomas H. Pasco, Detroit, Mich., assignor to the Detroit Car Wheel Company, same place. Filed Mar. 21, 1888. Serial No. 268,094. (No model.)

Claim.—1. In a mold for casting, a core having on its under side an annular groove, substantially as and for the purposes set forth.

2. In a mold for casting, a core having on its under side a groove adapted to arrest slag carried on the surface of molten metal, substantially as shown and described.

383,319. RAD-IRON. Thomas H. Parsonage, East Saginaw, Mich. Filed June 20, 1887. Serial No. 242,202. (No model.)

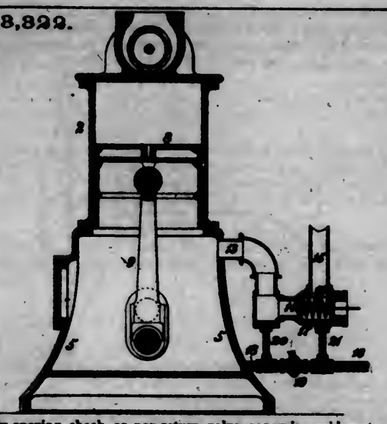
Claim.—In combination with the end-iron, the burner, the vessel, the coupling-head, the pipes joining said parts, the rod 4, having the thumb-button *t'*, the rod *n*, adapted to close the port *d'*, the non-conducting material surrounding the pipe 15, with perforated metal jacket D, and springs S, mounted on the arm A of the handle, as and for the purposes specified.

383,320. DYNAMO-ELECTRIC MACHINE. Lawrence H. P. Poland, Cincinnati, Ohio. Filed Apr. 21, 1887. Serial No. 235,500. (No model.)

Claim.—In a dynamo-electric machine, the combination, substantially as specified, of the armature-shaft, the longitudinally-grooved wooden cylinder mounted thereon, the iron rings C on said cylinder, said rings being separated from each other, the separate coils, the field-magnet having poles N S, the armature, and the shell inclosing the armature and magnet.

383,321. RUBBER STAMP. Edwin Reynolds, Providence, R. I. Filed Jan. 16, 1887. Serial No. 224,692. (No model.)

Claim.—1. In combination, the opposite rubber dies, the equal die-plates projecting at their edges beyond the corresponding edges of the attached rubber dies, and the intervening spring, which serves to connect the said die-plates and dies to each other in one instrumentality, substantially as and for the purpose specified.



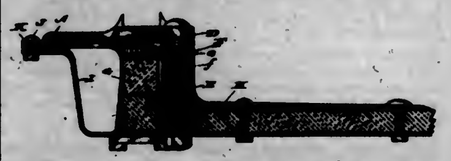
2. In combination, the grooved handle, the opposite die-plates, and the intervening spring, substantially as described.

383,322. STEAM-ENGINE. Frazer M. Ryan, Pittsburg, Pa., assignor to the Westinghouse Machine Company, same place. Filed Jan. 17, 1888. Serial No. 260,975. (No model.)

Claim.—1. In a single-acting engine, the combination of a closed crank-case, a cylinder fixed to and communicating by an open end with the crank-case, a vent-passage leading out of the crank-case, and a valve governing said passage and adapted to open the same at and adjoining the terminal of the downward stroke of a piston working in the cylinder, substantially as set forth.

2. In a single-acting engine, the combination of a closed crank-case, a cylinder fixed to and communicating by an open end with the crank-case, a vent-passage leading out of the crank-case, and an outwardly-opening check or non-return valve governing said vent-passage, substantially as set forth.

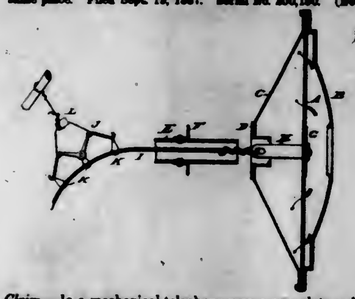
383,322.



3. In a single-acting engine, the combination of a closed crank-case, a cylinder fixed to and communicating by an open end with the crank-case, a vent-passage leading out of the crank-case, an outwardly-opening check or non-return valve governing said vent-passage, and a vapor-discharge pipe leading upwardly from the valve-casing to the atmosphere, substantially as set forth.

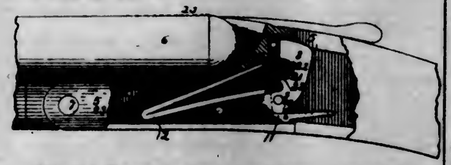
4. In a single-acting engine, the combination of a closed crank-case, a cylinder fixed to and communicating by an open end with the crank-case, a vent-passage leading out of the crank-case, an outwardly-opening check or non-return valve governing said vent-passage, a vapor-discharge pipe leading upwardly from the valve-casing to the atmosphere, and a liquid-discharge pipe leading downwardly from the valve-casing to the atmosphere, substantially as set forth.

5. In a single-acting engine, the combination of a closed crank-case, a cylinder fixed to and communicating by an open end with the crank-case, a vent-passage leading out of the crank-case above the level of lubricating material therein, a liquid-discharge pipe leading out of the crank-case below the level of lubricating material and communicating with the vent-passage, an outwardly-opening check or non-return valve governing the vent-passage, and a vapor-discharge pipe and a liquid-discharge pipe leading outwardly and upwardly and downwardly, respectively, from the valve-casing to the atmosphere, substantially as set forth.



6. In a single-acting engine, the combination of a closed crank-case, a cylinder fixed to and communicating by an open end with the crank-case, a vent-passage leading out of the crank-case above the level of lubricating material therein, a liquid-discharge pipe leading out of the crank-case below the level of lubricating material and communicating with the vent-passage, an outwardly-opening check or non-return valve governing the vent-passage and located at or adjacent to the level of lubricating material, a vapor-discharge pipe leading upwardly from the valve-casing to the atmosphere, a valve governing the liquid-discharge pipe beyond or on the outer side of its connection with the vent-passage, and a pipe leading from the check-valve casing to the liquid-discharge pipe beyond or on the outer side of the valve of the latter pipe, substantially as set forth.

383,323. FIFTH-WHEEL. William H. Rothwell, Galt, Ontario, Canada, assignor to Warnock & Co., same place. Filed Feb. 9, 1888. Serial No. 263,488. (No model.)



Claim.—A fifth-wheel having a lug, D, extending from its head-block bearing C, said lug having a hole to receive the king-bolt E, and a hub, *c*, surrounding the said hole and designed to fit into a hole made in the lug F, which extends from the axle-bearing G, in combination with a reach-bracket, H, having a hole in it to receive the king-bolt E, and a hub, *f*, to fit into a hole made in the lug F, substantially as and for the purpose specified.

383,324. MECHANICAL TELEPHONE. GEORGE F. SHAVER, New York, N. Y., assignor, by mesne assignments, to the Shaver Corporation, same place. Filed Sept. 19, 1887. Serial No. 250,180. (No model.)

Claim.—In a mechanical-telephone case, a rear plate and recessed supporting-chamber, D, through which a line-wire, I, is suspended, in combination with a concentrating-plate, B, extending over the said rear plate at its outer edge and flanged, thus supporting and clamping the telephone-diaphragm in position, substantially as herein set forth and described.

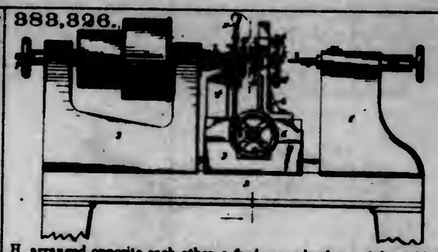
383,325. BREECH-LOADING GUN. LEROY H. SMITH, Lisle, assignor to the Rhoen Gun Co., Rhoen, N. Y. Filed Feb. 6, 1888. Serial No. 263,143. (No model.)

Claim.—1. The combination of a gun-frame, a spring folded on itself nearly in the middle, forming two arms of nearly equal length, and a hammer hinged in the frame and having a forward-projecting toe with a plane upper face, which plane extends back past the center of the hammer, the said frame having a plane face opposite to the center of the hammer and at an acute angle with the said plane of the hammer-toe, and provided with a shoulder for the stationary end of the spring to stop against, the said end of the spring resting upon the plane face of the frame both before and behind the point opposite the center of the hammer, substantially as shown and described.

2. The combination of a gun-frame having a downward internal face, a hammer hinged in the frame opposite the midway portion of the said face and having a plane upward face extending both sides of the hammer-center, and an angular spring having two arms of nearly equal length, the said two plane faces forming an acute angle opening in the same direction that the spring opens, and the spring bearing between the said faces, substantially as shown and described.

3. The combination of a gun-frame, a hammer hinged therein and provided with a cam-shaped forward projection between the hammer-face and hinge and nearly in line therewith, and a cocking-lever hinged midway, near its lower edge, in the frame, and having a cam-shaped rear end to engage the said projection, the under side of the said projection being nearly tangent to the circle of motion of the end of the said lever, whereby the rear end of the lever in moving downward cocks the hammer and brings the said projection nearly in the line of centers of the hammer and cocking-lever.

4. The combination of a gun-frame, a hammer hinged therein and provided with a cam-shaped forward projection, and a cocking-lever hinged below its central line in the frame and provided with a cam-shaped rear end, the upper side of the said projection on the hammer being a curve nearly coincident with the arc of a circle centered at the hammer-pivot, and whose lower side is a curve nearly coincident with an arc of a circle centered at the pivot of the cocking-lever when the hammer is at full-cock, substantially as shown and described.



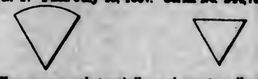
383,326. MACHINE FOR MAKING PENDANTS FOR WATCHES. ALFRED STALLMANN, New York, N. Y. Filed Jan. 26, 1888. Serial No. 261,943. (No model.)

Claim.—1. The combination, with a rotary chuck for holding a tubular blank, of rolls concentrically arranged to receive the blank in their common center, supports for said rolls constructed to move simultaneously toward the blank, a cutter, and means, substantially as described, for imparting to the same a motion across the blank, substantially as shown and described.

2. The combination, with the rotary chuck B, of the supports G and H, arranged opposite each other, a feed-screw having a right and left hand thread engaging respectively with the supports, a roll, I, mounted in a horizontal slide, i, on one of the supports, and rolls J and K, mounted in inclined slides j and k, arranged on the opposite support, substantially as shown and described.

3. The combination, with a rotary chuck for holding a tubular blank, of rolls concentrically arranged to receive the blank in their common center and having the closing-flange f, slides i, j, and k, in which said rolls are mounted, and supports for said slides arranged to move toward the blank, substantially as shown and described.

383,326.



383,327. ENVELOPE FOR PROTECTING GRAPES WHILE MATURING. ELI T. SHARP, Philadelphia, Pa. Filed Jan. 6, 1888. Serial No. 260,706. (No model.)

Claim.—1. A device for protecting fruit while maturing, consisting of an envelope of translucent water-proof material provided with drainage-ports, and with means for securing its open end when closed around the fruit, substantially as described.

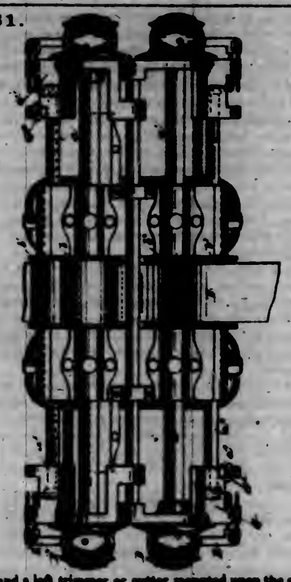
2. The device for protecting fruit while maturing, consisting of the envelope A, of translucent water-proof material, having its lower corners cut off to provide drainage-ports, and provided with devices for securing its open end when closed around the fruit, substantially as described.

383,328. PROCESS OF MAKING WIRE. WILLIAM A. SWEET, Syracuse, N. Y. Filed July 19, 1887. Serial No. 244,734. (No model.)

Claim.—The process, substantially as above described, of producing a stiffened wire for the manufacture of brads, nails, or spikes, consisting in cold-rolling a hot-rolled rod down to a wire of a materially-different form and of uniform stiffness.

383,329. ELLIPTIC SPRING. WILLIAM A. SWEET, Syracuse, N. Y. Filed Feb. 10, 1888. Serial No. 264,192. (No model.)

Claim.—The slotting and tenting of the ends of a vehicle or elliptic spring, either blind or open, in a roll-joint.



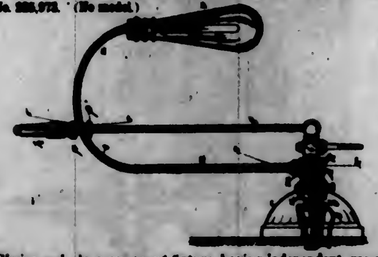
383,330. STAIN FOR BRICK-WORK. SAMUEL TELLAR, Warden, Quebec, Canada. Filed Jan. 16, 1888. Serial No. 260,991. (No specimens.)

Claim.—As a preparation for staining and preserving brick-work, the combination, with coloring material, of a solution of salt and alum and spirits of niter, in the proportions set forth.

383,331. BOOT OR SHOE TRIMMING MACHINE. CHARLES H. TRASK, Lynn, Mass., assignor to the Duplex Shoe Trimmer Company, Portland, Me. Filed June 6, 1887. Serial No. 240,609. (No model.)

Claim.—1. The combination of a common head, a shaft, *a*, supported by said head and rotated in one direction, a shaft, *a*, supported by said head and rotated in a direction opposite that of the shaft *a*, a right trimmer or cutter mounted upon one end of the shaft turning to the right, and a left trimmer or cutter mounted upon the end of the shaft turning to the left, all as and for the purposes specified.

383,331.

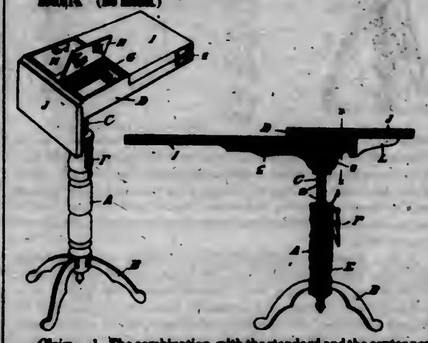


2. The combination, in a boot or shoe trimming machine, of a head, A, the shafts *a' a²*, supported by the head, arranged to extend from one or both fronts thereof, and adapted to be simultaneously turned in the same direction, trimmers at one or both ends of said shafts, and the shafts *a a²*, adapted to extend from one or both fronts of said head, and trimmers carried by said shafts, and means for rotating the said last-named shafts in a direction opposite that in which the shafts *a' a²* are rotated, as and for the purposes described.

3. The combination, in a boot or shoe trimming machine, of a common head, a shaft, *a'*, supported by said head and rotated in one direction, a shaft, *a*, also supported by said head and carried in a direction opposite to that of the shaft *a'*, a right trimmer or cutter carried at the end of the right-turning shaft, a left trimmer or cutter carried at the end of the left-turning shaft, devices in connection with the right trimmer for governing the right presentation of the boot or shoe thereto, and devices in connection with the left trimmer for governing the left presentation of the boot or shoe thereto, substantially as described.

4. In a boot or shoe trimming machine, the combination of the head A, the shafts *a a' a¹ a²*, the ends of which extend from the fronts *a³ a⁴* of the head, as specified, the pulleys *b⁶ b⁷* upon the shafts *a' a²*, respectively, and the pulleys *b b'* upon the shafts *a a¹*, respectively, the common operating-belt *b⁵*, adapted to turn the shaft *a' a²* in one direction and the shafts *a a¹* in an opposite direction, and rotary trimmers carried at the ends of said shafts, as and for the purposes described.

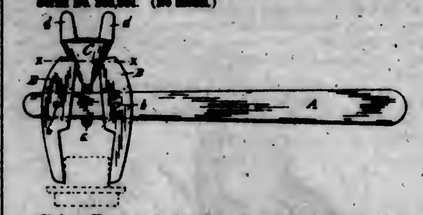
383,332. COMBINED GAS AND ELECTRIC-LIGHT FIXTURE. SAMUEL H. H. VANSE, New York, N. Y. Filed Jan. 31, 1887. Serial No. 226,073. (No model.)



Claim.—1. In a combined fixture having independent gas and wire tubes proceeding contiguous and crossing each other between their roots and their extremities receiving the lights, collars *p p'* on one tube, between which the other tube is held at the point of intersection, substantially as set forth.

2. In a combined fixture, the combination, with a gas-tube, *p*, of a contiguous wire-tube, *s*, wider than the gas-tube and turned to cross the path of said tube, with the extremity of said gas-tube passed through the said wire-tube at the intersecting turn, with wires laid through the wire-tube and passing at the intersecting point between the inner walls of the wire-tube and outer walls of gas-tube, substantially as shown and described.

3. In a combined fixture, the flat wire-tube *s*, laterally turned at the end of the recent or carrier gas-tube *p*, extending parallel with the initial part of said flat wire-tube and extending across and through the same at the lateral turn thereof, substantially as shown and described.

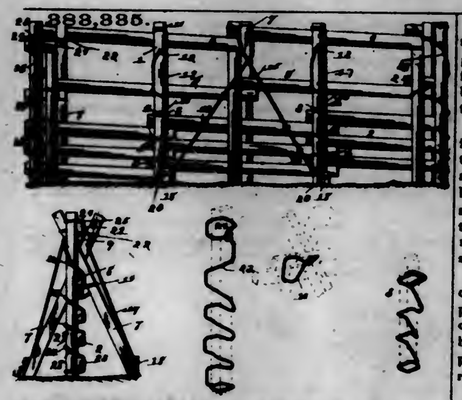


383,333. TABLE. GEORGE WEIS, Detroit, Mich., assignor of one-half to John Hindemann, same place. Filed Sept. 24, 1887. Serial No. 250,414. (No model.)

Claim.—1. The combination, with the standard and the center post, of the rigid leaf secured to one side of the center of the post, and provided at its inner end with the receptacles G, the leaf I, hinged to one end of the rigid leaf and folding in a recess below the top of the receptacles G, and the fall-leaf J, hinged to the other end of said rigid leaf, substantially as shown and described.

2. The combination, with the post and the rigid leaf, of the fall-leaf hinged to one end of the rigid leaf, the bracket L, pivoted to the end of said rigid leaf, and the bracket K, also pivoted to said leaf and formed with inclined supporting-faces, substantially as and for the purpose specified.

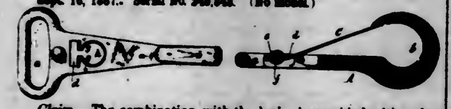
383,334. WRENCH. JOHN D. ARMEY, Reading, assignor of one-half to James A. Armstrong, Lexington, Mich. Filed Mar. 8, 1888. Serial No. 266,661. (No model.)



Claim.—The wrench described, consisting of the handle A, the jaws B B, pivoted on said handle and extended at right angles thereto, and provided with transverse slots for the reception of said handle, and the conical wedge provided with thumb-piece, and with screw-threaded stem engaging a threaded opening in the handle at right angles to the pivots of the jaws, substantially as shown and described.

383,335. FENCE. CHARLES C. RANDELL, Brooklyn, Ohio. Filed Dec. 14, 1887. Serial No. 257,992. (No model.)

Claim.—1. In a fence, the combination of the vertical posts and the inclined posts alternating with each other, said inclined posts



383,335.

crossing each other near the top, the lower rails, the ends of which overlap each other at the vertical posts, and the upper rails, the ends of which overlap each other at the inclined posts, one of which upper rails is above and the other one is below the crossing of said inclined posts, the wires secured to the vertical posts and wrapped around them and the rails, and the wires looped around the inclined posts and the upper rails.

2. In a fence, the combination of the vertical posts and the inclined posts alternating with each other, the inclined posts crossing each other near their tops, wire wrapped around the vertical posts and the rails and secured to the posts by means of loops around the posts, and the braces, each consisting of a single piece of wire wrapped around the tops of the inclined posts and over the upper rails, crossed upon the opposite side of the fence and passed down diagonally in opposite directions, and secured at their ends in the loops of the wires around the vertical posts.

383,336. SNAP-HOOK. JAMES M. BARNHART, Buffalo, N. Y. Filed Sept. 16, 1887. Serial No. 249,848. (No model.)

Claim.—The combination, with the body A, provided with a slot, *d*, and lugs or projections *g g*, of a pin or stud, *f*, formed on the under side of the body A, a tongue, C, provided with a hole engaging over said pin or stud, and an unobstructed opening, *h*, formed in the body A in front of the slot *d* and communicating with the latter, whereby dirt, &c., is prevented from lodging under the tongue, substantially as set forth.

383,337. ARGAND GAS-BURNER. ELIAS BRAUN, Chicago, Ill. Filed Feb. 21, 1887. Renewed Apr. 19, 1888. Serial No. 271,194. (No model.)

Claim.—1. In an Argand gas-burner, the combination, with the supply-pipe, coiled in the manner and for the purpose described, of the gas-burner provided with gas distributing and retarding devices, the fire-proof deflector of greater diameter than the flame-exit of said burner, and the movable adjustable regulating-bracket for controlling the flow of gas to the burner, as specified.

2. The combination, with the nipple-pipe coiled in the manner and for the purpose described, of the gas-burner provided with gas distributing and retarding devices, the fire-proof deflector of greater diameter than the flame-exit of said burner, the adjustable regulating-bracket having radial tubular openings, the suspended plug supporting said adjustable bracket and provided with openings which register with the openings of the said bracket, and means for changing the relative registrations of the respective openings of the plug and bracket, substantially as described.

3. The combination, with the adjustable bracket, having radial openings as described, and suspended by a suitable coupling from the plug J, of the plug J, having openings which normally register with the openings of the adjustable bracket, the coupling between the said bracket and plug for regulating the admittance of the gas, the supply-pipe and the nipple or handle N, formed of heat-non-conducting material, as specified.

4. The combination, with the supply-pipe coiled in the manner and for the purpose described, of the gas-burner having heat regulating and distributing devices, means for regulating the flow of gas to said burner, the bell-shaped deflector of larger diameter than the flame-exit of the said gas-burner and supported around the coils of the supply-pipe, and the ring screwed to the supply-pipe and supporting the deflector, as specified.

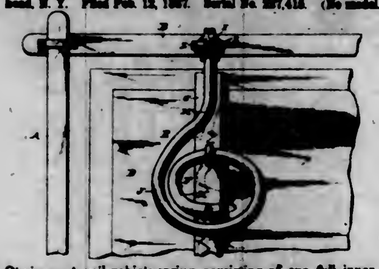
5. The combination, with the Argand gas-burner, of a series of perforated and relatively-graduated rings arranged in proper relative positions within the burner-chamber for equally distributing the gas to the flame-exit, the bell-shaped deflector of larger diameter than the said flame-exit and supported around the coils of the supply-pipe, the coiled supply-pipe, and means for admitting and regulating a flow of gas to the said burner, as specified.

6. The combination of the Argand gas-burner provided with the three rings of increasing fineness from the lowest to the uppermost the supply-pipe, the adjustable regulating-bracket having radial tubes, the short slotted pipe, and the handle having the lug, substantially as and for the purpose described.

7. The combination, with the Argand gas-burner, of the pipe I, the adjustable regulating-bracket having a screw-threaded central aperture, the screw-threaded nipple M, having the peripheral rim or flange, the gallery supported in the manner described, and the adjusting-handle formed of heat-non-conducting material, as specified.

8. The combination of the supply-pipe F, the short pipe I, having the slot L' at its lower end, the plug J, the bracket K, having the lug L arranged to be turned in the slot in said pipe I, and means for turning said bracket, substantially as described.

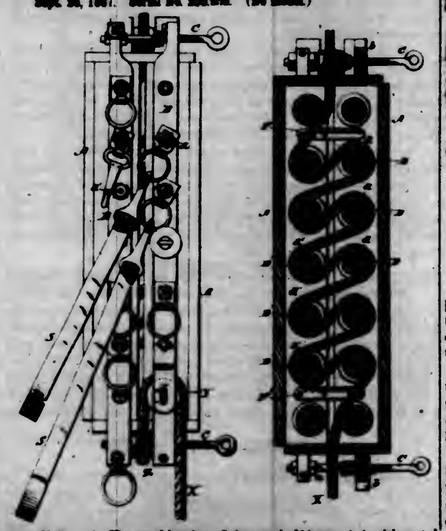
383,338. ARGAND GAS-BURNER. ELIAS BRAUN, Chicago, Ill. Filed Jan. 31, 1887. Renewed Apr. 19, 1888. Serial No. 271,126. (No model.)



Claim.—1. In an Argand gas-burner, the combination of the bracket provided with radial hollow arms, the conical tube screwed centrally upon said bracket, the cylinder surrounding said tube, and also secured to the bracket, the burner surrounding the cylinder and secured to the bracket, the deflector secured to the bracket and surrounding the burner, the flaring chamber, and flaring deflector surrounding said chamber, said deflector and chamber being supported on the upper end of the cylinder, substantially as set forth.

2. The combination, with the bracket having radial hollow arms, the central tube, the cylinder surrounding said tube, and the burner surrounding the cylinder, all being secured to the bracket, of the conical perforated thimble interposed between the cylinder and the burner, substantially as and for the purpose specified.

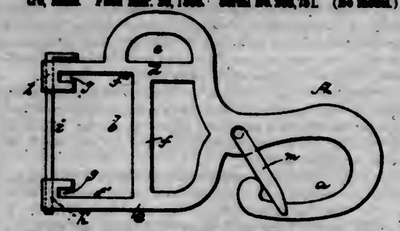
3. In an Argand gas-burner, the combination of the conical tube, the cylinder surrounding said tube, the hollow chamber mounted thereon, the non-fusible conical-shaped deflector surrounding said hollow chamber, the bracket having hollow arms connecting and supporting the burner-chamber, the perforated thimble mounted between the burner-chamber and the cylinder surrounding the central tube, and the outer thimble or air-conductor and deflector, substantially as described.



4. In an Argand gas-burner, the combination of the union B, having caps or bindings A, a conical tube, E, connected thereto, a cylinder, I, surrounding said tube, a hollow flaring chamber, L, a non-fusible deflector, M, surrounding chamber L, a bracket, D, having hollow radial arms S, supporting and connecting the chamber T with the cylinder I, a suitably-apertured tip or burner, K, inserted in the chamber T, and a suitable globe-support, substantially as described.

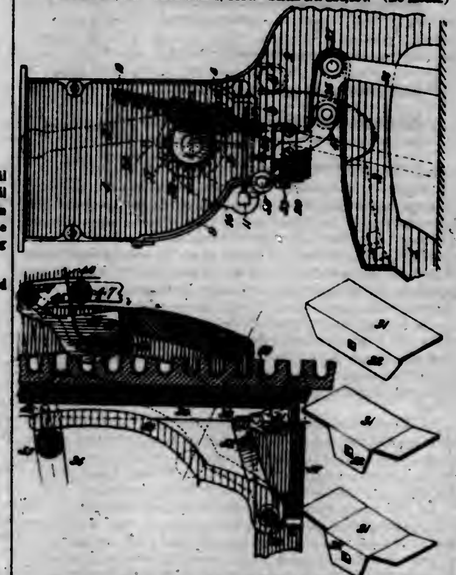
383,339. VEHICLE-SPRING. CHARLES M. BUTTERWORTH, Riverhead, N. Y. Filed Feb. 12, 1887. Serial No. 227,413. (No model.)

Claim.—A coil vehicle-spring consisting of one full inner coil forming the body-attachment portion and continued by an outer coil portion, J, of greater diameter than the inner coil and terminating in a straight arm, H, extending downward and outward away from the coil and beyond the body of the vehicle, the inner coil of said spring having the two opposite fastenings, substantially as specified



383,340. FIRE-ESCAPE. THOMAS BURNS, Sandy Hill, N. Y. Filed Sept. 20, 1887. Serial No. 250,090. (No model.)

Claim.—1. The combination of the two half-boxes A A with metal bands B B and screw-bolts C C, the two series of the pulleys D and D', with axes *d d'*, sustained in the heads B, and the rope wound about the pulleys, substantially as shown and described.



2. The combination of the two half-boxes A A with metal bands B B and screw-bolts C C, the two series of pulleys D D', with axes *d d'* located in the heads, the rope wound around the pulleys, and a graduated indicator-plate attached to one of the half-boxes and adapted to register with the other half-box to indicate the adjustment, substantially as shown and described.

383,341. HARNESS-HOOK. DANIEL W. BROWNELL, Newton Centre, Mass. Filed Mar. 30, 1888. Serial No. 268,731. (No model.)

Claim.—The within-described breeching-hook, consisting of the hook *a*, provided with the pivoted dog *m*, the frame composed of the parallel side bars and cross-bar, and having the loop *c*, said parallel bars having formed in their ends the hooks providing slots *g*, the whole formed integral and provided with a detachable holding-bar, *i*, substantially as described.

383,342. CIGAR-BUNCHING MACHINE. CLINTON BROWNING, Shoemakers, Pa. Filed Feb. 1, 1887. Serial No. 226,157. (No model.)

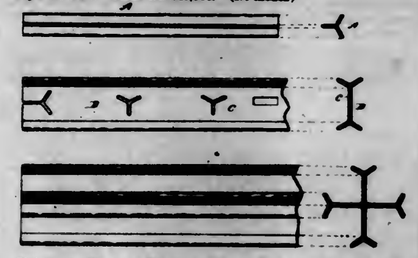
Claim.—1. In a cigar-bunching machine, the combination of a hopper, a nozzle at the discharge end of the hopper constructed to permit of the passage of the filler therethrough, and a reciprocating non-compressing comb arranged between the hopper and nozzle, substantially as set forth.

2. In a cigar-bunching machine, the combination of a hopper, a nozzle at the discharge end of the hopper constructed to permit of the passage of the filler therethrough, and provided with a swinging door, and a reciprocating non-compressing comb arranged between the hopper and nozzle, substantially as set forth.

3. In a cigar-bunching machine, the combination of a hopper, a nozzle at the discharge end of the hopper, a comb arranged between the hopper and nozzle, and mechanism for imparting a reciprocating and a jerking motion to the comb, whereby the filler cut off by the comb is disengaged from the comb and the body of filler in the hopper, substantially as set forth.

4. In a cigar-bunching machine, the combination of a bunching-

table, a movable bunching-roller, and an apron passing over the table and roller, said apron being comparatively stiff or rigid as regards the entire portion resting upon the table and flexible as regards the portion designed to form the pocket, whereby the apron is caused to lie smoothly upon the table and the flexible portion to loop down in front of the roller when in its rearmost position, substantially as set forth.



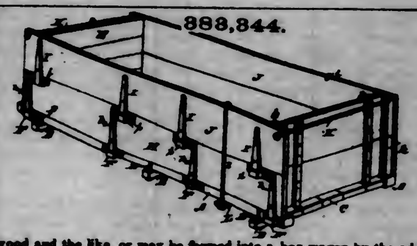
5. In a cigar-bunching machine, the combination of a hopper, a nozzle at the discharge end of the hopper provided with an adjustable swinging door, and a comb arranged to reciprocate between the hopper and nozzle, substantially as set forth.

6. In a cigar-bunching machine, the combination of filler-feeding mechanism, a bunching-table, a movable bunching-roller, an apron passing over the table and roller, and pivoted side plates arranged at the rear end of the table and movable to and from the end of the table by the bunching-roller, substantially as set forth.

7. In a cigar-bunching machine, the combination of filler-feeding mechanism, a bunching-table, a movable bunching-roller, an apron passing over the table and roller, and clamps at the rear end of the table for holding one end of the binder against the rear end of the table, substantially as set forth.

8. In a cigar-bunching machine, the combination of filler-feeding mechanism, a bunching-table provided at its rear end with a binder-clamp, a movable bunching-roller, a binder-smoothing roller, and an apron passing over the table and between the bunching and smoothing rollers, substantially as set forth.

383,343. IRON FENCE. WILLIAM H. CREIS, Macon, Ga. Filed Sept. 14, 1887. Serial No. 249,602. (No model.)



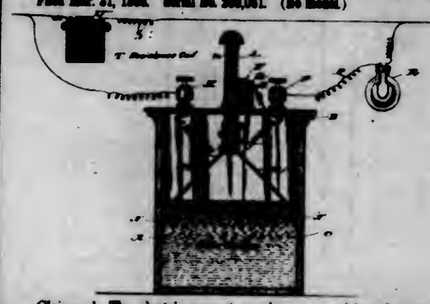
Claim.—1. The metallic fence-panel herein described, consisting of the posts provided with radial flanged wings, the horizontal rails each consisting of a web provided on its longitudinal edges with two diverging flanges, the ends of the said rails being provided with slots, which are cut to embrace and closely clamp the radial flanged wings of the posts in the manner described, whereby the said rails are supported by the posts and securely attached thereto, and the three-winged pickets supported by the said rails, substantially as described.

2. A fence-post consisting of the longitudinal radial wings, each of the said wings being provided on its longitudinal edge with two diverging flanges, the said post being constructed of sheet metal bent longitudinally and folded upon itself, as shown, the contiguous faces of the metal being pressed into intimate contact, substantially as described.

3. The herein-described fence-rail, consisting of a strip of metal bent longitudinally and folded upon itself with its contiguous surfaces pressed closely in contact, the sheet being so bent as to form a web, C, provided on its longitudinal edges with two diverging flanges equidistant from each other and the web, substantially as described.

4. The herein-described metallic fence-panel, consisting of the posts constructed of radial wings, the longitudinal edges of which are each provided with two diverging flanges, the rails B, each consisting of a web, the edges of which are also provided with two longitudinal diverging flanges, the webs of the said rails being punched or perforated for the reception of the pickets and slotted at their ends to engage or embrace the flanged edges of the radial wings of the posts, and the pickets inserted in the perforations in the webs of the rails, and each consisting of three radial wings equidistant from each other, the several parts of the panel being constructed of strips or sheets of metal bent longitudinally and folded upon themselves with their contiguous faces pressed into intimate contact, all arranged substantially as herein described.

383,344. WAGON. GEORGE H. COWELL, Bonneville, Tenn., assignor of one-half to Andrew G. Curl, same place. Filed Aug. 24, 1887. Serial No. 247,732. (No model.)



383,344.

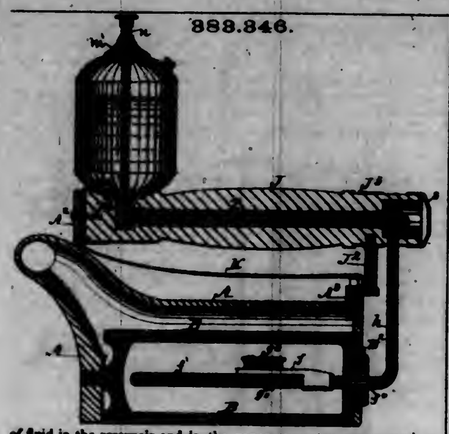
Claim.—1. In a wagon, the combination of the base-frame, having cuffs or sockets adapted to receive the lower ends of suitable standards, and the front gate or portion, H, framed or secured rigidly to said base-frame, whereby to prevent the load thereon from sliding forward off the base-frame, all being substantially as described, whereby the wagon can be readily fitted with side standards for hauling wood and the like, or may be formed into a box-wagon by the addition of suitable side-boards, substantially as and for the purposes specified.

2. In a wagon, substantially as described, the combination of the base, the side-boards having standards, the cuffs or sockets to receive said standards, the front end piece, the gate, the bar L, extended under the base and projected at its ends laterally beyond the same, and the rods *l*, secured at their lower ends to the bar L, and having their upper ends formed with hooks *l'* to engage the tops of the side-boards, substantially as set forth.

383,345. RHEOSTAT. FRANK J. CROCKER, Eugene City, Oreg. Filed Mar. 31, 1888. Serial No. 269,061. (No model.)

Claim.—1. The electric-current regulator comprising the vessel containing a chemical solution, and the diverging conducting-arms connected in circuit with the main line or conductor and insulated from each other, said arm being adapted to be lowered into the solution to any desired depth, for the purpose set forth, substantially as described.

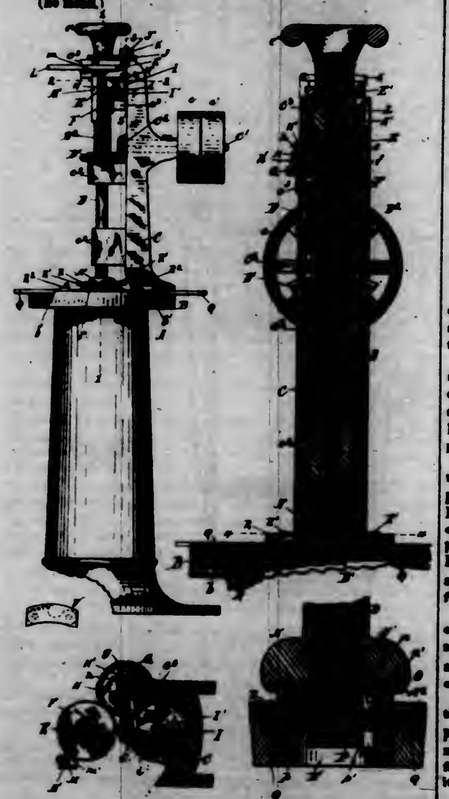
2. The combination, with the vessel to contain the chemical solution, of the vertically-movable rod K, the diverging arms M, attached to the said rod and insulated from each other, said arms being conductors of electricity and adapted to form part of an electric circuit, substantially as described.



3. The combination of the vessel A, to contain the chemical solution, the vertically-movable rod K, having the rack-teeth, the revoluble shaft G, having the pinion engaging the rack-teeth, and the conducting-arms M, secured to the lower end of rod K, diverging outward to the sides of the vessel and adapted to form part of the electric circuit, for the purpose set forth, substantially as described.

4. The combination, in electric-light systems, of the conducting-wire in which the electric lamps are included, the vessel containing the chemical solution, and the diverging conducting-arms M, connected to the conducting-wires, having their upper ends insulated from each other, and means to immerse the diverging lower ends of said arms into the chemical solution to any desired depth, for the purpose set forth, substantially as described.

383,346. SELF-HEATING FLAT-IRON. JESSE A. OTIS, Des Moines, Iowa. Filed Aug. 20, 1887. Serial No. 248,288. (No model.)



Claim.—An improved self-heating iron comprising an open-bottomed hollow iron having a chimney at its front end and journal-bearings at its opposite ends, a duplex bottom having journals on its ends and a crank on the end of one of said journals, a wooden handle having an oil-reservoir on its top connected by means of tubing with a vapor generator and burner located and concealed within the hollow iron and double revolving bottom, and valves for regulating the flow

383,346.

of fluid in the reservoir and in the vapor-generator, constructed, arranged, and combined to operate in the manner set forth.

383,347. MACHINE FOR MAKING BLANKS FOR CHAIN-CUTTING TEETH. CHARLES H. DOUGLAS, Chicago, Ill., assignor of one-half to Charles S. Baker, same place. Filed Oct. 15, 1887. Serial No. 252,001. (No model.)

Claim.—1. In a machine for cutting blanks, &c., the combination, with a suitable work-holding table for holding the bars from which the blanks are to be cut, of a tubular cutter or saw for severing the ends of the bars, substantially as and for the purposes specified.

2. In a machine for cutting blanks, &c., the combination, with a suitable table for holding the bars from which the blanks are to be cut in a position radial to the cutter, of a gage-piece to determine the position of the bars, and a tubular cutter or saw to sever the ends of the bars when in position, substantially as and for the purposes specified.

3. In a machine for cutting blanks, &c., the combination, with the tubular cutter and its rotary mandrel, of automatic feed devices for feeding the cutter to the work, substantially as and for the purposes specified.

4. In a machine for cutting blanks, &c., the combination, with the tubular cutter and its rotating mandrel, of automatic feed devices for feeding the cutter to the work, and an automatic stop for disconnecting the feed devices at a predetermined point, substantially as and for the purposes specified.

5. In a machine for cutting blanks, &c., the combination, with the tubular cutter and its actuating mechanism, of the work-holding table provided with seats or grooves to receive the bars from which the blanks are to be cut, said seats or grooves being arranged radially to the cutter and having suitable clamping devices to retain the bars in position, substantially as and for the purposes specified.

6. In a machine for cutting blanks, &c., the combination, with the tubular cutter and its operating mechanism, of the table B, having central recess or aperture, B', and radial grooves *b'*, and the cap-piece R, provided with corresponding grooves *r*, and having clamping-screws R', substantially as and for the purposes specified.

7. In a machine for cutting blanks, &c., the combination, with the tubular cutter and its operating mechanism, of the table B, provided with radial grooves *b'*, and the clamping-cams R², arranged at one side of said grooves, substantially as and for the purposes specified.

8. In a machine for cutting blanks, &c., the combination, with the rotating and vertically-movable mandrel, of a chuck removably secured on the end thereof, and a tubular cutter or saw mounted in said chuck, substantially as and for the purposes specified.

9. In a machine for cutting blanks, &c., the combination, with the mandrel D, having threaded portion *d*, of the chuck-body N', having recess *n*, the tubular cutter O, arranged in said recess, the split ring *n'*, having beveled inner wall, the beveled disk N², and the nut *n²*, for operating said disk, substantially as and for the purposes specified.

10. In a machine for cutting blanks, &c., the combination, with the mandrel D and the tubular cutter O, secured in a suitable chuck thereon, of a gage-piece mounted on said mandrel below the cutter, substantially as and for the purposes specified.

11. In a machine for cutting blanks, &c., the combination, with the mandrel D and the tubular cutter O, mounted in a suitable chuck, N, thereon, of the gage-piece P, mounted on said mandrel below the cutter and constructed at its upper portion within the cutter to prevent clogging, substantially as and for the purposes specified.

12. In a machine for cutting blanks, &c., the combination, with the cutter-mandrel D and the feed-screw E, swiveled to its upper end, of a spring arranged to thrust the mandrel upward against the feed-screw to prevent lost motion, substantially as and for the purposes specified.

13. In a machine for cutting blanks, &c., the combination, with the mandrel D, its actuating-pinion D', splined thereon, the pinion F, secured on the upper end to drive the feed-train, and the feed-screw E, swiveled in the pinion F, of the spring D², coiled around the mandrel D and bearing against the pinions D' and F, substantially as and for the purposes specified.

14. The combination, with the longitudinally-movable rotating mandrel D and elongated pinion F, secured thereon, of the pinion G, pinion H, adjustably connected thereto, shaft I, having ratchet-wheel I', and vibrating arm *i*, with spring-pawl *i'*, pinion J, loosely mounted on shaft I, clutch J', splined on said shaft and adapted to engage the pinion J, pinion E', arranged to mesh with the pinion J, and feed-screw E, swiveled to the upper end of the mandrel, splined in the pinion E', and passing through a suitable fixed nut or threaded aperture in the frame, substantially as and for the purposes specified.

15. The combination, with the cutter-mandrel and its feed-screw, of the feed-train connecting the two, clutch mechanism arranged in said feed-train to connect or disconnect the mandrel and feed-screw, and a lever connected to the said clutch to hold it normally in its disconnected position, substantially as and for the purposes specified.

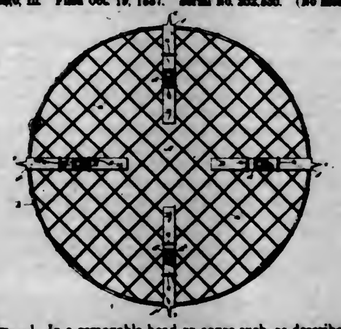
16. The combination, with the clutch-pinion J and clutch J' in the feed-train, of the lever K, connected to the said clutch, the sliding piece K', connected to said lever, and the lever L, having its fulcrum near the sliding piece engaging the same and extending forward therefrom, said lever serving by its weight to hold the clutch normally in its disengaged position, substantially as and for the purposes specified.

17. The combination, with the cutter-mandrel, its feed-train, the clutch mechanism arranged therein, and the lever L for operating the same, of the rock-shaft M, provided with pin *m* to support said lever, and having pin *m'* arranged in the path of the pinion on the cutter-mandrel, substantially as and for the purposes specified.

18. The combination, with the cutter-mandrel, its feed-train, the

clutch mechanism arranged therein, and the lever L for operating the same, of the rock-shaft M, provided with pin m to support said lever, and having pin m' arranged in the path of the pinion on the cutter-mandrel, said pin m' being adjustable upon the rock-shaft, substantially as and for purposes specified.

383,348. FLYING TARGET. Prime Ehn, Jr., Lafayette, Ind., assignor to John O. Perrin, same place. Filed Aug. 10, 1887. Serial No. 246,604. (No model.)



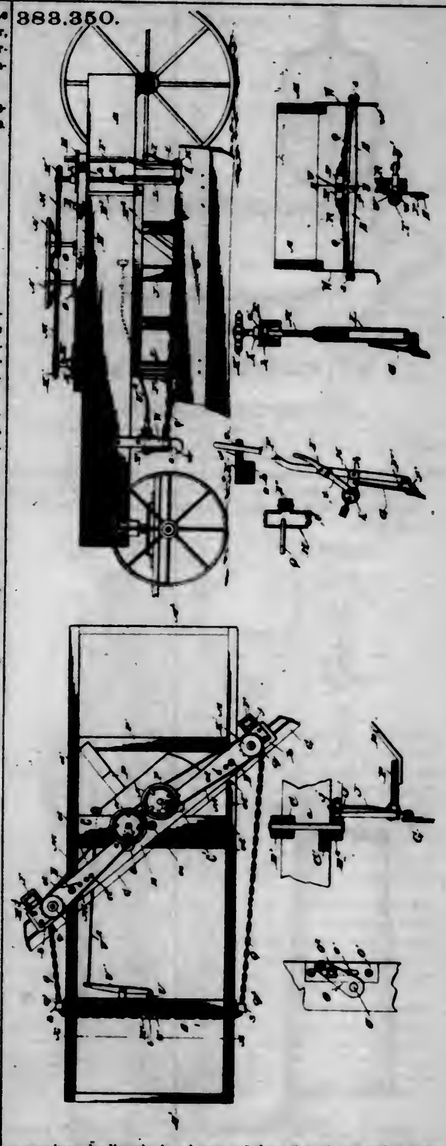
Claim.—1. A flying target having a hollow rounded concavo-convex top and a flat bottom formed integral therewith of brittle material, and having an annular re-enforce ring integral with the bottom and top, and a suitable opening for the insertion of feathers or similar articles, and means for closing said opening, all substantially as and for the purpose described.

2. The herein-described target, consisting of a hollow concavo-convex shell and a bottom formed of similar brittle material, and a diametrical transverse re-enforce strip secured to said bottom, substantially as and for the purpose described.

3. The target E, composed of a hollow concavo-convex rounded top and flat bottom formed integral therewith, of brittle material, and the re-enforce strip D in said bottom extending across the same and having projecting portion *d*, substantially as set forth.

4. The herein-described target, consisting of the concavo-convex shell or top and flat bottom formed integral therewith, and a re-enforcing strip, D, secured to said bottom and extending across the same, with a suitably-closed opening in said top for the insertion of feathers or other light articles into the target, all substantially as and for the purpose described.

383,349. BARREL-COVER ATTACHMENT. BENJAMIN F. FIELD, Chicago, Ill. Filed Oct. 19, 1887. Serial No. 252,830. (No model.)



Claim.—1. In a removable head or cover such as described, the flat circular disk, in combination with the series of pointed dogs, each dog provided with a stud or projection, and confining rings or loops applied to the disk and over the dogs, the one in front and the other in rear of the said stud or projection, substantially as described.

2. In combination with the open end of a barrel, a flat head or cover fitting entirely within the end and provided with a series of independent flat dogs, each dog being provided with a point and a stud or projection lying below the upper or outer end of the walls of the barrel, and confining rings or loops loosely engaging said dogs in front and rear of said stud or projection to hold them in position upon the head, substantially as described.

3. In combination with the flat cover or head A, the series of independent flat dogs B, each provided with a point and shoulders on its outer end, and a metal block secured to its upper surface by a rivet, as described, and confining rings or loops secured to the head or cover in front and rear of the metal blocks on each of the dogs, substantially as described.

383,350. ROAD-GRADER. ALBERTO FIELD, New Berlin, N. Y. Filed Aug. 10, 1887. Serial No. 246,616. (No model.)

Claim.—1. In a road-machine, a main frame having guides at its opposite sides for the scraper draft-chain, combined with a reversible scraper and a draft-chain passed around the guides of the main frame and connected at its ends to the scraper, such guides being arranged approximately directly in advance of the point of connection of the draft-chains and scraper, whereby the draft on each scraper will be in the direction of motion in the different adjustments of the scraper, substantially as and for the purposes specified.

2. In a road-machine, a main frame and a scraper, combined with draft-chains connected with each scraper and vertically-adjustable guides for said draft-chains, substantially as set forth.

3. The combination, in a road-machine, with the main frame and the scraper, of the draft-chains and the lever or bar pivoted between its ends, and having at each ends guides for the chains, substantially as set forth.

4. The scraper and the upright connected therewith and having a loop, H, elongated laterally, combined with the draft-chain connected with said loop and movable from side to side thereof, whereby to avoid any twisting of the upright, substantially as set forth.

5. The combination, in a road-machine, of the main frame, the lever or bar S, pivoted between its ends, and the supporting-plates W, arranged directly in rear of the ends of said pivoted lever, substantially as and for the purposes specified.

6. In a road-machine, the main frame and scraper, combined with the pivoted lever S, having guides at its ends, the plates W, arranged directly in rear of the ends of the lever and provided at their lower ends with hooks or stops *w*, and the draft-chains, substantially as set forth.

7. In a road-machine, the combination of the main frame, the scraper, the draft-chain extended across the frame from side to side and connected with the scraper, the side guides for the said chain, and a clamp for securing the same, substantially as set forth.

8. In a road-machine, the main frame, side guides, and scraper, combined with the chain, and a clamp arranged between said side guides and adapted to secure the chain, substantially as set forth.

9. The combination, in a road-machine, of the main frame, the scraper, the draft-chain, the pivoted lever S, having guides at its ends, the loops T T, and the clamp U, operating between said loops T, substantially as set forth.

10. In a road-machine, the combination of the main frame, the scraper, the draft-chain, the lever S, having guides *s*, the plates W, having hooks or stops *w*, the loops T T, the clamp U, operating between said loops and the lever U', and handle U^3, substantially as and for the purposes specified.

11. In a road-machine, a scraper proper or blade and upright or support, as F, combined with a pivoted latch, H, a lever, I, and a link, *i*, connecting said lever I with the latch H, all arranged and adapted for use substantially as and for the purposes specified.

12. In a road-machine, the combination, with the scraper proper or blade, of the box F', pivoted to the said blade, and the upright F, pivoted to said box, substantially as set forth.

13. In a road-machine, the combination of a scraper-blade, a nut connected therewith, and a screw engaging said nut and loosely swiveled at its upper end, substantially as described, whereby the said screw may be turned or rotated and may swing at its lower end, substantially as and for the purposes set forth.

14. In a road-machine, a changer, substantially as described, consisting of a screw-rod and a tube or sleeve, L, having a threaded bearing for the said rod and adapted below the said bearing to brace such rod, substantially as set forth.

15. The combination, in a road-machine, of the blade, the tube or sleeve connected therewith and having a threaded bearing, and the screw-rod engaging said bearing and loosely swiveled on its supporting-frame, substantially as set forth.

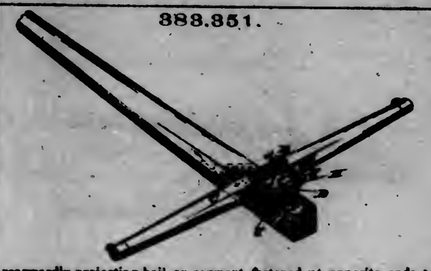
16. The combination, in a road-machine, of the scraper-frame having end extensions, *b*, provided with bearings in which to swivel the screw-rods and with guides for the uprights, the blade, and the hangers and uprights, substantially as set forth.

17. In a road-machine, the combination, with the screw-rod and the sprocket-wheel K' therefor, of the sprocket-wheel N, the arm or bar O, pivoted at one end and having the wheel N on its opposite end, and the belt connecting said sprocket-wheels, substantially as set forth.

18. The combination, in a road-machine, with suitable supports or framing, of an arm or bar, O, pivoted at one end, whereby its opposite end may be swung toward or from a given point, a plate on the frame, a bolt connecting such plate with the pivoted arm or bar, the pulley or wheel supported on the swinging end of the pivoted plate, and the belt for connecting such pulley with the pulley to be operated, substantially as set forth.

19. In a road-machine, the combination of the main frame, the scraper, the draft-chains connected with said scraper, and vertically-movable guides, as *s*, for said draft-chains, said guides being connected, whereby the raising or lowering of one will effect a reverse movement of the other, substantially as set forth.

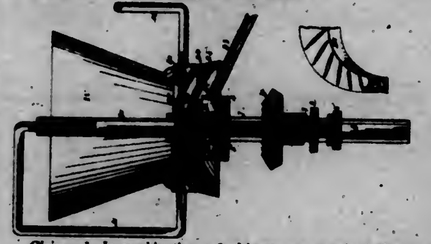
20. The combination of the main frame having a bar or bearing, P', the scraper-frame, the platform fixed to said frame, and the brace *p*, connected with said platform and resting and moving on the bearing P', substantially as set forth.



21. The combination, in a road-machine, of the main frame, the reversible scraper-frame, both having openings suitable to receive a pin, with a pin fitted to said openings, whereby to lock the scraper-frame in any desired position, substantially as set forth.

22. In a road-machine, the main frame, the reversible scraper-frame and the scraper suspended therefrom, and the draft-chain therefor, combined with the clamp for securing said chain and the lock for securing the scraper-frame in its different adjustments, substantially as set forth.

383,351. SINGLETREE. JAMES R. FREELAND, Wellsville, N. Y., assignor of one-half to Edwin Cotton Bentley, same place. Filed Feb. 7, 1888. Serial No. 263,512. (No model.)



Claim.—The combination of the singletree provided with a rearwardly-projecting bail or segment having two steps or offsets, the bolt upon which the singletree is pivoted and on which it draws, and the

383,351.

rearwardly-projecting bail or segment fastened at opposite ends to opposite ends of the bolt, and provided with an offset or shoulder overlapping and adapted to engage the shoulders on the rearwardly-projecting bail, substantially as and for the purpose shown and set forth.

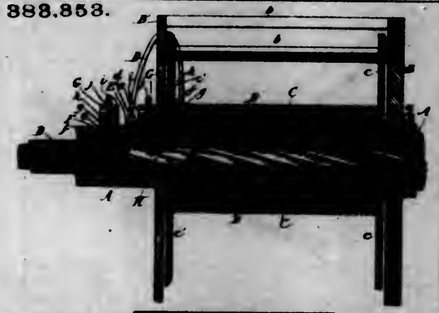
383,352. PAINT-MILL. AUGUSTUS J. GASTON, Beloit, Wis. Filed Mar. 4, 1887. Serial No. 229,702. (No model.)

Claim.—1. In combination, a feed-hopper, an annular hollow stationary grinder surrounding the base of the hopper, a vertical spindle, a rotary hollow grinder seated on the top of the spindle and provided with a tube fixed thereto and extending centrally upward through the hopper and communicating with the interior of the grinder, a water-inlet pipe in communication with the interior of the annular stationary grinder, a water-outlet pipe extending from the stationary grinder over the hopper and loosely into the said upwardly-extending tube, and an outlet-pipe in communication with the interior of the rotary grinder, substantially as set forth.

2. In combination, a stationary hollow grinder, a vertical spindle, a rotary hollow grinder seated on the top of the spindle, a water-inlet to the stationary grinder, water communication between the stationary and the rotary grinder, a water-outlet pipe depending from the bottom of the rotary grinder at one side of its center, a stationary annular trough located beneath the path of the depending outlet, and a waste-pipe leading from the stationary trough, substantially as set forth.

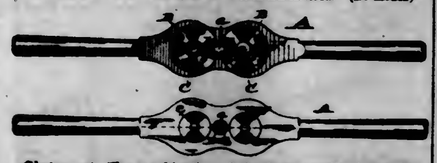
3. The combination, with the vertical spindle, of a hollow rotary grinder having a convex grinding-face and a concave under face, the said hollow grinder being seated on the top of the spindle at the center of its under or concave face, and provided with a discharge-pipe depending from its under or concave face, an annular trough fixed beneath the path of the free end of the depending pipe, the ends of the trough extending upwardly on opposite sides of the depending pipe, and a discharge-pipe leading from the annular trough, substantially as set forth.

383,353. CABLE-COVERING MACHINE. CHARLES H. GREEN, Chicago, Ill. Filed Jan. 30, 1886. Serial No. 209,993. (No model.)



Brief.—The object of the invention is to produce an improved machine for winding a covering upon a traction-cable in an expeditious and firm manner.

Claim.—1. The combination, with the hollow spindle A and disks B B', of the pressure-rollers E E' E'', each mounted upon a shaft, and each having a beveled shoulder, *d*, to fit the bevel of the cable-covering, substantially as specified.



2. The spindle A, in combination with the pressure-rollers E E' E'', carried by the spindle, and each having a shoulder, *d*, substantially as described.

388,853.

388,854. SCREW-CUTTING DIE AND STOCK. PETER GRABLER, St. Louis, Mo. Filed Dec. 6, 1887. Serial No. 257,032. (No model.)

Claim.—1. The combination of the lever or die-plate holder, perforated centrally and having seats for the die-plates, and a pin for engaging in the holes in the die-plates, with the pair of circular notched adjustable die-plates, and the bolts and thumb-nuts for securing the die-plates to the lever or holder, said die-plates having a series of holes for said pin to engage in, substantially as described.

2. The combination of the die-plate holder, perforated centrally, as described, the pair of notches, adjustable die-plates, and the bolts and thumb-nuts for securing the die-plates to the holder, substantially as described.

388,855. CORN-SHUCK COMPRESSOR. RANDOLPH F. HAGEMAN, DAVID NOGGLE, and ROWLAND S. RAIN, New Madison, Ohio. Filed Dec. 13, 1887. Serial No. 257,720. (No model.)

Claim.—The combination, with a suitable bracket and the curved compressor-arms B, pivoted at one end thereto, of the fulcrum-bars D, secured one to each of the compressor-arms and curved, as shown, the levers C, connected to the arms B, and disposed between said arms and the fulcrum-bars in the laterally-curved portions *l* of the bars, and connected to said bars by a loose connection, as the bolts *c* and elongated slots *d*, and the cord-holders secured to the levers C, with one end free, substantially as and for the purpose specified.

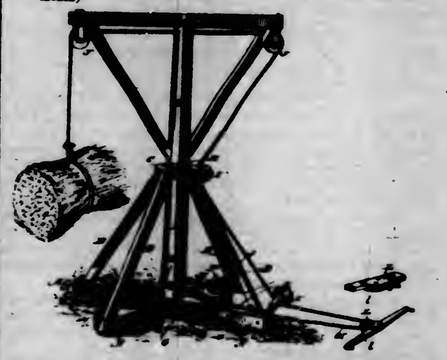
388,856. STOP-COCK. SAMUEL HAWKINSON, Rotcbon, N. J. Filed May 7, 1887. Serial No. 237,491. (No model.)

Claim.—1. In a stop-cock for gas and water mains, service-pipes, and fixtures, the combination, with the barrel or casing A, having two openings or passages through its walls, of a rotary valve-plug formed with a tapering circumferential groove or channel in the plane of the openings in the barrel or casing to form a passage between the same, said groove or channel having a length greater than the distance between said openings, whereby when the plug is turned the passage between the openings is gradually increased or diminished, substantially as shown and described.

2. In a stop-cock for gas and water mains, service-pipes, or fixtures, the combination, with the barrel or casing having two passages through its walls, of a rotary valve-plug formed with a circumferential groove or channel in the plane of the openings through the walls of the barrel or casing to form a passage between the same, said groove tapering in both directions from a point of maximum capacity, and each part from said point of maximum capacity outward having a length equal to or greater than the distance between the said two passages in the barrel or casing, substantially as and for the purpose described.

3. In a stop-cock for gas and water mains, pipes, or fixtures, the combination, with the barrel or casing having two openings through its walls, of a rotary valve-plug having an axial opening or passage in communication with the source of supply, said passage opening laterally into a circumferential groove or channel of varying capacity in the plane of the openings through the walls of the barrel or casing, said groove or channel having a length greater than the distance between the said openings, substantially as shown and described.

388,857. BRAIDER-HOLDER FOR PENCILS. JOSEPH HOFFMAN, Hoboken, N. J., assignor to Gustavus A. Goldsmith, New York, N. Y. Filed Dec. 10, 1887. Serial No. 257,509. (No model.)



Claim.—1. A tubular rubber-holder having inwardly-extending pointed teeth at the end thereof, arranged horizontally, substantially as set forth.

2. A tubular rubber-holder having inwardly and downwardly projecting pointed teeth at or near the end thereof, arranged horizontally, substantially as set forth.

3. A tubular rubber-holder having inwardly-projecting teeth at the end thereof, arranged horizontally, and a shoulder between the rubber-holding extremity and the part which fits over the pencil, substantially as set forth.

4. The combination of a tubular rubber-holder having inwardly projecting teeth near the end thereof and a rubber eraser having the shank E, adapted to enter the unsplit tubular holder, and shoulders F, substantially as set forth.

388,858. HAY-DERRICK. WILLIAM A. HOOPER and ROBERT P. HAMILTON, Marysville, Mo. Filed Jan. 7, 1888. Serial No. 260,262. (No model.)

Claim.—1. The combination of the base-frame having an outer guide-pulley at its lower end and an inner guide-pulley at its upper end, the mast, the crane-beam secured centrally between its ends to the said mast and provided at its opposite ends with guide-pulleys, and the rope disposed over said pulleys, substantially as set forth.

2. The combination of the base-frame, the mast journaled thereon, the crane-beam fixed thereto and having guide-pulleys for the hoisting-rope, the windlass journaled in the base-frame, a rope connecting said windlass and mast, whereby the turning of the former will effect a turning of the latter, and the draft-rope connected with said windlass, substantially as set forth.

3. The combination, with the base-frame, the windlass, the mast having a crane-beam, and the guide-pulleys, of the rope connecting the windlass and the mast, the whiffletree having a guide and a clamp for the rope, and the rope secured at one end to the windlass passed through the guide of the whiffletree, thence disposed around the guide-pulleys, and depending at one end from the crane-beam, substantially as set forth.

4. The improved hay-derrick consisting of the base-frame having ribs crossing each other at right angles, the diagonal braces and the collar supported at the upper end of the said braces, the mast having the crane-beam secured to and extended equally on opposite sides thereof, the diagonal braces supporting said crane-beam, the guide-pulleys, the windlass, the rope connecting the windlass and mast, and the draft-rope, all substantially as and for the purposes specified.

5. The combination, in a hay-derrick, of the base-frame, the mast suitably journaled and provided with the crane-beam having guide-pulleys, the windlass supported in the base-frame and connected with the mast, and the rope connected with said windlass and also disposed over the pulleys of the crane-beam, substantially as set forth.

388,859. HARNESS. ARMSTEAD H. JENKINS, Sidney, Ohio. Filed Mar. 15, 1888. Serial No. 267,322. (No model.)

Claim.—An anti-kicking strap for harness, consisting of a strap or straps having split ends passing through the terret-ring of the harness-saddle, and a retaining-guide secured to the hip-strap and adapted to be secured to the check-rein and whiffletree, as set forth.

388,860. HOSE-COUPLING. CHARLES KEEFER, Toledo, Ohio. Filed Dec. 22, 1887. Serial No. 258,762. (No model.)

Claim.—The improved hose-coupling herein described and shown, comprising the member A, having the reduced extended portion L, the lugs M on the said portion L, and the lugs N on its main body in rear of the said portion L, the member B, having open bayonet-slots provided with inclined cam portions to receive the lugs M of the member, and thereby draw the members together, and the internal annular flanges, D, to receive the end of the extended portion L of the member A, the lugs G on the member B, the latch I, pivoted on the side of the member B, and having a hook, K, at one end to engage one of the lugs M when within the inclined portion of the bayonet-slot, and the detent-plate H, pivoted on one of the lugs G, and having and inclined outer edge adapted to bear against the rear edge of the latch I and hold the same in engagement with the lug M, as set forth.

388,861. THEATRICAL APPLIANCE. JOHN T. KERAN, Wilmington, N. C. Filed Aug. 8, 1887. Serial No. 246,416. (No model.)

Claim.—1. A scene composed of sets of interchangeable sections, the sections of one set constructed to alternately hide and expose those of the other set, substantially as described.

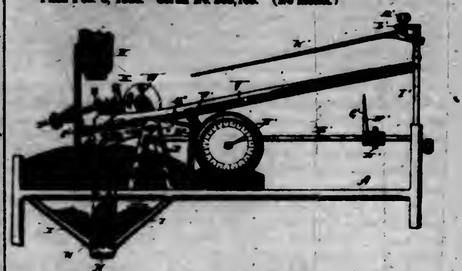
2. Two sectional curtains, the sections of one curtain constructed and arranged to be either exposed over or concealed beneath the other, as set forth.

3. The combination, with a stationary sectional curtain, of a movable sectional curtain, the sections of which move between the sections of the stationary curtain.

4. The combination, with a stationary sectional curtain, of two or more movable curtains, the sections of which move between the sections of the stationary curtain, as set forth.

5. The combination, with a stationary sectional curtain, of two or more movable sectional curtains and means for simultaneously moving all of the sections of one curtain independent of those of the other curtain, substantially as described.

6. A curtain composed of separate sections each carrying a portion of a scene and arranged when overlapped to form a complete scene, substantially as described.



388,861.

7. A curtain composed of separate removable sections each carrying a portion of a scene and arranged when overlapped to form a complete scene, substantially as described.

8. The combination, with the stationary uprights provided with transverse pins, of the movable uprights having inclined slots engaging said pins, and the slats carried by said movable uprights, substantially as and for the purpose described.

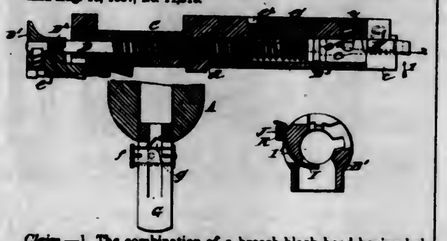
388,862. AUTOMATIC GRAIN-METER. JAMES C. KIRK, York, Pa. Filed Feb. 6, 1888. Serial No. 263,163. (No model.)

Claim.—1. The combination, with the weighing-beam, of the angle-plate located on ways thereon, the buffer-plate pivoted thereto, the spiral spring, and the set-screw whereby the buffer is adjusted, substantially as specified.

2. The combination, in a grain-meter, of the weighing-beam, the rolling weight, and the spring-arm K', whereby the momentum of the weight is partially overcome, substantially as specified.

3. The combination, with the pivoted weighing-beam, the rolling weight, and the spring-arm K', of the adjusting-screw, whereby said arm may be adjusted to bear against the rolling weight with different degrees of force, substantially as specified.

4. The combination, with the frame of the weighing-beam, of the registering device and the rod which operates it, the adjustable hand on the shaft of said registering device, the vertical rod having a lateral projection operated thereby, the shouldered bolt mounted in bearings in a vertical standard, and the spiral spring, whereby the bolt is operated to stop the motion of the meter at any desired point, substantially as specified.



5. The combination, with the frame of the machine, the weighing-beam pivotally hung thereon, the hopper pivotally hung to the weighing-beam, the registering device mounted on the said frame and operated by an arm attached to the weighing-beam, and a hand or pointer on the shaft of the said registering device, of a spring-actuated bolt mounted in bearings in close proximity to the weighing-

beam, and means connected with the registering device, substantially as described, for operating this sliding bolt, whereby it is caused to engage with and stop the weighing-beam, as herein specified.

6. The combination, with the weighing-beam and the hopper hung thereon, of the registering device operated by the movement of the weighing-beam, the sliding bolt mounted in bearings in close proximity to the weighing-beam, and means, substantially as described, for operating this sliding bolt connected with the registering device, whereby the bolt is caused to engage with the weighing-beam and hold it when the desired quantity of grain is weighed, substantially as specified.

7. In a grain-meter, the combination, with the frame of the machine, the pivoted weighing-beam and hopper, and the rolling weight upon the said weighing-beam, of an independent stationary graduated beam, E', secured to the frame of the machine, and an adjustable stop, F', upon the said graduated beam, whereby the travel of the said rolling weight upon the weighing-beam may be regulated, substantially as described.

383,868. MAGAZINE FIRE-ARM. JAMES P. LEE, New York, N. Y. Filed Nov. 9, 1887. Serial No. 254,716. (No model.) Patented in England Aug. 18, 1887, No. 11,310.

Claim.—1. The combination of a breech-block head having hollow radial projection c^2, an extractor alongside the projection interlocked with the head, and a spring in the hollow projection to hold the extractor in place and to its work, whereby the parts may be assembled and held together without the use of separate tools, substantially as described.

2. The combination, with the head of a breech-bolt movable with relation to the body thereof and provided with a hollow radial projection for a spring and a recess for the extractor, as described, of the extractor having an arm extending inward beyond the hook and a spring arranged in said hollow projection to hold the extractor in its place and to its work, substantially as described.

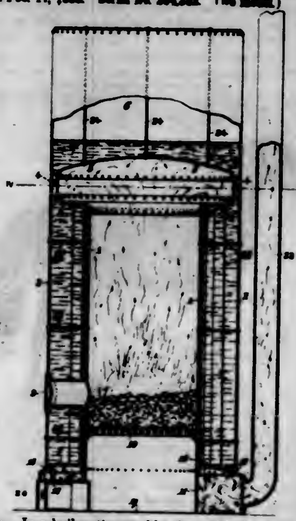
3. The combination described of the head and body of a breech-bolt radially movable with respect to each other and an extractor whose shank or body is of general bell-crank form and seated between such parts, whereby the forward end of the body of said bolt serves as a cam for forcing the extracting-hook into engagement with the flange of a cartridge as the said bolt is turned into locking position, substantially as described.

4. In a fire-arm, the combination of the frame or shoe, a trigger-guard provided with groove or slot, a transversely-sliding spring-stop, and a magazine having a lug, f^9, engaged thereby for securing the magazine to the gun, substantially as described.

5. The combination, with a breech-bolt and extractor, of a shoe or receiver having an inclined roughened projection or stud therein in line with the cartridge being extracted to engage the same when withdrawn by the extractor and to assist in ejecting it, as and for the purposes specified.

6. The combination, with the shoe or receiver of a magazine-gun and a magazine adapted to hold the cartridges side by side and feed them sidewise to the gun, of the curved cut-off or arch-shaped gate having the chord of its arc arranged at an angle of about forty-five degrees, oscillating across the mouth of the magazine, substantially as described.

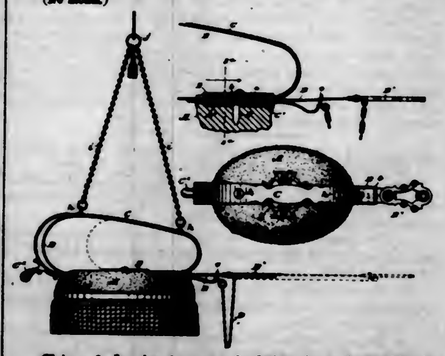
7. The combination, with the shoe or receiver, of an inclined roughened spring-stud in line with the cartridge being retracted to engage the same when withdrawn by the extractor for automatically ejecting it from the gun, as specified.



8. The combination, with a breech-bolt having a head provided with annular groove c^{10} and longitudinal groove c^{11}, connecting with the same, of a shield or cover provided with projection N', whereby the shield is detachably connected with said bolt, as set forth.

9. The combination, with a breech-bolt having a projection, C', and a head provided with annular groove c^{10} and longitudinal groove c^{11}, connecting therewith, of a shield or cover provided with projections N⁹ and N', engaging such projection and grooves, respectively, whereby said shield is detachably connected with the bolt and the body and head of the bolt are secured together, substantially as described.

10. The combination of the shoe or body of a gun, provided with a longitudinal groove along the inside thereof, a breech-bolt, and a shield or cover engaging said bolt, having a rib, N⁹, to fit in the groove in the shoe for holding the bolt in position, substantially as described.



11. The combination of a breech-bolt provided with a lateral opening and a shoe or body of the gun, provided with an opening or passage registering therewith when the bolt is locked, for the escape of gas from defective or ruptured cartridges, as set forth.

383,864. STEAM-BOILER. CHARLES P. MARSHALL, Memphis, Tenn. Filed Feb. 17, 1888. Serial No. 264,382. (No model.)

Claim.—In a boiler, the combination, with the furnace having a combustion-chamber and inner shell, 1, and the outer shell, 2, the former having the extension 11, adapted to sustain the entire weight of the boiler, the flue-ring 7, joining said shells, a box surrounding said extension and having an opening in its top of less diameter than said box, an upwardly-projecting flange, 16, at the edge of said opening, and a downwardly-projecting flange, 18, on the shell 2, surrounding and coinciding with flange 16, and adapted to contact with the top of said box and flues connecting said combustion-chamber and box, as set forth.

383,865. HAND-MEASURE FOR FITTING GLOVES. ALEXANDER B. MCDONALD, Brooklyn, N. Y. Filed Mar. 5, 1888. Serial No. 266,167. (No model.)

Claim.—1. In a hand-measure for fitting gloves, the combination, with a hand-support, of a hoop-like guard, as C, mounted on said support and provided with a passage for the free end of the tape, and the said tape formed of some suitable material of the character described, and mounted within the said guard, substantially as set forth.

2. In a hand-measure for fitting gloves, the combination, with a hand-support, of a hoop-like guard, as C, mounted on said support and provided with a passage for the free end of the tape, the tape B, mounted within said guard, and the suspenders or chains by which

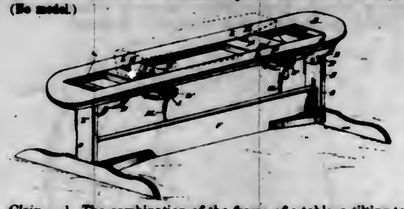
the measuring device is suspended attached to said guard, substantially as set forth.

3. In a hand-measure for fitting gloves, the combination, with the hand-support and the securing-plate g, of the hoop-like guard C, having its ends overlapped and provided with a spur, c^3, a keeper, c, and a passage, d, for the tape, and the said tape secured at one end to said guard and arranged within the same, substantially as set forth.

4. In a hand-measure for fitting gloves, the combination, with the guard C and the hand-support, of the tape B, mounted in said guard, the keeper, through which the tape plays, and the limiting chain or cord D, all arranged to operate as set forth.

383,866. NUT-LOCK. ALVIN B. HERMAN and LEWIS M. HERLDER, York, Pa. Filed Sept. 22, 1887. Serial No. 250,415. (No model.)

Claim.—The combination of a screw-nut having a tapered and threaded hole at right angles to and intersecting the bolt-hole on one side tangential thereto, and a tapered screw-plug fitted to enter said hole and cause a progressive burying of its threads transversely into the threads of the bolt, substantially as and for the purpose described.



383,867. DENTAL TOOL. JOHN J. B. PATRICK, Bellefville, Ill. Filed Dec. 20, 1886. Renewed Feb. 28, 1888. Serial No. 265,207. (No model.)

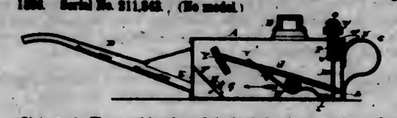
Claim.—1. The combination, with the hand-piece of a dental engine and a burr for said hand-piece, of a revolubie sleeve carrying a gum-protecting shield, substantially as specified.

2. The combination, with the adjustable sleeve, of the free ring and the revolving shield attached thereto and provided with the wings D D, substantially as specified.

383,868. TRIMMING-TABLE. SAMUEL W. PATTERSON, Ringgold, Ohio. Filed June 6, 1888. Renewed Sept. 17, 1887. Serial No. 250,050. (No model.)

Claim.—1. The combination of the frame of a table, a tilting top and means for operating it, said top having a longitudinal opening therein, blocks adapted to slide in said opening, attaching-hooks secured to said blocks, and suitable means for operating them.

2. The combination of the frame of, a table, a tilting top, and means for operating the same, metal strips, each having a projection at one end, hooked levers pivoted to said strips, handled levers pivoted to said projections, and curved links and straight ones connecting said handled levers to said hooked levers.

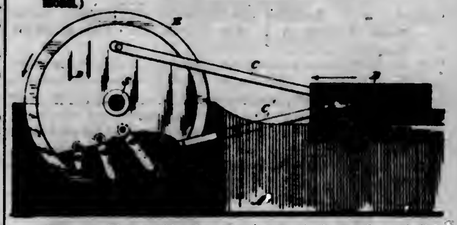


383,869. TURNING-LATHE. GEORGE PERLEE, Mishawaka, Ind., assignor to the Dodge Manufacturing Company, same place. Filed Sept. 5, 1887. Serial No. 248,894. (No model.)

Claim.—1. The hollow revolving cutter-head F, provided with journals n, pulley g, and cutters h, and the permanent journal-bearings d, supporting and centering said journals on each side of the cutters, and caps e e, combined with the tubular guides I J, supported and secured independent of the cutter-head and entering the latter from each side thereof, as set forth.

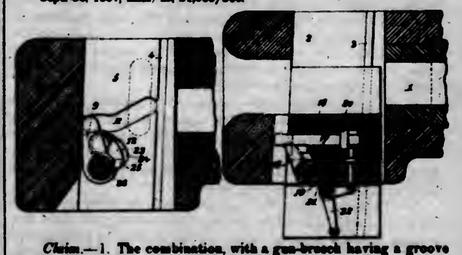
2. A hollow revolving cutter-head, enlarged at the planes of the cutters on each side of the latter, provided with journals n and journal-bearings d, combined with guides I and J, tapered or conical at their inner ends, and extending from each side inward to the planes x x of the cutter, as set forth.

383,870. OIL-CAN. JOHN RAE, St. Louis, Mo. Filed Aug. 25, 1886. Serial No. 211,843. (No model.)



Claim.—1. The combination of the body having a perforated valve-seat and a nozzle, the bar, the valve-stem fulcrumed on the bar and having a valve, a push-stem connected to the valve-stem having a collar, a sleeve surrounding the push-stem having inner and outer heads, and a spring located within the sleeve between the inner head and the collar, substantially as described.

2. The combination of the body having a nozzle and a perforated valve-seat, the bar, the valve-stem fulcrumed on the bar and having a valve, a spring surrounding the bar and bearing on the valve-stem, a push-stem connected to the valve-stem, and a sleeve surrounding the push-stem, substantially as described.

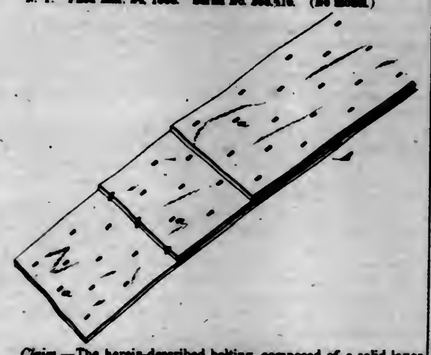


3. In an oil-can, in combination with the valve and perforated seat, the valve controlling communication between the body and nozzle of the can, the stem secured to the valve-bar upon which said stem is fulcrumed, spring surrounding the bar and bearing upon the valve-stem, push-stem forked at its lower end to enter grooves in the valve-stem, sleeve through which the push-stem passes, spring surrounding the stem within the sleeve, and knob upon the upper end of the stem, substantially as and for the purpose set forth.

383,871. INTERMITTENT GRIPPING DEVICE. MONTRUE S. REYNOLDS, Herman, Dak. Filed Aug. 23, 1887. Serial No. 247,605. (No model.)

Claim.—The combination of a rotary shaft, two flanged disks rigidly attached thereto, two plates adapted to loosely oscillate hung upon the shaft between the disks, and having pawls engaging with the inner periphery of the flanges of the disks, a reciprocating cross-head, and two pitmen connected at one end to the cross-head and at the other to the two loose plates upon opposite sides of the shaft, substantially as and for the purpose described.

383,872. BREECH-LOADING ORDNANCE. CARL MEYER, Magdeburg-Buckau, Prussia, Germany, assignor to Grusonwerk, same place. Filed Dec. 13, 1887. Serial No. 257,673. (No model.) Patented in Germany Jan. 13, 1887, No. 41,091; in Austria-Hungary June 10, 1887, 37/XXI. 1,120/1,100; in Belgium June 28, 1887, No. 77,988, and in Italy Sept. 30, 1887, XXI/42, 21,980/260.

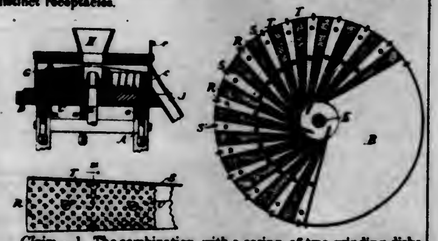


Claim.—1. The combination, with a gun-breech having a groove or guide formed therein, of a breech-block having a firing-pin, a shaft mounted in the breech-block and carrying an arm engaging the firing-pin, and a crank on the shaft working in and operated by the said groove as the block is moved, as set forth.

2. The combination, with a breech-block having a firing-pin and a shaft for operating the firing-pin, of a crank for moving the breech-block connected thereto, so as to allow lost motion of said block on first moving the crank, and an arm on the firing-pin shaft engaging

said crank and moved thereby, so that the pin will be started back before the block is lowered, as set forth.

3. The combination, with a breech-block having a firing-pin and an arm for operating the firing-pin, of a crank on the breech, groove formed in the breech-block, and a projection on the crank for engaging the groove, the said firing-pin arm engaging the crank and a portion of the groove being made concentric with the crank, whereby upon turning the crank the firing-pin is withdrawn before the block is moved, as described.



383,373. MACHINE-BELTING. CHARLES A. SCHIEREN, Brooklyn, N. Y. Filed Mar. 24, 1888. Serial No. 268,416. (No model.)

Claim.—The herein-described belting, composed of a solid layer or layers having perforations or air-openings therethrough.

383,374. MACHINE FOR DELINTING COTTON-SEED. ANTONY SIEBERT, Rock Hill, N. Y. Filed Mar. 26, 1887. Serial No. 232,477. (No model.)

Brief.—The seed is fed between disks, one of which is stationary and the other rotary. Their active faces are armed with radial or tangential toothed plates with intervening flat spaces, the latter being provided with grating-surfaces alternately smooth and roughened. The toothed plates prevent the fiber from balling between the disks. The fiber, hulls, and kernels pass to a separator, which removes the lighter impurities and directs the seeds and the hulls and fibers into distinct receptacles.

Claim.—1. The combination, with a casing, of two grinding-disks therein mounted to rotate relatively to one another, formed with grinding or rasping surfaces, and provided with teeth projecting beyond said grinding or rasping surfaces, and the disks spaced apart, so that the teeth on the opposite disks are out of contact with one another, whereby the teeth are adapted to tear the fiber from the seeds, keep it combed out and prevent its balling.

2. The combination, with a casing, of two grinding-disks therein mounted to rotate relatively to one another, formed with reciprocal grinding or rasping surfaces and provided with radial serrated blades set with their teeth projecting beyond said grinding or rasping surfaces, whereby the teeth are adapted to tear the fiber from the seeds, keep it combed out and prevent its balling.

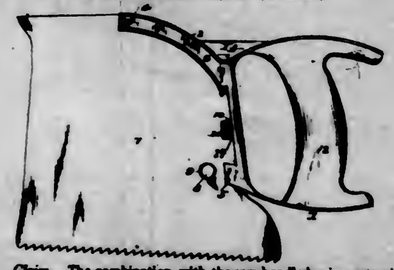
3. The combination of two grinding-disks, the lower one stationary and the upper one rotary, mechanism for rotating the upper disk, a casing inclosing the latter, projecting teeth set in the working-faces of the respective disks, projecting teeth set in the periphery of the upper disk, and projections from the inner face of the casing adapted to coact with the said peripheral teeth to keep the fiber drawn out and prevent its balling.

4. The combination, with two grinding-disks rotating relatively to one another, of radial serrated blades attached to the respective disks, with their teeth projecting from the working-faces thereof, and removable sections or bands attached to the disks between the blades.

5. The combination, with two grinding-disks rotating relatively to one another, of radial serrated blades attached to the respective disks, with their teeth projecting from the working-faces thereof, and with grating-surfaces applied at intervals between said blades.

6. The combination of two grinding-disks rotating relatively to one another, with serrated blades attached to the respective disks, with their teeth projecting from the working-faces thereof, and with said working-faces composed of alternately-arranged plain bands and graters.

7. The combination of two grinding-disks rotating relatively to one another, with removable sections attached to the working-faces thereof, with serrated blades fastened to said sections and removable therewith, and with graters applied to certain of said sections.



383,375. INSTRUMENT FOR MEASURING VERTICAL AND HORIZONTAL DISTANCES. JAMES SHAW, Centerville, Iowa. Filed Oct. 22, 1888. Serial No. 218,263. (No model.)

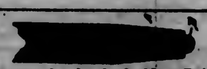
Claim.—1. The combination of the slotted arm B, the movable sliding block D in the slot thereof, slotted arm A, the stationary gage A', the said arms being pivoted to each other, as set forth, and the block D and gage A' being provided with scale-marks registering with graduated scale-strips, and the spirit-levels arranged on the said arms, as shown and described.

2. The combination of the slotted arm B, having the slot therein intersected by stay or brace blocks, a movable sliding block in said slot, a metallic socket in the upper end of said sliding block, having a clamping-clip, E', in connection therewith formed with a screw-threaded end, the clamping-screw S^3, having a nut, S^2, thereon, the arm A, having a slot with a stationary gage-block, A', therein, the screw and clamping-nut for securing the arms A and B together, the said screw passing through the sliding block D and the block A', the spirit-levels arranged on the arms A and B, as set forth, and the metallic shoes C, substantially as described.

383,376. SAW-HANDLE. GEORGE E. SEBLER, Dayton, Ohio. Filed Mar. 19, 1887. Serial No. 231,451. (No model.)

Claim.—The combination, with the saw-handle having extensions 2 and 5, provided, respectively, with a rigid stud, 6, and a stud, 4, upon a spring, 3, both studs engaging perforations 9 and 8 in the blade, and the blade, of a screw upon the handle projecting into a notch or recess in the rear edge of the blade, and a milled thumb-nut upon the screw bearing with its face against the inner side of the notch or recess, as shown and described.

383,377. FUSIBLE COUPLING FOR ELECTRIC FIRE-ALARM CIRCUITS. GEORGE G. SMITH, St. Albans, Vt. Filed Sept. 1, 1887. Serial No. 248,492. (No model.)



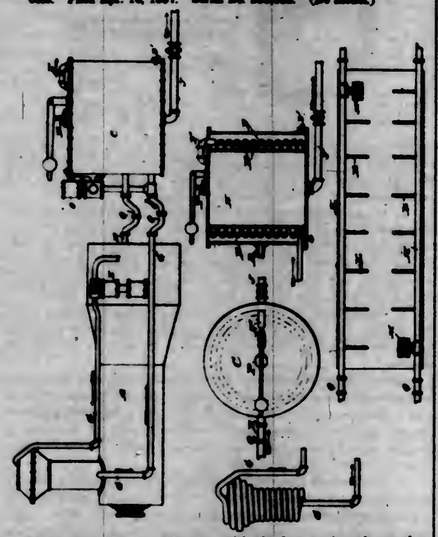
Claim.—The improved coupling for closed electric fire-alarm circuits, consisting of a tube of fusible metal adapted to receive the ends of the circuit-wire and a weight fixed centrally upon said tube, substantially in the manner and for the purpose herein set forth.

383,378. FERRULE FOR UMBRELLAS, CANES, &c. GEORGE H. SMITH, Philadelphia, Pa., assignor to William Grange, same place. Filed Mar. 17, 1888. Serial No. 267,833. (No model.)

Claim.—1. As a new article of manufacture, a ferrule for canes, umbrellas, and the like, consisting of a tube or socket of thin metal

383,378.

having a closed introverted end and a double-walled recess containing a conical plug or point, substantially as described.



2. As a new article of manufacture, a ferrule consisting of a thin metallic tube having a closed recess at its smaller end containing a conical plug or point resting against the base of said recess and clamped by the walls thereof, substantially as set forth.

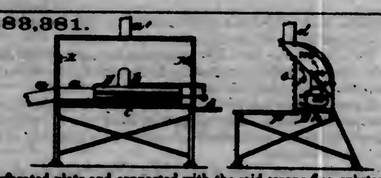
383,379. COMPOSITION OF MATTER FOR TANNING HIDES. LEVI B. SNOW and JAMES HOWARD, Wichita, Kans.; said Howard assignor to William Barton, same place. Filed Nov. 30, 1887. Serial No. 256,416. (No specimens.)

Claim.—1. A composition for use in tanning hides, consisting of the juice of the Osage orange, extract of hemlock, and ground sumac-berries, in the proportions substantially as specified.

2. A composition for use in tanning hides, consisting of the juice of the Osage orange, extract of hemlock, ground sumac-berries, salt, and alum, in the proportions substantially as specified.

383,380. HEATING RAILWAY-CARS. OTHO TAYLOR, Denver, Colo. Filed Apr. 16, 1887. Serial No. 235,052. (No model.)

Claim.—1. The combination, with the locomotive, the smoke-stack having pipe G coiled therein, and the pump I, connecting with said pipe, of an air-heater, C, having steam-chamber D, and air-chamber H, the coil of pipe E in the chamber D and connecting the pipe G and air-chamber H, and a pipe leading from the boiler of the locomotive to said chamber D, substantially as herein described.



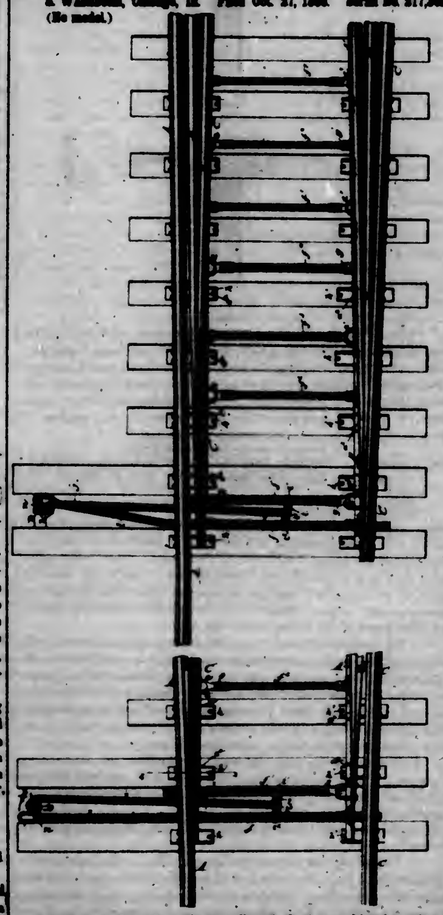
2. The combination, with the locomotive, of the air-heater C, located in a car contiguous to said locomotive and provided with a steam-chamber and an internal hot-air chamber, a pipe or coil within the steam-chamber and connected with the hot-air chamber, and a pipe leading from the boiler of the locomotive and connected with the steam-chamber, in combination with the pipe G, passing through the smoke-stack of the locomotive and connecting with said pipe or coil, and a pipe leading outward from the bottom of the heater, substantially as described.

3. An improved car-heating apparatus comprising a heater having an internal hot-air chamber and an outer casing surrounding said chamber, a coil or pipe between said chamber and outer casing of the heater, having a supply and and an opposite end communicating with the hot-air chamber, a pipe, E, in communication with the space within the outer casing, and a pipe, J, extending from said hot-air chamber, substantially as described.

383,381. HEATING-DRUM. VINCENT B. VAN BRUNDT, Ind. Filed Mar. 17, 1887. Serial No. 231,220. (No model.)

Claim.—1. In a heater, the combination of a slotted V-shaped distributer, an escape-flue of a furnace in connection therewith, a damper adapted to break the said connection, a lower chamber inclosing the said parts, and an upper chamber separated therefrom by a

383,381.



perforated plate and connected with the said escape-flue, substantially as and for the purpose described.

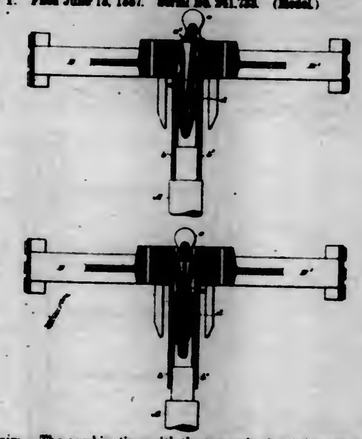
2. In a heater, the combination of a slotted V-shaped distributer, an escape-flue of a furnace in connection therewith, a damper adapted to break the said connection, a lower chamber inclosing the said parts, an upper chamber separated therefrom by a perforated plate and connected with the said escape-flue, and a damper, *b*, adapted to close the said flue, substantially as and for the purpose described.

3. In a heater, the combination of a slotted V-shaped distributer, an escape-flue of a furnace in connection therewith, a damper adapted to break the said connection, the said damper and distributer contained in a lower chamber, an upper chamber separated therefrom by a perforated plate and connected with the said escape-flue, and a heating-plate in front of the said distributer, forming a part of the casing or drum inclosing the said parts, substantially as and for the purpose described.

383,382. THREE-THROW SWITCH FOR RAILROADS. FRANK S. WASHBURN, Chicago, Ill. Filed Oct. 27, 1886. Serial No. 217,262. (No model.)

Claim.—1. In a three-throw split switch, the combination of two movable points, and a connecting-bar having one end forked and pinned

through holes in an intermediate point, whereby an undue weakening of the middle point for the passage of the bar is avoided.



2. The coupling-bar for a split switch, having one end divided vertically into two parallel horizontal arms adapted to pass through separate holes in the switch-rail, substantially as described.

3. In a three-throw split switch, the combination of the two pairs of switch-points, a single operating-shaft provided with two cranks, and connecting devices, substantially as described, for operating both pairs of points therefrom.

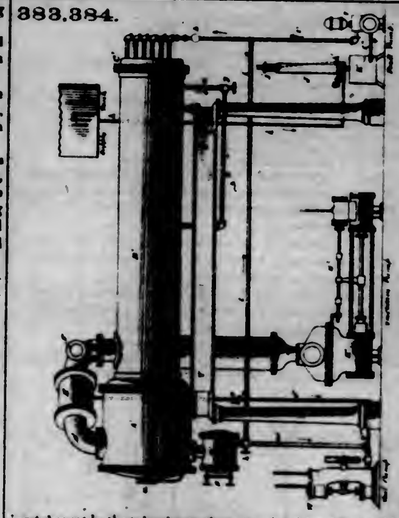
4. The points B and A' and their connecting-bar *f*, and the points C and B' and their connecting-bar, in combination with the lever *i*, uniting said connecting-bars, the operating-shaft with two cranks, the pitman extending from one crank to said lever, and the rod extending from the connecting-bar *f* to the second crank, and having a limited independent motion whereby the one crank-shaft is enabled to control a three-throw split switch.

5. In a split switch, the two pairs of switch-points and their connecting-bars, in combination with the connecting-lever *i* and an operating-rod jointed to said lever.

383,383. TYPE-WRITING MACHINE. Horace Wurr, Brooklyn, N. Y. Filed June 18, 1887. Serial No. 241,733. (Model.)

Claim.—The combination, with the type-wheels, of the cylindrical stem A, on which they are rotatively mounted, said stem being provided with a bore, *c*, leaving the stem cylindrical and intact, and the spring *d*, mounted in said bore and secured at one end to the stem, said spring being provided with a head, *e*, having a flange-like base, *e'*, which closes the mouth of said bore *c* and projects laterally over the boss of the type-wheel, normally, substantially as set forth.

383,384. VACUUM EVAPORATING APPARATUS. Homer T. Yarian, Toledo, Ohio. Filed Sept. 13, 1887. Serial No. 249,504. (No model.)



Claim.—1. In combination with a heating-cylinder of an evaporating apparatus, the inclosed evaporating-coils composed of tubes having their ends connected by closed return bends or coils, so as to form continuous closed conduits from their inlet to their outlet ends, and a feed-pipe connecting with the inlet end of each coil, whereby liquid to be evaporated may be subjected to an increased length of heating-surface without danger of overflowing till it is properly heated and discharged at the outlet end of the coil.

2. The heating-cylinder of an evaporating apparatus containing evaporating-tubes set in tube-sheets at each end, in combination with a return-bend head provided with intersecting partitions forming coils to connect the ends of the tubes, applied to the inlet end of the cylinder, the liquid-supply pipes piercing such head, and a separating-chamber connecting with the cylinder at the discharge end of the tubes for receiving the heated liquid and vapor.

3. In combination with the heating-cylinder of an evaporating apparatus, a separating-chamber connecting with one end thereof, the sets of evaporating-coils inclosed in the heating-cylinder and each opening into the separating-chamber at one end, and a feed-supply pipe connecting with the inlet end of each coil, for the purpose described.

4. In combination with the heating-cylinder containing evaporating-tubes set in the tube-sheets at each end, the return-bend heads provided with intersecting partitions forming coils to connect the ends of the tubes and form sets of coils, for the purpose described.

5. In combination with the heating-cylinder containing evaporat-

ing-tubes set in the tube-sheets, the return-bend head C, provided with intersecting partitions *c*, forming coils and openings *c'*, for connecting the supply-pipes, and the return-bend head T, having partitions *x* and outlet-openings *t''* for the discharge of liquid.

6. In combination with a heating-cylinder, the horizontal coils composed of sets of two or more connected tubes extending through the heating-cylinder, and a contracted liquid-feed duct connecting with the inlet end of each coil, whereby a reduced number of feed-ducts are required, and whereby the size of the ducts may be increased, so as to avoid the danger of their being clogged with solid matter.

7. In combination with the evaporating-coils and inclosing heating-cylinder, the externally-arranged manifold and contracted liquid-feed ducts connecting with the inlet ends of the coils, for the purpose described.

8. In combination with the series of evaporating-coils, the liquid-feeding apparatus consisting of a pump, a suction-pipe connecting it with a feed-box and having an automatic valve, a manifold, and contracted liquid-ducts connecting therewith and with the inlet ends of the coils, whereby each coil of the series may be fed by a single pump with the desired quantity of liquid.

9. In a vacuum evaporating apparatus, the combination, with an evaporator of any one effect and degree of vacuum, of a liquid-transfer pipe leading therefrom past one or more of the successive effect evaporators to an evaporator beyond having a greater degree of vacuum than the intervening evaporator or evaporators, for securing the advantage of a better vacuum, to facilitate the transfer and circulation of liquid from one evaporator to the other.

10. In a vacuum evaporating apparatus, a primary evaporator and a connecting liquid-feed pump, in combination with a transfer-pipe for partially-reduced liquid, leading from such evaporator past one or more of the succeeding evaporators to the feed-pipe of an evaporator having a greater degree of vacuum than the intermediate evaporator, whereby improved feed and circulation of liquid are secured.

11. In a multiple-effect vacuum evaporating apparatus, a primary evaporator having a separating-chamber, in combination with a liquid-feed pump connecting with the inlet end of the evaporator, a liquid-transfer pipe for partially-reduced liquid, leading from the separating-chamber of the primary evaporator past the second evaporator to the inlet end of the third evaporator of the series, a vapor-pipe connecting each evaporator with the next one in succession from the first to the last, and an exhaust device connecting with the last evaporator of the series, for the purpose described.

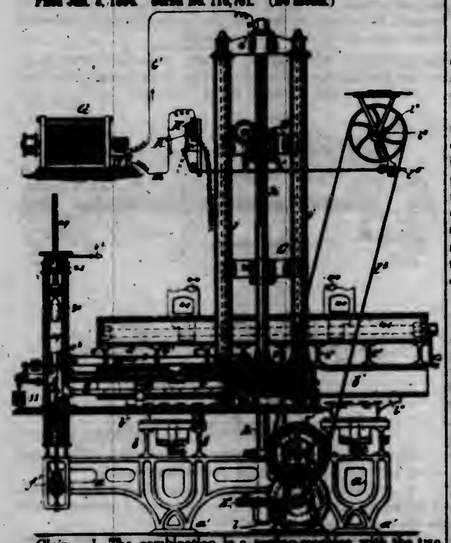
12. In a multiple-effect vacuum evaporating apparatus, a series of evaporators, each having a separating-chamber, a series of vapor-pipes connecting the evaporators in successive order from first to last, and an exhaust device connecting with the last evaporator of the series, in combination with a liquid-feed pump connecting with the inlet ends of the first and second evaporators of the series, and a liquid-transfer pipe leading from each separating-chamber past the next succeeding evaporator into the inlet end of the third evaporator from starting-point throughout the series, for the purpose of securing the advantages of a greater number of degrees of vacuum, for facilitating the flow and circulation of partially-reduced liquid from one evaporator to the other,

whereby an increased number of evaporators may be used in a series and more economical results secured.

13. A separating-chamber provided with numerous small open-ended tubes and an arresting-plate placed near their discharge ends for separating liquid or solid matter from the vapor arising from the liquid being evaporated.

14. In combination with a separating-chamber, A', having the evaporating-coils discharging into one end, the tube-sheet *r*, placed near each end and carrying open tubes *n*, and arresting-plate *b'*, placed in front of the discharging ends of tubes *n*, for the purpose described.

15. A catch-all chamber, E', having tube-sheet *o* placed near its vapor-inlet end and carrying open tubes extending to near its opposite end plate, and outlet-pipe *d''*, extending back from the rear end plate and connecting with outlet vapor-pipe D', for the purpose described.



16. In combination with two or more vacuum evaporators, each composed of a heating-chamber containing evaporating tubes or coils and a separating-chamber, the catch-all chambers containing small tubes and arresting-plates, and connected in the vapor-pipes leading from each separating-chamber to the heating-chamber of the adjacent evaporator, for the purpose described.

17. In a multiple-effect vacuum evaporating apparatus, the combination, with the last two evaporators of the series and their separating-chambers, as A^5 and A^6, of the liquid-transfer pipe S, connecting the separating-chambers together, and a liquid-discharge pipe leading directly from the last separating-chamber of the series, whereby the finished liquid of the two chambers may be mingled, cooled, and discharged together.

18. In a multiple-effect vacuum evaporating apparatus, the combination, with the last two evaporators of the series and their separating-chambers, of a liquid-transfer pipe connecting the two separating-chambers, a liquid-discharge or tail pipe leading from the last separating-chamber, a connected tail-pump for drawing off the liquid, and a vapor-exhaust device, also connecting with the last separating-chamber, for the purpose described.

19. In a multiple-effect vacuum evaporating apparatus, the last two evaporators of the series and their separating-chambers, in combination with liquid-supply pipes connecting with the inlet ends of the evaporators, an exhausting device connecting with the last separating-chamber, and a liquid-transfer pipe connecting the two separating-chambers, whereby the finished liquids of the two may be mingled, cooled to the same temperature, and together subjected to the vaporizing effect of the exhausting device preparatory to discharge from the apparatus.

383,385. TESTING-MACHINE. Andrew V. Anson, Brooklyn, N. Y., assignor to E. & T. Fairbanks & Company, St. Johnsbury, Vt. Filed Jan. 3, 1884. Serial No. 116,761. (No model.)

Claim.—1. The combination, in a testing-machine, with the two specimen-holding clamp-heads electrically insulated from each other, of a frangible electrical conductor extending between and fixed to the heads, and an electrical circuit completed through said conductor and through an electric-motor device controlling one or more active parts of the testing-machine, whereby the breakage of said conductor at the completion of the test will break the circuit and bring said active parts to rest, substantially as herein set forth.

2. The combination, with a testing-machine, of an electric-motor device controlling one or more active parts of the machine and an electric circuit completed through the specimen under test and through said motor device, arranged and operating substantially as herein set forth, whereby the breakage of the specimen will break the circuit and bring the machine to rest.

3. The combination, with a testing-machine, of a magnet or electric-motor device arranged to control the driving of the straining mechanism and an electric circuit energizing said magnet and completed through the specimen under test, and arranged and operating substantially as herein set forth, whereby the breakage of the specimen will break the circuit and automatically stop the straining mechanism.

4. The combination, in a testing-machine, with a device for marking and recording the stretch of the specimen, of a clamp affixed to each end of the specimen and provided with a pulley with a tape or connection extending at each end from the marker passing through the said pulley on one clamp and fixed at the opposite end to the other clamp, substantially as and for the purpose set forth.

5. The combination, in a testing-machine, of a device for marking and recording the stretch of the specimen, a tape or connection extending from the marker to clamps upon the specimen, and an electro-magnet on said specimen, arranged to hold the fixed end of said tape with an electric circuit completed through said specimen and magnet, whereby the breaking of the specimen breaks the circuit and instantly releases the tape and stops the advance of the stretch-mark coincident with the break of the specimen.

6. In a testing-machine, the combination, with the clamp-heads to hold the specimen and a specimen extending between and held by the same, of a stretch-clamp, such as *w* or *w'*, bound onto the specimen near the head and formed with the knife-edge w^2, arranged to grasp the specimen only at the extremity of the part under test, or at the line where it issues from the clamp-heads, substantially as and for the purpose set forth.

7. In a testing-machine, a stretch-clamp, such as *w* or *w'*, having the knife-edge w^2 and round edge w^3, substantially as and for the purpose set forth.

8. In a testing-machine, a clamp-head, such as B or C, formed with a central spherical socket whose center is coincident with the line of the specimen, or nearly so, in combination with a spherical universally-swiveling block, *m*, fitted in said socket, and means to secure the specimen in said block, substantially as herein set forth.

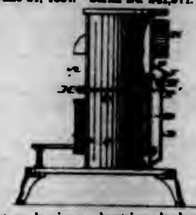
9. In a testing-machine, the combination, with the clamp-head B or C, having a central spherical socket, of the universally-swiveling block *m*, fitted therein, and the clamp-wedges *m'*, fitted in a central cavity in said block, substantially as and for the purpose set forth.

10. In a testing-machine, the combination, with the specimen, of a clamp-head provided with a clamp-socket inclined on more than two sides, with clamping-wedges driven in between said sides and between all sides of the specimen held therein, substantially as and for the purpose set forth.

11. In a testing-machine, a double scale-beam provided with a main and a minor poise, the former being movable in successive steps or graduations corresponding to the full travel of the latter, in combination with an electrical contact arranged in the path of the minor poise at the end of its movement, an electro-magnet controlling the movement of the main poise in its successive steps, and an electric circuit passing through said magnet and contact, arranged and operating substantially as and for the purpose set forth, whereby said contact and circuit are closed upon the arrival of the minor poise at the end of the beam and the magnet is energized, and the main poise thereby caused to be moved out one step, as set forth.

12. In a testing-machine, the combination, with the weighing-beam and its movable poise and a rotary driving-shaft, such as *i'*, and a clutch-pulley thereon for imparting motion to such poise, of an electro-magnet arranged when in circuit to attract or clutch said pulley to the shaft, with an electric circuit passing through said magnet and through contacts operated by the rise and fall of the beam, whereby the closing of one of said contacts by the rise and fall of the beam will energize the magnet and cause the pulley to be clutched to and revolved with the shaft to impart motion to the poise, substantially as herein set forth.

13. In a testing-machine, the combination, with the weighing-beam and its movable poise and a rotary driving-shaft for imparting motion to such poise, of an electro-magnet fixed to and revolving with said shaft, and a clutch-pulley arranged loosely on said shaft and forming an armature to said magnet and operatively connected to the poise, with an electric circuit passing through such magnets and through contacts operated by the rise and fall of the beam, substantially as and for the purpose herein shown and described.



14. In a testing-machine, the combination, with the weighing-

beam and its movable poise g^3, and with the recording-drum r^2, of the rotary driving-shaft f and a suitable motor to propel the same, of the clutch-magnets f^5 f^6 and the pulleys f^7 and f^8 on said shaft, arranged to impart relatively reverse movements to the poise, with the clutch-magnet r^4 and driving-wheel r' on the said drum, with an electrical circuit passing through said magnets and through contacts operated by the rise and fall of the beam, and so arranged that the said magnet r^4 of the recording-drum is always in circuit to revolve the drum when the poise is advancing, but is out of circuit to keep the drum stationary when the poise is retreating, substantially as and for the purpose set forth.

15. The combination, in a testing-machine, with a weighing-beam, g, and its movable poise g^3 and electrical contacts operated by the rise and fall of the beam, of the motor f and its releasing-magnet u, the driving-shaft f and its clutch-magnets f^5 f^6 and its pulleys f^7 f^8, arranged to impart relatively reverse movements to the poise, and an electrical circuit passing through said contacts and magnets and so arranged that when the beam is in balance said contacts and said circuit will be open and said magnets, motor, shaft, and pulleys at rest, but when the beam rises or falls one of said contacts will be closed and the corresponding parts energized to move the poise forward or backward, substantially as herein shown and described.

16. A compound testing-machine adapted for both light and heavy tests, constructed with one weighing-beam and a major and a minor set of clamp-heads and straining mechanism, both sets of clamp-heads being connected with the same beam, having major and minor graduations thereon corresponding to the clamp-heads, substantially as herein shown and described.

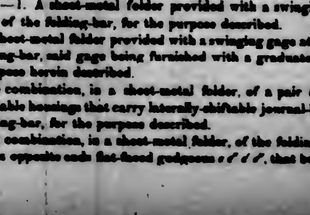
383,386. DUST-FLUE FOR STOVES. JOSEPH A. BOICKWALTER, Royer's Ford, Pa., assignor to the Boickwalter Stove Company, same place. Filed June 21, 1887. Serial No. 241,971. (No model.)

Claim.—A stove having a sheet-iron body with the openings *a* and *b* in the back thereof, said openings being respectively above and below the grate of said stove, and provided with a casting adapted to be secured to said stove, said casting having a channel forming the passage D between said openings *a* and *b*, a rearwardly-projecting portion, J, and smoke-flue K, and a damper, E, pivoted in the upper part of said passage D, and adapted to rest on said portion J of the casting when the passage D is open, said parts being combined, substantially as and for the purpose set forth.

383,387. CAR-BRAKE. THOMAS H. BURRIDGE, St. Louis, Mo. Filed Dec. 16, 1887. Serial No. 256,097. (No model.)

Claim.—1. In combination with the axle of a street-car, a fixed disk, a movable disk, sleeve on the axle, to which the movable disk is secured, stationary cam on the axle in contact with one end of the sleeve, and means for turning the sleeve to apply the brake, substantially as and for the purpose set forth.

2. In combination with the axle of a car, a fixed disk, the movable disk, sleeve on the axle, a disk secured to the movable sleeve, a stationary cam on the axle, and means for turning the sleeve to apply the brake, said sleeve having an incline on the opposite end from the movable disk, said incline adapted to bear against the cam when the sleeve is turned, substantially as and for the purpose set forth.

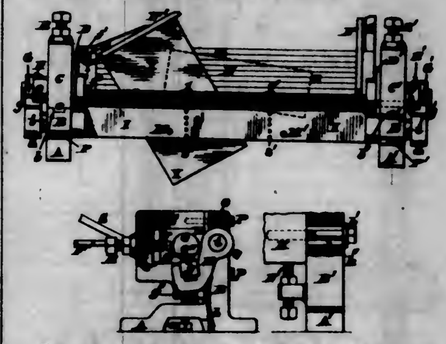


3. In combination with the axle of a car, a fixed disk, 5, rigidly secured to the axle, sleeve 10, mounted loosely on the axle, disk 9, formed upon or secured to the sleeve, cam 13, mounted loosely on the axle, and connected to the bottom of the car, and collar 14 to prevent end movement of the cam, substantially as and for the purpose set forth.

4. In combination with the axle and body of the car, a fixed disk, 5, sleeve 10, movable disk 9 on the sleeve, arms 17 and 19 on the sleeves, cams 13, arms 15, connecting the cams to the bottom of the car, collars 14, to prevent end movement of the cams, and means for connecting the arms of the different sleeves and for operating one of the sleeves, substantially as and for the purpose set forth.

383,388. SWEAT-PAD FASTENER. JASPER S. GIBBS, De Kalb, Ill., assignor of two-thirds to Joseph F. Glidden and Chase B. Glidden, same place. Filed Mar. 7, 1888. Serial No. 266,269. (No model.)

Claim.—The improved pad fastener or hook within described, consisting of the circular spring-band adapted to grasp the collar and pad, and provided with teeth at one end and the projecting thumb-piece at the opposite end, all substantially as described.



383,389. EDUCATIONAL DEVICE. JAMES DURHAM, South Bend, Ind. Filed Oct. 25, 1887. Serial No. 253,202. (No model.)

Claim.—1. The herein-described educational device, consisting of a rectangular frame having its front upper portion cut away, a series of parallel levers pivotally mounted in said frame, having upstanding pins in their front ends, and the removable object-blocks loosely mounted on said pins, all substantially as and for the purpose specified.

2. The within-described educational device, consisting of a rectangular frame cut away at its front portion and open in rear, the series of keyed pivoted levers mounted on a longitudinal rod in said frame, the step-board above said levers, the upstanding pins on the front ends thereof, and the series of removable object-blocks loosely mounted on said pins, the whole so arranged that the blocks will be normally out of sight of the pupil, but exposed upon the depression of the keys, all substantially as specified.

383,390. SHEET-METAL FOLDER. GEORGE B. EVERSON, Cincinnati, Ohio, assignor of one-half to William L. Rockenfeld, same place. Filed Mar. 6, 1888. Serial No. 266,226. (No model.)

Claim.—1. A sheet-metal folder provided with a swinging gage at one end of the folding-bar, for the purpose described.

2. A sheet-metal folder provided with a swinging gage at one end of the folding-bar, said gage being furnished with a graduated circle, for the purpose herein described.

3. The combination, in a sheet-metal folder, of a pair of vertically-adjustable bearings that carry laterally-shiftable journal-bearings of the folding-bar, for the purpose described.

4. The combination, in a sheet-metal folder, of the folding-bar E, having at its opposite ends flat-faced gudgeons e' e'', that bear upon

anti-friction rollers G G', journaled in bosses g g', fitted to the free ends of arms H H', said arms being attached to the journals f f' of the clamping-plate I, and being provided with set-screws g'', whereby said bosses are adjusted, as herein described.

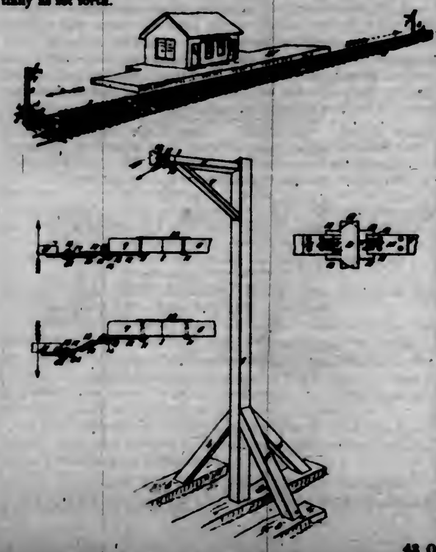
5. The combination, in a sheet-metal folder, of vertically-grooved standards B b B' b', vertically-tongued bearings C c C' c', slots O O', bolts P P', and adjusting-screws a a', said bearings having the folding-bar E journaled in them, for the purpose described.

6. The combination, in a sheet-metal folder, of the detachable binder T, having a branch, t, retaining-screw t', limb U, slot u, wedge V, screw v, and gage-screw W, for the purpose described.

7. In a sheet-metal folder, the clamping-plate I, having two sets of perforations, 1 8 and 1' 8', in combination with the perforations j, spring L, and removable pin l, for the purpose described.

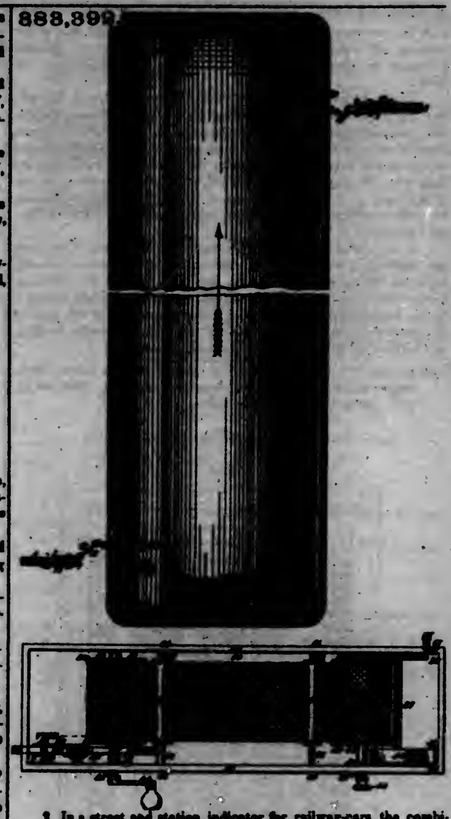
383,391. SHEET-METAL BENDING MACHINE. GEORGE B. EVERSON, Cincinnati, Ohio, assignor of one-half to William L. Rockenfeld, same place. Filed Mar. 12, 1888. Serial No. 267,723. (No model.)

Claim.—1. The combination, in a sheet-metal-bending machine, of bending-roll H, rack-bearings F f G g, shaft C, fixed pinion c, shiftable pinion c', and a device for locking said shaft, substantially as herein described.



2. In combination with the shaft C, operating the bending-roll H, as herein described, the stop-pin E and plate D, the latter being provided with a series of retainers, d, for the purpose stated.

3. The combination, in a sheet-metal-bending machine, of standard A U, slip-roll R r', perforation a, and shiftable pin S, for the purpose described.



4. The combination, in a sheet-metal-bending machine, of standard A U, slip-roll R r', perforation a, shiftable pin S, and reducing-bushing V v, for the purpose described.

383,392. STREET AND STATION INDICATOR. SAMUEL H. FISHER, St. Louis, Mo., assignor of one-half to Julius B. Abeles and Leon Goldman, both of same place. Filed Aug. 15, 1887. Serial No. 247,203. (No model.)

Claim.—1. In a street and station indicator for railway-cars, the combination, with the indicator proper and its trigger-lever, of a suitably-mounted arm projecting toward the side of the track from the car, an extension having spring-connection at one side therewith, a buffer-head having pivotal connection with the end of said extension on its opposite side, and a spring surrounding the pivot-connection, its ends bearing respectively on the buffer-head and extension, substantially as set forth.

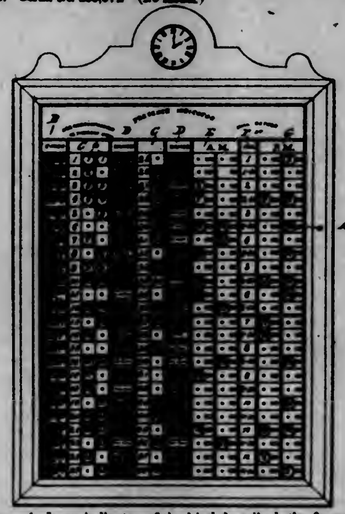
383,393.

2. In a street and station indicator for railway-cars, the combination of the frame, shafts journaled therein, reels provided with sleeves adapted to be secured on said shafts, an indicating-scroll wound on said reels, a projection from the side of the track on which the car travels, a catch for holding the scroll in inactivity, a projection from the car adapted to engage the aforesaid projection to release the catch, and suitable means for winding the scroll on the reels, substantially as set forth.

3. In a street and station indicator for railway-cars, the combination of the frame, shafts 32 journaled therein, reels 23, provided with sleeves adapted to be secured on said shafts, an indicating-scroll wound on said reels, an exhibiting-glass in front of said reels, and rollers mounted in said frame in proximity to said glass, over which the scroll passes, a projection from the side of the track on which the car travels, a catch for holding the scroll in inactivity, a projection from the car adapted to engage the aforesaid projection to release the catch, and suitable means for winding the scroll on the reels, substantially as set forth.

4. In a street and station indicator for railway-cars, the combination of the frame, shafts 32 journaled therein, reels 23, mounted on said shafts, a spring for actuating said reels, a stop to limit the movement of said reels, a projection from the side of the track on which the car travels, and a projection from the car adapted to engage the aforesaid projection and said stop, substantially as set forth.

5. In a street and station indicator for railway-cars, the combination of the frame, shafts 32 30 journaled therein, reels 23, mounted on shafts 32, scroll wound upon said reels, geared connection between shaft 30 and one of shafts 32, a coiled spring fixed to the frame and to shaft 30, a stop to limit the movement of said reels, a projection from the side of the track on which the car travels, and a projection from the car adapted to engage the aforesaid projection and said stop, substantially as set forth.



6. In a street and station indicator for railway-cars, the combination of the frame, shafts 32 30 journaled therein, reels 23, provided with sleeves 34 fitting on shafts 32, a scroll wound upon said reels, gear-wheel 37 on one of said sleeves 34, cog-wheel 38 on shaft 30 meshing

thereswith, coiled spring 40 fixed to shaft 39 and the frame, a stop to limit the movement of the indicator, a projection from the side of the track on which the car travels, and a projection from the car adapted to engage the aforesaid projection and said stop, substantially as set forth.

7. In a street and station indicator, the combination of the reels and shafts upon which they are mounted, scroll wound on said reels, disk mounted on one of said shafts having a spring-actuated dog-pawl thereon, and a pin to limit its movement, a pivoted trigger-lever adapted to engage said dog-pawl, a mainspring for winding the scroll upon the reels when the dog-pawl is disengaged, and a projection from the side of the track on which the car provided with the indicator travels, adapted to engage the trigger-lever, substantially as and for the purpose set forth.

8. In a street and station indicator, the combination of the reels and shafts upon which they are mounted, scroll wound on said reels, a pivoted lever projecting from the car provided with the indicator, devices on one of said reel-shafts adapted to be automatically operated by the engagement of said lever with a projection from the side of the track upon which the car travels, and a mainspring for winding said scroll upon the reels, substantially as set forth.

383,393. OFFICE-INDICATOR. ROSS R. GARNAR, Detroit, Mich., assignor of one-half to Philip John Reuston, same place. Filed Oct. 23, 1887. Serial No. 253,074. (No model.)

Claim.—1. In an indicator of the kind described, the frame provided with a plurality of columns, one forming card-receptacles, another a name-plate column, and another a number-column, with spaces opposite the numbers having holes, combined with removable indicating-pins in said holes, substantially as described.

2. In an indicator of the kind described, a frame provided with a plurality of subdivided columns, one column forming a number-column, another a name-column, and another a time-indicating column, and a column, E, bearing marks indicating divisions of the day, combined with a removable indicating-pin, as set forth.

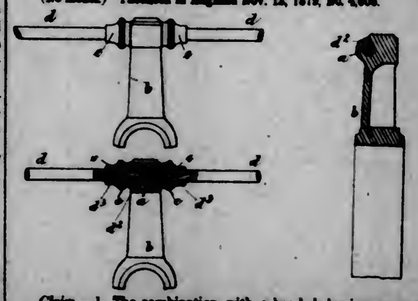
3. In an indicator of the kind described, a frame provided with a plurality of subdivided columns, one provided with numbers and corresponding spaces provided with holes, a column denoting hours and provided with holes and a day-indicator, combined with a removable indicating-pin, substantially as and for the purpose specified.

4. In an index of the kind described, the column E, having holding devices and day-indicator, in combination with the movable button *a*, provided with the folding arm *c*, all substantially as described.

383,394. POISON-BOTTLE INDICATOR. JOSEPH C. HIRSH, New Brunswick, N. J., assignor of one-half to Frederic B. Kilmer, same place. Filed May 16, 1887. Serial No. 238,493. (No model.)

Claim.—A poison-bottle indicator composed of the band A, the upright barbed or serrated strips B thereon, and the fastening-band D, for holding the strips against the bottle-neck, substantially as herein shown and described.

383,395. GAS-GENERATOR FOR LOCOMOTIVES. ARTHUR C. HARRISON, Meadville, Pa. Filed Apr. 30, 1887. Serial No. 236,622. (No model.)



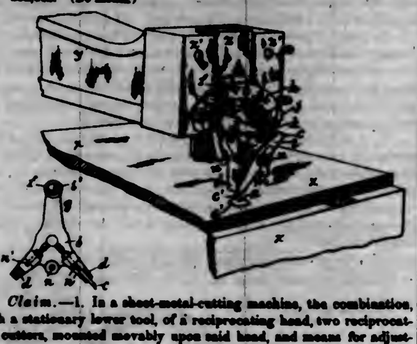
Claim.—1. The combination, with a tubular steam-boiler having a combustion-chamber, of a fire-box, a flue leading out of the top of the fire-box and directed downward and forward in said chamber, and an injecting-pipe leading from the steam-space of the boiler into the head of said flue and provided with a regulating-valve, all constructed and arranged substantially as and for the purpose described.

2. The combination, with a tubular steam-boiler having a combustion-chamber, of a fire-box located in said combustion-chamber, and having a downwardly-constructed extension, V, provided with a grate and a valve, a liquid hydrocarbon injector in said fire-box, a siphon-shaped outlet pipe or flue leading therefrom and into the combustion-chamber, and an injector leading from the steam-space of the boiler into said siphon-pipe, all constructed and arranged substantially as and for the purpose described.

3. The combination of a tubular steam-boiler having a combustion-chamber, a fire-box located therein, a flue-pipe connecting the said fire-box and combustion-chamber, and a steam-pipe leading from the boiler-space to said flue-pipe, with a liquid-fuel reservoir provided with a valved delivery-spout, and a pipe adapted to receive the liquid fuel entering the fire-box and provided with a spray pipe or head located inside the fire-box, substantially as and for the purpose described.

383,396. VELOCIPEDE. GEORGE ELLIOTT, Birmingham, County of Warwick, England, assignor to the Royal Machine Manufacturing Company, (Limited,) same place. Filed Mar. 2, 1887. Serial No. 229,444. (No model.) Patented in England Nov. 12, 1879, No. 4,606.

Claim.—1. The combination, with a head, *b*, having an angular open trough at its upper portion, of a continuous handle-bar, *d*, having the angular portion d^3 centrally between its ends removably fitting said trough, and devices engaging the handle-bar and the ends of the trough, substantially as described.



2. The combination of the head having an open trough, a continuous handle-bar, and sleeves on the bar for securing the latter in the trough, substantially as described.

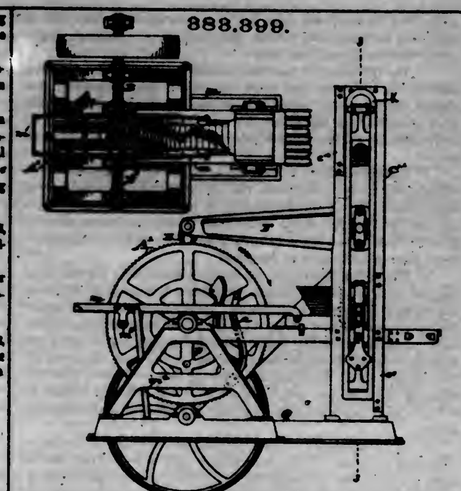
3. In a handle for bicycles and other vehicles, the combination of a head, *b*, having a trough at its upper portion provided with convex screw-threaded extensions *c*, the bar *d*, having a flattened central portion, d^3, adapted to said trough, and internally-threaded collars *e* on the bar, adapted to the convex threaded extensions for confining the bar in the trough, substantially as described.

383,397. FINISH FOR PLASTERED WALLS. THOMAS JONES, Ravenswood, Ill. Filed Nov. 14, 1887. Serial No. 255,209. (No specimens.)

Claim.—A finish for walls, consisting of lime, raw gypsum over calcined gypsum, and alum or its equivalents, in substantially the proportions stated.

383,398. SHEET-METAL-SCROLL CUTTER. ARTHUR O. KITTREDGE, Slate Hill, and BENJAMIN ARMBRUS, Brooklyn, N. Y., assignors to the Vulcan Company, of Pennsylvania. Filed Oct. 11, 1887. Serial No. 252,052. (No model.)

Claim.—1. In a sheet-metal-cutting machine, the combination, with a stationary lower tool, of a reciprocating head, two reciprocating cutters, mounted movably upon said head, and means for adjusting them separately to the opposite sides of the lower tool, as and for the purpose set forth.



2. In a sheet-metal-cutting machine, the combination, with a stationary lower tool having opposite cutting-edges, of a reciprocating head, two reciprocating cutters mounted movably upon said head, and means for adjusting them separately to the opposite sides of the lower tool, as and for the purpose set forth.

3. In a sheet-metal-cutting machine, the combination, with a stationary lower tool, of a reciprocating head, a tool-carrier pivoted thereon, two cutters held upon said carrier, and means for shifting the carrier to adjust said cutters to opposite sides of the lower tool, as and for the purpose set forth.

4. In a sheet-metal-cutting machine, the combination, with a stationary lower tool, of a reciprocating head, a tool-carrier pivoted thereon, two cutters held upon said carrier, a taper-pointed bolt upon said carrier, holes in a guard upon the head to fit the point of said bolt, and screws *k*, for setting the cutters in contact with the side of the lower tool.

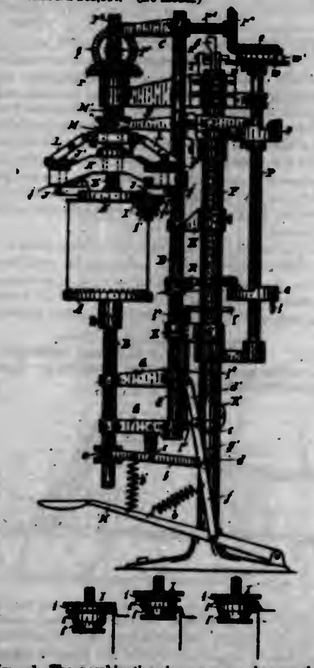
5. In a sheet-metal-cutting machine, the combination, with a stationary lower tool, of a reciprocating head, *b*, tool-carrier pivoted thereon, two cutters held upon said carrier, and means for shifting the carrier to adjust said cutters to opposite sides of the lower tool, the cutters being held upon the carrier in open-grooved holders, and the carrier being provided with set-screws to adjust the cutters vertically, and a button to clamp each cutter in its holder, the whole being arranged and operated substantially as shown and described.

383,399. BEAD-MACHINE. JOSEPH J. KRAMP, St. Louis, Mo. Filed Aug. 30, 1886. Serial No. 212,259. (No model.)

Claim.—1. In a bead-machine and in combination with the vertically-movable upper and lower plungers, *J* and *J'*, the former shouldered at *j'* and the latter carrying the spring-actuated hooks N, the deflector and sustaining-hooks independent of either plunger, whereby in operation the lower plunger is arrested and the sub-plunger momentarily upheld as the charge is moved over the mold.

2. The combination of the lower plunger, the hooks N, the upper plunger having the shoulder *j'*, the deflectors, the hooks O, and the springs P, substantially as described.

3. The combination of the charger M, the arms *m*, the link m^2, the base-plate Q, the adjustable rollers m^3, and the gears A A', having cams *a*, substantially as described.



4. The combination of the arms *m*, the adjustable rollers m^3, and the gears A A', having the cams *a*, as described.

5. The combination of the plunger J', the cylinder R', the piston R, and the bag R^2, as described.

6. The combination of the plunger J', the piston R, the valve *r'*, the cylinder R', and the bag R^2, as described.

7. The uprights having the removable stripe c^2 c^3, as described.

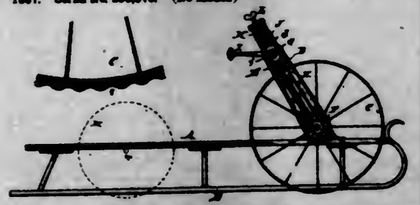
383,400. MACHINE FOR SEAMING CANS. GEORGE W. LOUIS, Detroit, Mich., assignor of four-fifths to George L. Hill, Charles T. Hill, Louis W. Briggs, and Jas. S. Spencer, all of same place. Filed Feb. 20, 1888. Serial No. 265,097. (No model.)

Claim.—1. The combination, in a can-seaming machine, of the non-rotating and vertically-sliding chucks for holding the can body and head, a seaming roller or rollers mounted upon a frame revolving around the head, expanding and contracting mechanism, substantially

as specified, to bring said roller or rollers in or out of contact with the head, and mechanism for raising and lowering the chucks simultaneously, substantially as described.

2. The combination, in a can-seaming machine, of the chucks for holding the can body and head, the sliding shafts carrying these chucks, the connecting mechanism between the shafts to compel their joint operation, and the break-joint in said connection to permit the independent operation of one of said sliding shafts, substantially as described.

3. The combination, in a can-seaming machine, of the chucks for holding the can body and head, the vertically-sliding shafts carrying these chucks, the connecting mechanism between these shafts to compel their joint operation, the break-joint in this connection, the foot-lever for locking and the automatic tripping device for unlocking said break-joint, substantially as described.



4. The combination, in a can-seaming machine, of the non-rotating and vertically-sliding chucks for holding the can body and head, the seaming roller or rollers mounted upon a frame revolving around the head, a set of can-seaming devices on said roller or rollers in vertical series, the expanding and contracting mechanism to carry said seaming roller or rollers in and out of contact with the head, and automatic mechanism for raising and lowering the chucks simultaneously, whereby the different seaming devices of the roller or rollers are brought into proper position relative to the head, substantially as described.

5. The combination, in an organized machine for double seaming can-heads to bodies, of the non-rotating chucks for holding the can body and head, the vertically-sliding shafts to which said chucks are secured, the break-joint connection between the lower and upper chuck, the seaming-roller provided with a set of seaming devices in vertical series, the revolving head carrying such seaming-roller, the expanding and contracting mechanism for operating said seaming-roller laterally toward and from the cam, with the chuck lowering and raising mechanism, the revolving cam-shaft for actuating said mechanism, the drive-connection for said shaft, the tripping-clutch in said drive-connection, the tripping-bar controlling said trip-clutch by the closing of the break-joint, the automatic trip controlling the breaking of the break-joint by the motion of the cam-shaft, and the foot-lever controlling the closing of the break-joint by the action of the operator, substantially as described.

6. The combination, in an organized machine for double seaming can-heads to bodies, of the non-rotating chucks for holding the can body and head, the vertically-sliding shafts to which said chucks are secured, a seaming roller or rollers provided with a complete set of seaming devices in vertical series, the double crank-lever, to one end of which said lever is mounted, the revolving head to which said crank-lever is fulcrumed, the shaft upon which said revolving head is mounted, the sliding collar upon said shaft, the link connecting the sliding collar with the crank-lever, the cam-lever engaging with the sliding collar, the seaming-cam actuating said cam-lever, the cam-shaft upon which said seaming-cam is mounted, the chuck-operating cam mounted upon the same shaft, the arm engaging with said chuck-operating cam, and the vertically-sliding frame which carries the chucks and to which the said arm is secured.

7. The combination, with the vertically-sliding chucks carrying the body and head of the can, of the seaming-roller revolving around the head of the can and provided with a set of seaming devices in vertical series, and mechanism, substantially as described, for bringing into operation the successive seaming devices of said roller, substantially as described.

383,401. SLEIGH. WILLIAM S. HARRAR, Philadelphia, Pa., assignor of one-half to Charles J. Spielberger, same place. Filed Dec. 30, 1887. Serial No. 259,370. (No model.)

Claim.—1. In a sleigh, the combination of a top board having runners attached thereto, a wheel located in the front part of said sleigh between the runners and extending through said top board, means, substantially as described, to allow said wheel to automatically rise and fall, a crank or handle carried upon the same support as the wheel, but located above it and free to rise and fall with it, to rotate said wheel, and mechanical power-transmitting connections between the crank and wheel, whereby the sleigh may be propelled.

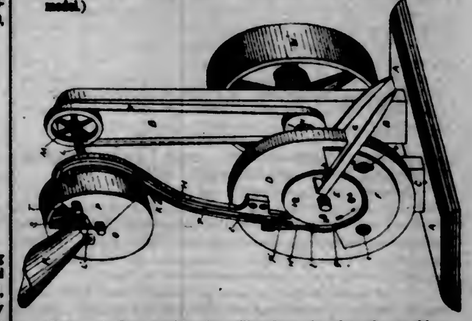
2. In a sleigh, the combination of a top board having runners attached thereto, a wheel located in the front part of said sleigh between the runners and extending through said top board, means, substantially as described, to allow said wheel to automatically rise and fall, a crank or handle carried upon the same support as the wheel, but located above it and free to rise and fall with it, to rotate said wheel, and mechanical power-transmitting connections between the crank and wheel, whereby the sleigh may be propelled, and axles for removable wheels located in the back part of the sleigh.

3. In a sleigh, the combination of the top board, A, having runners B, the wheel C, guides D, upright frame E, guided in said guides D, sprocket-wheel F, journaled to said upright bar E and connected with the wheel C, sprocket-wheel G, journaled to said upright bar, crank-arms I, and endless chain H.

4. In a sleigh, the combination of the top board, A, having runners B, the wheel C, guide D, upright frame E, guided in said guides D, sprocket-wheel F, journaled to said upright bar E and connected with the wheel C, sprocket-wheel G, journaled to said upright bar, crank-arms I and endless chain H, and spring J.

5. In a sleigh, the combination of the top board, A, having runners B, the wheel C, guide D, upright frame E, guided in said guides D, sprocket-wheel F, journaled to said upright bar E and connected with the wheel C, sprocket-wheel G, journaled to said upright bar, crank-arms I and endless chain H, spring J, and adjusting-screw L.

6. A sleigh-body combined with a drive-wheel connected to the forward end thereof with freedom of upward movement, a spring device, substantially as described, to press said wheel down toward the runners, power-transmitting devices, substantially as set out, to rotate said drive-wheel, and free to move upward with said wheel, and adjusting mechanism to adjust the tension of the spring.

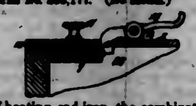


7. A sleigh-body combined with a drive-wheel connected to the forward end thereof with freedom of upward movement, a spring device, substantially as described, to press said wheel down toward the runners, extending backward toward the rear of the sleigh, and power-transmitting devices journaled upon the same support as the wheel, but above it, and having freedom of upward movement with it, to rotate said drive-wheel.

383,402. PLOW-POINT. ISAAC J. MARTIN, Henry Grove, Tex. Filed June 9, 1887. Serial No. 240,770. (No model.)

Claim.—The combination, with the double mold-board A, rigidly fixed to the curved beam B in the rear of the lower end thereof, of the point D, having symmetrical corners *d*, and legs *e*, adapted to pass beneath the front edge of said mold-board and prevent rocking of the point upon the beam, to which alone it is attached, and bolts E, securing said point in position.

383,403. MACHINE FOR ROLLING FLANGED EYELETS. ALBERT G. MEAD, Boston, Mass., assignor to the International Fastening Company, Portland, Me. Filed Nov. 26, 1887. Serial No. 256,393. (No model.)



Claim.—1. In a machine for rolling flanged eyelets, the combination of a stationary plate, a revolving circular plate let into the surface of said stationary plate and flush therewith, a circular die secured to said revolving plate, and a curved die adjustably secured to said stationary plate, whereby a flange-receiving space is left between said dies and the surfaces to which they are secured, all constructed, arranged, and operated substantially as and for the purposes described.

2. In a machine for rolling eyelets and other articles, the combination of a feeding device consisting of a drum provided with a discharge mechanism, substantially as described, with a revolving die, B, and a stationary die, F, whereby flanged eyelets or studs are automatically fed and rolled, substantially as set forth.

3. In a machine for rolling eyelets, a feeding device consisting of a drum provided with a revolving brush and a chute, substantially as described, in combination with the guide H', the stationary plate D, the revolving plate E, and the circular dies E and F, all constructed, arranged, and operated substantially as and for the purposes set forth.

383,404. SAD-IRON. WILLIAM HEMPEL, St. Louis, Mo. Filed Mar. 31, 1887. Serial No. 233,177. (No model.)

Claim.—In a self-heating sad-iron, the combination of the body, the lid, and a catch consisting of a sliding bolt provided with a stud working in a slot in the lid, a bracket on the under side of the lid perforated for the reception of said bolt, which latter engages a recess in the body, and a gravitating lock adapted to engage through a slot in the lid with the end of the bolt, substantially as set forth.

383,405. STEAM OR OTHER MOTOR. HERMANN MEMMINGER and ALBERT FRÖHLICH, Frankfort-on-the-Main, Prussia, Germany. Filed Apr. 6, 1886. Serial No. 197,948. (No model.) Patented in England Apr. 7, 1886, No. 4,899; in France Apr. 7, 1886, No. 176,388; in Belgium Apr. 7, 1886, No. 72,688; in Germany Apr. 8, 1886, Nos. 37,864 and 40,827, and July 10, 1886, No. 41,148, and Nov. 14, 1886, No. 41,921; in Italy June 30, 1886, No. 19,777, and June 30, 1887, No. 21,888, and in Austria-Hungary Sept. 13, 1886, No. 14,694 and No. 41,694.

Claim.—1. The combination of a slide-valve constructed and arranged to receive a longitudinal movement and an oscillating or lateral movement, a shaft, a movable eccentric or eccentric-pin arranged at an angle with reference to said shaft, and a rod connecting said eccentric or eccentric-pin and the valve, whereby the point of cut-off of the valve may be varied by a change in the position of the angle of the said eccentric or eccentric-pin, substantially as and for the purpose herein set forth.

2. The combination of a slide-valve constructed and arranged to receive a longitudinal and an oscillating or lateral movement, a shaft, an eccentric or eccentric-pin carried by said shaft at an angle or inclination thereto, a rod connecting said eccentric or eccentric-pin, and the valve and mechanism for varying the position of the inclined eccentric or eccentric-pin to vary the point of cut-off of the valve, substantially as and for the purpose herein set forth.

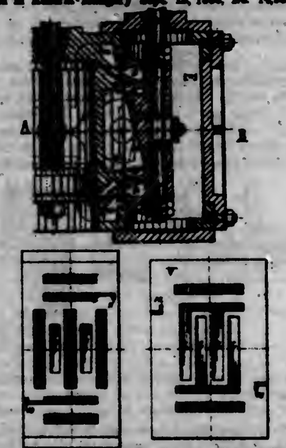
3. The combination of a slide-valve constructed and arranged to receive a longitudinal and an oscillating or lateral movement, a shaft, an eccentric or eccentric-pin carried by said shaft at an angle or inclination thereto, a rod connecting said eccentric or eccentric-pin with the valve, a governor and devices connecting the same with the eccentric or eccentric-pin to automatically vary the position of the inclined eccentric or eccentric-pin in order to automatically vary the point of cut-off of the valve, substantially as and for the purpose herein set forth.

4. The combination of a valve-seat provided with steam and exhaust ports and with cavities *f* and passages *d*, a slide-valve having transverse covered passages *a* and *b* and longitudinal passages *c* and *e*, and mechanism for communicating longitudinal and transverse movements to the said slide-valve, substantially as and for the purpose herein set forth.

5. The combination of a slide-valve, a revolving shaft, an eccentric or eccentric-pin revolving with the said shaft and mounted at an inclination to the same, and a rod pivotally connected to the said eccentric or eccentric-pin and to the slide-valve, so that the said valve receives longitudinal and transverse movements, substantially as and for the purpose herein set forth.

6. The combination of a valve-seat provided with steam and exhaust ports and with cavities *f* and passages *d*, a slide-valve having transverse covered passages *a* and *b* and longitudinal passages *c* and *e*, a revolving shaft, an eccentric or eccentric-pin revolving with the said shaft and mounted at an inclination to the same, and a rod pivotally connected to the said eccentric or eccentric-pin and to the slide-valve, so that the said valve receives longitudinal and transverse movements, substantially as and for the purpose herein set forth.

7. The combination, in a valve-gear, of a revolving shaft having trunnions projecting from it at an inclination to its axis, and an eccentric or eccentric-pin pivoted on the said trunnions and adapted to transmit a longitudinal and an adjustable transverse movement to the valve, substantially as and for the purpose herein set forth.



8. The combination, in a valve-gear, of a revolving shaft, an eccentric or eccentric-pin mounted on the said shaft at an inclination to its axis, and a pin or device connecting the eccentric or eccentric-pin with the shaft, so that the position of the said inclined eccentric or eccentric-pin may be varied, substantially as and for the purpose herein set forth.

9. The combination of a slide-valve, a revolving shaft, an eccentric or eccentric-pin mounted on the said shaft at an inclination to its axis, a pin or device connecting the eccentric or eccentric-pin with the shaft, so that the position of the said inclined eccentric or eccentric-pin may be varied, a rod pivotally connected to the eccentric or eccentric-pin and to the slide-valve, so that the said valve receives longitudinal and transverse movements from the eccentric or eccentric-pin, and a speed-governor connected to the eccentric or eccentric-pin for automatically varying its inclination and the transverse movement of the valve, substantially as and for the purpose herein set forth.

10. The combination of a slide-valve, a revolving shaft provided with the spherical portion S' and slot *s*, an eccentric mounted on the said spherical portion at an inclination to the axis of the shaft and provided with the conical beveled face *w*, the pin *p*, connecting the eccentric with the slot in the shaft, a rod pivotally connected to the eccentric and to the slide-valve, the eccentric-disk W, having the pinion *f* secured to it, and a governor connected to the said pinion for automatically varying the position of said inclined eccentric and the transverse movement of the valve without altering its longitudinal movement, substantially as and for the purpose herein set forth.

11. The combination, in a valve-gear, of a revolving shaft, an eccentric or eccentric-pin mounted on said shaft at an inclination thereto and adapted to transmit longitudinal and transverse movements to the valve, and mechanism connected to the eccentric for changing the position of its center and of its inclination, so that the direction of the movements transmitted by it to the valve may be reversed, substantially as and for the purpose herein set forth.

383,406. VALVE FOR STEAM OR OTHER MOTORS. HERMANN MEMMINGER and ALBERT FRÖHLICH, Frankfort-on-the-Main, Prussia, Germany. Filed Apr. 26, 1887. Serial No. 236,132. (No model.) Patented in England Apr. 7, 1886, No. 4,899; in France Apr. 7, 1886, No. 176,388; in Belgium Apr. 7, 1886, No. 72,688; in Germany Apr. 8, 1886, Nos. 37,864 and 40,827, and Dec. 14, 1886, No. 41,921, and May 27, 1887, No. 41,878; in Italy June 30, 1886, No. 19,777, and June 30, 1887, No. 21,888, and in Austria-Hungary Sept. 13, 1886, No. 14,694 and No. 41,694.

Claim.—1. A valve constructed and arranged to receive combined longitudinal and lateral movements, having main ports to govern the admission of steam to the cylinder by one motion of the valve and to govern the cut-off of steam by the other motion thereof, and a valve-seat having main ports arranged to act in conjunction with the main ports of the valve, substantially as described.

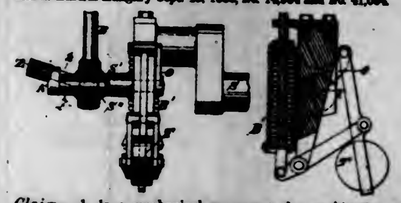
2. A valve constructed and arranged to receive combined longi-

tudinal and lateral movements, having main ports to govern the admission of steam to the cylinder by one motion of the valve and to govern the cut-off of steam by the other motion thereof, and having adjunctive ports or passages 12 13, a closed valve-chest external to said valve, and a valve-seat having main and adjunctive ports or passages 10 11, arranged to act in conjunction with the main and adjunctive ports or passages of the valve, the whole in combination and for operation, substantially as and for the purpose herein set forth.

388,407. MECHANICAL MOVEMENT. HERMANN MOSSNER and ALBERT PFLUGER, Frankfort-on-the-Main, Prussia, Germany. Filed Feb. 13, 1888. Serial No. 263,787. (No model.) Patented in England Apr. 7, 1886, No. 4,850; in France Apr. 7, 1886, No. 176,889; in Germany Apr. 8, 1886 No. 40,837, and Dec. 14, 1886, No. 41,821; in Belgium Apr. 7, 1886, No. 73,682; in Italy June 30, 1886, No. 19,777, and June 30, 1887, No. 21,502, and in Austria-Hungary Sept. 13, 1886, No. 14,904 and No. 41,064.

Claim.—1. A valve-gear mechanical movement comprising a shaft, in combination with an eccentric, carried thereon and arranged at an angle or inclination thereto, substantially as and for the purpose herein set forth.

2. In a mechanical movement, the combination, with a shaft, of a movable inclined eccentric and mechanism for varying the position of said eccentric, substantially as and for the purpose herein set forth.



3. In a mechanical movement, the combination, with a shaft, of a movable inclined eccentric, an independent crank, and mechanism connecting said crank and eccentric to vary and control the position of the inclined eccentric, substantially as and for the purpose herein set forth.

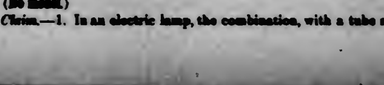
4. In a mechanical movement, the combination of the following elements, to wit: a shaft, a movable inclined eccentric carried by said shaft, a speed-governor, and mechanism for transmitting motion from said governor to said eccentric, substantially as and for the purpose herein set forth.

5. In a mechanical movement, the combination, with a shaft, of a movable inclined eccentric carried by said shaft, an independent crank, a lever or levers connecting said crank with said eccentric, a speed-governor, and mechanism connecting said governor with said crank, substantially as and for the purpose herein set forth.

6. In a mechanical movement, the combination, with a shaft, of a movable inclined eccentric carried by said shaft and provided with an arm, *l*, and an independent crank connected with the extremity of said arm, substantially as and for the purpose herein set forth.

388,408. VALVE-GEAR. HERMANN MOSSNER and ALBERT PFLUGER, Frankfort-on-the-Main, Prussia, Germany. Filed Feb. 13, 1888. Serial No. 263,787. (No model.) Patented in England Apr. 7, 1886, No. 4,850; in France Apr. 7, 1886, No. 176,889; in Germany Apr. 8, 1886 No. 40,837, and Dec. 14, 1886, No. 41,821; in Belgium Apr. 7, 1886, No. 73,682; in Italy June 30, 1886, No. 19,777, and June 30, 1887, No. 21,502 and in Austria-Hungary Sept. 13, 1886, No. 14,904 and No. 41,064.

Claim.—1. In a mechanical movement, the combination of a wrist arranged eccentric to its axis of motion, a rod connected with said wrist to receive a longitudinal to-and-fro movement therefrom, and an eccentric-pin arranged at an angle to said wrist to give a transverse, lateral, or oscillating movement to the said rod during the longitudinal to-and-fro movement thereof, substantially as and for the purpose herein set forth.



2. In a mechanical movement, the combination of a wrist arranged eccentric to its axis of motion, a rod connected with said wrist to receive a longitudinal to-and-fro movement therefrom, an eccentric-pin arranged at an angle to said wrist to give a transverse, lateral, or oscillating movement to the said rod during the longitudinal to-and-fro movement thereof, and a device for changing the position of the eccentric-pin, substantially as and for the purpose herein set forth.

3. In a mechanical movement, the combination of a wrist arranged eccentric to its axis of motion, a rod connected with said wrist to receive a longitudinal to-and-fro movement therefrom, an eccentric-pin arranged at an angle to said wrist to give a transverse, lateral, or oscillating movement to the said rod during the longitudinal to-and-fro movement thereof, and a crank or arm connected with said eccentric-pin to actuate or change the position of the same, substantially as and for the purpose herein set forth.

4. In a mechanical movement, the combination of a wrist arranged eccentric to its axis of motion, a rod connected with said wrist to receive a longitudinal to-and-fro movement therefrom, an eccentric-pin arranged at an angle to said wrist to give a transverse, lateral, or oscillating movement to the said rod during the longitudinal to-and-fro movement thereof, and a speed-governor to control the movement of said eccentric-pin, substantially as and for the purpose herein set forth.

5. In a mechanical movement, the combination of a wrist arranged eccentric to its axis of motion, a rod connected with said wrist to receive a longitudinal to-and-fro movement therefrom, an eccentric-pin arranged at an angle to said wrist to give a transverse, lateral, or oscillating movement to said rod during the longitudinal to-and-fro movement thereof, a crank or arm connected with said eccentric-pin to actuate or change the position of the same, and a speed-governor to control the movement of said eccentric-pin, substantially as and for the purpose herein set forth.

388,409. RUNNING-GEAR FOR VEHICLES. THEODORE C. MUSE, Toledo, Ohio, assignor of one-half to Warren Henry Eldridge and Franklin Hubbard, same place. Filed Sept. 13, 1887. Serial No. 249,603. (No model.)

Claim.—In a vehicle running-gear, metal axles formed with a longitudinal opening upon their lower sides, in combination with a packing placed within the longitudinal opening and against the upper web, with spindles bearing against the packing and held in a firm relation thereto by clips embracing the axle and spindle, as and for the purpose set forth.

388,410. JOURNAL-BOX. JOSEPH H. HOSMAN, Springfield, Ohio, assignor of one-half to the Thomas Manufacturing Company, same place. Filed Sept. 30, 1887. Serial No. 251,104. (No model.)

Claim.—1. In a journal-box, the combination, with the box proper, of a compressible bearing-sleeve fitted therein and supports therefor, and on which it is universally adjustable, one at least of said supports being inwardly adjustable so as to compress said sleeve.

2. In a journal-box, the combination, with the box proper and supports projecting into the interior thereof, one at least of which is inwardly adjustable, of a bearing-sleeve having an exterior recess and a channel with which the respective supports engage, and an incision through the wall thereof, whereby it is compressible.

3. In a journal-box, the combination, with the box proper having a radial slot or opening in a fixed wall thereof whose width is greater than the diameter of the shaft to be used in said box, whereby the shaft may be introduced and removed from the box sidewise to its axis, and supports projecting through the wall of said box and into the interior thereof, of a bearing-sleeve of less diameter than the interior of said box, mounted therein upon said supports and universally adjustable on them, and arranged to be introduced into and removed from said box at either side in a longitudinal direction, so as to slip over and off the shaft already within the box, for the purpose set forth.

4. In a journal-box, a compressible bearing-sleeve composed of a cylindrical body, through the wall of which an incision is made, and having a recess in the outside of the wall to one side of the incision, and a longitudinal channel in the outside of the wall at a point diametrical to the recess.

388,411. ELECTRIC LAMP. ELI C. OSMAN, New York, N. Y., assignor, by mesne assignments, to the Osmant-Hermann Electric Lighting Company, of New York. Filed Mar. 6, 1886. Serial No. 194,362. (No model.)

Claim.—1. In an electric lamp, the combination, with a tube surrounded by a helix, of a carbon-holding rod sliding in said tube and provided at its upper end with a head, and of a stop on the lower end of the tube to prevent the head passing out of the tube, the rod forming the core of the solenoid, substantially as shown and described.

388,411.

2. In an electric lamp, the combination, with a globe and mechanism for holding and regulating the upper carbon, of the socket *m* for the lower carbon, the ball *m'*, on which the socket *m* is fastened, the plate *n*, having the neck *n'*, the rod *p*, passed through said neck, the washer *r*, through which the rod *p* is passed, and the nut *s*, screwed on the lower end of said rod *p*, substantially as shown and described.

3. In an electric-arc lamp, the combination of a helix formed of the wire through which the entire lighting-current is conducted, said wire being provided with an insulating-covering, with an iron rod within the bore of said helix, which rod is the upper-carbon holder, and of a wire connecting the wire forming the helix with the above-mentioned carbon-holding rod, the current passing from the wire of the helix through said connecting-wire to the upper carbon, substantially as shown and described.

388,412. COAL-SIFTER. FRANCIS H. PERRY, Philadelphia, Pa., assignor to Charles J. Webb and Maggie Hughes Perry, both of same place. Filed Apr. 9, 1887. Serial No. 234,203. (No model.)

Claim.—A coal or ash sifter comprising a casing, a diaphragm having an opening through it and dividing said casing into a charging and a discharging compartment, the latter provided with an external vent or discharge opening, a reciprocating sieve and an ash drawer in the receiving compartment, and a deflector in the discharging compartment, substantially as set forth.

388,413. JOINT FOR CEMENT-LINED PIPES. EDWARD H. PHIPPS, New Haven, Conn. Filed June 16, 1888. Serial No. 276,909. (No model.)

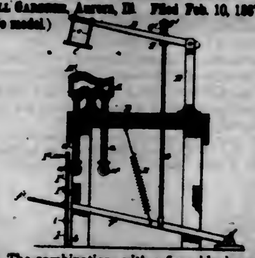
Claim.—A folded sheet-metal cement-lined shell having in each end a rigid cement-lined ring, each provided with a sleeve closely fitting into the shell in direct contact therewith, a shoulder virtually corresponding in depth to the thickness of the shell against which it abuts, and an end adapted to form one member of a water-tight universal joint, the two rings of each shell being concaved and convexed, respectively, substantially as set forth.

388,418.

388,414. SASH-BALANCE. THORNELL G. RUSSELL, St. Louis, Mo. Filed Jan. 3, 1888. Serial No. 259,542. (No model.)

Claim.—The combination of a window-frame, two spiral springs coiled in opposite directions, each of which is fastened at one end to the window-frame, while its other end is fastened to the spindle of a spur-wheel, one of said springs being placed in tension while the other is relaxed, with a window-sash having a toothed rack, substantially as described, and for the purpose specified.

388,415. LAMP-SHADE HOLDER AND SHADE. GEORGE E. SPENCER, Fitchburg, Mass., assignor of one-half to William M. Copeland, same place. Filed Apr. 23, 1887. Serial No. 236,021. (No model.)



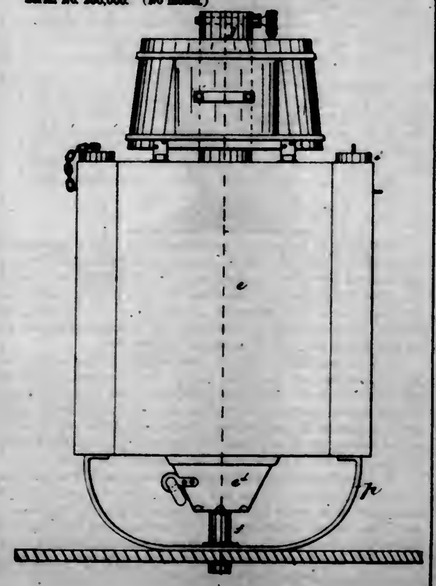
Claim.—1. A lamp-shade holder consisting of a collar adapted to encircle and be secured to the neck of a lamp, and an arm extending out from said collar, in combination with a vertical rod or standard adjustably supported on said arm, and two rings for supporting the lamp-shade, each adjustably supported on said rod and each adapted to be moved up or down or swung around thereon, for the purpose stated, substantially as shown and described.

2. In a lamp-shade holder, the combination, with a collar, D, an arm, *b*, extending out therefrom, and the rod or standard E, adjustably supported in the outer end of said arm, of the ring F, an arm, *c*, secured thereto and extending toward the center thereof, and adjustably supported at its inner end upon the rod E and the ring G, and an arm, *h*, extending out therefrom and adjustably supported at its outer end upon said rod E, substantially as shown and described.

3. The combination, with a collar, D, provided with a set-screw, *a*, arm *b*, extending out from said collar, and having a collar, *c*, and set-screw *b* at its outer end, and the rod E, adjustably supported in said collar *c* by means of set-screw *b*, of the ring F, an arm, *c*, secured thereto and extending toward the center of said ring, said arm *c* having a collar and set-screw at its inner end for adjustably supporting

said arm and the ring F on the rod B, and the ring G, and an arm, A, secured thereto and extending out therefrom, said arm A having a collar and set-screw at its outer end for adjustably supporting said arm A and the ring G upon the rod B, all constructed and arranged substantially as shown and described.

388,416. APPARATUS FOR SHAPING CORSETS. JAMES STOUT and MARSHALL GARDNER, Aurora, Ill. Filed Feb. 10, 1887. Serial No. 227,289. (No model.)



Claim.—1. The combination, with a form-block and two vertically-movable spring-clamps or clamp-bars located normally above the form-block and adapted to engage the latter when depressed, of a pivoted arm sustaining said clamp-bars, a treadle connected with the arm for depressing the latter and forcing the clamp-bars into engagement with the form-block, and a spring connected with the treadle for lifting the arm and clamp-bars, as set forth.

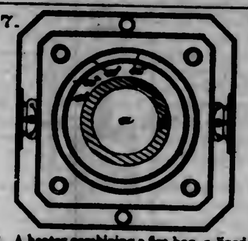
2. The combination, with a form-block and two spring-clamps or clamp-bars, of a pivoted arm sustaining said clamp-bars, a treadle, a rod attached to the treadle and having sliding connection with the arm, and a spring engaged with the said rod and the arm, whereby a yielding pressure is applied to the latter, substantially as described.

3. The combination, with a form-block and two vertically-movable spring-clamps or clamp-bars located normally above said form-block and adapted to engage the latter when depressed, of a pivoted arm, D, supporting said clamps, a treadle, F, a rod, G, connecting the treadle with said arm, a spring applied to hold the free end of the arm at the upward limit of its movement, and a detent, I, constructed to engage the said treadle, substantially as described.

4. The combination, with a form-block and two spring-clamps or clamp-bars, of a movable support for said clamps, a treadle connected with said support, a spring applied to lift the said support, and a spring detent-lever, I', provided with a notch, *i*, at its lower end for engagement with said treadle, substantially as described.

388,417. CAR-HEATER. CHARLES R. STRUCK, Newark, N. J., assignor of one-half to John A. Baldwin, same place. Filed Apr. 16, 1887. Serial No. 235,009. (No model.)

Claim.—1. In a sewing-machine, a rock-shaft and an arm, E, on said shaft and in the head of the machine, in combination with the needle-bar connected with the arm, a slotted link-connection between the presser-bar and arm, said link being formed in a continuous piece, a collar loosely mounted on the presser-bar, and a set-screw adjustably securing said collar to determine the movement of the presser-bar or to disconnect said collar from the presser-bar, substantially as described.



2. In a sewing-machine, the rock-shaft and an operating-arm having projecting pins *e* and *g*, in combination with the needle and presser bars, a link, F, connecting the needle-bar with the operating-arm, a collar, *d*, loosely mounted on the presser-bar and having the pin *f*, a link, G, having an elongated slot, H, within which the pin *g* travels, and an adjusting-screw, *c*, substantially as herein described.

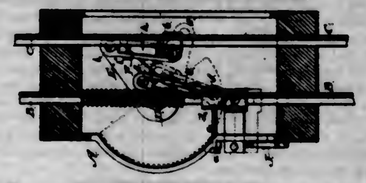
3. In a sewing-machine, the combination, with the rock-shaft having an arm, E, as described, of the presser-bar and a link, G, connecting the presser-bar with the arm on the shaft, said link having the elongated slot H, and the screws passing through the slider to compensate for wear, substantially as herein described.

4. In a sewing-machine, the combination, with the needle-bar and its actuating mechanism, of the link F, formed in a continuous piece, having the inner portions of its hubs split or slotted, its side portions separated from each other, and the screws engaging the sides to take up the wear in the hubs, substantially as herein described.

5. The combination, with the presser-bar, the rock-shaft, and the arm E on said shaft, of the link G, formed in a continuous piece and having an elongated opening or slot engaging a pin on said arm, substantially as described.

388,417.

Claim.—1. A heater combining a fire-box, *c*, lined with fire-brick, flange *d*, to protect said brick from water, air-chambers *c*², and water-tank *e*, having communication with said fire-box, substantially as set forth.



2. A heater combining a fire-box, water-tank, passages *e*, openings *d'*, and heat-chamber *c*², provided with walls perforated, as at *c'*, substantially as and for the purposes set forth.

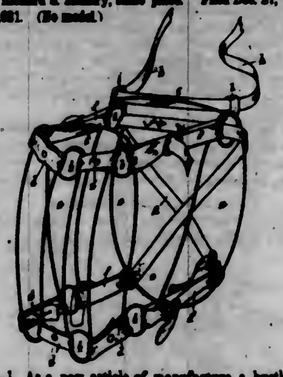
388,418. COOKING-STOVE. JAMES STRONG, New York, N. Y. Filed June 18, 1887. Serial No. 241,713. (No model.)

Claim.—The combination of a stove-body comprising a water-tank, a fire-pot disposed centrally within said tank, a top plate provided with a central opening opposite the fire-pot and with openings opposite the tank, and a roasting-chamber at the top of the fire-pot below said top plate, substantially as described.

388,419. SEWING-MACHINE. CHARLES E. TISDEL, Chicago, Ill. Filed Aug. 30, 1886. Serial No. 212,174. (No model.)

Claim.—1. As a new article of manufacture, a bustle formed of convoluted spring-wire in vertical loops with re-entering coils in the angles of the loops, and the flexible and adjustable straps, *articulos*, secured in the coils and connecting the loops, substantially as described.

2. As a new article of manufacture, a bustle formed of convoluted spring-wire in vertical loops with re-entering coils in the angles of the loops, the flexible and adjustable straps, *articulos*, connecting the loops, the cross-buckle strap at the base of the bustle, and arched spring-wire top brace, substantially as described.

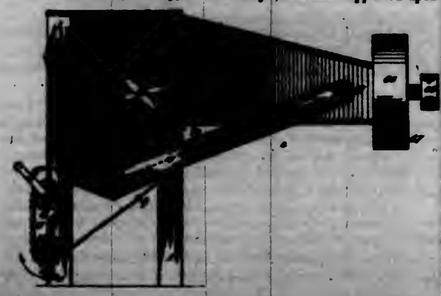


388,420. EXPLOSIVE COMPOUND. CARL W. VOLNEY, Troll's River, N. J., assignor to Andrea S. Finch, New York, N. Y. Filed Nov. 3, 1887. Serial No. 254,161. (No specimens.)

Claim.—1. An explosive compound consisting of a mixture of charcoal and an oxidant, as nitrate of sodium, with which is combined starch in about the proportions named, and forming an absorbent granular powder, together with nitro-glycerine absorbed by the powder granules, said granules being maintained as such and constituting a granular powder after said absorption of nitro-glycerine, and adapted for use in such granular form, substantially as described.

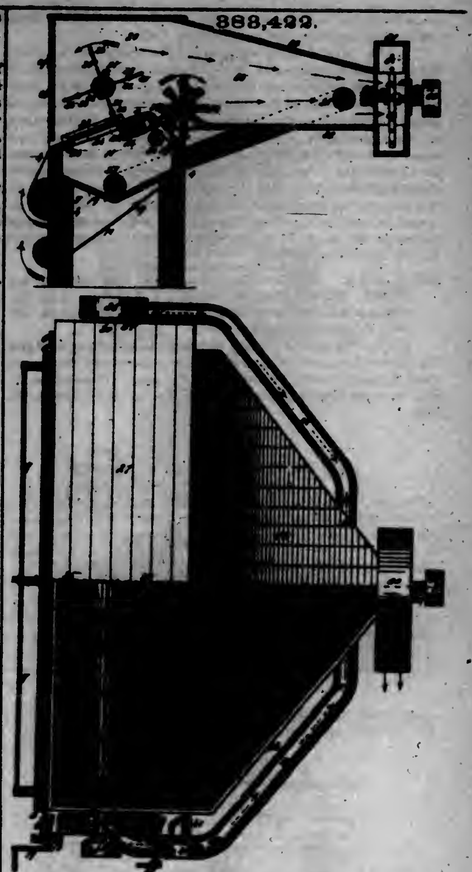
2. As an article of manufacture, an absorbent granular powder composed of charcoal, an oxidant, as nitrate of sodium and starch, combined in about the proportions and in the manner specified, and constituting a powder the granules of which are cellular or honeycombed in structure, and adapted to absorb nitro-glycerine and to maintain their granular form after such absorption, as set forth.

3. In the manufacture of an explosive compound, the process of producing a granular powder, which consists in combining starch dissolved and boiled in water as a paste, in about the proportions named, with the gas-producing ingredients of black powder—as, for example, charcoal and an oxidant, as sodium nitrate—and then evaporating the water of the paste from the mass, whereby when the dried mass is granulated the resulting granular powder will consist of granules which are cellular or honeycombed in structure, and which are adapted to absorb nitro-glycerine and will maintain their granular form subsequent to such absorption, as set forth.



388,421. BUSTLE. ALBIS WEISS, Detroit, Mich., assignor of one-half to Richard S. Mallory, same place. Filed Dec. 27, 1887. Serial No. 259,021. (No model.)

Claim.—1. As a new article of manufacture, a bustle formed of convoluted spring-wire in vertical loops with re-entering coils in the angles of the loops, and the flexible and adjustable straps, *articulos*, secured in the coils and connecting the loops, substantially as described.



2. As a new article of manufacture, a bustle formed of convoluted spring-wire in vertical loops with re-entering coils in the angles of the loops, the flexible and adjustable straps, *articulos*, connecting the loops, the cross-buckle strap at the base of the bustle, and arched spring-wire top brace, substantially as described.

388,422. CARPET-CLEANER AND DUST-CONVEYER. HENRY A. WISMAR, Jr., St. Louis, Mo. Filed July 2, 1887. Serial No. 243,217. (No model.)

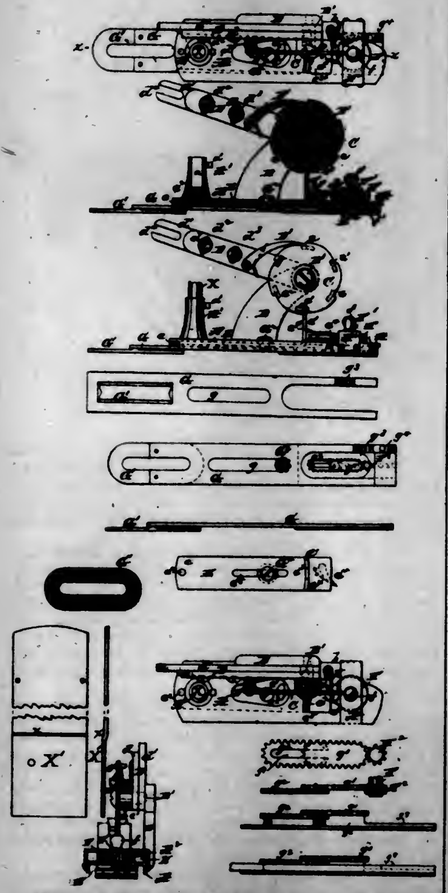
Claim.—1. In a carpet-cleaning machine, the combination of the two reels from and upon which the carpet is respectively unwound and wound, an upper and lower casing containing the upper and lower dust-chambers, respectively, a reciprocatory bed-frame supported upon

388,422.

the lower casing, provided with a screened opening over which the carpet passes, a revolvable shaft having thereon rope-beaters adapted to beat the carpet above said screened opening, a revolvable shaft provided with bristles adapted to brush the loosened dirt from the carpet, and suitable means for operating the reels and shafts, substantially as set forth.

2. In a carpet-cleaning machine, the combination of the casing over which the carpet is adapted to be passed, a beater, a frame pivoted within an opening in the casing and provided with a screen secured within its sides, a brush adapted to operate above the opening, and means for adjusting the frame within the opening relatively to the brush and the carpet, consisting of a shaft provided with eccentrics adapted to bear upon the frame, and means for securing said shaft when turned in one or the other direction, substantially as and for the purpose set forth.

3. In a carpet-cleaning machine, the combination of the casing over which the carpet is adapted to be passed, a frame pivoted within an opening in the casing and provided with a screen secured therein, a revolvable brush above said opening in the casing, a shaft mounted in the casing and provided with a crank at one end outside of the casing, eccentrics fixed to the shaft and adapted to engage said frame, an arm rigidly attached to the crank end of the shaft, provided with a projection adapted to engage any one of a series of holes in the casing, whereby the eccentrics are held in any desired position against the frame, substantially as set forth.



4. In a carpet-cleaning machine, the combination of the upper casing, the lower casing provided with openings over which the carpet is adapted to be passed, the beater and brush mounted in the upper casing above said openings, an extension-casing connecting with the upper casing, dust tubes or pipes communicating with the lower dust-casing and the forward part of said extension-casing, and a fan-case secured to the end of said extension-casing, provided with a rotary

fan, whereby the dust is exhausted from both the upper and lower casings simultaneously, substantially as set forth.

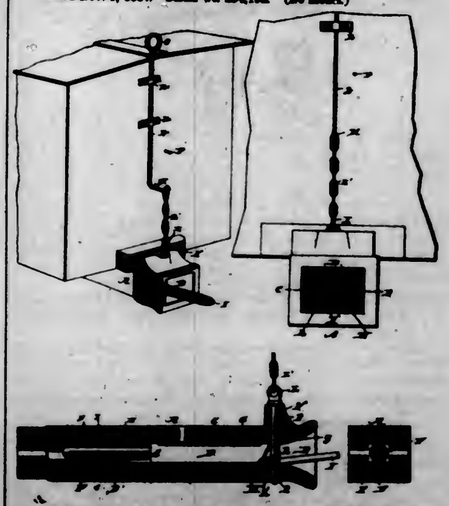
5. In a carpet-cleaning machine, the combination of the rotary beater, on the shaft of which is rigidly secured the band-wheel 36, that drives the machine, and the band-wheel 42, that, with the band-wheel 43 on the shaft of the rotary brush, co-operatively carries the endless belt 44, arranged to drive the beater and brush simultaneously, and the rotary fan 61, running on its shaft 62, and driven by the band-wheel 66 on said shaft, and producing an exhaust from the dust-chamber 18 below the carpet through the dust-tubes 57, and from the dust-chamber 20 above the carpet through the extension dust-chamber 55, that connects the chamber 20 with the case 60 of the rotary fan, arranged to draw the dust from the carpet as it is cleaned and discharge it through the mouth 67 of the fan-case, substantially as described, and for the purpose set forth.

383,423. BUTTON-HOLE ATTACHMENT FOR SEWING-MACHINES. HENRY J. WILLIAMS, New York, N. Y., assignor to the Harris Button Hole Attachment Company, same place. Filed May 24, 1887. Serial No. 238,302. (No model.)

Brief.—The main or primary operating-cam consists of small cam wipers or wedges placed alternately upon opposite sides of the ratchet-wheel operated directly from the needle-bar lever. These wipers engage upwardly-projecting portions of the vibrating lever to vibrate the same.

Claim.—1. The combination of the frame-plate, the feed-plate, the rack secured thereon, a pinion mounted in the frame-plate, the driving-wheel having ratchet-teeth in its periphery, and cams or wipers alternately set upon its opposite sides, a lever vibrated by the driving-wheel, connections between the lever and the feed-plate for giving the latter a vibrating movement, and connections between the lever and pinion that engage with the rack for giving the feed-plate a longitudinal movement, substantially as set forth.

2. The combination of the frame-plate, the driving-wheel having teeth in its periphery, and cams or wipers alternately set upon its opposite sides, the vibrating lever in operative connection with the driving-wheel, a pinion mounted on the frame-plate operatively connected with the vibrating lever, the rack on the feed-plate with which the pinion meshes, and connections between the vibrating lever and the feed-plate for giving the latter a vibrating motion, substantially as set forth.



3. The combination of the frame-plate, the feed-plate, the driving-wheel, means for rotating it, the vibrating lever operated by the driving-wheel, the rack secured on the feed-plate, the pinion with which it meshes, the ratchet-wheel rigidly connected with the pinion and operatively connected with the vibrating lever, and a handle or knob for withdrawing the pinion from engaging with the rack, substantially as set forth.

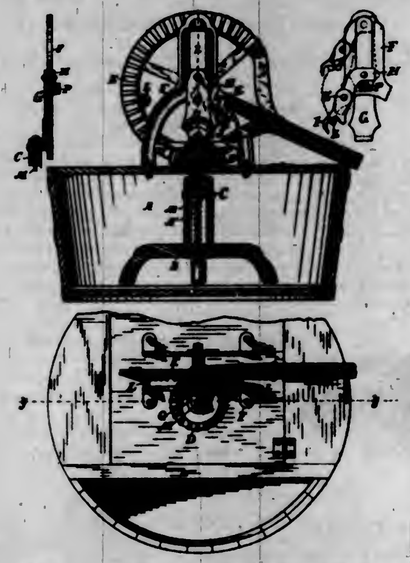
4. The combination of the frame-plate, the feed-plate, the driving-wheel, means for rotating it, the vibrating lever operated by the driving-wheel, the pawl on the end of said lever, the ratchet-wheel with which it engages, the pinion rigidly secured thereto, the rack on the feed-plate with which the pinion engages, and an adjustable gage that regulates the movement of the pawl on the end of the vibrating lever, substantially as set forth.

5. The combination of the frame-plate, the feed-plate, the driving-wheel mounted on the frame-plate and having teeth in its periphery and cam-shaped lugs or wipers on its opposite sides, a lever pivoted to the frame-plate and having a slotted upright extension in which the driving-wheel works, and a backwardly-extending arm carrying a pawl, the ratchet-wheel with which said pawl engages, the pinion secured thereto, the rack secured to the feed-plate with which the pinion meshes, and the securing-pin G^3, extending through slots in the feed-plate and the vibrating lever and adjustable therein, substantially as set forth.

6. The combination of the button-hole attachment herein described, the bed-plate of a sewing-machine, and the removable throat-plate X', having a transverse offset at *x* to form a cover for the ordinary feeding mechanism of the sewing-machine, substantially as set forth.

383,424. CAR-COUPLING. ELIAS R. YARNES, Rockwood, Tenn. Filed Nov. 3, 1887. Serial No. 254,192. (No model.)

Claim.—1. In a car-coupling, the combination, with the draw-head A, of the spring-actuated follower D, operating therein and having a shoulder, *h*, on the front end, the pressure-spring G on the upper side of the follower and bearing against the upper side of the opening in the draw-head, and the link adapted to be engaged at the rear end under the shoulder *h*, as and for the purpose hereinbefore specified.



2. In a car-coupling, the combination, with the draw-head having a recess or slot, C, therein, provided at the front end on the lower side with an upwardly and outwardly beveled portion, *k'*, of the spring-actuated follower D, operating in the recess C, and having a shoulder, *h*, on the front end to pass over the coupling-link, and the spring G on the upper side of the follower, adapted to press the front end of the same down to hold the end of the link depressed, substantially as and for the purpose specified.

3. In a car-coupling, the combination, with the draw-head having a recess or slot, C, therein, and the shoulder *g* on the upper side of the said recess at the front end, of the spring-actuated follower D in the draw-head, having the leaf-spring G on the upper side to bear against the upper side of the recess C and engage the shoulder *g*, to limit the forward motion of the follower, all arranged substantially as specified.

4. In a car-coupling, the combination, with draw-head A, of the coupling-pin K, the vertically-movable uncoupling-rod N, having the horizontal arm M, the chain or other flexible connection between the said pin and the horizontal arm M, and the stud or stop P on the end of the car, adapted to be engaged by the said horizontal arm when the coupling-pin is elevated, substantially as specified.

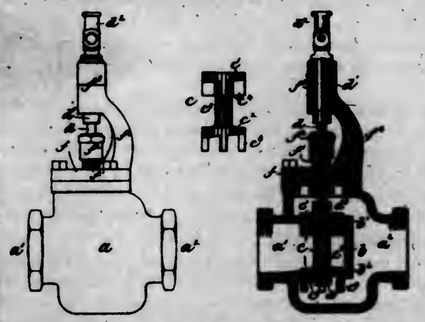
5. In a car-coupling, the combination, with the recessed draw-head having a shoulder, *g*, of the follower operating in the draw-head and carrying a spring which bears against the said shoulder when the follower is in its extended position, substantially as specified.

383,425. WASHING-MACHINE. SOLAH F. GLIDDEN, Grand Rapids, Mich., assignor, by mesne assignments, to the Michigan Washing Machine Company, same place. Filed May 26, 1887. Serial No. 239,191. (No model.)

Claim.—1. In a washing-machine of the class described, a revolvable and vertically-adjustable stirrer or rub-block, in combination with a vertically-placed segmental gear engaging with the pinion on the shaft of the stirrer, a pin or stud upon such segmental gear, and a plate attached to the stirrer, said plate having attached thereto the jointed arm H I, with which arm the stud or pin engages and thereby raises the stirrer, substantially as and for the purpose described.

2. In a washing-machine of the class named, the combination of the tub or vessel A, the stirrer B, vertically adjustable, the bellow shaft C, spring N, pinion D, segmental gear E, provided with the pin L, plate G, the arm H, the hooked arm I, and the rod M, and the standard F, substantially as described.

383,426. FLUID-PRESSURE REGULATOR. WILLIAM B. MASON, Boston, Mass., assignor to the Mason Regulator Company, same place. Filed Nov. 9, 1885. Serial No. 182,253. (No model.)

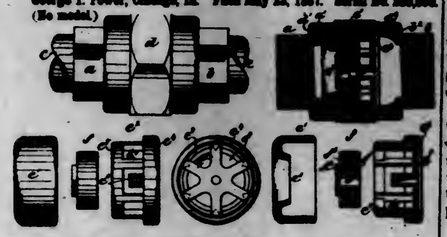


Claim.—1. In a fluid-pressure regulator, a piston and cylinder therefor, the said piston being constantly acted upon on one side by fluid-pressure, said provided with a small passage, through which the fluid passes into the cylinder at the other side of the said piston, combined with an exhaust-passage from the said cylinder, a secondary valve consisting of a rod having a longitudinal movement in a socket, and provided with a circumferential groove, the said valve controlling the said exhaust-passage, which intersects the said socket, and being actuated by a predetermined governing force and by an opposing variable pressure of a fluid in a pressure-chamber, substantially as described.

2. The main shell provided with a cylinder, and the cup-shaped piston working therein, combined with a bonnet for said cylinder having a sleeve-like projection passing down within the cylinder and piston, a pressure-chamber and diaphragm or equivalent therein, and a stem connected with the said diaphragm having a working fit in a passage in the sleeve-like projection, the said stem being provided with a valve controlling the exhaust of fluid from the said cylinder, substantially as described.

383,426.

383,427. GOVERNOR-VALVE. WILLIAM B. MASON, Boston, Mass., assignor to the Mason Regulator Company, same place. Filed Aug. 20, 1888. Serial No. 211,612. (No model.)



Claim.—1. The combination of the valve-shell provided with an inlet-chamber having opposite openings communicating with the outlet-chamber, and the valve consisting of two pistons having a working fit in the said openings, and a connecting portion between the said pistons, the faces of said pistons being inclined to their line of movement, as set forth, whereby a portion of the said pistons passes into or out from the openings controlled by them in advance of the remainder, substantially as and for the purpose described.

2. The combination of the valve-shell provided with an internal chamber having openings, and the bonnet provided with a bracket having a guide-passage, with a piston-valve having a working fit in the said openings in the valve-chamber, and a valve-stem loosely connected with the said valve and passing through the said bonnet and working in the guide-passage in the said bracket, substantially as described.

3. The combination of the valve-shell and valve with a valve-stem and coupling-piece provided with a longitudinal socket connected therewith by a hinge-joint transverse to the axis of the valve-stem, substantially as described.

383,428. COMBINED PIPE-COUPLING AND CHECK VALVE OR CHAMBER. WILLIAM T. MERRIMAN, Cambridge, Mass., assignor to George T. Power, Chicago, Ill. Filed May 23, 1887. Serial No. 238,602. (No model.)

Claim.—1. The combination of a pair of coupling-pieces and a co-operating coupling-nut with an independent chamber inclosed within the said coupling-nut and engaged at its ends by said coupling-pieces, being laterally removable from between said coupling-pieces without separating them, the said chamber consisting of two parts, one provided with an inwardly-projecting valve-seat and the other with a central valve-guide, and a valve inclosed within said parts and co-operating with said valve seat and guide, substantially as described.

2. The combination of a pair of coupling-pieces and a co-operating coupling-nut with an independent removable chamber engaged at its ends by said coupling-pieces and inclosed within the said coupling-nut, the said chamber being composed of a main part, *d*, having an internal valve-seat, and a valve-guiding part, *d*', composed of a ring, *d*', an open frame, *d*', a valve-guide, *d*', and a portion fitting within the said main portion *d*, substantially as and for the purpose set forth.

NORRIS PETERS

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

LYON *v.* THE PERIN AND GAFF MANUFACTURING COMPANY.

Decided April 16, 1888.

PLEA IN BAR.

The defendants pleaded in bar an adjudication and decree in their favor in a prior suit by the complainant against them for the same infringement, and put in evidence a copy of the decree. The complainant put in evidence a statement of the clerk of the court granting the decree, which statement was dated nearly two years after the decree was made, to the effect that no proof or testimony was filed in the suit by either party; that complainant did not appear nor was represented by counsel, and that the decree dismissing complainant's bill was granted on default of complainant.

1. THE RECORD OF THE COURT CONTROLS.

The court must look to the record, and not to the statement of the clerk of the court, made two years afterward.

2. A DECREE ABSOLUTE IN TERMS—EFFECT ON LATER LITIGATION.

A decree absolute in its terms is an adjudication of the merits of the controversy, and constitutes a bar to any further litigation of the same subject between the parties.

BARBALOCK—STIFFENER FOR BOOTS AND SHOES.

APPEAL from the Circuit Court of the United States for the District of Indiana.

Mr. William H. King for the appellant.

No counsel appeared for appellee.

Mr. Justice LAMAR delivered the opinion of the Court.

This is a suit in equity brought in the Circuit Court of the United States for the District of Indiana by Nelson Lyon against The Perin and Gaff Manufacturing Company, praying an injunction and damages for an alleged infringement of reissued Letters Patent No. 9,198, dated May 11, 1880, owned by complainant, for an improvement in metallic stiffeners for boot and shoe heels.

The bill of complainant, after the usual recitals necessary in a suit of this character, among other things, sets forth that before the commencement of this action—to wit, in September, 1881—complainant, having been informed and believing that the defendant was manufacturing an instrument which infringed said reissued Letters Patent, filed his bill in equity against the said defendant in the United States Circuit Court for the Southern District of Ohio, to restrain said defendant from further infringement; that the company appeared therein and answered, setting forth, among other things, the defense that said reissued Letters Patent was invalid for want of novelty in the invention, and was not granted in accordance with law, denying, also, that the instrument used infringed the said reissued Letters Patent, and denying that complainant was entitled to any of the relief therein prayed, to which answer complainant filed his replication; that the statutory time for taking testimony having expired, and an extension thereof not having been granted, and the complainant not having been able to get the proof of the infringement in time, no evidence of the facts, matters, or things alleged in his complaint was offered or taken, and upon the call of the case before the court, counsel for complainant not appearing, a decree was entered, dismissing the bill, and that none of the issues were tried, and no decision rendered on the merits thereof, the suit having been dismissed merely for want of prosecution.

The defendants interposed a plea that the prior adjudication and decree of the suit mentioned in said plea (which is the same suit set forth in said bill of complaint) is a bar to the present suit. The court below found the plea to be good and sufficient. Thereupon complainant filed his replication. The cause being at issue was referred to a master in chancery to take testimony, and to return the same into court with his conclusion of law thereon. Testimony was taken, and the master made and filed his report, in and by which said master concluded, as a matter of law, that the decree mentioned in said plea stands as an absolute adjudication of the rights of the parties upon the merits, and reported and found that the averments of the plea were sustained by the evidence. Exceptions to said master's report having been overruled by the court and the report confirmed, a decree was entered that the defendant's plea was well taken in law and sustained by the proofs, and the bill was dismissed. An appeal from this decree brings the case here.

The only material question for consideration is as to the effect of the decree of the Circuit Court of the United States for the Southern District of Ohio, rendered May 4, 1883, which is correctly found to be still in full force, as a bar to the prosecution of this suit.

It is well settled that, in order to render a matter *res adjudicata*, there must be a concurrence of the four conditions, viz: (1) *identity in the thing sued for;* (2) *identity of the cause of action;* (3) *identity of persons and parties to the action*, and (4) *identity of the quality in the persons* for or against whom the claim is made. (2 Bouv., 467.) All these elements or conditions exist in this case, as shown by the master's report, which was to the effect that the averments of said plea were sustained by the evidence; that there was no controversy as to the identity of the cause of action, or of the identity of the parties in the two suits; that the bill was sworn to by the complainant, and the answer was sworn to by the defendants, and the cause submitted in due course, and that the decree rendered in the suit pending in the court of Ohio was, as it professed to be, an absolute adjudication of the rights of the parties upon the merits, without any qualifying clause, and was conclusive of the rights attempted to be litigated in this case. The dispute, however, seems to be as to the *nature* of the former judgment—that is, whether it is a final judgment or decree. It is contended on the part of appellant that such judgment was merely one of *nos pros*—a decree entered by default—and is therefore not a bar to the prosecution of this suit. To sustain this view of the case he has recourse to a statement by the clerk of the Circuit Court of the United States for the Southern District of Ohio, (wherein the decree was rendered,) under his hand and seal, dated nearly two years after said decree was rendered, to the effect that no proof or testimony was filed in said cause in his office either for the complainant or the defendant; that at the time of the granting of said decree, May 4, 1882, the complainant did not appear, nor was he represented by counsel, and that said decree dismissing the complainant's bill was granted on default of the complainant. The decree itself is in the words and figures following, to wit:

The United States of America,
Western Division of the Southern District of Ohio, } *ss:*

At a stated term of the Circuit Court of the Western Division of the Southern District of Ohio, in the Sixth Judicial Circuit of the United States of America, begun and had in the court-rooms at the city of Cincinnati, Ohio, in said district, on the first Tuesday of April, being the fourth day of that month, in the year of our Lord one thousand eight hundred and eighty-two, and of the independence of the United States of America the one hundredth and sixth.

Present: The Hon. John Baxter, Circuit Judge, and Hon. Philip B. Swing, District Judge.

On Thursday, the fourth day of May, 1882, among the proceedings had were the following, to wit:

Nelson Lyon
vs. } 3180. In Equity.
The Perin and Gaff Manufacturing Co.

This cause coming on for hearing, and, being submitted to the court upon bill, answer, and replication, and having been duly considered, the court finds, adjudges, and decrees *that the equities are with the defendant;* that the bill of complaint be dismissed, and that defendant recover its costs, to be taxed.

This is the record to which the Court must look, and not to the statement of the clerk of the court, made two years afterward. This decree on its face is absolute in its terms, is an adjudication of the merits of the controversy, and therefore constitutes a bar to any further litigation of the same subject between the same parties. As was said by this Court in *Durant* v. *Essex Company*, (7 Wall., 107, 109:)

A decree of that kind, unless made because of some defect in the pleadings, or for want of jurisdiction, or because the complainant has an adequate remedy at law, or upon some other ground which does not go to the merits, is a final determination. Where words of qualification, such as "without prejudice," or other terms indicating a right or privilege to take further legal proceedings on the subject, do not accompany the decree, it is presumed to be rendered on the merits.

To the same effect see *Bigelow* v. *Windsor*, (1 Gray, 299, 301,) where it is said:

Sometimes, indeed, a party plaintiff in equity, who, because he is not prepared with his proofs, or for other reasons, desires not to go into a hearing, but rather to have his bill dismissed, in the nature of a discontinuance or non-suit in an action at law, may be allowed to do so; but we believe the uniform practice in such case is to enter "Dismissed without prejudice."

Likewise Cooper Eq. Pl., 270, as follows:

A plea in bar, stating a dismissal of a former bill, is conclusive against a new bill, if the dismissal was upon hearing, and if that dismissal be not, in direct terms, "without prejudice." (See, also, Story's Eq. Pl., sec. 798, and authorities there cited.)

The authorities to sustain this view of the case might be multiplied; but those cited are sufficient, and demonstrate the uniformity of the rule.

It is clear to this Court that the decree below dismissing the bill is in harmony with the law, and it is therefore affirmed.

Supreme Court of the United States.

FORNCROOK *v.* ROOT.

Decided April 23, 1888.

1. FORNCROOK—SECTIONAL HONEY-FRAMES.
Letters Patent No. 243,674, granted to James Forncrook, June 28, 1881, for an improvement in sectional honey-frames, adjudged to be invalid for lack of patentable novelty.
2. EQUIVALENT—WHAT IS NOT MECHANICALLY.
The claim of the patent embracing a longitudinal groove, the employment instead of pieces of wax is not a mechanical equivalent.

APPEAL from the Circuit Court of the United States for the Northern District of Ohio.

Mr. W. P. Wells for the appellant.
Messrs. M. D. & L. L. Leggett for the appellee.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity, brought in the Circuit Court of the United States for the Northern District of Ohio by James Forncrook against Amos I. Root, for the infringement of Letters Patent of the United States No. 243,674, granted to the plaintiff June 28, 1881, for an improvement in sectional honey-frames, on an application filed May 18, 1879.

The specification, claim, and drawings of the patent are as follows:

Be it known that I, JAMES FORNCROOK, of Watertown, in the county of Jefferson and State of Wisconsin, have invented certain new and useful improvements in Sectional Honey-Frames; and I do hereby declare the following to be a full, clear, and exact description of the invention, such as will enable others skilled in the art to which it appertains to make and use the same, reference being had to the accompanying drawings, and to letters of reference marked thereon, which form a part of this specification.

This invention relates to an improvement in sectional honey-frames, the object being to so construct them that they shall be stronger and in a more portable form than the frames now used for such purposes; and the invention consists, essentially, in forming the frame from a single blank or piece of material having all the necessary grooves and recesses required to form a complete frame cut in it, the ends of the blank being notched or dentated and angular grooves cut across it at those points which are to form the corners. These blanks, after being thus prepared, may be packed solidly in boxes or otherwise for transportation, and when required for use are bent into the square form and their ends united at one of the corners by means of the interlocking notches or teeth, thus forming a complete frame ready for use.

In the drawings, Figure 1 is a plan of one of the blanks, showing the various recesses and grooves with which it is supplied. Fig. 2 is an edge view of the blank, and shows the form and depth of the angular grooves which form the corners of the frame. Fig. 3 shows the blank bent into a square form with the ends united, making a complete frame ready for use. Fig. 4 shows a modification of the groove or miter *c*, Fig. 2.

The blanks for these frames are preferably formed from some light, tasteless, and comparatively tough wood, which will bend at the corners without steaming or boiling, such as bass-wood or whitewood, the material being produced by cutting it from the log in the form of a thick veneer, or by sawing into thin stuff and then planing both surfaces. The blanks A are then cut from this material of the proper width and length, the ends dentated, as shown at *a a*, by means of a series of saws set on a shaft and close together upon an arbor or other suitable tool, so that they will interlock when brought together. The recesses *b b* are then formed in the edges at such points in its length as will bring them at the top and bottom of the frames when set up in the hive. These recesses form openings, which allow space for the passage of the bees between the frames and for the ventilation of this part of the hive. Three triangular grooves, *c c c*, are then cut across the blank at such points in its length as will divide it into four nearly equal parts, each of which forms one side of the frame after the blank is bent into a quadrangular shape. These triangular grooves are cut nearly through the blank, sufficient wood only being left to hold the parts firmly together. As the sides of the grooves are inclined toward each other at a right angle it follows that when the blank is bent into the form of a frame these grooves make perfectly-fitting miter-joints at three of its corners, the fourth corner being that at which the ends of the blank are united to each other by means of the interlocking teeth formed thereon.

In one of the spaces between two of the grooves *c*, and preferably that which will form the top of the frame when placed in the hive, is formed a longitudinal groove, *d*, for the guide-strip, which makes a secure point of attachment for the comb when the bees begin to build in the frames set side by side in the hive with the parts of the frame containing the recesses *b b* at top. These frames meet a want long felt by bee-keepers, as those in common use are either dovetailed or nailed together at the corners, and if set up at the manufactory form a large bulk for transportation, and are very liable to breakage in handling; but if sold to the user in pieces to be put together by him the numerous joints to be made cause loss of time and produce a very fragile article when finished, which loses its rectangular shape with the slightest rough usage, as the joints at the corners lack the necessary strength and rigidity to hold them in shape.

My frame will be found to possess none of the above-named defects, as it is intended for transportation in solid packages before being set up, and when set up possesses great strength and rigidity, preserving its form without difficulty during all the rough handling to which such frames are frequently subjected.

Having thus described my invention, I claim as new, and desire to secure by Letters Patent, the following:

As a new article of manufacture, a blank for honey-frames formed of a single piece of wood having transverse angular grooves *c*, longitudinal groove *d*, and recesses *b*, all arranged in the manner shown and described.

Fig. 1.

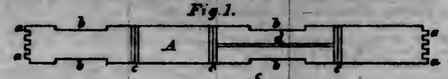


Fig. 3.

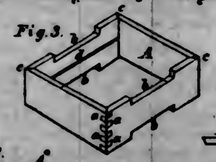

Fig. 4.

Fig. 2.

The answer sets up as defenses non-infringement and want of novelty. After issue joined, proofs were taken on both sides, and the circuit court, on a hearing, dismissed the bill. Its decision is reported in 21 Fed. Rep., 826.

The plaintiff does not carry his invention further back than the summer or late spring of 1877. The answer sets up that the same invention as that patented was known to Alexander Fiddes, who resides at Centralia, in the State of Illinois, as early as May or June, 1873.

The circuit court in its decision said that if the patentee was entitled to claim the blank for honey-frames as a new and useful device it was because it is a constituent of the frame or section into which it is formed by bending, no matter who bends it, whether the maker or the purchaser for use, and that if the state of the art at the date of the alleged invention was such that the patentee could not claim as his invention the honey-frame or section when formed by bending and uniting the ends of such a frame, he, for the same reason, could not claim as his invention such a blank for the purpose of forming it into a frame or a section. The opinion then proceeded:

The question, therefore, is whether, upon the evidence, at the date of the alleged invention the manufacture of honey-frames or sections by bending and uniting the ends of a blank consisting of a single piece, substantially as described in this patent, was a patentable novelty. Upon a careful comparison and consideration of all the evidence, this question must be answered in the negative. Alexander Fiddes testifies to making and using honey-sections formed from a single piece grooved, bent, and united at the ends as early as 1872 and 1873, some of which he sold to others for use and if those now made by the complainant under his patent are superior in any respect to the first specimens of the manufacture it is merely in point of finish and workmanship. There is no difference whatever in principle, and the early examples were complete and practical frames, actually used and perfectly serving the purpose, so that they cannot be considered as rude and imperfect experiments subsequently developed into a successful manufacture.

We concur in these views of the circuit court.

In addition to this the claim of the patent is as follows:

As a new article of manufacture, a blank for honey-frames formed of a single piece of wood having transverse angular grooves *c*, longitudinal groove *d*, and recesses *b*, all arranged in the manner shown and described.

The description in the specification states that—

the invention consists, essentially, in forming the frame from a single blank or piece of material having all the necessary grooves and recesses required to form a complete frame cut in it.

It also says that—

In the drawings, Figure 1 is a plan of one of the blanks, showing the various recesses and grooves with which it is supplied.

One of those grooves is the longitudinal groove *d*. The description further says:

In one of the spaces, between two of the grooves *c*, . . . is formed a longitudinal groove, *d*, for the guide-strip, which makes a secure point of attachment for the comb when the bees begin to build in the frames set side by side in the hive, with the parts of the frame containing the recesses *b b* at the top.

Thus the longitudinal groove *d* is made by the patentee a necessary element in the structure. The defendant's structure has no longitudinal groove, and no substitute or equivalent for it. (*Fay* v. *Cordesman*, 109 U. S., 408; *Yale Lock Co.* v. *Sargent*, 117 U. S., 373; *Dryfoos* v. *Wiese*, 124 U. S., 32.)

It is urged by the plaintiff that it is shown that the defendant's section is to be used with the comb foundation or attachment made by the putting by the user of pieces of wax on the section; but this is not a mechanical equivalent in the blank for the longitudinal groove, any more than, in *Gage* v. *Herring*, (107 U. S., 640, 648,) the person who shoveled or swept up by manual labor the meal deposited upon the floor of the dust-room was a mechanical equivalent, in the sense of the patent law, for the automatic conveyer-shaft in the dust-room.

The decree of the circuit court is affirmed.

Supreme Court of the United States.

CORNELL *v.* WEIDNER.

Decided April 30, 1888.

1. CORNELL—BUNG-BUSHING.
Reissued Letters Patent No. 8,759, granted June 17, 1879, to Lacy and Cornell, for bushes for bungs, adjudged invalid, as for an invention different from that of the original patent.
2. REISSUE VOID FOR CHANGE OF ORIGINAL INVENTION.
The original patent and the first reissue having been distinctly limited to a bushing having a notch, the second reissue, obtained nearly seven years afterward, for a bushing without any such notch, is an unwarrantable enlargement.

APPEAL from the Circuit Court of the United States for the Eastern District of Michigan.

Mr. J. W. Merriam for the appellant.
Mr. George H. Lothrop for the appellee.

Mr. Justice GRAY delivered the opinion of the Court.

This was a bill in equity for the infringement of a second reissue of Letters Patent. When the facts are understood the case is clear.

The original patent, issued August 29, 1871, No. 118,617, was for an improvement in metallic bushings for the bungs of casks, &c., and in wrenches for operating the same, and described the bushing thus:

* * * A tapering thimble or ring of metal, provided with a flanch, *b*, at its larger end, and having a screw-thread, *c*, on its outer surface, which screw-thread is cast on the bushing in the mold, and is capable of immediate use without other finishing. The flanch *b* is rounded off at its edge, and is provided at some point in its extent with a V-shaped notch, *d*, extending in to the screw-thread.

It then described the wrench and its mode of operation as follows:

* * * E represents the wrench-bar, consisting of the slotted plate *e* and the shank *f*. The metal of the shank, at its junction with the plate, forms a downward V-shaped projection, *l*, whose point extends forward toward the center of the plate *e*. F represents a tapering core of metal adapted to fit the bung-bushing *a*, and secured to the plate *e* by means of the bolt *h* and its nut. This core is made separable from the wrench-bar, in order that, by providing a number of cores of different sizes, the same wrench may be used for bushings of different diameters. Provision is also made, by the slot *k*, for moving the bolt toward the angular projection *l*, which becomes necessary when a smaller core is substituted for a larger one.

The wrench is applied by inserting the core into the opening through the bushing, and turning it until the projection *l* falls into the notch *d*. By means of the core the bushing is kept steady, and is readily prevented from assuming an oblique position in the bung-opening; at the same time the operator is enabled to get a better hold on the bushing than by means of the wrenches in common use, which are apt to slip from their seats when used on such difficult work as turning a rough-cast screw into place.

The single claim was in these words:

What we claim as our invention, and desire to secure by Letters Patent, is—

The combination, with the notched bung-bushing *a*, of the wrench, consisting of the bar E having the slotted plate *e* and angular projection *l*, and the removable core F, substantially as specified.

It thus appears that the original patent described a bushing with a V-shaped notch in the flange and a wrench made with an angular projection to fit that notch, and applied by turning the wrench until the projection fell into the notch, and that all that the patentee claimed as his invention was the combination of the notched bushing with the wrench having a projection to fit it.

On August 6, 1872, the patent was reissued in two divisions, No. 5,026 (not in this record) being for the wrench and No. 5,027 being for the bushing, describing it as—

an annular ring of metal. This ring is made tapering on both its outer and inner sides, and is screw-threaded upon its outer side, by which means the same is secured within the aperture in the cask. This thread may be formed by a suitable tool or may be formed in the mold, as found most advantageous. The larger end of the said ring is provided with a flange, B, the outer surface or periphery of which is made in an ovolo shape, and is provided with a V-shaped notch, *d*, which extends inward to a point near the body of the ring. The object of this notch is to allow a suitable wrench, adapted for the purpose, to engage therewith, whereby the said bushing may be turned into place without the wrench slipping from its seat, as would be the case with a bushing having a smooth surface.

The claim in that reissue was for—

The screw-threaded metallic bung-bushing, made tapering upon both its outer and inner sides, and provided with the flange B, having the V-shaped notch *d*, as and for the purpose described.

The specification and the claim of that reissue, as clearly appears upon its face, both treated the notch in the flange of the bushing as an essential element of the invention. Of the notch in that reissue it may be said, as this Court in a case decided at October term, 1877, said of the notch described in the reissue for the wrench, that it was—

vital in the invention covered by his patent. The notch is the point of engagement between the bushing and the wrench when the latter, operating as a lever, gives the former its circular motion and thus forces it home. Without this arrangement such motion could not be communicated and the desired result produced. Hence its importance in the scheme of the invention. (*Schumacher* v. *Cornell*, 96 U. S., 549, 553.)

On June 17, 1879, a second reissue, No. 8,759, was obtained for the bushing, the material parts of the specification and the claim of which were as follows:

Our invention relates to bushings for barrels; and consists of a short metallic tube in exterior form in shape of the frustum of a cone, slightly tapering. The outer surface is screw-threaded, to adapt it to be screwed forcibly into the bung-hole of the barrel, and to be held securely in place by the contact of the surfaces. The larger end of this tube is provided with an annular flange projecting outwardly, and adapted to rest, when the bushing is screwed to its place in the hole of the barrel, snugly upon the outer surface of the stave. The interior surface of the bushing is also made in the form of a frustum of a cone, and tapers uniformly from the exterior or flanged to the inner end of the bushing. This surface is made smooth and unbroken, and extends in such form quite through from one end of the bushing to the other, so that the wooden or compressible plug or bung to which it is adapted may have a ready and unobstructed entrance, and may pass, if necessary, beyond the inner end of the bushing, and have a uniform bearing-surface throughout the entire length of the bushing.

* * * * * * *

Having thus described our invention, what we claim as new, and desire to secure by Letters Patent, is—

A metallic bushing for the bung-holes of barrels, made with a flange adapted to rest on the outer surface of the stave, and with an exterior threaded and an interior smooth surface, both tapering from the flanged to the inner end, said inner surface being unbroken and unobstructed, and tapering uniformly from one end of the bushing to the other, as and for the purpose set forth.

The notch in the flange of the bushing is not mentioned either in the specification or in the claim of this reissue, although it is shown in the accompanying drawings substantially as it was shown in the drawings of the original patent and of the former reissue.

The original patent and the first reissue having been distinctly limited to a bushing having a notch to aid in forcing it into place, the second reissue, obtained nearly seven years later, for a bushing without any such notch, is an unwarrantable enlargement of the supposed invention, which, according to the now well-settled law, renders the reissue void. (*Yale Lock Co.* v. *James*, 125 U. S., 447, 464, and cases there cited.)

The defendant's plea that the second reissue was for a different invention from that described or claimed either in the original patent or in the first reissue was therefore rightly adjudged good by the circuit court, and the decree dismissing the bill is affirmed.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., May 19, 1888.

SIR: The Secretary of the Interior has ordered that Oscar B. Barber, of Warren Mills, Wisconsin, be not recognized after this date as attorney in the prosecution of any claim or other matter before this Department or any bureau thereof.

Very respectfully,

GEO. A. HOWARD,
Chief Clerk.

The Commissioner of Patents.

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 487 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *Isaac S. McGehee, No. 155 Broadway, New York*, a disbarred attorney, has been practicing under the name of *Alexander Mellado*.

Notice.

UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1888.

To expedite the distribution of the mail in this Office, and to insure the prompt and certain delivery of communications to the divisions and officials having charge of the matters to which they relate, attorneys and correspondents are respectfully requested to enter upon the upper left-hand corner of amendments and other communications, if known to them, the number of the room and the name of the examiner or designation of the division to which the communication should be sent.

BENTON J. HALL,
Commissioner of Patents.

Issue of May 29, 1888.

DESIGNS.

18,352.—TOY BANK.—*Jacob A. Graff*, Brooklyn, N. Y. Application filed October 1, 1887. Serial No. 251,246. Term of patent 3½ years.

18,353.—WRIST-HOLDER AND MATCH-SAFE.—*James F. Lockwood*, Philadelphia, Pa., assignor to himself, *Thomas J. Whitney*, and *Alva Bryant*, all of same place. Application filed April 23, 1888. Serial No. 272,001. Term of patent 3½ years.

18,354.—DENTIFRICE-CASE.—*Joseph C. Moore*, Montreal, Quebec, Canada. Application filed April 11, 1888. Serial No. 270,373. Term of patent 7 years.

18,355.—COVERS ON TEA POT.—*Lucius J. Richards*, Philadelphia, Pa. Application filed April 11, 1888. Serial No. 270,374. Term of patent 14 years.

18,356.—WATCH-CHARM.—*Edwin Terry*, Brooklyn, N. Y. Application filed March 29, 1888. Serial No. 268,874. Term of patent 7 years.

18,357.—ORNAMENTATION OF BUILDERS' HARDWARE.—*Thomas Village*, South Norwalk, assignor to *The Branford Lock Works*, Branford, Conn. Application filed April 23, 1888. Serial No. 271,644. Term of patent 7 years.

18,358.—DESK.—*William G. Walter*, Pittsburg, Pa., assignor to *Atterbury & Co.*, same place. Application filed April 14, 1888. Serial No. 270,703. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

15,521.—GIN, WINE, WHISKY, RUM, LIQUEURS, BRANDY, AND OTHER SIMILAR LIQUORS.—*Boord & Son*, London, England. Application filed April 28, 1868. Used since 1851.
"The representation of a cat standing upon a barrel."

15,522.—WATCH-CASES.—*The Brooklyn Watch Case Company*, Brooklyn, N. Y. Application filed March 15, 1888. Used since February 20, 1888.
"The word 'GRANGER' in connection with the representation of a stag's head."

15,523.—CYPRESS SHINGLES.—*Clark, Fairhead & Co.*, Jacksonville, Fla. Application filed January 18, 1888. Used since January, 1888.
"The words 'ALLIGATOR,' 'C. F. Co.,' and 'BRAND,' and the representation of an alligator."

15,524.—CYPRESS SHINGLES.—*Clark, Fairhead & Co.*, Jacksonville, Fla. Application filed January 18, 1888. Used since November 1, 1887.
"The words 'CROCODILE,' '2,' 'C. F. Co.,' and 'BRAND,' and the representation of a crocodile."

15,525.—HARD SOAP FOR LAUNDRY AND GENERAL PURPOSES.—*The Columbia Manufacturing Company*, Boston, Mass. Application filed March 16, 1888. Used since August 1, 1887.
"The word 'CLOVER.'"

15,526.—WHISKY.—*James E. Davis*, Detroit, Mich. Application filed April 30, 1888. Used since May 1, 1885.
"The words 'ST. BERNARD.'"

15,527.—MALT AND CARBONATED BEVERAGES.—*Joseph M. Donnelly*, College Point, N. Y. Application filed April 13, 1888. Used since April 1, 1888.
"The word 'REGAL.'"

15,528.—HYDRAULIC HOSE.—*Eureka Fire Hose Company*, New York, N. Y. Application filed April 25, 1888. Used since January, 1888.
"The words 'TRADE LINEN.'"

15,529.—GINGHAMS, TICKINGS, AND ALL COTTON GOODS.—*John Farnum & Co.*, Philadelphia, Pa. Application filed April 26, 1888. Used since April 10, 1868.
"The word 'CONEWINGO.'"

15,530.—GOLD PENS.—*John Foley*, New York, N. Y. Application filed April 25, 1888. Used since January 1, 1852.
"The word 'FOLEY.'"

15,531.—GAS-STOVES.—*The Gem City Stove Company*, Dayton, Ohio. Application filed April 19, 1888. Used since December 15, 1885.
"The word 'SUCCESS.'"

15,532.—DOWLE OR FINELY-DIVIDED PORTIONS OF FEATHERS RESEMBLING DOWN.—*Colin M. Hawkins & Co.*, Raleigh, N. C. Application filed March 3, 1888. Used since December 3, 1887.
"The word 'THISTLEDOWN.'"

15,533.—CHEWING-GUM.—*Charles T. Heisel*, Cleveland, Ohio. Application filed March 14, 1888. Used since March 9, 1888.
"The word 'NOMINEE' associated with the picture of Grover Cleveland."

15,534.—WOOLEN AND COTTON FABRICS FOR LININGS AND OUTER CLOTHING.—*Thomas Illingworth*, Bradford, county of York, England. Application filed April 24, 1888. Used since October 1, 1887.
"The representation of two hands grasping a piece of cloth in an attempt to tear it."

15,535.—CHAMPAGNE.—*Ernest Irroy*, Rheims, France. Application filed February 11, 1888. Used since November, 1887.
"The words 'BLACK TOP.'"

15,536.—CIGARS, CIGARETTES, AND SMOKING AND CHEWING TOBACCO. *Irwin & Co.*, Boston, Mass. Application filed March 29, 1888. Used since January 2, 1888.
"The words 'LOS DOCTORES.'"

15,537.—COUGH MEDICINE.—*Minnie Lawrence Keyes*, New York, N. Y. Application filed April 16, 1888. Used since March 28, 1888.
"The word 'INOKOP.'"

15,538.—MEDICAL COMPOUND FOR THE CURE OF CERTAIN NAMED DISEASES.—*Charles F. Kittredge*, Rockland, Me. Application filed April 14, 1888. Used since February, 1888.
"The letter 'K' inclosed within a triangular border."

15,539.—ARTIFICIAL STONE AND CEMENT AND CONCRETE PAVEMENTS. *William Krause & Son*, Philadelphia, Pa. Application filed April 17, 1888. Used since March 31, 1868.
"The representation of a star."

15,540.—REMEDY FOR DIPHTHERIA.—*Antoine Laqueau*, New Orleans, La. Application filed April 27, 1888. Used since May, 1887.
"A symbol composed of a crescent, three-pointed star, and cross."

15,541.—COUGH MEDICINE.—*John McLeish*, Cincinnati, Ohio. Application filed April 23, 1888. Used since November 17, 1868.
"The representation of a tree and the word 'TREMELLA.'"

15,542.—HORSE-NAILS.—*Calvin M. McClung & Co.*, Knoxville, Tenn. Application filed April 20, 1888. Used since March 18, 1881.
"The word 'CRANBERRY.'"

15,543.—TOILET, MEDICATED, AND COMMERCIAL SOAP.—*R. H. McDonald Drug Company*, New York, N. Y. Application filed March 29, 1888. Used since December 15, 1887.
"The word 'SEA-SALT.'"

15,544.—SALVE.—*Charles S. Phelps*, Gowanda, N. Y. Application filed March 10, 1888. Used since May 1, 1886.
"The compound word 'BORO-HYDRASTIS.'"

15,545.—ANTISEPTIC CHEMICAL COMPOUND.—*Phénique Chemical Company*, St. Louis, Mo. Application filed March 28, 1888. Used since February, 1884.
"The compound word 'CARBRO-PHÉNIQUE.'"

15,546.—METALLIC PAINT.—*Prince's Metallic Paint Company*, Philadelphia, Pa., and New York, N. Y. Application filed March 6, 1888. Used since October 5, 1875.
"The words 'PRINCE'S METALLIC PAINT' in plain capital letters."

15,547.—CIGARS.—*Reid, Murdoch & Fischer*, Chicago, Ill. Application filed April 14, 1888. Used since January 20, 1888.
"The bust figure, face, and head of a man wearing a Rubens hat, with the arbitrary word 'RUBENS' above the same in ornamental letters."

15,548.—CIGARS.—*Reid, Murdoch & Fischer*, Chicago, Ill. Application filed April 16, 1888. Used since August 12, 1887.
"A representation from the play of Richelieu, in which the King's guards are bowing low before the Cardinal while he draws around the form of the heroine the holy circle. Behind her stands a priest, and in the background are walls, scenery, &c., with the arbitrary words 'EL SANTO' in ornamental letters above the figure or representation."

15,549.—CIGARS.—*Reid, Murdoch & Fischer*, Chicago, Ill. Application filed April 16, 1888. Used since January 20, 1888.
"The bust figure, face, and head of a woman wearing a lady's hat, and the arbitrary word 'JULIANA' above said picture in ornamental letters."

15,550.—LEATHER BOOTS AND SHOES.—*Thomas Rice & Co.*, Shrewsbury and Boston, Mass. Application filed April 26, 1888. Used since April 16, 1886.
"The words 'OIL GRAIN' and the representation of two sheaves of grain."

15,551.—CERTAIN NAMED CONFECTIONERY.—*Matthew D. Saxe*, New York, N. Y. Application filed March 6, 1888. Used since February 28, 1884.
"The letters and character 'S & R.'"

15,552.—PRINTED PERIODICAL PUBLICATION.—*The Seeger & Guernsey Company*, New York, N. Y. Application filed April 12, 1888. Used since October, 1882.
"The words 'THE MEXICAN FINANCIER.'"

15,553.—BEER.—*Frank Seely*, New York, N. Y. Application filed April 18, 1888. Used since March 1, 1888.
"The word 'GANYMEDE.'"

15,554.—WINDOW-SASH CHAINS.—*The Smith & Egge Manufacturing Company*, Bridgeport, Conn. Application filed March 19, 1888. Used since April, 1884.
"The words 'RED METAL.'"

15,555.—CERTAIN SUPPLIES AND INSTRUMENTS FOR DRAFTSMEN AND ENGINEERS.—*Edward G. Soltmann*, New York, N. Y. Application filed April 12, 1888. Used since May, 1882.
"The word 'EMPEROR' inclosed in quotation-marks."

15,556.—TOILET SALVE.—*Frank M. Towne*, San Bernardino, Cal. Application filed March 20, 1888. Used since December 1, 1886.
"The word 'CARNATION.'"

15,557.—FREIGHT OR FARM WAGONS.—*The Turnbull Wagon Company*, Defiance, Ohio. Application filed April 9, 1888. Used since November 15, 1882.
"The word 'TURNBULL.'"

15,558.—PAPER BAGS.—*Union Bag and Paper Company*, Chicago, Ill. Application filed April 19, 1888. Used since January, 1875.
"The word 'UNION.'"

15,559.—PAPER BAGS.—*Union Bag and Paper Company*, Chicago, Ill. Application filed April 23, 1888. Used since April 17, 1886.
"The word 'LION' or the representation of a lion."

15,560.—PAPER BAGS.—*Union Bag and Paper Company*, Chicago, Ill. Application filed April 23, 1888. Used since December 10, 1887.
"The word 'KANGAROO' or the representation of a kangaroo."

15,561.—CATARRH REMEDY.—*Frank Wortz, Jr.*, Wausau, Wis. Application filed February 13, 1888. Used since April 7, 1888.
"The representation of a human head over the nose of which there appears a bandage which passes behind the neck."

LABELS.

5,609.—Title: "READY GLUE."—*Samuel M. Birby*, New York, N. Y. Application filed April 13, 1888.

5,610.—Title: "TURNER'S HAIR TINT."—*Finlay & Brunswig*, New Orleans, La. Application filed April 19, 1888.

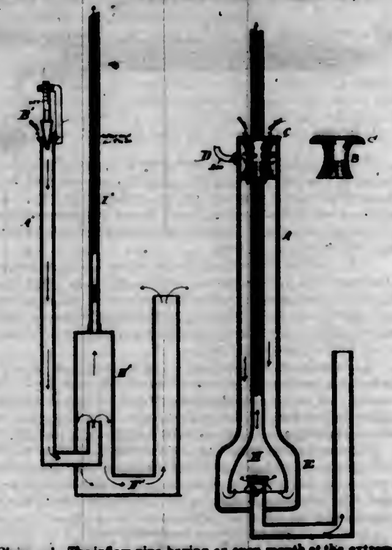
5,611.—Title: "GERMAN COCOA POWDER."—*Hawley & Hoops*, New York, N. Y. Application filed May 2, 1888.

5,612.—Title: "COLE'S RHEUMATIC PAIN ANNIHILATOR."—*Charles F. Kittredge*, Rockland, Me. Application filed April 14, 1888.

5,613.—Title: "ART FLOWERS." (FOR ARTIFICIAL FLOWERS.)—*Abraham W. Maas*, New York, N. Y. Application filed May 2, 1888.

5,614.—Title: "ATCHISON CORNICE WORKS." (FOR METAL CORNICES, &c.)—*James W. McKelvey*, Atchison, Kans. Application filed April 24, 1888.

5,615.—Title: "TRIMBLE'S OZARK MOUNTAIN HERB SALVE."—*R. F. P. Trimble*, Seymour, Mo. Application filed April 12, 1888.



5,616.—Title: "KAISAROO." (FOR PAPER BAGS.)—*Union Bag and Paper Company*, Chicago, Ill. Application filed April 19, 1888. (Trade-Mark Registered.)

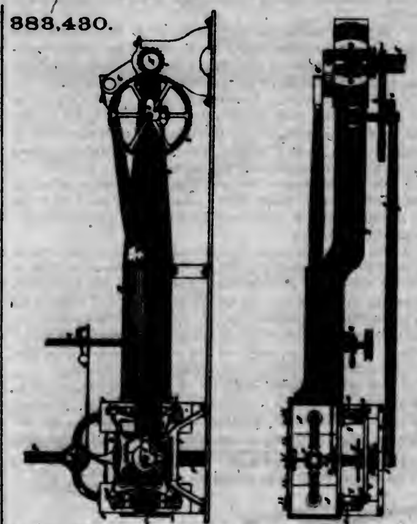
5,617.—Title: "LION." (FOR PAPER BAGS.)—*Union Bag and Paper Company*, Chicago, Ill. Application filed April 23, 1888. (Trade-Mark Registered.)

PATENTS

GRANTED MAY 29, 1888.

383,429. HYDROPNEUMATIC-PRESSURE APPARATUS. THOS. ARTHUR, Bangor, Pa., assignor of one-half to Robert J. Hagin, same place. Filed Mar. 26, 1887. Serial No. 232,593. (No model.)

Claim.—1. The inflow-pipe having an open mouth at the extreme upper end to permit a direct downflow of water, combined with an inspirator or air-injector near the open end of said pipe, an expansion-chamber connected with the lower end of said inflow-pipe, an escape-pipe leading from the expansion-chamber and having its outflow end above said expansion-chamber, and a delivery-pipe leading from the upper portion of said expansion-chamber.



2. The open-ended inflow-pipe having a double conical inspirator removably attached to its upper end, as described, in combination with the expansion-chamber, escape-pipe, and delivery-pipe, all constructed and relatively arranged substantially as shown and described.

3. The inflow-pipe having an open mouth at the extreme upper end, said pipe having an expanded lower portion, in combination with an expansion-chamber inclosed therein and having a delivery-pipe connected therewith, and an escape-pipe having its lower end above the bottom of the expansion-chamber and its outer end above the upper portion of said expansion-chamber.

4. The combination, with an inflow-pipe having an air-injector near its mouth, of an expansion-chamber connected with the lower end of said inflow-pipe, an escape-pipe, and a delivery-pipe extending upward from the upper portion of the expansion-chamber, substantially as described.

383,430. STEAM-ENGINE. WILLIAM K. ASHER, Brooklyn, N. Y. Filed Dec. 29, 1886. Serial No. 223,267. (No model.)

383,430.

Claim.—1. In steam-engines, the combination of a steam-chest, a valve-casing placed in said chest and inclosing a steam-chamber that forms a prolongation of the port leading into the cylinder, a hollow cylindrical valve-seat provided with lateral openings for the passage of the steam to the ports, a hollow cylindrical rotary valve having open ends for the admission of steam from the steam-chest, and lateral openings for the exit of the steam from the valve, and through which the steam passes into the steam-ports, substantially as specified.

2. The combination of a steam-chest, a valve-casing placed inside said chest and inclosing a steam-chamber that connects with the steam-port of the cylinder, a hollow cylindrical steam-valve seat provided with lateral openings, a hollow cylindrical rotary valve having open ends for the admission of steam to the interior of the valve, and lateral openings for the exit thereof, and a hollow cylindrical cut-off valve placed inside the steam-valve and having open ends and lateral openings, said cut-off valve being moved independently of the steam-valve, substantially as specified.

3. The combination, with the cylinder of a steam engine, of the rotary cylindrical induction-valve and cylindrical cut-off valve inclosed therein, the said valves being provided with open ends that communicate with the steam-chest, and a rotary cylindrical exhaust-valve having open ends and lateral openings for the passage of the exhaust-steam into the interior of the valve, and suitable mechanism for moving the said valves in harmony with each other, substantially as specified.

4. The combination of the rotary cylindrical induction-valves, the stems 11, collared sleeve fixed to said stems and carrying the crank 13, the quadrilateral frame Q, shaft 15, carrying a crank which connects with frame Q, and suitable mechanism to connect shaft 15 with the main shaft of the engine, substantially as specified.

5. The combination of the rotary cylindrical induction and exhaust valves, having stems which connect with collared sleeve-bearings carrying cranks 13, the frame Q, shaft 15, carrying a crank which connects with the frame Q, and suitable mechanism to connect shaft 15 with the main shaft of the engine, substantially as specified.

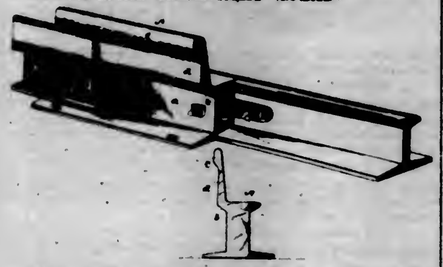
6. The combination of the rotary cylindrical induction and exhaust valves having stems which connect with the collared sleeves carrying cranks 13, the frame Q, shaft 15, and crank 16, suitable connections between shaft 15 and duplex crank 5, the connecting-rods 4 4, spur-wheel 2, and pinion 1, fixed to the main shaft S, substantially as specified.

7. The combination of the rotary cylindrical valves connected with the crank 16 by suitable mechanism, the crank-shaft 15, journaled in sleeve *i*, and shaft 6, a suitable clutch to connect shaft 15 with shaft 6, and suitable mechanism for connecting shaft 6 with the main shaft of the engine, substantially as specified.

8. The combination of the valves having stems provided with cranks which are connected together by a frame, Q, placed on crank 16, the crank-shaft 15, the shaft 6, connected with the main shaft of the engine, and a reversing-clutch interposed between crank-shafts 16 and 6, substantially as specified.

9. The combination, with the valves of a steam-engine and the valve-gear connecting the same with the main shaft S', of the reversing-clutch R, composed of the member 18 on shaft 6, provided with suitable clutch-pins, and the member 18* on shaft 16, having slots *k* for the clutch-pins, and movable chucks 20, for filling the space between the clutch-pins and the opposite ends of the slots, substantially as specified.

10. The combination, with the member 18*, of the clutch R, having slots *k* and the movable chucks 20, the flanged face-plate 19, provided with slots *j*, connected with the member 18* by bolts for adjusting the chucks to change the valves, substantially as specified.



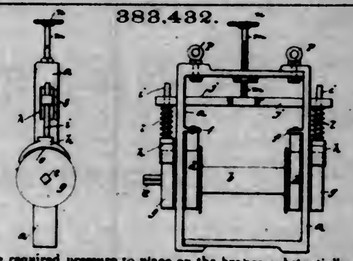
11. The combination of the induction and exhaust valves having stems which connect with sleeves carrying cranks 13, the quadrilateral frame Q, the shaft 15 and crank 16, the reversing-clutch R, the shaft 6, duplex crank 5, rods 4 4, spur-wheel 2, and pinion 1, fixed to the main shaft S', substantially as specified.

12. The combination of the induction-valves, the cut-off valves provided with suitable stems, slotted arms 22, connected with the stems, adjustable rods 23, rock-levers 25 and 26, and governor-rod 28, substantially as specified.

13. The combination, with the rotary cylindrical induction-valves, of cylindrical cut-off valves placed inside the induction-valves at each end of the cylinder, a governor and governor-rod, and connections between the cut-off valves and the governor-rod, said connections being susceptible of adjustment for the purpose of changing the positions of the cut-off valves independently of each other and setting said valves so that the cut-off at one end of the cylinder will be later than the cut-off at the opposite end, substantially as specified.

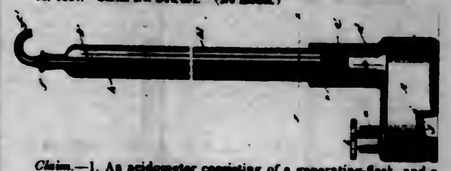
14. The method herein described of equalizing the cut-off in steam-engines, consisting in changing the position of the governor-connections with the cut-off valves for the purpose of causing one cut-off valve to move in advance of the other, substantially as specified.

383,431. RAILWAY-RAIL. DAVID T. BURNETT, Trenton, N. J. Filed Feb. 16, 1888. Serial No. 264,294. (No model.)



Claim.—1. The railway-rail having its web of an increased thickness, and having the base-attaching flanges and the guard formed on one side of the web and extending vertically and laterally from the outer side of the head, and the fish-plate adapted to snugly engage the outer side of the said rail and guard and serve as a bearing for its top lateral projection, substantially as specified.

2. The combination, with a combined rail and guard constructed as described, of the fish-plate adapted to conform to the side of the said rail and guard, and the angular bracket for connecting the end of the guard-rail with an ordinary rail, substantially as specified.



383,432. FIRE-ESCAPE. ADOLPH BERNSTEIN and ABRAHAM GOLDSTEIN, Pittsburg, Pa., assignors of one-half to Josiah Cohen, same place. Filed Sept. 27, 1887. Serial No. 250,972. (No model.)

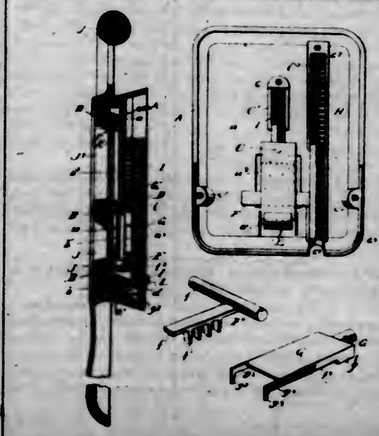
Claim.—In a fire-escape such as described, the combination consisting of the frame *a*, the drum *b*, mounted thereon, the brake-wheels *g*, secured to the same shaft, *c*, as the drum *b*, the horizontal bar *j*, operating the brake-shoes *h*, the spiral springs *l*, and vertical guides *i*, the screw *m*, for operating the brakes, the wire cord *c*, one end of which is attached to the drum *b* and the other provided with suitable stirrups, *q r*, the eyebolts *p*, for securing the device in position, the springs *d*, for rewinding the cord *c*, and an indicator or scale, *s*, for ascertaining the required pressure to place on the brakes, substantially as and for the purpose set forth.

383,432.

383,433. ACIDOMETER. PHILIPP BAUER, Chicago, Ill. Filed July 16, 1887. Serial No. 244,451. (No model.)

Claim.—1. An acidometer consisting of a generating-flask, and a graduated glass tube detachably secured thereto, and provided with two small glass tubes projected into the graduated tube from opposite ends to extend nearly the entire length thereof in a manner that water filled in said tube will be displaced by the carbonic-acid gases generated, substantially as set forth.

2. An acidometer consisting of a generating-flask arranged to hold a carbonate and liquid separated, and adapted to be mixed by shaking, and of a graduated tube detachably connected with each flask and provided with two small tubes projected into the graduated tube from opposite ends to extend nearly the entire length thereof, substantially as and for the purpose set forth.



3. An acidometer consisting of a generating-flask, A, and of a graduated glass tube, E, removably secured to flask A by a screw-coupling, and having small-sized tubes F and *h* projected into the tube E from opposite ends to pass each other, the whole being constructed and arranged substantially as set forth, to operate as specified.

4. An acidometer consisting of generating-flask A, provided with shelf *j*, mouth *a*, with stopper *b*, and with neck *c* and screw-sleeve *d*, in combination with graduated glass tube E, having screw-plug *e*, tube A, and detachable tube F, forming the stopper *f*, the whole being constructed and arranged substantially as set forth, to operate as specified.

383,434. SEAL-LOCK. FIRST BROWN, Louisville, Ky. Filed Aug. 24, 1887. Serial No. 247,716. (Model.)

Claim.—1. A seal-lock provided with a defacer moving in line with the bolt, and means for moving said defacer to destroy the seal before the bolt is moved, as set forth.

2. The combination, with the bolt and the hasp engaging the same, of a defacer moving in line with the bolt, and means for operating said defacer to cause it to engage and operate the bolt, as set forth.

383,434.

3. The combination, with the bolt and the defacer moving in line therewith but in bearings independent of the bolt, of means for engaging said defacer to move the same to cause it to destroy a seal before engaging the bolt, substantially as described.

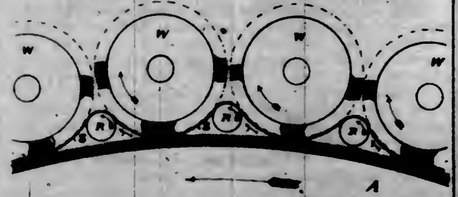
4. The combination, with the bolt and the defacer having a limited loose connection therewith, of a hinged cover and a hasp carried thereby to engage said bolt, substantially as described.

5. In a seal-lock, the combination, with the spring-actuated bolt and the spring-actuated defacer having a limited loose connection therewith, of a hinged cover and a hasp carried thereby and formed with a transverse groove, substantially as and for the purpose specified.

6. The combination, with the slotted case, and the defacer provided with tooth working through the slots in said case and having a stem working in guides in said case, of a bolt moving in guides in said case and having a limited loose connection with said defacer, a hasp engaging said bolt independent of the defacer, and means for moving said defacer to destroy a seal before moving the bolt, substantially as described.

7. In a seal-lock, the combination, with the case having a slotted diaphragm, as described, of a defacer having a stem working in a guide on one side of said diaphragm, and an arm at right angles to said stem carrying teeth working in the slots of the diaphragm, substantially as and for the purpose specified.

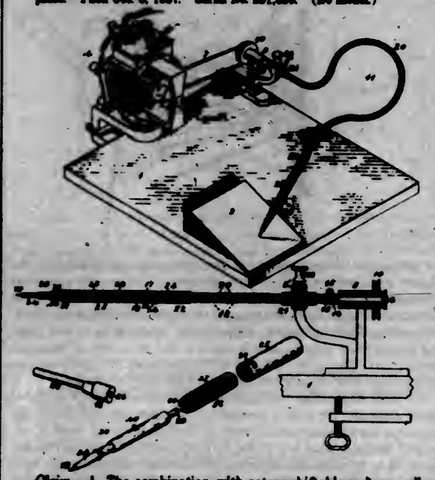
8. In a seal-lock, the combination, with the case, the seal, and the plate B, of elastic blocks secured to said plate to press upon said seal, substantially as and for the purpose specified.



9. The combination, with the case having slotted diaphragm and half-barrel open at one side, as shown, of the defacer having a stem working in said half-barrel, and a right-angled extension working in the cut-away portion of said half-barrel and carrying teeth working in the slots of the diaphragm, substantially as described.

10. The combination, with the case having a diaphragm, *a*, and half-barrel C, open at one end and formed with ledge *c'* and tapering seat, of the back plate formed with half-barrel D and wedge-shaped lug *d'*, engaging said seat, substantially as shown and described.

11. The combination, with the case having diaphragm *a*, stud C, and half-barrel C, of the bolt having a stem working in said half-barrel, a slot engaging said stud and provided at its opposite end with extensions *g'*, formed with downwardly-extending lugs *g''*, substantially as and for the purpose specified.

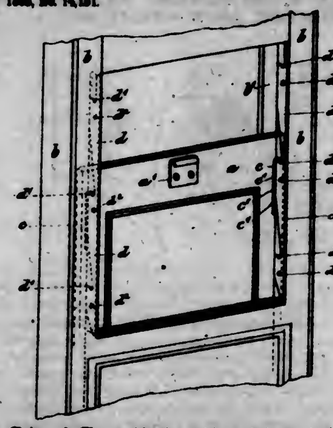


383,435. CARDING-ENGINE. WILLIAM BROWN, Galbert, Scotland. Filed Aug. 10, 1887. Serial No. 246,578. (No model.) Patented in England Feb. 17, 1887, No. 2,496.

Brief.—Strippers are dispensed with, and the fiber is always carded in the same direction. Between each two workers is a supporting-roller geared to the following worker, whereby the sliver is kept from touching the main cylinder till the point of contact of the following worker and cylinder. The workers rotate with successively-increasing speeds.

Claim.—The combination of the main cylinder of a carding-engine, and workers thereafter, with rotary rollers between the workers to carry and feed the lap from one worker to the next, all substantially as described.

383,436. REMOOKING DEVICE. GEORGE F. GAIN, Covington, Ky., assignor to the George F. Gain Manufacturing Company, same place. Filed Oct. 6, 1887. Serial No. 251,689. (No model.)

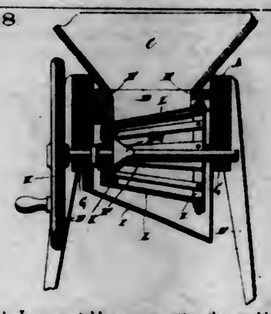


Claim.—1. The combination, with rotary shiftable and normally-retracted crayon-holder 30, having the pin 40, of the diversely-notched tube 36, attached to the handle 25.

2. The combination, with the longitudinally-adjustable sleeve 21 of the ballast shaft 12, of the socket 5' and set-screw 28, as and for the purpose set forth.

3. In the described combination with an electric motor, the combination of the rotary flexible transmitter 11, the tappet 17, the circumferentially-adjustable crayon-holder 30, having the pin 40, and the diversely-notched tube 36 upon the handle 25, for the purposes set forth.

383,437. CARRIAGE-WINDOW. ARTHUR W. GOLD and GEORGE B. GOLD, Clerkenwell, County of Middlesex, England. Filed Nov. 5, 1887. Serial No. 254,642. (No model.) Patented in England Nov. 18, 1886, No. 14,151.

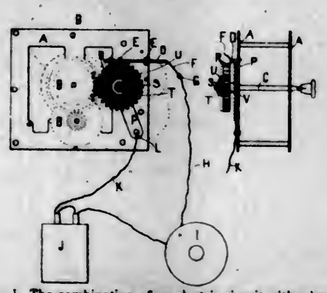


Claim.—1. The combination, with a window-sash and its framing, of a hook-shaped catch, as *c*, and a rack, as *d*, having sunken notches, and recesses, as *d'*, to receive and hold the catch *c*, substantially as and for the purpose set forth.

2. The combination, with a window-sash and its framing, of a hook-shaped catch, as *c*, and a rack, as *d*, having sunken notches, and recesses, as *d'*, to receive, hold, and hook the catch, aided by a spring applied to the sash, so as to press the catch and rack toward each other, as set forth.

383,438. VEGETABLE OR ROOT CUTTER. EDWIN H. CLARK, L'Original, Ontario, Canada. Filed Feb. 11, 1888. Serial No. 263,693. (No model.) Patented in Canada Feb. 2, 1887, No. 28,802.

383,438



Claim.—1. In a vegetable or root cutter, the combination of the hopper, the cutting-cylinder arranged under the same, and composed of the shaft F, the solid disk K, secured on the shaft near one end of the same, the open band N, arranged near the other end of the shaft, the cutting-blades arranged obliquely and tangentially to the shaft and having their opposite ends secured to the inner side of the band and the outer side of the disk, and the conical block F^3, rigidly secured on the shaft with its base resting against the disk, as set forth.

2. The combination of the hopper, the transverse shaft arranged under the same, the disk K, secured on the shaft near one end of the same and having tangential recesses in its periphery, the band N, arranged near the other end of the shaft and having tangential enlargements M on its inner side, and the knives having their opposite ends secured, respectively, in the tangential recesses of the disks and to the tangential enlargements of the band, as set forth.

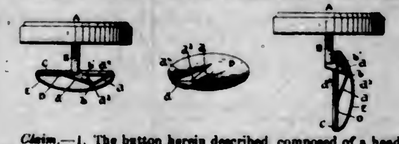
3. In a root-cutter, the combination of the supporting-frame, the hopper thereon, the bearings G, secured to the under side of the frame, the transverse shaft journaled in said bearings, the disk secured on said shaft near one end thereof, the band N, arranged near the other end of the shaft and of a larger diameter than the disk, the knives arranged obliquely and tangentially to the shaft, and having their opposite ends secured, respectively, to the inner side of the band and the periphery of the disk, and the inclined discharge-trough arranged below the cutting-cylinder and concentric therewith, and having its sides secured to the under side of the hopper and its end secured to one of the bearings G, as set forth.

383,439. ELECTRIC ALARM-CLOCK. EDWARD J. COLBY, Chicago, Ill. Filed Feb. 1, 1888. Serial No. 262,690. (No model.)

Claim.—1. The combination of an electric circuit with a battery, a bell, a clock, a shaft, a sliding pinion thereon intermeshing with a clock-gear, a spring which tends to force such pinion outwardly and which forms one terminal of the circuit, an insulated contact-piece which forms the other terminal located in the path of the spring, a pin on the shaft, and a recess on the pinion, so that at stated intervals the pinion is released and the spring permitted to move and engage the contact-piece and close the circuit.

2. In an alarm-clock, the combination of a clock mechanism, a gear meshing with such mechanism, a spring flexed by said pinion, a contact in the path of such spring, said spring and contact forming terminals of an electric circuit, and a pin on the pinion-shaft, and a recess on the pinion, so that at stated intervals the pinion can move on its shaft.

383,440. APPARATUS FOR ADMINISTERING MEDICINE TO ANIMALS. CHARLES W. COLLYER, Harrisburg, Pa. Filed Oct. 11, 1887. Serial No. 251,881. (No model.)



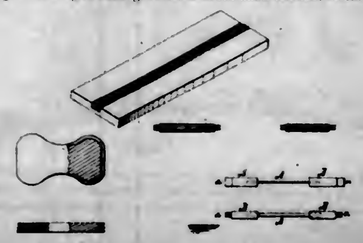
Claim.—1. In an apparatus for administering medicine to horses and other animals, a bit provided at its center with a transverse liquid-passage, combined with a closed reservoir containing the liquid material, and a conducting-pipe communicating directly with the said transverse liquid-passage and fitting into the outer end of the same, substantially as described.

2. In an apparatus for administering medicine to horses and other animals, the bit having a liquid-passage and a hollow flat projection communicating therewith, combined with flanges at each end of the bit, substantially as described.

3. In an apparatus for administering medicine to horses and other animals, the bit having a liquid-passage and a hollow flat projection communicating therewith, combined with the flanges at each end of the bit, and the flange projecting from the lower side of the bit for substantially its entire length, as and for the purposes set forth.

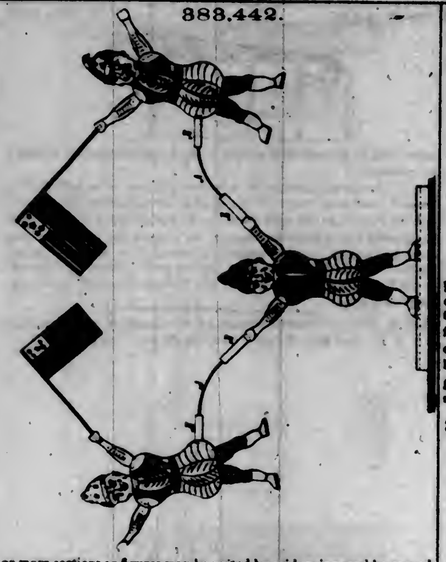
4. In an apparatus for administering medicine to horses and other animals, the bit having the liquid-passage integral therewith, combined with a spring-controlled valve for opening and closing said passage, substantially as described.

383,441. DETACHABLE BUTTON. WILLIAM W. COVELL, Providence, R. I. Filed Nov. 11, 1887. Serial No. 254,903. (No model.)



Claim.—1. The button herein described, composed of a head, an attached post having its free end bent to one side and furnished with shoulders or ears b', and a shoe consisting of a plate, D, having a spring-tongue, d, integral therewith, depressed below the plate-body, thereby allowing the said ears to pass between the tongue and plate-body, and having a bend, d^2, which forms a fulcrum in which the end of the post rests, and a covering shell or front attached to the plate, substantially as set forth.

2. The combination, with the post having its free end bent to one side and furnished with shoulders or ears b', of a shoe composed of a plate, D, having a spring-tongue, d, integral therewith and bent at d^2, and having a slot, d^3, which is produced by depressing the tongue below the plate-body, in which slot the post plays or swings, and a covering shell or front secured to said plate, the free end of the post resting in the bend d^2 as a fulcrum, and the shoulders or ears b', engaging the under side of the plate D, substantially as set forth.



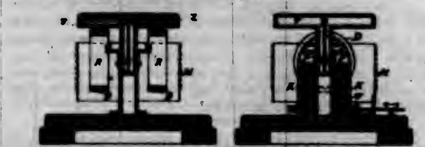
3. The plate D, having a portion, d, cut or slit therefrom, forming an integral spring-tongue, which is depressed below the plate-body, is bent at d^2, and extends beyond the perimeter of the plate, said plate being adapted to combine with a post such as described, substantially as set forth, and for the purposes specified.

383,442. TOY. CHARLES M. CRANDALL, Waverly, N. Y., assignor to Moses Lyman, same place. Filed Feb. 6, 1888. Serial No. 263,090. (No model.)

Claim.—In combination, tongued and grooved sectional toys, and springs with tongued and grooved sections fixed thereto, whereby two

383,442.

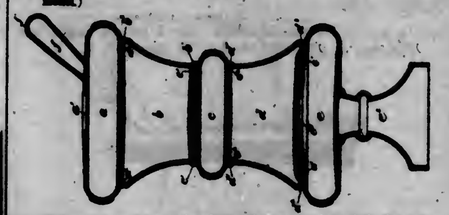
or more sections or figures may be united by said springs and be caused to vibrate, as and for the purpose shown and described.



383,443. SWEEP FOR HORSE-POWERS. GEORGE W. CRANE, Minneapolis, Minn. Filed Jan. 30, 1888. Serial No. 262,926. (No model.)

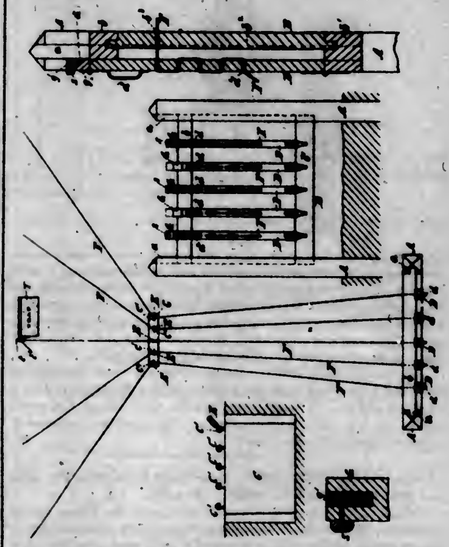
Claim.—1. The combination, with a sweep and the draft chains or cables movably attached to the opposite ends of said sweep, of the equalizing-lever pivoted to the sweep and arranged to receive the ends of said draft-cable at relatively-varying points upon its length, in the manner and for the purpose substantially as described.

2. The combination, with the sweep, of the equalizing-lever 8, pivoted upon said sweep and provided with means for attaching draft chains or cables thereto, and the cables or chains 16, attached to said equalizing-lever and extending in opposite directions to the ends of said sweep, substantially as described.



383,444. GALVANOMETER. ROBERT E. B. CROMPTON and GUSTAV KAPP, Chelmsford, County of Essex, England. Filed Sept. 27, 1884. Serial No. 144,126. (No model.) Patented in England Apr. 13, 1883, No. 1,977, and Sept. 16, 1883, No. 4,495; in France Sept. 26, 1883, No. 157,743; in Belgium Sept. 26, 1883, No. 63,717, and in Austria-Hungary Dec. 24, 1883, No. 26,800 and No. 26,900.

Claim.—1. In an instrument for measuring electro-motive force or current, an electro-magnet or electro-magnets having the core or cores small enough to be easily saturated, excited by all or part of the current to be measured, supplying the controlling-field instead of the permanent magnet hitherto employed, in combination with a deflecting-coil or its equivalent, and a steel or soft-iron needle free to take up a portion depending on the relative strengths of the controlling and deflecting fields, substantially as described.



2. In an instrument for measuring electro-motive force or current, the combination of the controlling electro-magnet or electro-magnets having a core or cores small enough to be easily saturated, with poles extended beyond the exciting coil or coils toward the needle, so as to minimize the direct action of the magnetizing coil or coils upon the needle, substantially as set forth.

383,445. DRUGGIST'S SIGN. JOHN I. DAVIS and WILLIAM G. WALKER, Pittsburg, Pa. Filed Oct. 3, 1887. Serial No. 251,267. (No model.)

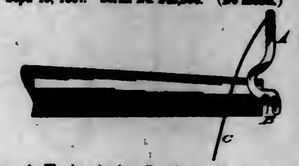
Claim.—As a new article of manufacture, a druggist's sign composed of several glass vessels whose forms are those of horizontally-divided sections of the sign—namely, one or more vessels, b d, forming the body of the sign, and one or more shallower and wider vessels forming ornamental bands or zones of the sign—said vessels being open at the top to permit of the introduction of colored liquids and being provided with interlocking flanges, whereby they are united together one upon the other, substantially as and for the purposes described.

383,446. APPARATUS FOR SPRINGING TARGET-TRAPS. ASHBURN C. DOTY, Cincinnati, Ohio. Filed Jan. 18, 1888. Serial No. 261,101. (No model.)

Claim.—1. The combination of posts A, detachable frame B, provided with levers D, hinged to the frame B, block C, provided with hooks C' and pulleys E, traps, and lines F, passing from the pickets to the traps through the pulleys E, substantially as and for the purposes specified.

2. The combination of posts A, provided with grooves a, frame B, sliding in grooves a, and provided with strips b^2 and pulls D, block C, located between the lever and the trap and provided with hooks C' and pulleys E, traps, and lines F, passing from the levers to the traps through the pulleys, substantially as and for the purposes specified.

3. The combination of lever D, drop-indicator G, hinged to the top of the lever, a trap, line F, connecting the trap and the lever, and fulcrum-pulley E, located between the trap and the lever, substantially as and for the purposes specified.

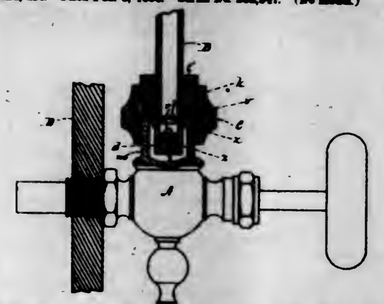


4. The combination of lever D, drop-indicator G, provided with weight f and hinged to the top of the lever, a trap, line F, connecting the trap and the lever, and fulcrum-pulley E, located between the trap and the lever, substantially as and for the purposes specified.

5. The combination of hinged lever D, provided with openings d', a trap, line F, laced through openings d' and connecting the lever and the trap, and intermediate fulcrum-pulley, E, substantially as and for the purposes specified.

6. The combination of a trap, a pull independent of and separate

from said trap, drop-indicator attached to the pull, and the line connecting the pull and the trap, substantially as and for the purposes specified.

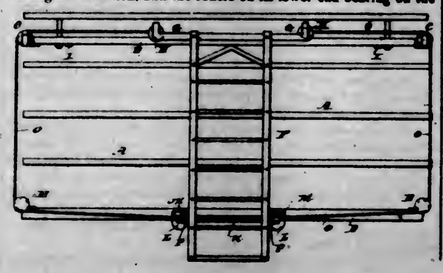


383,447. HORSE-DETACHER. JOHN A. DENTON, Pulaski, Tenn. Filed Sept. 13, 1887. Serial No. 249,598. (No model.)

Claim.—1. The herein-described horse-detacher, consisting of the whiffletree provided at its ends with the holding-pin, the curved lever pivoted to the end of said pin in the plane of the upper horizontal surface of the whiffletree, and the cord for operating the lever, as set forth.

2. The combination, in a horse-detacher, of the whiffletree, the bent pin B, lever A, and cord C, as set forth.

383,448. VALVE FOR WATER-GAGES. CLARK B. DENTON, Portland, Me. Filed Feb. 3, 1888. Serial No. 262,847. (No model.)



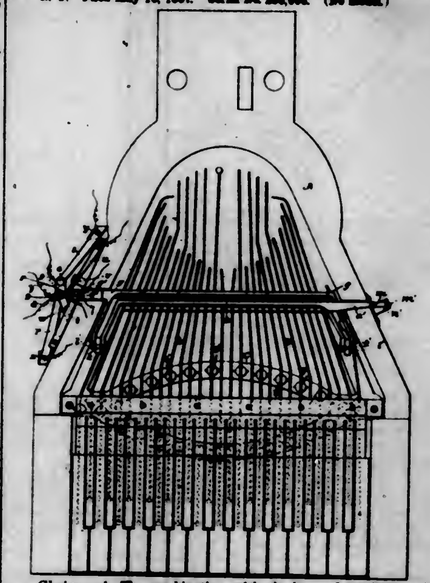
Claim.—1. The combination of a valve provided with a screw-threaded nipple, a nut thereon provided with a perforated cap, a packing-ring between said nut and nipple, a gage-tube passing through said cap, and an auxiliary dependent valve within said nipple, comprising a perforated tube having a flanged socket-head, a duct and valve-seat at its upper end, and a valve-stop at its lower end, and a cylindrical block-valve within said tube, substantially as described.

2. The auxiliary valve herein described, the same consisting of the tube *x*, provided with the holes *r*, head *z*, flanges *v y*, duct *t*, socket *f*, and pin *i*, in combination with the valve proper, *d*, disposed within said tube, all of said parts being constructed and arranged to operate substantially as set forth.

383,449. STEP-LADDER. JAMES RIBEN, Oconomowoc, Wis. Filed Mar. 8, 1888. Serial No. 266,868. (No model.)

Claim.—1. The combination of the track, the ladder having sheaves mounted on the track and provided with the guide-loops P P, the stationary pulleys C C E E, and the guide-rope attached at its ends to the upper end of the ladder, passing around the pulleys C C E E and running through the loops P P, whereby the occupant of the ladder may, by pulling the running portion of the rope, move the ladder in either direction, substantially as specified.

2. The combination, with a shelf having a depending flange on its edge and the track B, of the ladder having sheaves at its upper end running on the track, and the rollers on its lower end bearing on the



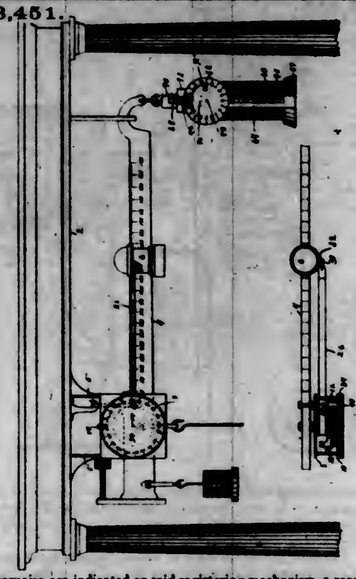
383,449.

under side of the said shelf in rear of the flange thereon, substantially as specified.

3. The combination, with a ladder adapted to be arranged in front of a series of shelves, of the track B, having pulleys C C thereon, and the stops near the ends of the track, the pulleys E E, mounted at the ends of one of the lower shelves, the sheaves on the ladder running on the track, and the rollers L L and M M on the same bearing against the shelves, and the guide rope or cord O, attached at its ends to the ladder and passing around the pulleys C C and E E, substantially as specified.

383,450. PRINTING-TELEGRAPH. SAMUEL V. BIRDS, Brooklyn, N. Y. Filed May 18, 1887. Serial No. 238,092. (No model.)

Claim.—1. The combination, with the keys of a printing-telegraph, the levers thereof, the contacts *n' n'*, located within the line-circuit, and the angular lever *a*, lying across the keys or their levers, whereby contact is broken at the contact-points of said levers and remains broken until the release of the key, substantially as described.



2. In a printing-telegraph, the longitudinally-movable rotating shaft, and means, substantially as described, for revolving and shifting the same, and the latch for holding said shaft in position when shifted, the lever for striking said latch and releasing said shaft, and the printing device, in combination with types and printing-characters disposed in parallel circular series around said shaft and rigidly connected thereto, so as to be shifted therewith.

383,451. REGISTERING AND RECORDING WEIGHING-SCALE. EDWARD G. PRIEST, Minneapolis, Minn. Filed Apr. 23, 1887. Serial No. 236,302. (No model.)

Claim.—1. The combination, with a scale-beam having a sliding poise and a suspended counterpoise, of a registering mechanism connected with said sliding poise, whereby the weight indicated by said poise is also indicated on said registering mechanism, a sliding follower on said counterpoise, and a registering mechanism connected with said follower, whereby the weights on said counterpoise are indicated upon said registering mechanism, substantially as described.

2. The combination, with a scale-beam having a sliding poise and a suspended counterpoise, of a registering mechanism connected with said sliding poise, whereby the weight is indicated on said registering mechanism, a sliding follower on said counterpoise, a registering mechanism connected with said follower, whereby the weights on said

383,451.

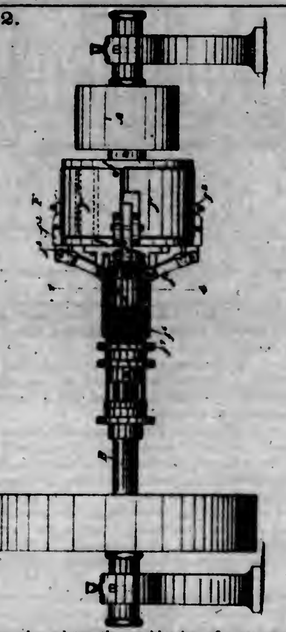
counterpoise are indicated on said registering mechanism, a recording-ticket, and means for forming on said ticket a record of the readings of said registering mechanism, substantially as described.

3. The combination, with the scale-beam and the suspended counterpoise having the removable weights 60, of the follower 72, arranged to rest on the upper weight, and a registering mechanism connected with and operated by the movement of said follower, substantially as described.

4. The combination, with the scale-beam and the suspended counterpoise having the removable weights 60, of the follower resting on the upper of said weights 60, a registering mechanism connected with said follower, a recording-ticket, and means for forming on said ticket a record of the reading of said registering mechanism, substantially as described.

5. The combination, with the scale-beam, of the suspended counterpoise having the removable weights 60, the standard 64, having the rack 70, the follower 72, adapted to rest on said weights, and the registering mechanism carried by said follower and provided with a gear-wheel engaging said rack 70, substantially as described.

383,452. SPEED-REGULATOR. THEODORE M. FOOTE, Boston, Mass., assignor to William Lamb, trustee, same place. Filed Apr. 25, 1887. Serial No. 236,111. (No model.)



Claim.—1. Driver A and friction-wheel *f*, in combination with carrier f^2, mounted on shaft B, and one or more brake-shoes, *f'*, secured in contact with friction-wheel *f*, to the carrier f^2, substantially as and for the purpose set forth.

2. Driver A and friction-wheel *f*, in combination with carrier f^2, mounted on shaft B, one or more brake-shoes, *f'*, secured in contact with friction-wheel *f*, to the carrier f^2, and means, substantially such as described—viz., one or more levers, f^3, and links f^4, and sliding sleeve f^5—for increasing the frictional contact between brake-shoes *f'* and friction-wheel *f*, substantially as and for the purpose set forth.

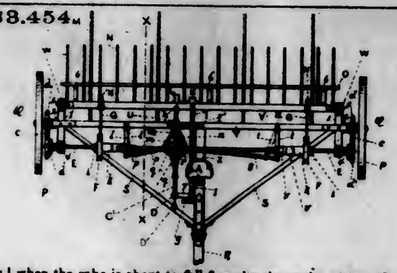
3. In a friction-coupling, the combination of friction-wheel *f* and one or more brake-shoes, *f'*, in contact with friction-wheel *f*, with one or more levers, f^3, and links f^4, slide f^5, and spring f^6, substantially as and for the purpose set forth.

383,452.

4. In a speed-regulator, the combination of a governor, G, with slide H, and springs h^4, connecting the governor and slide, substantially as and for the purpose set forth.

383,453. AUTOMATIC CAR-LINK. FARAH S. PERSHING, Lititz, Pa. Filed Sept. 26, 1887. Serial No. 250,012. (No model.)

Claim.—1. A car-link consisting of a body, A, formed with a hole, A', guide-arm A^2, hook A^4, and snout A^5, in combination with a pivoted arm, B, adapted to be guided by said arm A^2, and having a projecting end, B', and with a spring, D, substantially as set forth.



2. A car-link consisting of a body, A, formed with a hole, A', snout A^5, and hook A^4, said hook formed with a shoulder, A^6, in combination with a pivoted arm, B, having a projecting end, B', and an offset, B^2, adapted to engage with said shoulder and with a spring, D, substantially as set forth.

3. A car-link consisting of a body, A, formed with a hole, A', guide-arm A^2 A^3, hook A^4, with shoulder A^6, and snout A^5, in combination with an arm, B, pivoted at C to said body and formed with a projecting end, B', and offset B^2, and with a coiled spring, D, connecting said body and pivoted arm, all arranged and operated substantially as set forth.

383,454. HAY-RAKE. TALBAI F. GOODELL, Longmont, Colo., and MILAN G. GOODELL, Santa Anita, Cal. Filed Sept. 7, 1887. Serial No. 248,926. (No model.)

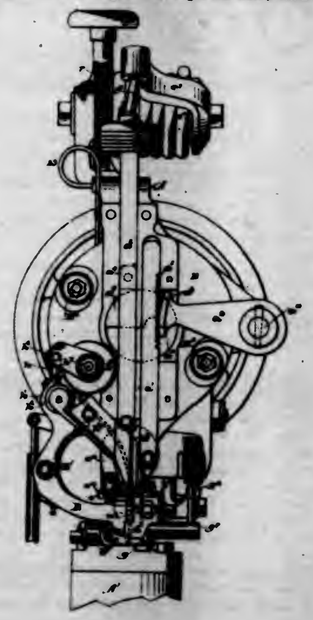
Claim.—In a horse-rake, the combination of the following parts: the shaft E, journaled in the frame and operated from the carrying-wheels, the loose pulleys F on said shaft, chains G, connecting said loose pulleys and the rake-head, sliding clutches *v*, adapted to engage the loose pulleys, the bar Y, the toggle-frame *r*, pivoted on said bar Y, bars *p* and *s*, connecting the toggle-frame and the clutches *v*, the sliding bar *h*, connected with the toggle-frame and projecting rearwardly, a lug, L, on the rake-head, arranged to operate the bar *h* when the rake is elevated to release the clutches, the lever I, pivoted in the frame and having a rearwardly-extending hooked end, *a*, and a lug, K, on the rake-head, arranged to engage the hooked end of the

383,454.

lever l when the rake is about to fall from its elevated position, all as set forth

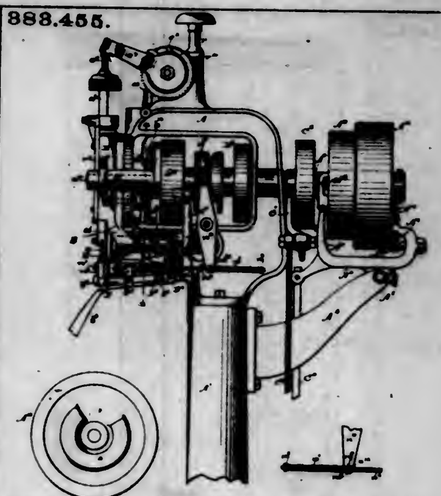
383,455. NAILING-MACHINE. LOUIS GROSS, Winchester, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed June 13, 1887. Serial No. 241,116. (No model.)

Claim.—1. In a nailing-machine, a vibrating head, a driver-bar, and awl-carrier therein, the latter provided at one side with teeth, and a toothed sector to move it, combined with a horn to support the work, substantially as described.



2. In a nailing-machine, a vibrating head, a driver-bar, and awl-carrier therein, the latter provided at one side with teeth, and a toothed sector to move it, combined with a horn to support the work, and with wire feeding and cutting mechanism to sever the wire into fasteners, substantially as described.

3. In a nailing-machine, wire-feeding mechanism, combined with wire-cutting mechanism containing a cutting-disk having a beveled edge, any portion of which may be brought into operative position in case any other portion of the edge becomes dulled, substantially as described.



4. The nose attached to the lower end of the head in which the driver reciprocates, and an attached disk cutter, combined with a lever, d^{10}, and with a disk-shaped cutter fastened to it, to operate substantially as described.

5. The nose attached to the lower end of the head in which the driver reciprocates, wire-feeding mechanism, cutting mechanism having disk-like cutters, and a carrier to receive a fastener cut from the wire, combined with means to reciprocate the said carrier to transfer a fastener from the cutting mechanism into position to be driven by the driver, substantially as described.

6. The nose attached to the lower end of the head in which the driver reciprocates, wire feeding and cutting mechanism, and a carrier

383,455.

to receive a fastener cut from a wire, combined with the rod or shank, spring, and lever to move the carrier, whereby in case the backward movement of the carrier is obstructed the spring may yield and avoid breaking of parts, substantially as described.

7. The loose pulley, the shaft A^9, and the balance-wheel, provided with the cam-surface 2, combined with the yoke, and the roller A^{10}, to co-operate with the said cam-surface, substantially as described.

8. The loose pulley, the shaft A^9, and the balance-wheel fast on it, combined with the pivoted yoke, and friction device carried by it to act on the balance-wheel, substantially as described.

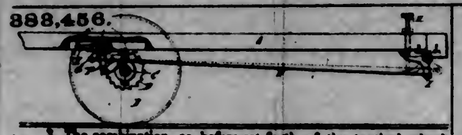
9. The loose pulley, the shaft A^9, and the balance-wheel provided with the cam-surface 2, combined with the yoke, the roller A^{10}, to co-operate with the said cam-surface, and a friction device, substantially as described, to act on the balance-wheel, as set forth.

10. The gage g, having a dovetailed shank, and the block on which the shank of the gage is free to slide, combined with the friction-plates g^6, to retain the shank of the gage in place, substantially as described.

11. In a nailing-machine, a vibrating head to carry the awl, and wire-feeding mechanism made movable with the said head, combined with a measuring mechanism, substantially as described, connected to the frame-work or detached from the vibrating head, and controlled by the height of the horn to determine the extent of movement of the wire-feeding mechanism and the length of the fastener to correspond with the requirements of the stock on the horn, substantially as described.

12. The feeding-ratchet, the tappet-shaft, on which it is mounted loosely, the tappet-lever, pawl to move the said ratchet, and means to move the tappet-lever, combined with the measuring-sleeve, measuring-leg, the horn, and connections between the said horn and leg, to operate substantially as described.

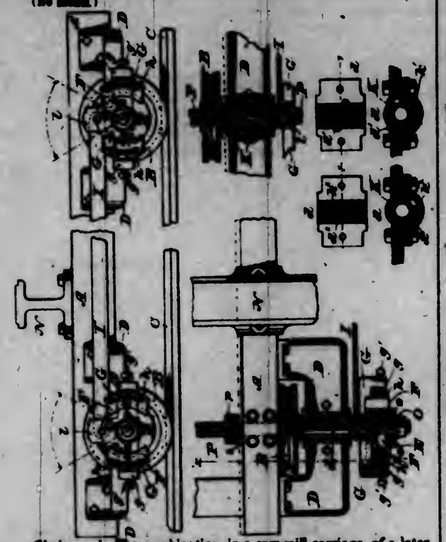
13. The feeding-ratchet, a pawl to move it, the tappet-shaft, and tappet-lever, having an arm, 22, provided with a curved and inclined edge or end, combined with the rock-shaft D^2, the stud 27, and sleeve mounted thereon having arms, one of which co-operates with the curved and inclined end of the tappet-lever, while the other arm co-operates with or is moved by the horn, substantially as described.



14. The rock-shaft D^2, the vibrating head, the awl-carrying bar located in the said head, connections between the said rock-shaft and head to operate the latter, and feeding-ratchet, combined with the horn, the measuring-sleeve m^2, having means to support the said sleeve and to actuate it from the said horn, and with a tappet-lever, its shaft, and means to move it a greater or less distance, and a pawl actuated by the said tappet-shaft to move the feeding-ratchet, substantially as described.

383,456. APPLIANCE FOR RAILWAY-CARS. JAMES GOODWILLOW, New York, N. Y. Filed Oct. 5, 1887. Serial No. 251,598. (No model.)

Claim.—1. In an appliance of the character herein set forth, the toothed wheel, the pawl or dog, the counter-weight, the crank, and the line, combined and arranged substantially as explained.



2. In an appliance of the character herein set forth, the combination, with the operating-line, of the hinged arm and the removable pin bearing thereon, substantially as explained.

383,456.

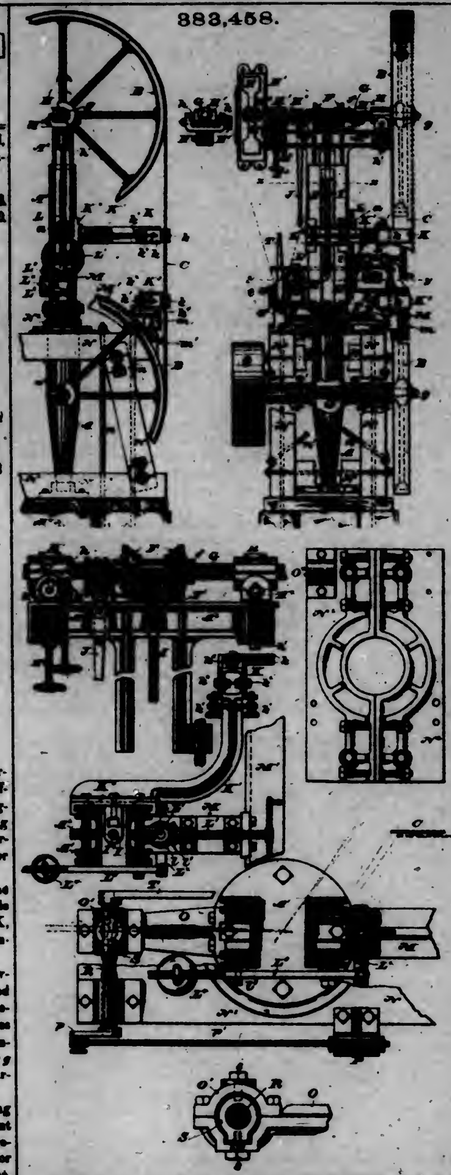
3. The combination, as before set forth, of the toothed wheel, pawl, counter-weight, crank, operating-line, hinged arm, and removable pin, for the purposes explained.

383,457. AUTOMATIC OFFSET FOR SAW-MILL CARRIAGES. WILLIAM GOWER, Wausau, Wis. Filed Oct. 6, 1886. Serial No. 215,402. (No model.)

Claim.—1. The combination, in a saw-mill carriage, of a laterally-movable carriage-frame and its supporting-wheels and axles, offsetting mechanism connecting said carriage-frame and its supporting-axles, and a friction wheel or wheels connected with said offsetting mechanism and arranged to actuate the same and to move said carriage-frame transversely to its line of travel, substantially as and for the purposes set forth.

2. The combination, in a saw-mill carriage, of the carriage-frame A, laterally movable with reference to the travel of said carriage, axle P, carriage-wheel B, friction-wheel E, applied to said axle, screw K, and shoe F, connected with said screw and bearing upon said friction-wheel, substantially as and for the purposes set forth.

3. The combination, in a saw-mill carriage, of the laterally-movable frame A, supporting-wheels B B, and axles P, screws K, mounted upon said axles and working in threaded boxes secured to the carriage-frame, cross-heads G G, formed on or attached to said screws, shoes F F, connected with said cross-heads and bearing against said friction-wheels, springs h h, interposed between said shoes, and projections $g\,g$ on said cross-heads, and set-bolts $g'\,g'$, substantially as and for the purposes set forth.



4. In a saw-mill carriage, the combination, with the supporting wheels and axles of the carriage-frame, capable of lateral movement on said axles, of a screw or screws arranged to move the carriage-frame laterally, and actuating mechanism connecting the screw or screws and one or more of the axles, substantially as and for the purposes set forth.

5. The combination, with the supporting-axles of a saw-mill carriage, of the carriage-frame arranged to move laterally thereon, a screw or screws to cause said lateral movement, a friction-wheel secured on one of the axles and provided with a friction shoe or strap to actuate said screw or screws, and mechanism connecting said shoe or strap and said screws, substantially as and for the purposes set forth.

383,458. BAND-SAW MILL. WILLIAM GOWER, Wausau, Wis. Filed Dec. 29, 1886. Serial No. 223,004. (No model.)

Claim.—1. In a band-saw mill, the combination of a supporting-column arranged to swing about a vertical axis, band-wheels carried by said column, and the band-saw mounted upon said wheels, substantially as and for the purposes set forth.

383,458.

2. In a band-saw mill, the combination of the band-wheels and their connections movable about a common upright axis and mechanism connected with and arranged to swing said band-wheels and their connections simultaneously toward and away from the log-carriage way, substantially as and for the purposes set forth.

3. In a band-saw mill, the combination of an upright column supported and arranged to swing about its axis in suitable bearings, band-wheels and their shafts supported by and movable with said column, a screw working in a nut in connection with said column and bearing or engaging with a fixed box, and means for operating said screw, substantially as and for the purposes set forth.

4. In a band-saw mill, an upright supporting-column composed of two sections, the lower section of which is furnished with bearings for the lower band-wheel shaft, in combination with a vertically-adjust-

able frame mounted upon the upper section and furnished with bearings for the upper band-wheel shaft, all arranged to be swung in suitable bearings about an upright axis, substantially as and for the purposes set forth.

5. In a band-saw mill, the combination of an upright supporting-column bearing at its lower end in a step and at an intermediate point in a box permanently secured to suitable frame-work, and the band wheels and saw carried by and movable with said column about its axis, substantially as and for the purposes set forth.

6. In a band-saw mill, the combination, with the band wheels and saw, of an upright supporting-column capable of angular movement about an upright axis, a vertically-adjustable frame movable in ways provided therefor on said column and furnished with bearings for the upper band-wheel shaft, and mechanism arranged to raise and lower said frame, substantially as and for the purposes set forth.

7. In a band-saw mill, the combination of the supporting-column, a T-frame having a central upright section movable in upright ways on said column, and a horizontal section both ends of which project beyond said column, boxes attached to the projecting ends of said horizontal section by universal-joint connections, the box opposite the upper band-wheel being vertically and laterally adjustable, and the upper band-wheel shaft bearing in said boxes, substantially as and for the purposes set forth.

8. In a band-saw mill, the combination of the band wheels and saw, an upright supporting standard or column, a vertically-adjustable frame mounted thereon and furnished with bearings for the upper band-wheel shaft, a screw working with a nut on said frame and bearing at the lower end in a step-lever fulcrumed to the supporting-column, a weighted lever connected with the free end of said step-lever and fulcrumed transversely thereto upon said supporting-column, and means for turning said screw, substantially as and for the purposes set forth.

9. In a band-saw mill, the combination, with the band wheels and saw, of a fan secured directly upon the upper band-wheel shaft, a case inclosing an air-chamber about said fan and provided with induction and eduction openings, and a regulating valve or slide working in one of said openings, substantially as and for the purposes set forth.

10. In a band-saw mill, the combination, with the band wheels and saw, of an upright supporting-column provided on opposite sides with ways, a reversible and vertically-adjustable guide-arm or slide adapted to the ways on either side of said column, a guide attached to said guide-arm or slide, and means for raising and lowering said guide-arm or slide with its guide, substantially as and for the purposes set forth.

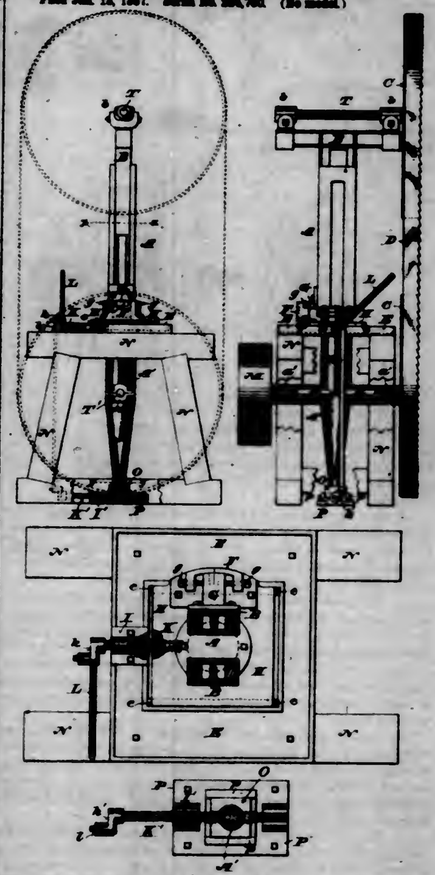
11. In a band-saw mill, the combination, with the band wheels and saw, of a guide mounted upon a vertically-adjustable slide, a supporting-column provided with ways for said slide, an upright screw working with a nut on said slide and provided with a friction-wheel, a sleeve feathered on one of the band-wheel shafts and provided with a pair of friction-wheels, either of which works with the friction-wheel on said screw, and a lever connected with and arranged to move said sleeve endwise on said shaft, substantially as and for the purposes set forth.

12. In a band-saw mill, the combination, with the band wheels and saw, of a housing covering the upper portion of the lower band-wheel and provided at each end with a plate or flange for the attachment of a saw-guide, and a right and left guide or guides attachable thereto, substantially as and for the purposes set forth.

13. In a band-saw mill, the combination, with the band wheels and saw, of an upright supporting-column adjustable about its axis, a lever connected with and arranged to turn said column, and an adjustable stop arranged to limit the angular movement of said column, substantially as and for the purposes set forth.

14. In a band-saw mill, the combination, with the band wheels and saw, of an upright supporting-column carrying said wheels and saw, and an engine connected therewith and arranged under the control of the operator to swing said column about its axis, substantially as and for the purposes set forth.

15. In a band-saw mill, the combination, with the band wheels and saw, of an upright supporting-column carrying said band wheels and saw and capable of angular movement about an upright axis, a vertically-adjustable frame carrying the upper band-wheel and movable in ways provided therefor on said column, a screw working with a nut on said frame and provided with a gear, a bracket attached to the front side of said column between the sides of said saw, a step-lever fulcrumed in a recess in said bracket and furnishing a bearing for the lower end of said screw, a weighted lever fulcrumed to the side of said column and connected with the free end of said step-lever, and a crank-shaft mounted on said bracket and provided with a gear working with the gear on said screw, substantially as and for the purposes set forth.



16. In a band-saw mill, the combination, with the band wheels and saw, of an upright supporting-column, a vertically-adjustable frame mounted upon said column, trunnions bearing in vertical sockets formed therefor in said frame, boxes horizontally hinged to the heads of said trunnions and supporting the upper band-wheel shaft, and adjusting-screws arranged to move the box farthest from the upper band-wheel vertically and horizontally, substantially as and for the purposes set forth.

17. In a band-saw mill, the combination, with the band wheels and saw, of a supporting-column provided on opposite sides with vertical ways, a reversible arm provided with a guide and adapted to the ways on either side of said column, and a cross-piece projecting on both sides of said column, and a right and left guide or guides attachable to the opposite ends of said cross-piece, substantially as and for the purposes set forth.

18. In a band-saw mill, the combination, with the band wheels and saw, of a centrally-slotted supporting-column, a vertically-adjustable frame mounted thereon and carrying the upper band-wheel, an upright screw-shaft centrally journaled in said frame, a reversible guide-supporting arm adapted to ways on either side of said column and provided with a nut working in either position with said screw-shaft, and means for driving said screw-shaft from said upper band wheel shaft, substantially as and for the purposes set forth.

388,459. BAND-SAW MILL. William Gowie, Weston, Wis.

Filed Jan. 12, 1887. Serial No. 224,702. (No model.)

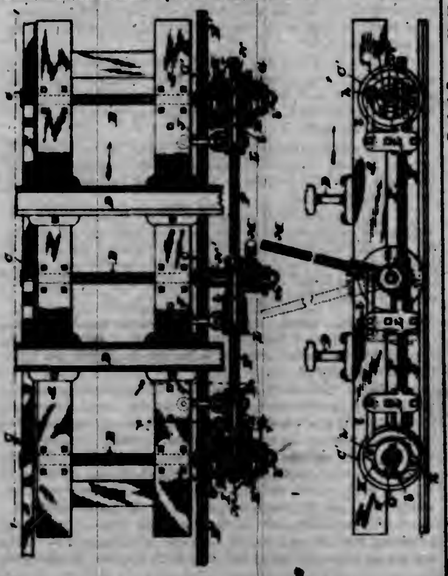
Claim.—1. The combination, in a band-saw mill, with the upper and lower band-wheels and their shafts, the band-saw, and their connections, of an upright supporting-standard carrying the same, provided with bearings for the upper and lower band-wheel shafts, and movable with said band wheels and saw and their connections transversely to the carriage-track, substantially as and for the purposes set forth.

2. The combination, in a band-saw mill, with the band wheels and saw, of a standard carrying the same and supported in bearings adjustable transversely to the carriage-track and arranged to be turned about its axis in said bearings, so as to change the lead of the saw, substantially as and for the purposes set forth.

3. The combination, in a band-saw mill, with the band wheels and saw, of a supporting column or standard provided with bearings for the upper and lower band-wheel shafts and movable laterally in ways transverse to the carriage-track, and screws working therewith to move said column or standard and the parts supported thereon toward and from said carriage-track, substantially as and for the purposes set forth.

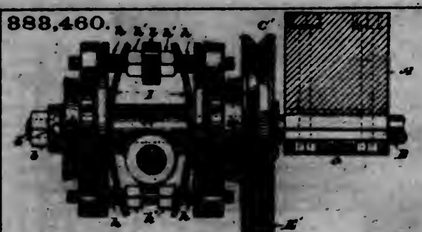
4. The combination, in a band-saw mill, with the band wheels and saw, of a standard carrying the same and supported and arranged to be turned in bearings adjustable transversely to the carriage-track, screws working with said bearings, and mechanism for operating the same, whereby the saw is carried out of contact with the log in rigging, substantially as and for the purposes set forth.

5. The combination, in a band-saw mill, with the band wheels and saw, of an upright column or standard provided with bearings for the upper and lower band-wheel shafts and supported in slides movable in ways transverse to the carriage-track, crank-shafts working with said slides, and a lever connected with said crank-shafts and arranged to operate said screws and to move the saw toward and from the carriage-track, substantially as and for the purposes set forth.



6. The combination, in a band-saw mill, with the band wheels and saw, of a column or standard provided with bearings for the upper and lower band-wheel shafts and supported and arranged to turn about an upright axis in suitable bearings provided therefor, an arm projecting laterally from said standard, and adjusting-screws working in fixed nuts against the opposite sides of said arm and arranged to turn said standard upon its axis and to lock the same at any desired angle, substantially as and for the purposes set forth.

7. The combination, in a band-saw mill, with the band wheels and saw, of an upright column or standard capable of angular movement about its axis, a vertically-adjustable frame mounted upon said standard and provided with bearings for the upper band-wheel shaft, slides supporting said standard and movable transversely to the carriage-track, and mechanism for moving said slides toward and from said track, substantially as and for the purposes set forth.



388,460. OPERATING MECHANISM FOR SAW-MILL CARRIAGE. William Gowie, Weston, Wis. Filed Jan. 12, 1887. Serial No. 224,703. (No model.)

Claim.—1. The combination, in a saw-mill carriage, of a log-supporting frame laterally movable upon its axles, a friction-wheel mounted upon one of said axles, a bar supported in bearings upon and movable lengthwise of said carriage and connecting said frame and axles, and a friction shoe or ring working with said friction-wheel and connected with said sliding bar, substantially as and for the purposes set forth.

2. The combination, in a saw-mill carriage, of a log-supporting frame movable laterally upon its axles, a bar linked to said frame and

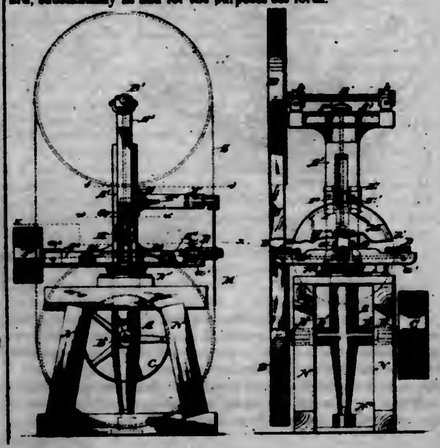
388,460.

supported and movable endwise in cross-boxes mounted upon said axles, and a lever fulcrumed upon a carriage-axle and connected with said sliding bar, substantially as and for the purposes set forth.

3. The combination, in a saw-mill carriage, of a log-supporting frame movable laterally upon its axles, a sliding bar linked to said frame and supported in boxes mounted upon said axles, and a friction wheel or wheels fixed upon one or more of said axles and connected with said sliding bar, substantially as and for the purposes set forth.

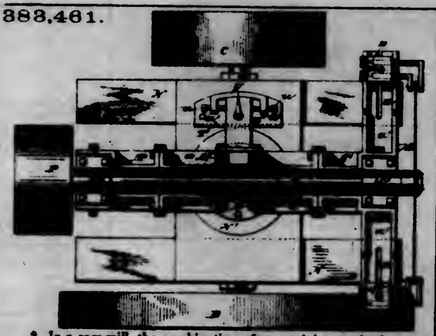
4. The combination, in a saw-mill carriage, of a log-supporting frame laterally movable upon its axles, beveled friction-wheels mounted upon one or more of said axles, friction-rings working with said friction-wheels and connected with said log-supporting frame, and a spring or springs holding said friction-rings in engagement with said friction-wheels, substantially as and for the purposes set forth.

5. The combination, in a saw-mill carriage, of a log-supporting frame laterally movable upon its axles, friction-wheels mounted upon one or more of said axles, friction-rings working with said friction-wheels, and a sliding bar linked to said frame and friction-rings, substantially as and for the purposes set forth.



6. The combination, in a saw-mill carriage, of a log-supporting frame movable laterally upon its axles, a sliding bar connecting said frame and axles, an arm formed in sections bolted upon said sliding bar, and a crank mounted upon one of said axles and connected with said arm, substantially as and for the purposes set forth.

7. The combination, in a saw-mill carriage, of a log-supporting frame laterally movable upon its axles, a sliding bar connecting said frame and axles, and a crank mounted upon one of said axles and connected with said sliding bar, substantially as and for the purposes set forth.



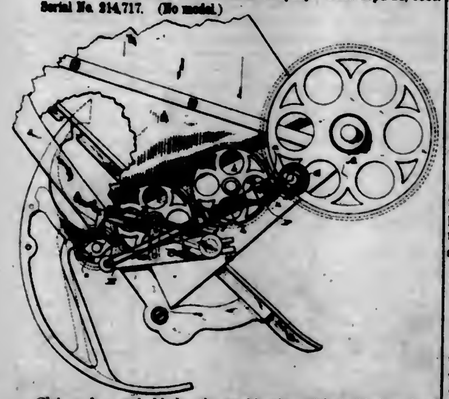
8. The combination, in a saw-mill carriage, of a log-supporting frame laterally movable upon its axles, friction-wheels mounted upon one or more of said axles, friction-rings engaging said friction-wheels, curved annular springs bearing against said friction-rings, threaded pins passing through said rings and provided with adjusting-nuts bearing against said springs, and a sliding bar connecting said frame and axles and connected with one of said pins, substantially as and for the purposes set forth.

388,461. SAW-MILL. William Gowie, Weston, Wis. Filed May 2, 1887. Serial No. 236,797. (No model.)

Claim.—1. The combination of an upright supporting post or standard movable about its axis, band-wheels supported and movable with said central standard, a band-saw mounted upon said band-wheels, and a circular saw supported by and movable with said standard, substantially as and for the purposes set forth.

383,461.

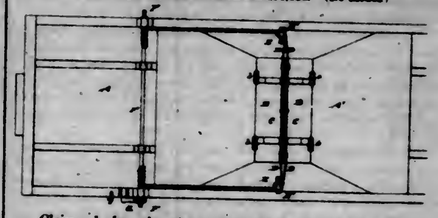
2. In a saw-mill, the combination of an upright standard or column supported by and capable of angular movement in suitable bearings and provided on opposite sides with laterally-projecting bracket-bearings, the saw and its mandrel supported transversely to said column in said bracket-bearings, a saw-guide attached to an arm projecting laterally from said standard or column and partaking of its angular movement, and mechanism for imparting an angular movement to said standard or column, substantially as and for the purposes set forth.



3. The combination, with an upright post or standard movable about its axis, provided with lateral arms and bearings for a circular-saw mandrel, of a circular saw supported in said bearings and movable with said standard, and a vertically-adjustable guide-support working in ways on said standard, substantially as and for the purposes set forth.

4. The combination, with an upright post or standard movable about its axis, furnished with bearings for a horizontal saw-mandrel and with vertical ways for a guide-support, of a circular saw mounted upon said mandrel, a guide-supporting arm movable vertically upon said ways, and an adjusting-screw working with said guide-supporting arm, substantially as and for the purposes set forth.

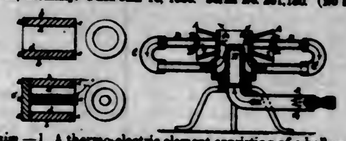
5. The combination, with an upright post or standard arranged to be turned about its axis, of arms extending laterally from said standard and provided with boxes for the saw-mandrel, cross-arms projecting transversely to the saw-mandrel from its adjacent supporting-arm, and guides adjustably attached to said cross-arms and working with the saw in front and rear of the mandrel, substantially as and for the purposes set forth.



6. In a saw-mill, the combination, with the band-wheels and their shafts, of an upright supporting post or standard capable of angular movement about its axis and provided with bearings for a circular-saw mandrel and with bearings for said band-wheel shafts, substantially as and for the purposes set forth.

383,462. GRAIN-BINDER. JAMES A. GRAHAM, Milwaukee, Wis., assignor to the Milwaukee Harvester Company. Filed Sept. 26, 1888. Serial No. 214,717. (No model.)

Claim.—In a grain-binder, the combination, with the binder-wheel and crank-arm of the needle-shaft, of an eccentric cam-disk carried by the binder-wheel, a pitman, a pitman-head wristed to the cam-disk aforesaid and having a yielding connection with the pitman, and a stop carried by the pitman and adapted for impingement on the periphery of the cam-disk during the last portion of each revolution of the binder-wheel, substantially as described.



383,463. DUMPING-CAR. GEORGE H. GRAHAM, Elizabethport, N. J. Filed Sept. 20, 1887. Serial No. 249,893. (No model.)

Claim.—1. In a dumping-car, the hatches B, hinged to the car-body at *b*, and each operated by two chains, D, one connected to each end of the hatch, said chains being exterior to the hopper, substantially as herein specified.

2. A dumping-car for coal and analogous material, having, in combination with the body A, hopper A', and hinged hatches B *b*, the trusses C C, arranged to strengthen the hatches, the chains D D, sheaves E E, and windlass F, all arranged on the exterior of the car, substantially as herein specified.

383,464. THERMO-ELECTRIC GENERATOR. ROBERT J. GRAMME, Berlin, Germany. Filed Jan. 16, 1886. Serial No. 261,120. (No model.)

Claim.—1. A thermo-electric element consisting of a hollow cylindrical body provided with a small base-surface at one end for receiving heat and a large cooling-surface, substantially as and for the purpose set forth.

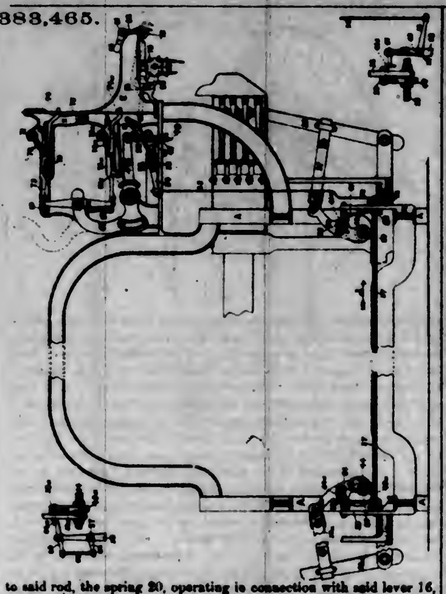
2. A thermo-electric element consisting of a hollow body provided with a small base-surface for receiving heat and a large cooling-surface, in combination with a second thermo-electric body arranged within the first one, substantially as and for the purpose set forth.

3. A thermo-electric element consisting of a hollow body provided with a small base-surface for receiving heat and a large cooling-surface, in combination with a second hollow thermo-electric body arranged within the first one, substantially as and for the purpose set forth.

4. A thermo-electric element consisting of a hollow body provided with a small base-surface for receiving heat and a large cooling-surface, in combination with a second hollow thermo-electric body arranged within the first one and provided with lateral air-holes somewhat below the edge of the said outer body, substantially as and for the purpose set forth.

5. The combination, with a series of external hollow thermo-electric elements, A, of the internal elements, B, the chimneys C, connected to the said elements B, and a heating-chamber common to all the elements and connected to the said chimneys, substantially as and for the purpose set forth.

6. The combination, with an external hollow thermo-electric element, of a second internal element provided with a central passage for gas, and a burner-hole common to both elements, substantially as and for the purpose set forth.



7. The combination of an external hollow thermo-electric element, and a second internal element provided with a central passage for gas, and a burner-hole common to both elements, with a second pair of external and internal elements similar to the first pair, and arranged with the heated ends of each pair opposite to each other, substantially as and for the purpose set forth.

383,465. LOOM. RICHARD I. HAYWORTH and JAMES HILL, Keighley, County of York, England. Filed Sept. 3, 1888. Serial No. 283,881. (No model.) Patented in England Mar. 6, 1885, No. 3,264, and July 4, 1885, No. 8,169.

Claim.—1. The combination, with the frictional driving-pulley 1, the disk 5, the gear-wheel 3, said pulley and disk being mounted on the boss of said gear-wheel, the former being loose and the latter fast to said boss, shaft 4, the gear-wheels 6 and 8, shaft 7, and the gear-wheel 9, rigidly mounted on shaft 4, of the levers 11 and 13, the rods 17 and 18, the springs 19 and 20, the levers 14, 15, and 14, the shaft 761, and the handle 12, said rods, springs, levers, and handle operating said levers 11 and 13, substantially as and for the purposes specified.

2. The projecting piece 21, the dagger 23, which operates said projecting piece, the stop-rod 24, to which said dagger is attached, and the lay *c*, in combination with the rod 17, the lever 16, connected

383,465.

to said rod, the spring 20, operating in connection with said lever 16, the rod 18, also joined to lever 16, the lever 11, and the disk 5, all arranged to operate substantially as and for the purpose specified.

3. The combination of the shaft 29 and the joint 30, in which said shaft is swiveled, with the tumbling-lever 32, the rod 34, which enters into the notch of said tumbling-lever 32, and the spring 35, all arranged to operate substantially as and for the purpose specified.

4. The combination, with the picking-cam 26, shaft 7, the cone 27, the stud 28, and the shaft 29, to which said stud 28 is attached, of the swivel-joint 30, the tumbling-lever 32, which, with said joint 30, carries said shaft, and rod 34, with its spring 35, all arranged to operate substantially as and for the purpose specified.

5. The lever 56, the connecting-rod 55, the levers 54 and 51, the sleeve or tube 52, the rod 48, the jack-lever having the arm 47ª, which, through said rods and levers, operates said lever 56, the means for actuating said jack-lever, the shaft 57, the lever 60, attached to said shaft, and the lever 61, operated by said lever 60, in combination with the pin 61ª, the catch 39, to which said pin is attached, the arm 38, carrying said catch, the picking-stick 36, the strap 37, joining said arm and picking-stick together, the notched piece 40, the shaft 29, to which said notched piece is attached, the cam 26, the bowl 27, and the stud 28, substantially as and for the purpose specified.

6. The lever 56, the connecting-rod 55, the levers 54 and 51, the sleeve or tube 52, the rod 48, the jack-lever 47, having arm 47ª, which, through said rods and levers, operates said lever 56, the means for actuating said jack-lever, the shaft 57, the lever 62, attached to said shaft, and the lever 64, joined to said lever 62 by rod 63, in combination with the pin 64ª, the catch 39ª, to which said pin is attached, the arm 38ª, carrying said catch, the picking-stick 36ª, the strap 37ª, joining said arm and picking-stick together, the notched piece 40ª, the shaft 44, the swape 43, the rod 42, the swape 41, the shaft 29, said shaft operating the shaft 44 by said swapes and rod, and the means for operating shaft 29, substantially as and for the purpose specified.

7. The combination of the jack-lever 47, having an arm, 47ª, the lever 68, the catches 73ª and 73ᵇ, and the reciprocating draw-bars 70 and 70ª, by which said jack-lever 47 is operated, with the connecting-rod 48, the yielding springs 49 and 50, mounted on said rod 48, the levers 51 and 54, the sleeve or tube 52, the connecting-rod 55, attached to said lever 54, the lever 56, the shaft 57, which is operated by said jack-lever 47 by means of said springs and rods, the levers 60 and 61, the pin 61ª, the catch 39, the lever 62, the rod 63, the lever 64, the pin 64ª, the catch 39ª, the picking-sticks 36 and 36ª, the arms 38 and 38ª, straps 37 and 37ª, notched plates 40 and 40ª, and means for operating the said plates, substantially as and for the purposes specified.

8. The combination of the lever 68, the shaft 66, and the handle 67, said lever and handle being mounted on said shaft, with the lever 51, the springs 49 and 50, the said lever 51 being permitted to move by the yielding of the said springs 49 and 50, the rod 48, jack-lever 47, having the arm 47ª, with said rod attached to it, means for operating the said lever, the sleeve 52, the lever 54, the rod 55, attached thereto, the lever 56, engaging with said rod, the shaft 57, to which lever 56 is attached, the levers 60 and 62, mounted on said shaft, the rod 63, the lever 64, joined to lever 62 by said rod 63, the lever 61, the pins 61ª and 64ª, operated upon by said levers 61 and 64, respectively, the catches 39 and 39ª, to which said pins 61ª and 64ª are respectively attached, the notched pieces 40 and 40ª, the means for operating said notched pieces, arms 38 and 38ª, straps 37 and 37ª, and picking-sticks 36 and 36ª, all arranged to operate substantially as and for the purposes specified.

9. The combination of the jack-lever 47 and the lever 68 hinged thereto with the catches 69, 69ª, 73, and 73ª, the said catches 69 and 69ª being hinged to the lever 68 and the catches 73 and 73ª being hinged to the catches 69 and 69ª, respectively, the reciprocating draw-bars 70 and 70ª, and the needle 75, for operating on said catches, the lever 77, the peg 76, the pattern-chain 79ª, and the barrel 79, all arranged to operate substantially as and for the purposes specified.

10. The combination of the catches 73 and 73ª, formed with their outer ends of an inclined shape, with the needle or rod 75, having loops or openings 74 and 74ª to receive said catches 73 and 73ª, the catches 69 and 69ª, to which said catches 73 and 73ª are hinged, respectively, the lever 68, the jack-lever 47, the reciprocating draw-bars 70 and 70ª, the crank 111, the rod 112, lever *l*, and rods *s' s²*, shaft 4, and gears 111ª, 111ᵇ, and 111ᶜ, all arranged to operate to the end set forth.

11. The combination of the hinged stop-bars 72 and 72ª with the catches 73 73ª and 69 69ª, the former catches, 73 73ª, being hinged to the latter, the lever 68, to which catches 69 and 69ª are hinged, the jack-lever 47, the draw-bars 70 and 70ª, the crank 111, the rod 112, lever *l*, and rods *s' s²*, all arranged to operate to the end set forth.

12. The combination of the series of levers 77, the barrel 79, and the pattern-chain with the series of looped needles 75, the series of catches 73 and 73ª, the series of catches 69 and 69ª, the series of levers 68, the series of jack-levers 47, on which the series of levers 68 is mounted, said series of levers 68 carrying said series of catches 69 69ª, on which are mounted the said series of catches 73 and 73ª, respectively, and the draw-bars 70 and 70ª, which operate upon the two series of catches 69 69ª and 73 73ª, the driving-crank 111, the rod 112, the lever *l*, and the rods *s'* and *s²*, all arranged to operate substantially as and for the purpose specified.

13. The combination of the pattern-barrel 79, the series of levers 77, the pattern-chain on said barrel, the series of needles 75, the two series of catches 73 73ª, said catches being operated by said levers 77 and said needles 75, the two series of catches 69 69ª, the levers 68, the jack-levers 47, the reciprocating draw-bars 70 and 70ª, which operate said series of catches 69 and 69ª, 73 and 73ª, the rods *s' s²*, the lever *l*, the rod 112, the crank 111, said rods, lever, and crank operating said bars 70 and 70ª, the levers 84 and 85, on which said barrel 79 is mounted, the gear-wheels 92, 93, 95, and 96, the shaft 97, the wheel 99, the crown-wheel 100, the nogging-wheel 103, the pins 101 and 102, the shaft 89, from which intermittent motion is derived, the shaft 86, upon which said levers 84 and 85 are mounted, the lever 87, fixed to said shaft, the rod 88, attached to said lever, the anti-friction bowl 91, mounted on said rod, the cam 90, fixed on said shaft 89, by which cam, bowl, rod, levers, and shaft vertically-oscillatory motion is imparted to the said pattern-barrel 79, the yielding coupling, and the gear-wheels 109 and 110, which impart rotary motion to the shaft 89, substantially as and for the purposes specified.

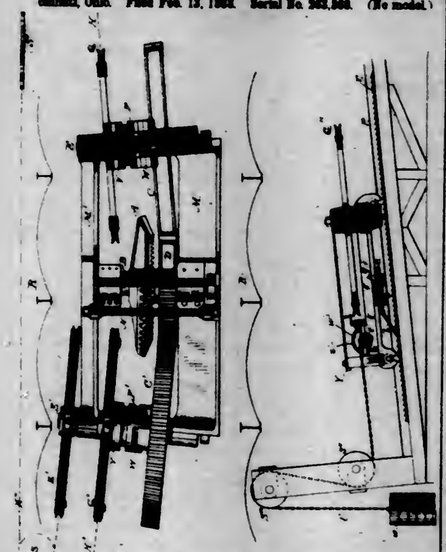
14. The combination of the upright revolving shaft 89, the yielding coupling consisting of box 106, spring 107, boss 105, and key *m*, the gear-wheels 109 and 110, and the shaft of the driving-crank 111 with the nogging-wheel 103 and its pins 101 and 102, the crown-wheel 100, the shaft 97, the gear-wheels 99, 96, 95, 93, and 92, the pattern-barrel 79, the levers 84 and 85, the shaft 86, the lever 87, the rod 88, and cam 90, through and by which the vertically-oscillatory motion of the said barrel 79 is derived from said shaft 89, substantially as and for the purposes specified.

15. The combination of the rib 82 and the handle 83, by which it is manually operated, with the series of levers 77, the series of needles 75, and the two series of catches 73 and 73ª, by the pressure or weight of which catches 73 and 73ª and needles 75 the said levers 77 are raised at their outer ends when the said rib 82 is removed, the pattern-chain, the barrel 79, and the reciprocating draw-bars 70 and and 70ª, substantially as and for the purpose specified.

16. The combination of the ratchet-wheels 124 and 125 and their respective pawls 126 and 127 with the levers 128 and 129, upon which said pawls 126 and 127 are respectively mounted, the spring 130, attached to said levers 128 and 129, the rod 131, the levers 132 and 133, the rod 134, and the swing-rail 135, for operating said levers 128 and 129, substantially as and for the purpose specified.

17. The combination of the friction-wheels 117 and 118 and the straps 119 and 120, partly encompassing said wheels, with the straps 121 and 122, for joining together the straps 119 and 120, and the weight 123, all arranged to operate substantially as and for the purpose specified.

18. The combination of the back part, 136, having openings 137 made therein and projections 138, with the shelves 139, having bifurcations 139ª, the bolts 139ᵇ, and the swell-levers 140, substantially as and for the purpose specified.



19. The combination of the bolts 141 and 141ª, the shelves 139, through which said bolts pass, the back part, 136, the swell-levers 140, and the pin 148 with the tubes 142 and 142ª and the tube 149, all arranged and constructed substantially as and for the purpose specified.

20. The combination of the strips of metal 144 with the tubes 142 and 142ª, the bolts 141 and 141ª, the shelves 139, and the back part, 136, all constructed and arranged substantially as and for the purpose specified.

21. The combination of the swell-lever 140, constructed with its end *p* open, with the pin 146, the back part, 136, and the pin 148, all constructed and arranged substantially as and for the purpose specified.

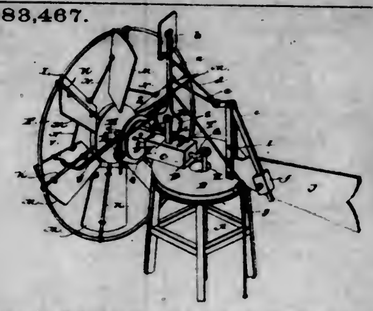
22. The combination of the swell-lever 140, constructed with its end *p* open, and the pin 146 with the tube 149, the pin 148, and the back part, 136, all constructed and arranged substantially as and for the purpose specified.

383,466. DRIVING MACHINERY FOR CABLE ROADS. WILLIAM HEBERT, Yonkers, N. Y., assignor to Benj. Butterworth, trustee, Cincinnati, Ohio. Filed Feb. 13, 1882. Serial No. 263,868. (No model.)

Claim.—1. In the driving machinery of a traction-cable railroad, the frame under the track, in combination with the motor at one side of the track, the shaft stepped in the frame and inclined slightly from the perpendicular, suitable gearing for transmitting motion from the motor to the shaft, and the expansion driving-drum having adjustable eccentric shoes upon the shaft, substantially as described.

2. In a traction-cable railroad, the combination of the double driving machinery placed midway of the length of the road, the two cables extending in opposite directions, each furnishing motive power to one section of the road, and the auxiliary cable which supplies the hiatus between the two main cables operated by a third wheel on the driving machinery, substantially as described.

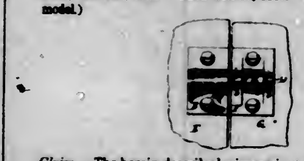
3. In cable-driving machinery, an expansion driving-wheel having adjustable eccentric-shoes, substantially as described.



4. In cable-driving machinery, an expansion driving-wheel having eccentric bearing-surfaces upon its outer rim, in combination with adjustable shoes having inner eccentric bearing-surfaces and outer concentric bearing-surfaces, and the bolts passing through the shoes and through the slots in the wheel-rim, substantially as described.

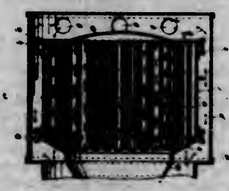
5. In a tension apparatus for cable railroads, the combination of the inclined track with its rack, weighted carriage running on the track, and the adjustable spring-pawl engaging with the rack, substantially as described.

383,467. WIND-WHEEL. HENRY R. JOHNSON, Clay Centre, Kans. Filed Nov. 10, 1887. Serial No. 254,592. (No model.)



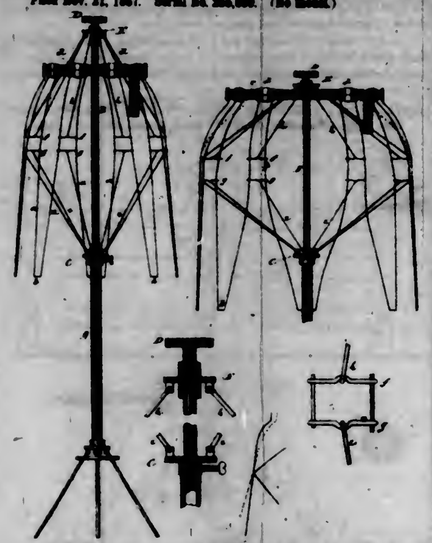
Claim.—The combination of the turn-table, the elongated bearing-plate F, constructed with longitudinal slits *a a*, of greater length than the diameter of the pivot, and so as to form two side parts, *b b*, with an intermediate part, *d*, the said side parts constructed with transverse bends *c c* midway of their length, and the intermediate part constructed with a corresponding bend, *f*, in line with, but in opposite direction to, the side bends, *c c*, the said slits extending longitudinally of the plate each side of said bends, combined with a second plate carrying a pivot, D, adapted to rest in the said bends of the plate, and the said two plates constructed for attachment, substantially as described.

383,467.



C, secured radially thereon, the wheel having its shaft D journaled in said bearing, the sliding rod T, mounted on the bearing C and having an integral rack, X, on its upper side, and provided at its outer or front end with an integral fork, S, having downwardly-bent ends, the sleeve O, mounted on the shaft D and having the annular flange P at its front edge, the collar Q, mounted on the sleeve O in rear of the flange P and having the diametrically-opposite ears R, engaged by the downwardly-bent ends of the fork S, the disk W, secured to the rear face of the sleeve O to hold the collar Q thereon, the rod U, secured to the sleeve O and connected to the wheel, the standard Y, erected on the bearing C, the segmental gear Z, pivoted to the upper end of said standard and engaging the rack X, the rod *a*, extending upward from the said gear, the governor-vane *b*, pivoted on the upper end of said rod, the standard I, erected on the turn-table at a point diametrically-opposite the end of the bearing C, the angle-lever *c*, fulcrumed to the upper end of said standard and having an adjustable weight, *f*, on its longer arm, the links *d e*, connecting the shorter arm of said lever to the vane *b* and the rod *a*, respectively, and the rope *g*, secured to and extending downward from the rod *a*, substantially as specified.

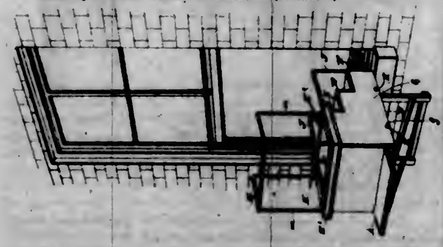
383,468. MIRROR-PIVOT. AUGUSTUS H. JOHNS and ROBERT H. PECK, Meriden, Conn. Filed Oct. 24, 1887. Serial No. 253,179. (No model.)



Claim.—The herein-described mirror-pivot, consisting of the bearing-plate F, constructed with longitudinal slits *a a*, of greater length than the diameter of the pivot, and so as to form two side parts, *b b*, with an intermediate part, *d*, the said side parts constructed with transverse bends *c c* midway of their length, and the intermediate part constructed with a corresponding bend, *f*, in line with, but in opposite direction to, the side bends, *c c*, the said slits extending longitudinally of the plate each side of said bends, combined with a second plate carrying a pivot, D, adapted to rest in the said bends of the plate, and the said two plates constructed for attachment, substantially as described.

383,469. HEATING-FURNACE. FRANCIS KERRAN, Jr., Utica, N. Y. Filed Apr. 18, 1887. Serial No. 235,202. (No model.)

Claim.—The combination, with the combustion-dome, of larger diameter than the fire-pot immediately above the same, of a circular cellular partition formed of vertical air-tubes passing through the dome, forming a combustion-chamber within the dome, and a circular flue between the partition and the wall of the dome, the air-tubes having spaces between them in front and adjacent to the charging-door, and the remainder being so nearly in contact as to form a partition in front of and adjacent to the smoke-exit, as described.



383,470. DRESS-FORM. WILLIAM H. KRAFF, Brooklyn, N. Y. Filed Nov. 21, 1887. Serial No. 255,669. (No model.)

Claim.—1. A garment-stand consisting of a central upright and a vertically-adjustable spindle, B, combined with a screw-threaded collar, C, on said spindle, a collar, E, above, loose on said spindle, but fixed against vertical movement, a series of substantially vertical ribs surrounding said spindle, a series of braces hung by their upper ends to the collar E and extending diagonally downward, hung by their outer ends to the ribs at a point below the upper ends of the ribs, a second series of braces hung by their inner ends to the collar C, extending diagonally upward, their outer ends hung to the ribs immediately below the connection of the upper braces with the ribs, the said ribs contractible from the point of connection with the braces upward, and a flexible band connecting said upper ends of the braces, substantially as described.

2. In a garment-stand consisting of a vertical central adjustable spindle, *d*, a series of ribs, each rib made from wire and of U shape, the upper end of one leg of each rib connected by a loop to the upper end of the adjacent leg of the next rib, a flexible band through said loops on the upper ends of the ribs, a collar, C, on the adjusting-spindle below, and a similar collar, E, above, a series of braces hung to the collar E and extending diagonally downward, their outer ends hung between the connected legs of adjacent ribs at a point below the upper ends, and a second series of ribs hung to the collar C below and extending diagonally upward, their outer ends hung between the connected legs at a point below the connection of the upper braces, the said braces constructed in pairs, each pair composed of a single piece of elastic wire bent so as to form a connection between the two braces of a pair at their inner ends, substantially as described.

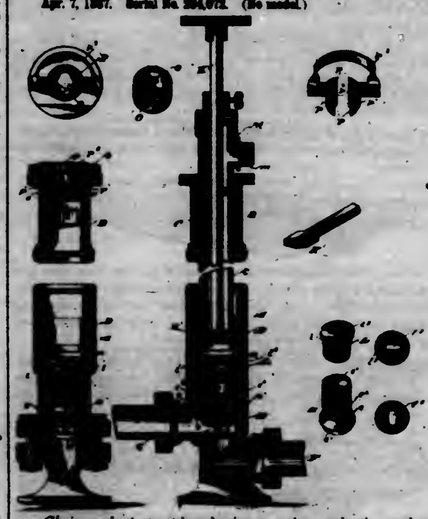
383,471. PAINTER'S SCAFFOLD. MATHIAS LAUT, Wheaton, Ill. Filed Sept. 5, 1887. Serial No. 248,892. (No model.)

Claim.—1. The combination, with the scaffold having a platform, A, of the steps E on the upper side of the platform and having the depending flanges *g g*, to pass on opposite sides of the platform, and the bolts H, to pass through the said flanges under the platform to hold the steps thereon, substantially as specified.

2. The combination, with the scaffold having the platform A, provided at the inner end with the central series of perforations, *a*, of the steps E, having the base-board F, provided at the inner end with the series of perforations *f*, to align with the perforations *a*, the bolt or pin to pass through the aligned perforations, the depending flanges *g g* on the sides of the steps to pass down on opposite sides of the platform, and having perforations *g'* therein, and the bolt H, to pass through the said perforations, substantially as and for the purpose specified.

3. The combination, with the scaffold having the platform A, adapted to be secured to the sill of a window, of the steps E, adapted to be movably secured to the said platform, and having the flange *l* around the upper step, the railing K, having the base K', provided around the inner side with the groove *k* to fit the flange *l*, and the bolt K², to pass through the sides of the base at the inner end and engage the front side of the upper step, all constructed and arranged substantially as and for the purpose specified.

4. The combination, with the scaffold having the platform A, of the steps E, removably secured to the said platform and having the rails J J at the sides of the steps, the platform L at the top, and the horizontal flange *l* around the outer edge of the said platform, the removable railing K, secured around the platform L and comprising the base K', having groove *k* around the inner side to receive the flange *l*, aligned perforations in the inner ends of the sides of the base, through which passes the bolt K², to prevent the base from sliding rearwardly, the uprights *m*, secured at the lower ends to the base, and the top rail, M, secured to the upper ends of the uprights, all constructed and arranged substantially as and for the purpose specified.



5. The combination, with the scaffold having the platform A, of the movable railing secured to the upper side thereof and adapted to be adjusted at any desired point of the same, as and for the purpose specified.

6. The combination, with a painter's scaffold, of the steps E, adjustably secured thereto and having the removable railing around the same, arranged substantially as and for the purpose specified.

7. In a painter's scaffold, the platform A, adapted to be secured to the window-sill, and the steps E, removably and adjustably secured to the platform, as set forth.

8. In a painter's scaffold, the platform adapted to be secured to the window-sill, and the brace B, depending from the platform and designed to bear against the house below the sill, the steps E, removably and adjustably secured to the platform, and the removable railing around the steps, as set forth.

383,472. STREET-BOX AND SHUT-OFF FOR WATER, GAS, OR OTHER FLUID SERVICE. EDWARD LUDLOW, Cleveland, Ohio. Filed Apr. 7, 1887. Serial No. 234,072. (No model.)

Claim.—1. A street-box having a main supply-pipe, and two branch pipes leading therefrom, and each provided with channels to convey fluid directly from the source of supply, the supply-pipe and the branch pipe above it each being provided with a separate seat, and single valve constructed to occupy either of said seats, substantially as set forth.

2. In a street-box, a main supply-pipe, and branch pipes leading from a common opening in said pipe, and one of said pipes being in a

direct line with said opening, in combination with a single valve provided with two opposite seating-faces, and an internal fluid-channel having an induction-opening from the outside above said seating-faces, and located to control the flow of fluid through the opening in the main pipe and through the branch pipes, substantially as shown and described.

3. In a street-box and shut-off having two valve-seats, a valve between said seats provided with a hollow neck and an opening above the seats leading into said neck, substantially as set forth.

4. In a street-box and shut-off, a double-faced valve having a hollow screw-threaded neck, a fluid-passage through said neck above the faces, and a seat for a turning key in said neck, substantially as set forth.

5. A street-box formed with a main-valve seat, a drip-orifice above the main-valve seat, and a valve-seat about said orifice, in combination with a main valve, and a plug separate from the main valve, and having a fluid-passage through it, and faced about its side to cover the drip-orifice, substantially as set forth.

6. In a street-box and shut-off having a main valve to control the fluid-supply, and formed with a chamber above said valve, with a drip-orifice at its side, in combination with a plug having a passage-way through it, and faced about its sides to cover the drip-orifice, with means to adjust the plug separately, substantially as set forth.

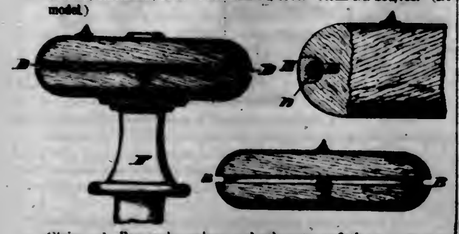
7. In a street-box, the casing provided with a drip-orifice above the main valve, and an annular shoulder, as *a*, above said orifice, in combination with a tube resting on said shoulder, and a plug provided with a fluid-passage through it, and faced about its sides to close the drip-orifice, substantially as set forth.

8. In a street-box, the casing provided with a main-valve seat, and a drip-orifice above said seat, and a chamber about the drip-orifice terminating in a shoulder in the casing, in combination with a tube resting on said shoulder, a main valve, and a plug adjustable in the said chamber to close the drip-orifice, substantially as set forth.

9. In street-boxes, a sectional bushing constructed with an irregular outer seating-surface, and each section having part of a key-seat formed on its inner face, in combination with a plug for the street-box, having an irregular seat for the bushing, whereby the bushing is prevented from turning, substantially as set forth.

10. In a street-box, a bushing consisting of two sections having lugs outside and faces inside shaped to form an angular key-seat when the bushing is set for use, in combination with a plug provided with a seat for said bushing, substantially as set forth.

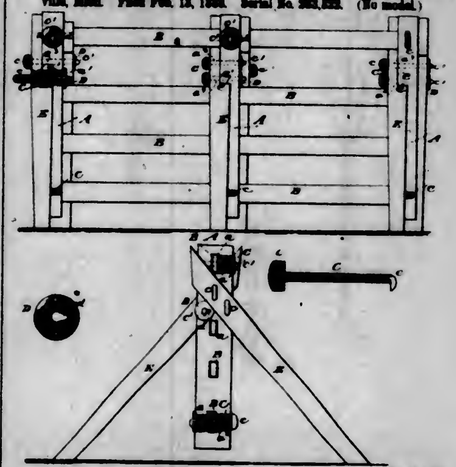
11. In a street-box, a bushing formed in two sections connected by a spring, in combination with a plug for the street-box, provided with a seat in which the sections lock and form a key-seat, substantially as set forth.



12. In a street-box, a lower section rigidly connected with the supply-pipe, a separate upper section, and a tube sleeved and packed in said sections at its respective ends, whereby the upper section alone or with the intermediate tube may be raised, as by frost, without impairing the box, substantially as set forth.

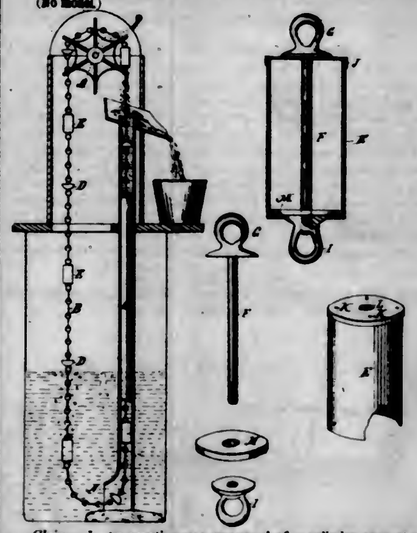
383,473. GUARD-FINGER FOR MOWERS AND REAPERS. HENRY LUEKER, Columbus, Nebr. Filed Jan. 14, 1888. Serial No. 260,607. (No model.)

Claim.—The combination of the guard-finger, the finger-bar, and the L-shaped wearing-plate having its horizontal flange rjveted to the upper surface of the guard-finger and arranged between the same and the finger-bar, and having its vertical flange resting against the front edge of the finger-bar, substantially as specified.



383,474. NON-CONDUCTING HAND-WHEEL FOR COCKS, VALVES, AND OTHER STEAM-FITTINGS. FREDERICK LUNKENHEIMER, Cincinnati, Ohio. Filed Jan. 24, 1888. Serial No. 261,792. (No model.)

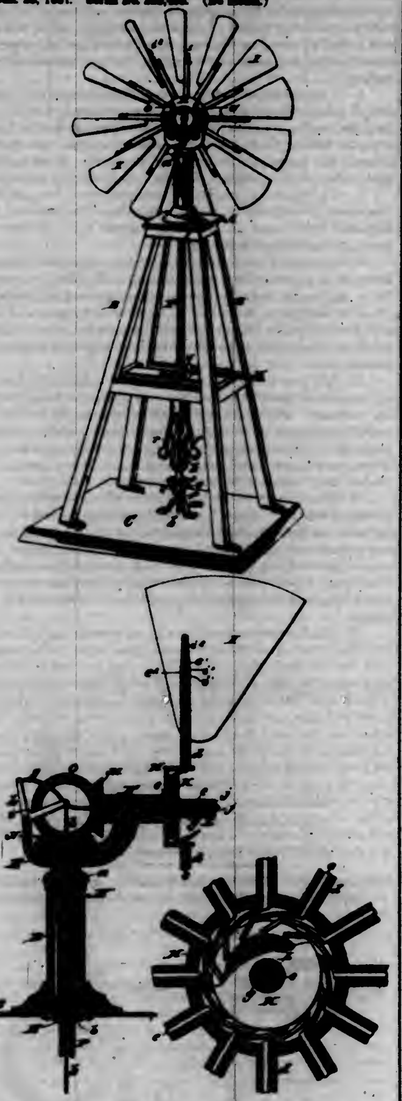
Claim.—1. For cocks, valves, and other steam-fittings, a non-conducting hand-wheel having a circumferential groove with a tie or binder inserted therein and concealed by a filling applied to said groove, the ends of said tie being twisted together and housed within a pit or socket of said wheel, for the purpose described.



2. For cocks, valves, and other steam-fittings, a non-conducting hand-wheel having a circumferential groove with a tie or binder inserted therein, said tie being concealed by a filling applied to the groove, for the purpose described.

383,475. PORTABLE FENCE. MARLY R. MARSHALL, Rogersville, Mich. Filed Feb. 13, 1888. Serial No. 263,532. (No model.)

Claim.—In portable fences, the combination, with rails B, of posts having holes a' a^3 a^4, washers passing through said holes a^3 a^4 and provided with a hole, *d*, T-headed and hook-ended bolts C, passing through said holes a' a^3, and stakes E, having rabbets *e* and shoulders *e'*, as shown and described.

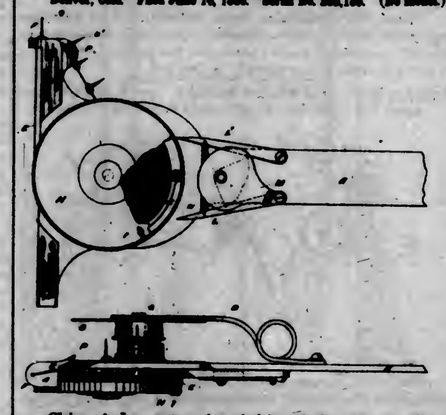


383,476. AERATING ATTACHMENT FOR CHAIN-PUMPS. WILLIAM MILD, Hamilton, Ohio. Filed Aug. 8, 1887. Serial No. 246,446. (No model.)

Claim.—1. An aerating-cup composed of a cylinder open at one end and having a perforated head at its other end, in combination with the stem having a link or eye at each end, and the disk for partially closing the cup, substantially as herein set forth.

2. The combination of the cup E, having the perforated head, and the central stem, F, having fixed at one end the eye G and upon its other screw-threaded end the disk M, of smaller diameter than the cup, and eye I, with the chain, substantially as described.

383,477. WINDMILL. HIRAM P. HIXON, Clay Center, Kans. Filed Jan. 28, 1887. Serial No. 225,622. (No model.)



Claim.—1. In a windmill, a series of sails mounted upon radial arms having cranks at their inner ends, a disk having a grooved periphery, in which the ends of said cranks fit, a rod giving horizontal adjustment to said disk, a vertical governor-rod, connected to said adjusting-rod through an elbow or bell-crank lever, and a governor mounted upon a sleeve surrounding said governor-rod, and connected to a head which is adjustable on the latter, by the rotation of which the governor-rod is raised and lowered to give angular adjustment to the sails, substantially as described.

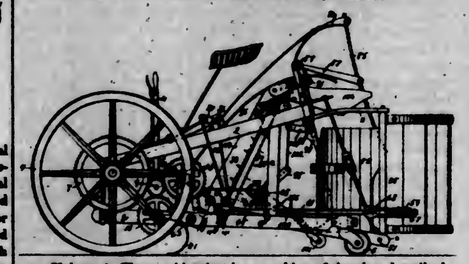
2. In a windmill, the combination, with a series of sails mounted on radial arms having cranks at their inner ends, of a grooved disk, with which the ends of said cranks engage, a rod giving horizontal adjustment to said disk, a governor-rod connected to the adjusting-rod by a bell-crank or elbow lever, a pair of weighted governor-arms pivoted upon a rigid revolving support and linked to the governor-rod, and an adjusting-wheel revolved upon the head to which said links are connected, and having a nut engaging with a threaded portion of the governor-rod, substantially as described.

3. The combination, with the sails I, having tubes *d*, of the rods *e*, having cranks *f*, the head or hub H, having hub *c*, the disk K, having a peripheral groove and an extension, L, the rod *g*, bell-crank A, governor-rod *k*, the governor E *r r'*, connected to a head, p^1, adjustable on said rod, the gear M, carried by a sleeve connected to hub *c*, the gear N, having sleeve P, to which the governor is attached, and the intermediate O, substantially as described.

4. The combination, with the sails and with devices, substantially as described, for feathering the same, of a governor-rod, a bell-crank operated by the same and actuating the feathering devices, a governor mounted upon a rotating sleeve surrounding the governor-rod and connected to a head upon the governor-rod, and a nut revolved in said head and having a female thread meshing with a male thread on the rod, substantially as described.

383,478. AUTOMATIC TACK-DRIVER. JAMES H. MONTGOMERY, Denver, Colo. Filed June 14, 1888. Serial No. 205,189. (No model.)

Claim.—1. In an automatic tack-driver, the hammer A, provided with an eye in its face, or its equivalent, substantially as shown and described, and for the purposes set forth.



2. In an automatic tack-driver, the combination, with the means for feeding and driving the nails, of the reel actuated by a spring, all substantially as shown and described.

3. The dogs L and L', the spring N, and the lever M, in combination with the ratchet and reel, substantially as shown and described, and for the purpose set forth.

4. In an automatic tack-driver, the spring D and spool-post C, in combination with the tack holding and feeding devices, substantially as shown and described, and for the purpose set forth.

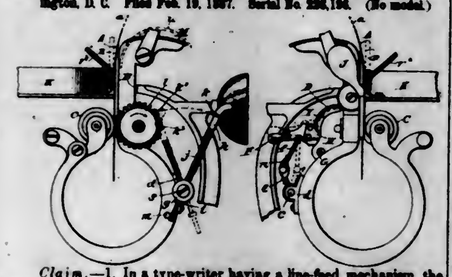
5. In an automatic tack driving and feeding device, the hammer A, provided with the guard P, substantially as shown and described.

383,479. HAY RAKE AND COCKER. HIRAM J. REESE, Hartline, Wis. Filed Oct. 24, 1887. Serial No. 253,103. (No model.)

Claim.—1. The combination, in a machine of the class described, of a hay-rake, an elevator for raising the hay gathered by said rake, a receptacle arranged to receive the hay from said elevator and composed of a tilting platform having fronts 33 secured to it, and swinging racks vertically pivoted upon projections on the frame of the machine, packers for compressing the hay in said receptacle, and pushers for discharging the hay from said receptacle, substantially as described.

2. The combination, in a machine of the class described, with the hay rake and elevator, of the hay-receptacle composed of a tilting

platform mounted on a suitable pivot or axis and having the fronts 83, the segmental swinging and opening racks 56, pivoted upon the frame of the machine, means to swing said racks, whereby they are opened or closed, and means to tilt said platform, substantially as described.



3. The combination, in a machine of the class described, with the hay rake and elevator, of the receptacle formed of the tilting platform having the fronts 83, and the vertically-hinged racks 56, mounted upon suitable projections from the frame of the machine and adapted to swing open, the pushers 97, and means for tilting said platform, opening said racks, and operating said pushers.

388,480. TYPE-WRITING MACHINE. JOHN W. OSBORNE, Washington, D. C. Filed Sept. 22, 1886. Serial No. 214,201. (No model.)

Claim.—The combination, with a ribbon-shield for a Hammond type-writer, of a straining-bow having vertical supporting-arms bent forward at an obtuse angle, whereby the bow is out of the plane of vision of the operator, substantially as described.

388,481. TYPE-WRITING MACHINE. JOHN W. OSBORNE, Washington, D. C. Filed Feb. 19, 1887. Serial No. 228,196. (No model.)

Claim.—1. In a type-writer having a line-feed mechanism, the combination of a positively-operated feed-roller, and locking mechanism therefor, with a knob for operating the roller independently of the feed mechanism, and a lever-connection for disengaging the locking mechanism extended within operative proximity of the knob, substantially as described.

2. In a type-writer having a line-feed mechanism, the combination of a positively-operating feed-roller, and locking mechanism therefor, with a knob for operating the roller independently of the feed mechanism, a lever-connection extending within operative proximity of the knob for disengaging the locking mechanism and accommodating coupling mechanism, substantially as described, for establishing and maintaining operative connection between the lever-connection and the knob during the rotation of the latter, whereby the roller may be freely rotated by the knob when its locking mechanism is disengaged, substantially as described.

3. In a type-writer having a line-feed mechanism, the combination of a feed-roller, and locking mechanism held in engagement with the roller by a spring, with a knob for rotating the roller independently of the feed mechanism, a lever-connection extended within operative proximity of the knob for lifting the locking mechanism against the action of its spring, and accommodating coupling mechanism, substantially as described, for establishing and maintaining operative connection between the lever-connection and the knob pending the rotation of the latter from its original position, whereby the connection of the knob with the lifting mechanism will be automatically severed when the knob returns to its original position, substantially as described.

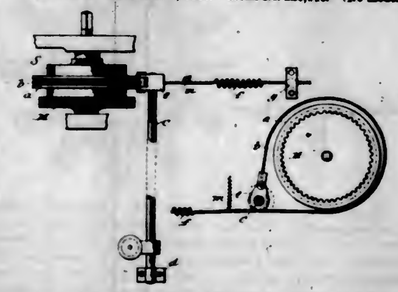
4. In a type-writer having a line-feed mechanism, the combination of a feed-roller, and automatic locking mechanism therefor, with a knob for rotating the roller independently of the feed mechanism when the locking mechanism is lifted, and a stop for limiting the rotation of the roller by the knob, and a lock for holding it in its limited position, substantially as described.

5. In a type-writer having a line-feed mechanism, the combination of a feed-roller, and automatic locking mechanism therefor, with a knob for rotating the roller independently of the feed mechanism, a cam for lifting the locking mechanism, a shaft for actuating the cam extending within operative proximity of the knob, and accommodating coupling mechanism, substantially as described, for establishing and maintaining operative connection between the shaft and knob when the latter is actuated, substantially as described.

6. In a type-writer having a line-feed mechanism, the combination of a feed-roller, and automatic locking mechanism therefor, with a knob for rotating the roller independently of the feed mechanism, a lever-connection for disengaging the locking mechanism terminating within operative proximity of the knob in a sliding rod, a stud on the rod, a toothed wheel on the knob or roller arranged for engagement with the stud, and a spring controlling the rod, substantially as described.

7. In a type-writer having a line-feed mechanism, the combination of a feed-roller, locking and releasing mechanism therefor, and a knob for rotating the roller independently of the feed mechanism, with stops for limiting the rotation of the released roller in both directions, whereby the paper may be raised for correction or inspection and again returned to its original position, substantially as described.

8. In a Hammond type-writer, an erasing-plate arranged behind the paper and in proximity to the same, curved, as described, to be tangential to the paper where the same appears above the type-wheel guard, substantially as described.



9. In a type-writer having an oscillating type-wheel, the combination of an erasing-plate suitably curved, as described, to be tangential to and located behind the paper, with a ribbon-shield and its bow, the latter being bent forward at an angle over the type-wheel guard and from the paper, whereby the writing upon the same is fully exposed to view and is accessible to erasing-tools, substantially as described.

10. In a type-writer, the combination of a feed-roller, and locking mechanism therefor, with a lever-connection for lifting the locking mechanism, a knob for rotating the roller when the locking mechanism is disengaged, and a toothed wheel connected with the knob and feed-roller, and a reciprocating coupling-rod constituting a part of the lever-connection for locking the same to the toothed wheel and roller pending the rotation of the latter, substantially as described.

11. In a type-writer, the combination of a feed-roller, a ratchet connected therewith, a pawl for actuating the ratchet and for locking the same and the roller, with a toothed wheel connected with the roller having teeth corresponding in number to those of the ratchet, a lever-connection for disengaging the pawl from the ratchet, a coupling-rod constituting a part of the lever-connection for actuating the same, and a stud upon said rod engaging the toothed wheel, substantially as described.

12. In a type-writer provided with a paper-carriage, a feed-roller mounted thereon, and a knob for rotating the latter when disengaged, and a locking mechanism and stop for holding the released roller after its rotation through a predetermined length of arc, consisting of a toothed wheel fast to the roller and knob, in combination with a boss journaled to the carriage-frame, a rod sliding across said boss, but sustained and controlled therein by a spring, a stud projecting from the rod adapted to engage the teeth of the wheel, and an extension of the rod formed and arranged to strike the shaft of the feed-roller as a stop when the predetermined rotation is completed and the engaged stud has been carried across and beyond a line in passing through the center of the wheel and that of the boss upon the carriage-frame, whereby said wheel is persistently urged by the controlling-spring upon the rod in a direction it cannot follow, substantially as described.

388,482. TYPE-WRITING MACHINE. JOHN W. OSBORNE, Washington, D. C. Filed Mar. 7, 1887. Serial No. 230,010. (No model.)

Claim.—1. In a type-writer, the combination of the carriage-feed mechanism and a friction-strap normally out of gear with the same with a strap-tightener adapted to the friction-strap for throwing it into gear with the carriage-feed mechanism and for actuating the latter in opposition to the direction of the feed of the carriage, substantially as described.

2. In a type-writer, the combination of a rotary element of the carriage-feed mechanism with a friction-strap loosely surrounding the same, and a strap-tightener adapted to the strap for tightening it upon the rotary element and for rotating the latter in opposition to

the direction of the carriage-feed, substantially as and for the purpose described.

3. In a type-writer, the combination of the carriage-feed mechanism and of an extensible friction-strap normally out of gear with said mechanism with a strap-tightener adapted to the extensible friction-strap for throwing it into gear with the carriage-feed mechanism, and for actuating the latter in opposition to the direction of the carriage-feed, substantially as and for the purpose described.

4. In a type-writer, the combination of a rotary element of the carriage-feed mechanism with an extensible friction-strap loosely surrounding the same, and a strap-tightener adapted to the strap for tightening it upon the rotary element and for rotating the latter in opposition to the direction of the carriage-feed, substantially as described.

5. In a type-writer, the combination of the carriage-feed mechanism thereof and a friction-strap normally out of gear with said mechanisms with lever-connections extended within convenient reach of the operator for throwing the strap into gear with the feed mechanism and for actuating the latter in opposition to the direction of the carriage-feed, substantially as described.

6. In a type-writer, the combination of the carriage-feed mechanism thereof and a friction-strap normally out of gear with said mechanism with lever-connections extended within convenient reach of the operator for throwing the strap into gear with said mechanism and for actuating the latter in opposition to the direction of the feed, and a stop for determining the throw of the lever and thereby the backward feed of the carriage, substantially as described.

7. In a type-writer, the combination of the carriage-feed mechanism thereof and a friction-strap normally out of gear with said mechanism with lever-connections extended within convenient reach of the operator for throwing the strap into gear with said mechanism and for actuating the latter in opposition to the direction of the feed, with a stop for determining the throw of the lever, and a spring to restore said lever and strap to their normal position, substantially as described.

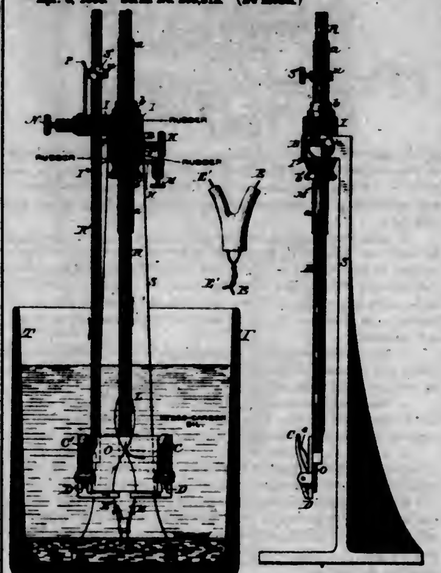
8. In a type-writer, the combination of a rotary element of the carriage-feed mechanism and the pawl and ratchet for holding the carriage against the actuating-spring with a friction-strap adapted to grasp the rotary element of the carriage-feed mechanism, and lever-connections, substantially as described, for drawing one end of said friction-strap (acting as a belt) against the actuating-spring through an interval representing one space-tooth of said ratchet, substantially as described.

388,483. ERASER. JOHN W. OSBORNE, Washington, D. C. Filed Sept. 6, 1887. Serial No. 248,518. (No model.)

Claim.—1. In an erasing-pencil, a tubular holder containing a movable strip of erasing-rubber, in combination with an extensible follower adapted to one end of said tube, whereby an advancing abutment within the same is provided for the sliding strip of rubber, substantially as described.

2. In an erasing-pencil, a tubular holder containing a movable strip of erasing-rubber, in combination with an extensible follower adapted to enter one end of said tube, and a shoulder upon the follower to limit its inward movement, substantially as described.

3. In an erasing-pencil, a tubular holder containing a movable strip of erasing-rubber, in combination with an extensible follower consisting of two pieces relatively adjustable lengthwise, and adapted as a whole to enter and fit one end of said tube, substantially as described.



4. In an erasing-pencil, a tubular holder containing a movable strip of erasing-rubber, in combination with an extensible follower consisting of a plug adapted to fit one end of said tube, with a notched blade or shank extending inward therefrom, and a folded sleeve clasping said blade or shank and provided with a tooth to engage its notches, substantially as described.

5. In an erasing-pencil, a tubular holder containing a movable strip of erasing-rubber, in combination with an extensible follower supporting the inner end of said strip in its successive positions, and with a brush forming part of said follower extending from its outer end, substantially as described.

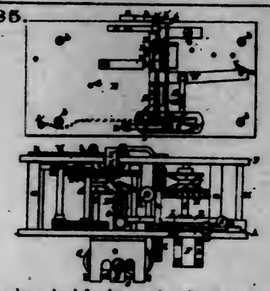
6. In an erasing-pencil, a follower adapted to push forward the movable rubber strip, and provided with a concave end whereby impact is made with the rubber at its edges only, substantially as described.

7. A follower adapted to push forward the movable rubber strip in an erasing-pencil, consisting of two separable pieces of stiff material sliding lengthwise upon each other, in combination with locking mechanism to effect their rigid connection in predetermined positions, and with a tubular holder whereby such connection is maintained, substantially as described.

388,484. MANUFACTURE OF FILAMENTS FOR ELECTRIC INCANDESCENT LAMPS. JAMES W. PARKER, New York, N. Y. Filed Apr. 6, 1883. Serial No. 269,512. (No model.)

Claim.—1. The combination of the insulating-standard having suitable binding-posts upon it, the spring contact-piece connected to one binding-post, and the clamp-holding frame adjustable upon the standard and having clamps insulated one from the other upon it, one of said clamps having continuous electrical connection with one binding-post, while the other clamp is electrically connected with the second binding-post through the spring contact-piece only when the clamp-holding frame is at one position of its adjustment, substantially as described.

2. The combination of the receptacle containing mercury and a solution of carbon, the insulating-standard, the clamps and clamp-holding frame adjustable upon said standard, and suitable contact-pieces upon the standard and clamp-holding frame, contact between which said pieces can only occur when the ends of the electrodes held in the clamps are immersed in the mercury and thereby short-circuited, substantially as described.



3. The combination of the insulating-standard having the clamp-holding frame adjustable upon it, and having also suitable contact-pieces connected to an external electric circuit, together with the clamps insulated one from the other upon the clamp-holding frame, and the electrical connections upon the clamp-holding frame, by which the internal circuit from one contact-piece upon the standard through the clamps and the object held by them to the second contact-piece upon the standard can be complete only when the clamp-holding frame is between certain positions of its adjustment, substantially as described.

4. The combination of an insulating-standard, a frame bearing clamps of suitable conducting material insulated one from the other, and a receptacle for liquids, the said frame and receptacle being relatively adjustable one to the other, together with suitable contact-pieces on the standard and on the frame, between which pieces contact can occur, and the clamps and the object held by them be thereby brought in circuit with an external source of electricity only when the clamp-holding frame and the liquid-receptacle are between such positions of their relative adjustment that the clamps are immersed in the liquid, substantially as described.

388,485. ELECTRIC PUNCH-REGISTER. ASHBEL G. PALMER, Utica, N. Y. Filed Nov. 30, 1886. Serial No. 219,803. (No model.)

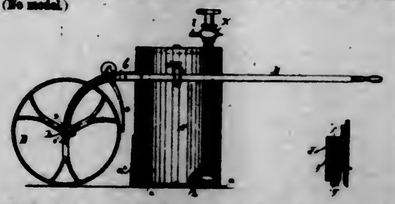
Claim.—1. In an electric punch-register, the combination, with two feed-rollers, the shaft of one of which may be swung as specified,

383,485.

of a toothed or key wheel, I, a lever or key, L, a lever, R, provided with an adjusting-screw, *s*, to bear on the lever or key L, a spring, *m'*, and screw *n'*, for gaging the tension of said spring, said key-wheel, levers, and spring being for swinging said shaft, substantially as shown and described.

2. In an electric punch-register, in combination with a punch and die and two feed-rollers, the shaft of one of which may swing, a toothed or key wheel, I, a lever or key, L, operated by said key-wheel and provided with an arm extending under the punch to operate the same, and a lever, R, for swinging said shaft, and provided with an adjusting-screw, *s*, to bear on the lever or key L, substantially as shown and described.

3. The combination, with an armature, of an armature-lever, a sliding rod, *r*, latch O, a shaft, K, bearing an arm, *p*, and mechanism for revolving said shaft, substantially as and for the purposes set forth.



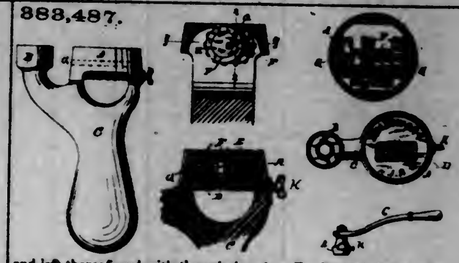
4. The combination of the toothed or key wheel H, the lever or key T, arm *s*, rod *a'*, lever *h'*, and latch X, which is an element in the stopping mechanism, substantially as and for the purpose set forth.

5. A gear, T, provided with one or more pins, *c'*, a shaft, *b'*, arm *d'*, provided with a cam-piece, *d'*, a rod, *g'*, a pivoted plate, W, and a latch X, pivoted in said plate, substantially as described.

6. The combination of a lever or key, Y, operated as set forth, a rod, *a'*, a lever, *h'*, a pivoted plate, W, bearing a pin, *u*, a latch, X, a rod, *g'*, an arm, *c'*, bearing a cam-piece, *d'*, a gear, T, provided with one or more pins, *c'*, a verge-wheel driven by said gear, and a verge, substantially as described.

7. In an electric punch-register, and in combination with the punch and die and mechanism, including a key-wheel, I, and key L, for operating the punch, feed-rollers revolved independently of said mechanism by means of clock-work regulated by a verge and verge-wheel, and stopped by a pin or like instrument engaging with an arm extending from said verge, said pin being moved into the path of said arm by devices controlled by means of a key, Y, and a key-wheel, H, fixed on the same shaft with the key-wheel I, substantially as described.

383,486. PORTABLE FORCE-PUMP APPARATUS. JOSEPH A PARSONS, Rocky River, Ohio. Filed Feb. 24, 1888. Serial No. 265,152. (No model.)

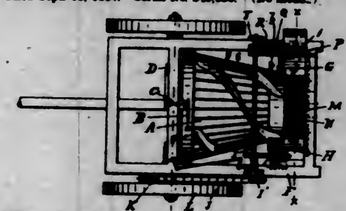


Claim.—1. In a portable force-pump apparatus, the combination of a forked journal and handle bearing cast integral, a wheel journaled in the forward portion of the same, handles secured to its opposite ends, a tank having bearing on said handles, said tank provided with radial arms, one of said arms terminating in a feeder, a second feeder secured to said fork, the two said feeders engaging with each other when the tank is in elevated position, substantially as set forth.

2. In a portable force-pump apparatus, the combination of a tank provided with a journal, handles on either side of said tank engaging with said journals, and journal-caps secured respectively by set-screws to the handles and having pivotal engagement with said journals, substantially as set forth.

383,487. STAMP FOR CANCELING, &c. JOHN B. PERRY, White Said, R. I. Filed Dec. 16, 1886. Serial No. 221,712. (No model.)

Claim.—1. In a stamping device, the recessed head A, having the transverse shaft G fixed thereon, in combination with the stationary hub E, mounted eccentrically upon said shaft and projecting to right



383,487.

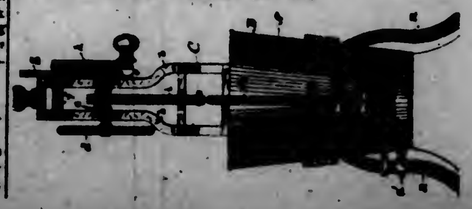
and left thereof, and with the printing-rings F, adjustable by rotation on said hubs, substantially as set forth.

2. The described adjustable stamp, having on its face a permanent local stamp or die and provided with a polygonal shaft fixed horizontally across its recessed head, in combination with two or more eccentric hubs or disks fixed on said shaft, and having their centers alternately to right and left thereof in a horizontal plane, with rotatable printing-rings mounted on said hubs, and with a clamp-screw, as K, adapted to secure said rings in position when adjusted for use, substantially as set forth.

383,488. POTATO-DIGGER. JOSEPH D. PERRY, Detroit, Mich. Filed Sept. 16, 1887. Serial No. 249,850. (No model.)

Claim.—1. In a potato-digging machine, the combination, with the revolving scoop A, of the rolling disk B, supporting the forward end thereof, the crank-shaft and operating-lever for adjusting said disk vertically, and the ring-bearing G at the rear end of the scoop, said ring-bearing being supported on trunnions of the frame, substantially as described.

2. In a potato-digging machine, the combination, with a revolving scoop, of a bevel gear-wheel secured upon the rear end thereof, a ring-bearing in which said gear-wheel is journaled, trunnions on said bearing, and by which it is mounted in the frame, and a drive-pinion upon one of said trunnions and meshing with said gear-wheel, all substantially as described.



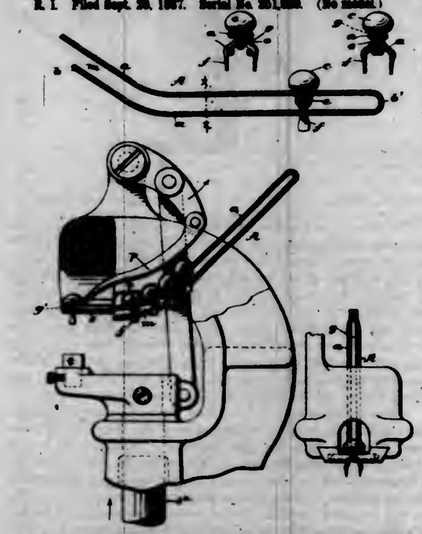
3. The combination, with the revolving scoop and the frame, of the crank-shaft C, provided with lever D, and the disk B on said crank-shaft, within said scoop and supporting the front end thereof, substantially as described.

4. The combination, with the revolving scoop and the frame, of the crank-shaft C, provided with lever D, and the disk B on said crank-shaft, within said scoop and supporting the front end thereof, and the rollers *k* on the frame, near the front end of the scoop, substantially as described.

5. In a potato-digging machine, the combination of the revolving scoop A, the circular trough M, provided with a grating on top, the elevator-trunk P, the elevator O, the discharge-spout U, and the revolving vine-cutter N, within said trough below the grating, all arranged to operate substantially as described.

6. In a potato-digging-machine, a revolving scoop consisting of the cutting-blade *a*, the tapered grating *c*, the gear-wheel B, the spiral brace *d*, secured to said grating, and the spiral wings *e*, secured to said brace, all substantially as described.

383,489. BEE-HEATER. DANIEL PETERS, Cincinnati, Ohio. Filed Nov. 9, 1886. Serial No. 182,262. (No model.)

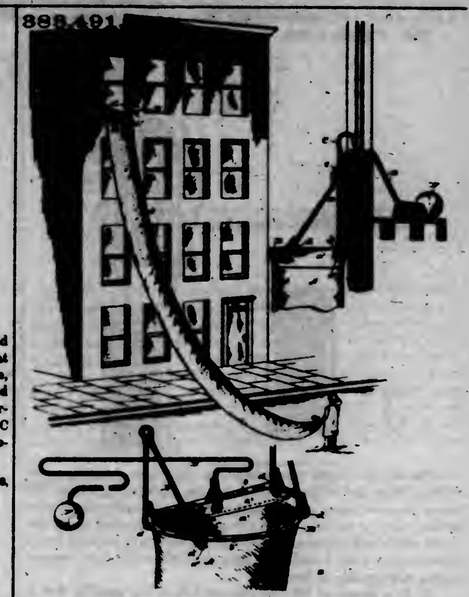


383,489.

Claim.—The improved egg-beater consisting of the vessel A, and arched frame C, hinged to the upper margin of the containing-vessel at one side and extending to and detachably fastened at the opposite side, the upper extensions, *b b*, of said arched frame, the crank-shafts *e* and *f*, journaled in and between said extensions and provided with intermeshing gears *g c*, the pitman *i*, extended through the arched frame C as a guide, and the detachable plunger D, combined and arranged substantially as set forth.

383,490. BUTTON-MACHINE. GEORGE W. PRENTISS, Providence, R. I. Filed Sept. 20, 1887. Serial No. 251,092. (No model.)

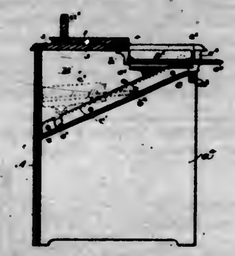
Claim.—1. The runway hereinbefore described, made of wire, having its upper portion adapted to receive the shanks of buttons and the lower portion of the runway arranged to guide the fasteners laterally when connected with the buttons.



2. The combination, with button feeding and attaching mechanism, of a runway, substantially as described, made of wire, adapted to hold a series of buttons and fasteners, and having its lower end portion arranged to connect with said machine, and forming a continuation of the slotted guide, along which the buttons and fasteners are intermittently passed to the action of the clinching-die, substantially as hereinbefore described.

383,491. FIRE-ESCAPE. HENRY REMMERS PERRY, Tex. Filed Feb. 4, 1888. Serial No. 263,604. (No model.)

Claim.—1. In a fire-escape, the combination, with an elongated sack or flexible tube and with a ring permanently secured around the mouth of the same and formed with a curved or bowed portion and a straight inner or rear side, of divergent supporting-ropes carrying hooks at their upper ends and having their lower ends secured around said ring, the inner ends of said ropes being connected with the rings at the junction of the straight inner sides with the front curved portion, substantially as set forth.

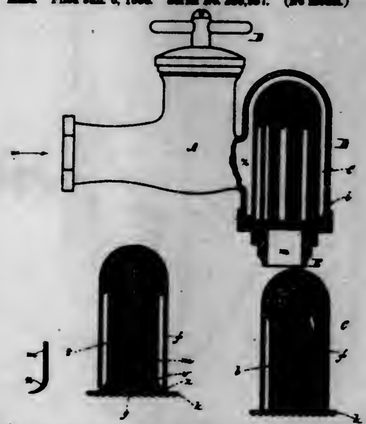


2. In a fire-escape, the combination, with an elongated sack or

383,491.

flexible tube and with a ring permanently secured around the mouth of the same and formed with a curved or bowed portion and a straight inner or rear side, of divergent supporting-ropes carrying hooks at their upper ends and having their lower ends secured around said ring, and a rope secured to said inner or rear side, provided with a ball or weight at its end, substantially as set forth.

383,492. TYPE-WRITER CABINET. BENJAMIN P. RICHARDSON, Boston, Mass. Filed Mar. 22, 1887. Serial No. 231,880. (No model.)



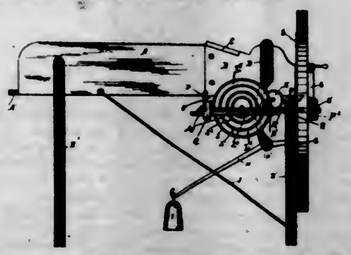
Claim.—1. The combination, with a cabinet or desk, of a track or tramway extending from front to rear of the said desk, and a machine-carriage supported by and adapted to be moved on the said track or tramway to bring it into position to enable the machine to be used, and thereafter, when not in use, to be moved back from the front of the desk on said track, substantially as described.

2. A cabinet or desk for type-writers, having a movable top or cover, and an inclined track or tramway extending from front to rear of the said desk below the said movable cover and upon which a type-writer is supported and adapted to be moved, substantially as described.

3. A cabinet or desk for type-writers, having a movable top or cover, and an inclined track or tramway extending from front to rear of the said desk below the said movable cover and upon which a type-writer is supported and adapted to be moved, and a locking shoulder or projection to retain the carriage in its elevated position, substantially as described.

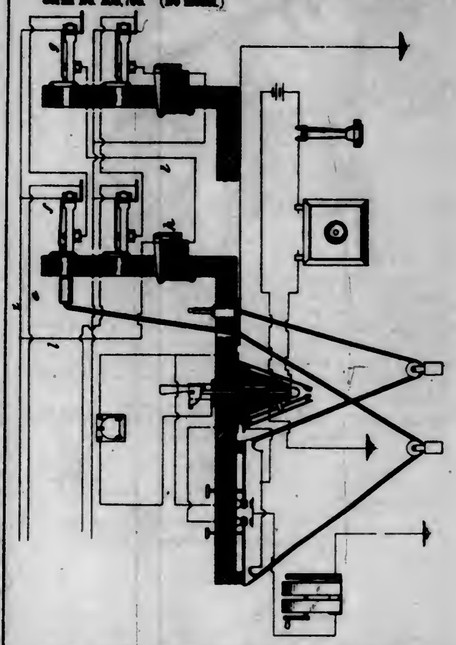
4. A cabinet or desk for type-writers, having a movable top or cover, and an inclined track or tramway extending from front to rear of the said desk below the said movable cover and upon which a type-writer is supported and adapted to be moved, and a locking shoulder or projection to retain the carriage in its elevated position, combined with the pushing e^1, substantially as described.

383,493. FILTERING-FAUCET. WILLIAM H. SARGENT, Weymouth, Mass. Filed Jan. 6, 1888. Serial No. 259,927. (No model.)



Claim.—1. A filter comprising the metallic case *f*, having a corrugated body and a perforated crown-top, a thimble-shaped felt screen disposed within said case and provided with an outwardly-projecting flange at its lower end, a thimble-shaped wire-cloth screen disposed within said felt screen, and also provided with an outward flange at its lower end, and a perforated plate disposed beneath said case and screen, substantially as described.

2. In a faucet of the character described, the metallic case *f*, having its body corrugated and its upper portion perforated, in combination with a felt screen disposed within said case, a wire-cloth screen disposed within said felt screen, a perforated plate disposed beneath said case and screen, the body A, valve D, chamber B, and cap E, having the duct *m*, all combined and arranged to operate substantially as specified.



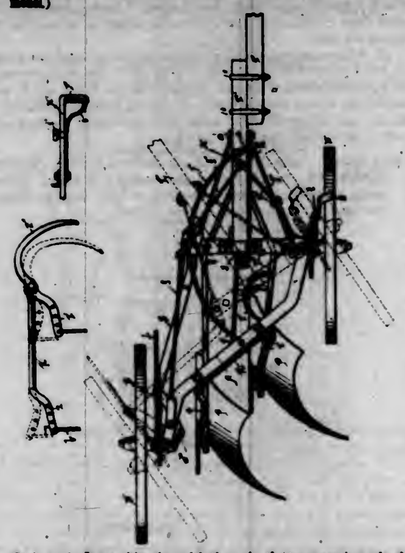
3. The improved faucet herein described, the same consisting of the body A, provided with the valve D, the chamber B, connected with said body and provided with the flange *i*, and screw-cap E, having the duct *m*, the metallic case *f*, having its body corrugated and its upper portion perforated, the thimble-shaped felt screens, *m*, provided with the water-proofed flanges *s*, the thimble-shaped wire-cloth screen *t*, provided with the flange *v*, the filtering material *b*, disposed within the screen *t*, and the perforated plate *k*, having the upwardly-curved projection *y*, all being constructed, combined, and arranged to operate substantially as set forth.

383,494. FEED-CUTTER. GOTTLOB F. SCHEID, Boardstown, Ill. Filed Feb. 15, 1888. Serial No. 264,092. (No model.)

Claim.—In feed-cutters, the trough A', having guiding-uprights A B, mounted on supports E E' and maintained by braces J, in combination with the shaft N, rotated in bearings Q R, having a crank, G, on its outer end, the fly-wheel F, having curved knives S, held on one side by the screws S' and pressed in on the other side by the screws T, the sliding pinion N', adjustably keyed to said shaft, the rod M, having arm M', the shaft X', the crown-wheel L³ thereon, having a concentric series of teeth to engage the pinion N' in its different positions on the shaft N and a parallel pinion, L⁴, mounted on the said shaft X', the meshing gears V K, operating the pinions Y X, which in turn mesh with the gear-wheels Z W, which respectively operate the rigid feed-roller W'' and the yielding roller W', the sliding standards D, the rod H', the lever H, and the weight I, for the purpose fully shown and described.

383,495. TEST-CIRCUIT FOR MULTIPLE SWITCH-BOARDS. CHARLES E. SCRIBNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 27, 1886. Renewed Nov. 21, 1887. Serial No. 256,709. (No model.)

Claim.—1. In a multiple-switch-board system of telephone-exchange, the combination, with a spring-jack switch on each of the boards, of a circuit extending from ground at the subscriber's station through his generator and bell and switch to the central office, through said switches and an annunciator to a line connected with the test plates or frames of said switches and extending to the subscriber's station, and two branches of said line at the subscriber's station, one branch including the telephone and being normally open at the telephone-switch, and the other branch being connected with a normally-open ground-switch, whereby signals may be sent between the subscriber's station and the central office, substantially as described.



2. In a multiple-switch-board system, the combination of switches, one on each board for each telephone-line of the telephone-lines connected therewith, each line consisting of two branches, one branch of which, after passing through its switches and an annunciator, being connected with the other branch, which other branch is connected with the insulated frames or contact-pieces of the switches of the line, said branches extending to the subscriber's station, and the former being connected with the subscriber's telephone-switch, and when the telephone is on the switch through the bell and generator to ground, and the other branch, which includes the telephone, being normally open at the subscriber's telephone-switch when the telephone is hung thereon, and a branch connection including a ground-switch on the line side of the telephone, whereby a complete circuit may be formed from ground at the subscriber's station through the switches and the annunciator of the line at the central office, and back to ground at the subscriber's station, substantially as and for the purpose specified.

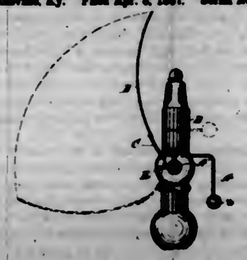
3. In a multiple-switch-board system of telephone-exchange, switches *f g* on different boards and telephone-line consisting of branches *c i*, connected therewith, and through an annunciator, A, said branches extending to the subscriber's station, and branch *c* being normally connected with ground, and branch *i* being normally open, in combination with a loop-plug inserted in switch *f* at the central office, whereby the insulated frames of the switches are disconnected from branch *c*, substantially as shown and described.

4. A subscriber's circuit extending from ground at the subscriber's station through the springs of a series of switches on different sections of a multiple switch-board and an annunciator back through the insulated frames or test-pieces of said switches, and thence back to the subscriber's station, the portion of the circuit connecting with the frames or test-pieces being normally open at said subscriber's station.

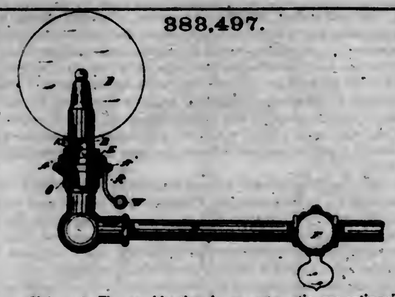
in combination with a plug which, being inserted in a switch at either of the boards, opens the metallic circuit at said switch.

383,496. GAS-FLOW. ABRAHAM SHAFFER and GEORGE M. SHAFFER, Crampsin, Mich. Filed Nov. 26, 1887. Serial No. 256,264. (No model.)

Claim.—1. In combination with the axle, the transporting-wheels, the swinging arm or head H', pivoted at one end to the forward end of the axle, the tongue attached thereto, the bar E, coupled to the swinging head and to the arm D of the rear axle-plate, E', and the circle-iron F, having its ends secured to the axle, as and for the purpose specified.



2. In combination with the wheels, the oblique axle, the mechanism for raising and lowering said axle on said wheels, the swinging head pivoted at one end to the forward end of the axle, the circle-iron supporting the outer end of said swinging head, the bar E, coupling the swinging head to the arm D of the rear plate, E', and the tongue pivoted to the yoke Y', having the braces *f''*, as and for the purpose specified.

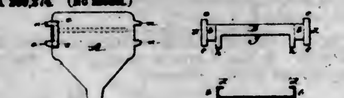


3. In combination with the transporting-wheels, the oblique axle, the circle-iron F, the swinging frame, the tongue mounted thereon, the reach H, and the plows adjustably coupled to said reach, as and for the purpose specified.

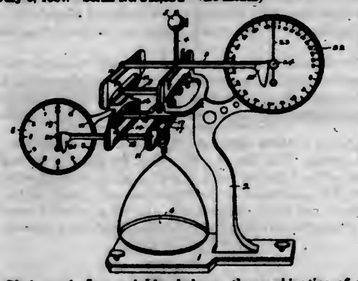
4. In combination with the oblique axle, the transporting-wheels, and the circle-iron F, the swinging head H', mounted thereon and having braces connected thereto supporting the tongue, said tongue having a pivoted connection to said braces, the curved lever *k'*, pivoted to said tongue, the reach H, and the plows coupled to said reach, as and for the purpose specified.

5. In combination with the axle-frame, the transporting-wheels, the swinging frame consisting of the parts H' N *f''* *f''*, the tongue, the bar E, the arm D, the plows coupled to the reach H, the rock-shaft B, having the arm Z, the curved arm Z', having the extension Z' made fast to said rock-shaft, and the loop-rods *b*, coupled to the plow-beams, the whole combined and operated as and for the purpose specified.

383,497. AUTOMATIC GAS-EXTINGUISHER. MICHAEL SHEEHEEN, Louisville, Ky. Filed Apr. 6, 1887. Serial No. 234,177. (No model.)



Claim.—1. The combination, in an automatic gas-extinguisher, of a cylindrical key passing horizontally through the gas-tube, an arm attached rigidly to said key and extending above and below the same, a disk secured to the upper end, and a counter-balance secured to the lower end of the arm, substantially as and for the purpose set forth.



2. An automatic gas-extinguisher consisting, essentially, of a casing, E, a key, A, provided with an opening, O, and a Y-shaped arm, C, rigidly attached to the key, a concave polished disk, D, at its upper end, and a counterbalancing-weight, W, at the lower end of said arm, all adapted to operate substantially as and for the purposes set forth.

383,498. BUCKLE. DUNBAR I. SMITH, Waterbury, Conn., assignor of one-half to Earl A. Smith, same place. Filed Apr. 2, 1888. Serial No. 269,274. (No model.)

Claim.—In a buckle the frame of which consists of front and rear plates, A B, forming substantially a tubular frame, the said plate B constructed with projections *d* at each end, the said projections forming laterally-projecting ears *e e*, the said projections turned inside the plate B and parallel therewith, distant from the plate B corresponding substantially to the distance required between the plates A and B, and the plate A constructed with ears *a a* at each end, corresponding to the said ears *e e* on the plate B, and the said ears *a a* closed over the ears *e e* as a means for uniting the two plates A and B to form the buckle-frame, substantially as described.

383,499. WEIGHT AND PRICE INDICATING BALANCE. ALFRED STRINGER, Cincinnati, Ohio, and WILLIAM KENT, Passaic, N. J. Filed July 9, 1887. Serial No. 243,324. (No model.)

Claim.—1. In a weighing-balance, the combination of a scale-beam having a pivotal resistance to deflection, a graduated vertical standard rigidly mounted thereon, an adjustable poise upon said standard opposing the pivotal resistance of the beam, and a registering device actuated by the beam oscillations to indicate total products of weight upon the beam terminal by the price-unit as fixed by the vertical adjustment of the resistance-counterpoise, substantially as set forth.

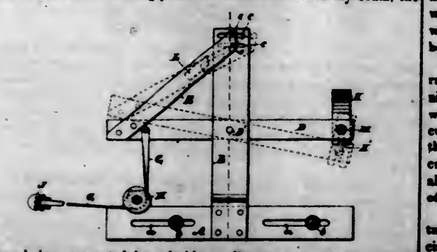
2. In a weighing-balance, the combination of a balance-beam having a pivotal resistance to deflection, a graduated vertical standard mounted rigidly thereon, a counterpoise to such pivotal resistance adjustable vertically on the standard, and a dial or indicating-register actuated by the beam's deflection as governed by the adjustment of the counterpoise, and an independent balance-beam or weight-indicator suspended from the main balance-beam and carrying the weighed body, substantially as set forth.

3. The combination, in a weighing-balance, of a balance-beam, a fulcrum-pivot acting by molecular displacement and involving molecular resistance, a rigid vertical standard upon the beam graduated into definite spaces, and a counterpoise carried upon the standard and adjustable to the graduations, whereby the molecular resistance of the fulcrum-pivot is increased or diminished to exact degrees by the adjustment of the counterpoise, thereby regulating the limit of oscillation of the beam under a given weight for the purpose of ascertaining and indicating both weight and price at the same time, substantially as set forth.

4. In a weighing-balance, the combination of a base-frame or pedestal carrying an indicating-dial, a balance-beam carried upon the pedestal or frame by a molecular fulcrum-pivot and engaging the dial-finger at one end, a suspending-link carried by the opposite end of the balance-beam, an indicating-dial carried by said link, and an independent balance-beam fulcrumed upon and suspended by said link, engaging at one end the index-finger of the last-mentioned dial and carrying at the other the weight-platform or scale-pan, substantially as set forth.

5. The combination, in a torsional balance, of the following instrumentalities, viz: a base frame or pedestal carrying a torsion-frame, a balance-beam carried upon one pivot of the frame, and a radius-arm upon the other, a double torsion-frame connecting the terminal of the balance-beam and radius-arm by two of its pivots, a second balance-beam and radius-arm carried upon the remaining pivots of a double torsion-frame, a third torsion-frame connecting the ends of the second balance-beam and its radius-arm and carrying the weight-platform, a graduated standard and poise adjustable thereon carried by the main balance-beam, a dial carried upon the pedestal with its index-finger in actuating engagement with the free end of the main balance-beam, and a second dial carried upon the double torsion-frame with its index-finger in actuating engagement with the free end of the second balance-beam, substantially as set forth.

383,500. COMBINED PANTS-PROTECTOR AND PULL-STRAP FOR SHOES. William H. Stewart, Brooklyn, N. Y. Filed Jan. 3, 1888. Serial No. 259,668. (No model.)

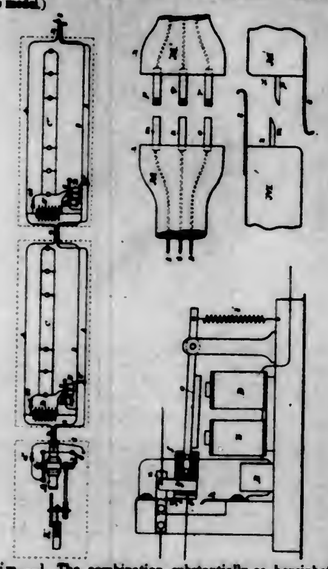


Claim.—1. In a pants-protector and pull-strap for shoes, the ring B, attached to the rear of a shoe, in combination with a strap, C, attached to said ring, and a hook, D, at the lower end of said strap, said hook being adapted to engage said ring, as and for the purpose herein specified.

2. The webbing C, folded upon itself and firmly secured to the rear of a shoe near its fold, in combination with a ring, B, secured to its short arm, and a hook, D, secured to its long arm, said hook being adapted to engage said ring, as and for the purpose herein specified.

383,501. LOOM-TEMPLE. William H. Taylor, Hampton, Ontario, Canada. Filed Feb. 13, 1888. Serial No. 263,809. (No model.)

Brief.—The T-shaped frame of the temple is provided with slots to permit of its adjustment on the breast-beam of a loom, and has pivoted to its central arm a vibrating arm, one end of which is provided with an adjustable striking-piece for contact with the lay-beam, the



other being connected by suitable cording to a gravitating weight which retracts the bar after it has been set by its contact with the lay. To the end of the bar is riveted a spring-piece provided with teeth to engage the cloth projecting through slots in the frame, and also provided with an inclined plane, which, meeting the long arm of the frame when the vibrating bar is struck by the lay, lifts the teeth out of the cloth at the time mentioned.

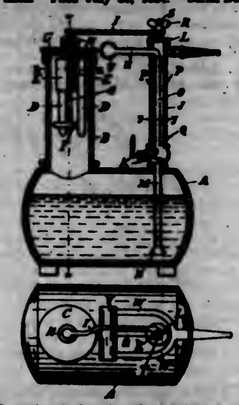
Claim.—1. The combination, with the T-shaped frame composed of bars A and B, of the tilting bar D, spring E, having tooth *c* and inclined plane L, and a cord and gravitating weight, J, as and for the purpose set forth.

2. A loom-temple consisting of a bar, A, having longitudinal slots *a a*, bar B, secured at one end to the middle of bar A transversely, and provided with slots *c c* near the opposite end, tilting bar D, pivoted to bar B, and provided with an adjustable striker-plate, K, at one end, and spring E at the other end, said spring provided with tooth *c*, and inclined plane L, as set forth.

383,502. APPARATUS FOR LIGHTING RAILWAY-CARS BY ELECTRICITY. Ellis A. Tremis and Stanley C. C. Currie, London, County of Middlesex, England. Filed July 30, 1887. Serial No. 245,228. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of an independently-driven dynamo or generator of electricity mounted upon a locomotive, an electric charging-circuit running from the generator through all the cars, a secondary battery in each car and in said circuit, lamps in the car in multiple-arc circuit with the charging-circuit and secondary battery, and a circuit-controlling device which simultaneously cuts out and lets in both the generator and storage-battery.

2. The combination, substantially as hereinbefore set forth, of an independently-driven dynamo or generator of electricity mounted upon a locomotive, an electric charging-circuit running from the generator through all the cars, a secondary battery in each car and in said circuit, lamps in the car in multiple-arc circuit with the charging-circuit and secondary battery, an electro-magnetic circuit-controlling device which cuts the lamps in and out of circuit, and a controlling-circuit which regulates the circuit-controlling device, whereby the lamps may be lighted or extinguished from the locomotive as well as from the car.



3. The combination, substantially as hereinbefore set forth, of a railway-train, a dynamo or generator, an electric charging-circuit running from car to car, a secondary battery in each car in multiple arc with said circuit, lamps in each car, also in multiple arc with said circuit and secondary battery, a circuit-controlling device which holds the lamps out of circuit in an independent circuit, and detachable circuit-connections between the cars, whereby the lamps are automatically lighted by the separation of the cars and the consequent breaking of the circuit.

4. The combination, substantially as hereinbefore set forth, of a train of cars carrying secondary batteries, a generator and a charging-circuit, and lamps all in multiple arc in the same charging-circuit with the secondary batteries, so that any inequality in condition of the storage-batteries is rapidly compensated when the train is coupled up.

5. The combination, substantially as hereinbefore set forth, of the

generator, the charging-circuit, the storage-batteries and lamps in multiple are in the charging-circuit, their electro-magnet circuit-controllers, the actuating mechanism thereof, and a controlling-circuit of which one of the charging-wires constitutes a portion.

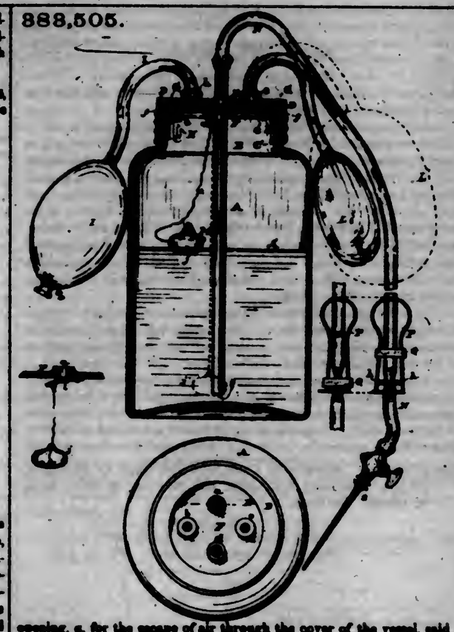
383,503. CHEMICAL ENGINE. Randall P. Van Valkenburg, Manchester, Mich. Filed July 23, 1887. Serial No. 245,239. (No model.)

Claim.—1. In a chemical engine, the combination, with the main reservoir or tank, of two receptacles connected therewith on the top, one receptacle containing a series of pockets for the reception of acid-containing glass vessels and a mechanical crusher, and the other receptacle being provided with an exit-pipe on top, a valve at the bottom, a lower extension projecting into the main tank to near the bottom thereof, and an annular chamber formed between the outer wall of said receptacle and an inner perforated pipe inclosed in said receptacle, and an outlet from said pipe, all substantially as described.

2. In a chemical engine, the combination, with the main reservoir or tank, of a dry-compound-containing receptacle connected therewith on top and having a lower extension projecting into said main tank to near the bottom thereof and terminating in a strainer, a perforated tube within said receptacle, a valve between said lower extension and the receptacle, an exit-pipe communicating with the top of said perforated tube, a transverse drum communicating with said exit-pipe, and one or more exits from said drum, substantially as described.

3. In a chemical engine, the combination, with the main reservoir or tank, of a dry-compound-containing receptacle connected therewith on top and having a lower extension projecting into said main reservoir or tank to near the bottom thereof and terminating in a strainer, a valve between said lower extension and the receptacle, and an exit-pipe communicating with the top of said perforated tube, all arranged substantially as described.

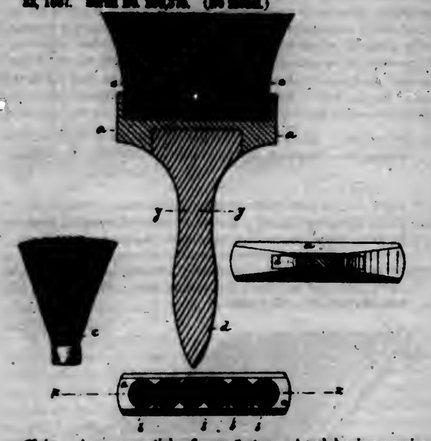
383,504. CAR-COUPLING. Joseph Wagner, Mike Grove, Ill. Filed Mar. 12, 1888. Serial No. 267,115. (No model.)



Claim.—1. In automatic car-couplers, the stationary buffer E H G, provided with the pin-plate O and slots V, in combination with the reciprocating buffer K W X, operating therein, and the link, as specified.

2. The stationary buffer E H G, provided with the link-plate O, slots V, and rim J I, in combination with the pin P, link V, and inclined reciprocating buffer K W X, provided with the pin S, operating in the said slots V, and the enlarged end part L M, shouldering against the rim J I, as specified.

383,505. APPARATUS FOR EMBALMING. Frank Warren, Cleveland, Ohio. Filed July 15, 1887. Serial No. 244,614. (No model.)



Claim.—In combination, the vessel for containing the embalming-fluid, an air-generator, I, connected by a pipe to the interior thereof through the upper part, an air-reservoir, also in connection with the interior upper portion of the vessel, a discharge-tube having a suitable nipple, O, and an extension-tube, M, within the vessel, reaching to near the bottom thereof, said tube having the discharge-opening at its lower portion, a valve, *i*, located at the top of the vessel and controlling an

383,505.

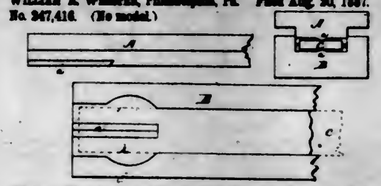
opening, *a*, for the escape of air through the cover of the vessel, said valve being in turn controlled by a float, *j*, and a suitable connection, all substantially as described.

383,506. BRUSH. Philip Warren, New York, N. Y. Filed Sept. 22, 1887. Serial No. 250,575. (No model.)

Claim.—As a new article of manufacture, a brush having a series of sockets opening into one another, in combination with tufts set into said sockets, substantially as specified.

383,507. SHEET-METAL VESSEL. Francis A. Walsh, Milwaukee, Wis. Filed Nov. 14, 1887. Serial No. 256,173. (No model.)

Claim.—1. In a sheet-metal vessel, the body having a flat vertical fold or false seam constituting part of said vessel-body and continuous



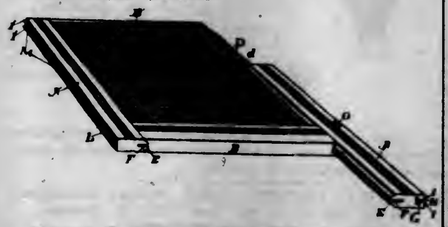
and integral therewith, said fold being of two thicknesses only in close contact, and one of said thicknesses being in close contact with said body, forming a seat for the can head or cover, in combination with a head or cover consisting of a horizontal plate having a vertical flange on its periphery, said head or cover resting on said seat composed of said vertical fold or false seam.

2. In a sheet-metal vessel, the body having a flat vertical fold or false seam constituting part of said vessel-body and continuous and integral therewith, said fold being of two thicknesses only in close contact and one of said thicknesses being in close contact with said body, forming a seat for the can head or cover, and said body rising vertically above said fold or seam, in combination with a head or cover consisting of a horizontal plate having a vertical flange on its periphery, said head or cover resting on said seat composed of said vertical fold or false seam within the vessel-body, and the top of said vessel-body above said fold or seam and the vertical flange of the head or cover rising to different heights.

3. In a sheet-metal vessel, the combination of the body having a fold or false seam formed therein, with ears or analogous attachments secured to the body by being pressed between two adjacent surfaces of the said folded part, substantially as shown and described.

4. In a circular sheet-metal vessel, the body A, consisting of a sheet of metal notched out, as shown at c, and provided with a flat vertical fold or false seam, B, near its upper end, consisting of two thicknesses of the vessel-body pressed closely together, and one of said thicknesses pressed closely against the said body, forming a seat for a head or cover.

388,508. METHOD OF SPREADING THE ENDS OF EYE-BARS. WILLIAM R. WEBSTER, Philadelphia, Pa. Filed Aug. 20, 1887. Serial No. 247,416. (No model.)



Claim.—The process of spreading the end of a rectangular metal bar, which consists in heating said end to the required temperature for upsetting, clamping it between die-faces, one or both of which are provided with a continuous central longitudinal rib or projection arranged to lie along the whole length of the heated end, and then upsetting it by pressure on its end and in the line of the central rib on the supporting die-face, all substantially as specified, and so that the heated end of the bar will be distorted and engaged with the ribbed die-face along its median line and throughout its length during the upsetting.

388,509. BLANK FOR EYE-BARS. WILLIAM R. WEBSTER, Philadelphia, Pa. Filed Sept. 30, 1887. Serial No. 251,084. (No model.)

Claim.—As a new article of manufacture, an eye-bar blank consisting of a metal bar having a central bead or ridge formed upon one or both of its sides, substantially as and for the purpose specified.

388,510. SCREEN. DIEDRICH WESSMANN, Los Angeles, Cal., assignor of one-half to John J. Jones, same place. Filed Dec. 22, 1887. Serial No. 258,730. (No model.)

Claim.—1. The combination of the rail of the screen having the groove E therein, and the groove F, opening into the groove E at or near its mid-width, at a point wholly within the groove, the trough D, retained in said grooves and not exposed to view, and the material of the screen having its edges lapped around one side of the trough.

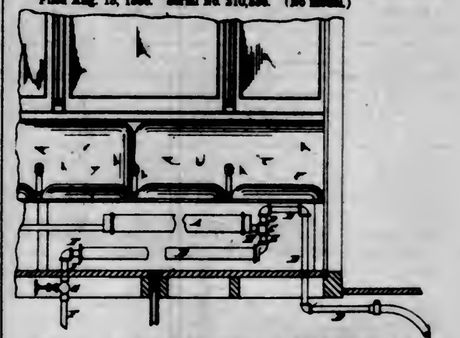
2. The combination of the screen-frame provided with the T-shaped groove G in one of its stiles, the guide H I I, held in the groove G, the steps K K', provided with grooves J J and J' J', and the rectangular trough L I' I', secured to the other stile.

3. In a screen substantially such as set forth, the combination of the stile A, having the T-shaped groove therein, the guide H, formed to the shape of the groove and provided with the tongue I I and the hole N, and a spring-bolt adapted to be inserted into and withdrawn from the hole, as and for the purpose set forth.

388,511. HARNESS-OIL. ALLEN S. ASHCRAFT, Brandenburg, Ky. Filed Aug. 13, 1887. Serial No. 246,869. (No specimens.)

Claim.—A harness-oil composed of lard, fish, castor, and Eldorado oils, the pulverized barks of the roots of the alder and Paradise trees, indigo, and copperas, in about the proportions set forth.

388,512. COIN-SPINNER. FRANCIS M. BARNES, Washington, D. C. Filed Mar. 3, 1888. Serial No. 266,082. (No model.)



Claim.—1. A coin-spinner comprising a holder and a striker for discharging the coin from the holder and giving it a spinning motion, substantially as described.

2. A coin-spinner comprising, in combination, a holder and a spring-actuated striker adapted to strike the coin near its edge while in said holder, substantially as described.

3. The combination of the spring holding-fingers for clasping a coin at opposite points on its periphery and a spring-actuated striker for striking the coin near its edge and midway between the holding-fingers, substantially as described.

388,513. CAR-HEATER. JOHN D. CAMPBELL, New York, N. Y. Filed Aug. 13, 1886. Serial No. 210,198. (No model.)

Claim.—1. In a car-heating system, a steam-supply pipe, a heater, and a reservoir for the condensed steam; all connected with a coupling, the connection with the heater being out of line with the steam-pipe, and the steam-pipe being contracted at the point where it enters the coupling, substantially as described.

2. The combination, with heater A, reservoir B, lying outside of the steam-circuit, and coupling C, of a steam-pipe, D, rising vertically from said coupling, a pipe, E, of larger area than steam-pipe D, connecting said reservoir with the lower side of said coupling and located in line with the steam-pipe D, and a pipe, H, also of larger area than steam-pipe D, connecting said coupling with the heater A, substantially as and for the purpose set forth.

388,514. INK-WELL. EDWARD J. COLBY, Chicago, Ill. Filed Sept. 17, 1887. Serial No. 249,914. (No model.)

Claim.—1. An ink-well, in combination with a supporting-frame which is secured at any desired position, and provided with a projecting rod upon which the ink-well can be adjusted, so as to vary its distance from the supporting-frame.

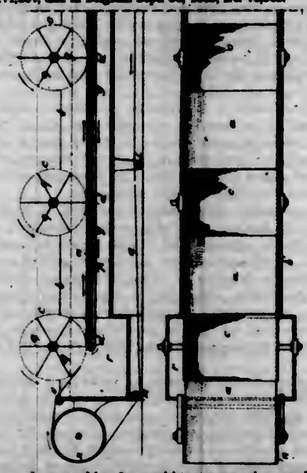
2. An ink-well, in combination with a supporting-frame which is adapted to be secured at any desired point, and an arm pivoted to said frame so as to swing horizontally about the same, to which arm the ink-well is secured so as to be movable therealong.

388,514.

3. The combination of a supporting-frame, an ink-well, and an arm secured to said frame so as to be vertically adjustable, and pivoted so as to swing horizontally about said frame, which arm supports the ink-well, which is adjustably secured thereon so as to be movable therealong.

4. The combination of an ink-well, a supporting-frame, and an arm to which the ink-well is secured so as to be movable therealong, said arm being secured to the frame so as to be vertically adjustable thereon.

5. The combination of an ink-well, an arm to which it is secured so as to be movable therealong, and a supporting-frame to which the arm is pivoted, so as to horizontally rotate about the frame.



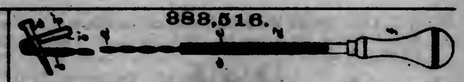
6. The combination of an ink-well, an arm to which the ink-well is secured so as to be movable therealong, and a supporting-frame on which the arm is secured so as to be vertically adjustable and to rotate horizontally about said frame.

7. In an ink-well, the combination of a series of angle-arms pivoted concentrically below and supporting above a series of rings, a series of ink-wells resting in said rings, and a supporting attachment upon which said arms are secured, the attachment adapted to reciprocate upon a supporting-frame.

8. The combination of a series of rotating ink-wells with a hollow portion on which they are secured, and a supporting-arm which is received within said hollow portion and upon which the said portion reciprocates.

9. The combination of a supporting-arm, a reciprocating hollow portion thereon, a series of ink-wells, and a covering-plate for said ink-wells secured to said hollow portion.

388,515. MACHINERY FOR WASHING WOOL. WALTER COOK, Christchurch, Canterbury, New Zealand. Filed Jan. 19, 1888. Serial No. 180,980. (No model.) Patented in New Zealand May 5, 1884, and Sept. 2, 1884; in England Mar. 20, 1885, No. 4,022; in France Sept. 28, 1885, No. 171,267, and in Belgium Sept. 30, 1885, No. 70,988.

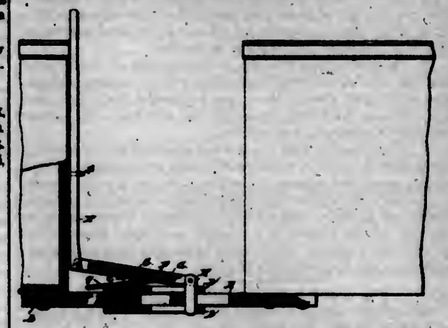


Claim.—In a machine for washing or scouring wool, the combination of the following elements, namely: a trough, a feeding-belt, squeezing-rollers which nip or squeeze the wool under water in said trough, a false bottom in the trough below the water-line, and paddles or fans *g* above said false bottom and serving to drive forward the water and the wool above the false bottom to wool-receiving mechanism and to create a circulation and return-current of the water beneath the false bottom.

388,516. TACK OR NAIL HOLDER. WILLIAM H. DE PUY, New York, N. Y. Filed Oct. 28, 1887. Serial No. 253,202. (No model.)

Claim.—1. The improved nail-holder consisting of the staff combined with spring-jaws in prolongation of said staff, and being adapted

388,516.



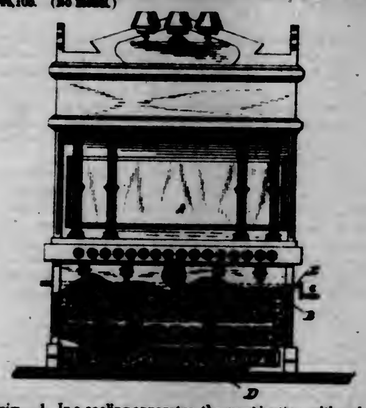
to grip and hold the body of a nail transversely and to be detached therefrom laterally when the nail is set, substantially as described.

2. The improved nail-holder consisting of the staff combined with spring-jaws in prolongation of said staff, each consisting of two members adapted to grip and hold the body of a nail transversely at two points a suitable distance apart for insuring a definite and stable position of the nail, and also adapted to be detached from the nail laterally when the nail is set, substantially as described.

3. The improved nail-holder consisting of the staff combined with spring-jaws in prolongation of the staff and consisting of two members, each formed of a loop of a wire bent nearly double at the middle, or thereabout, and at right angles to the plane of the two members of the loop, said jaws being adapted to grip and hold the body of a nail transversely at two points a suitable distance apart for insuring a definite and stable position of the nail, and also adapted to be detached from the nail laterally when the nail is set, substantially as described.

4. The improved nail-holder consisting of the staff combined with spring-jaws in prolongation of the staff and consisting of two members, each formed of a loop of a wire staff bent nearly double at the middle, or thereabout, of said loop and at right angles to the plane of the two members thereof, said jaws being adapted to grip and hold the body of a nail transversely at two points a suitable distance apart for insuring a definite and stable position of the nail, and also adapted to be detached from the nail laterally when the nail is set, substantially as described.

388,517. CAR-COUPLING. JAMES H. FISHER, Lebanon, Tenn. Filed Mar. 30, 1888. Serial No. 269,019. (No model.)

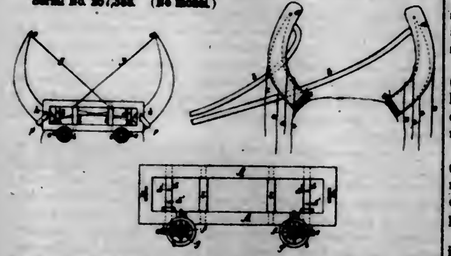


Claim.—1. In a car-coupling, the combination of the single-armed link secured to the end of a car, the bifurcated link secured to the facing end of a second car, and having an upper and a lower arm provided with longitudinal elongated registering pin-openings, the swinging pin hanging normally through the openings in the bifurcated link, and means, substantially as described, whereby the pin may be lifted out of said openings from the top of the adjoining car, substantially as specified.

2. In a car-coupler, the combination of the single-armed link secured to the end of a car, the bifurcated link having similar upper and lower arms and secured to the end of a second car, the vibratory lever journaled at its center between the arms of a bracket secured to the top of the bifurcated link inward from the pin-openings therein, the pin pivoted to the end of the outer arm of said lever at its upper end and hanging down through the pin-openings in the bifurcated link, and the rod with its lower end pivoted to the end of the inner arm of the vibratory lever and rising thence through a guide-staple to a suitable distance above the top of the car to which the bifurcated link is secured, substantially as specified.

3. In a car-coupler, the combination of the link A, secured to the end of a car, with the bifurcated link B, secured to the end of a second car, and having the similar upper and lower arms *b'*, the bracket C, secured to the upper surface of the bifurcated link, the lever D, journaled at its center between the arms *c c* of said bracket, the swinging pin E, pivoted at its upper end to the outer arm of said lever, the rod F, pivoted at its lower end to the inner arm of the lever and rising through the staple *f*, secured to the end of the car, to a suitable distance above the top of the latter, and the spring G, secured to the under surface of the outer arm of the lever D, having its inner end free and riding on the shoulder *g* of the bifurcated link, substantially as specified.

383,518. COOLER FOR SODA-WATER APPARATUS, &c. ALEXANDER K. FIRLAY, New Orleans, La. Filed July 12, 1887. Serial No. 244,105. (No model.)



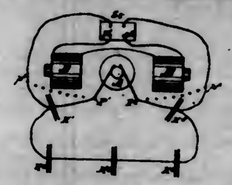
Claim.—1. In a cooling apparatus, the combination, with a chamber to receive the material to be cooled, of an ice-chamber adjacent thereto and extending above the same, and an agitator provided with suitable operative devices, said agitator being located in the ice-chamber in position to engage the ice-arch and rupture the same when it is operated.

2. The combination, with the cooling or ice chamber of a soda or other like fountain, of an agitator capable of a reciprocating, oscillating, or rotary motion, whereby the ice may be loosened and shaken down upon the coolers, substantially as specified.

3. The combination, with the cooling-chamber of a soda-water apparatus, of a horizontal rod extending through the same, and provided with fingers whereby the ice may be agitated, the said rod having a handle on the outside whereby it may be rotated, oscillated, or reciprocated, substantially as specified.

4. In combination with a soda-water apparatus having a cooling-compartment provided at its bottom with soda-water coolers and their ordinary supply and exhaust connections, a rod arranged to operate in apertures in the walls of the cooling-chamber, the said rod provided between the apertures with a series of projecting fingers, and at its ends with handles whereby it is operated so that the fingers of the rod may rake across the upper surface of the soda-water coolers, substantially as and for the purpose set forth.

383,519. MACHINE FOR SOFTENING AND BEVELING THE HORNS OF CATTLE. GEORGE B. FERRIS, Fremont, Nebr. Filed Dec. 2, 1887. Serial No. 257,388. (No model.)



Claim.—1. The horn-sack *a*, having the series of cords *c* and the pipe *b* connected therewith, said pipe having its free end provided with a coupling, *b*², for connecting it with a nozzle projecting from a steam-generator, substantially as shown and described.

2. The horn-bending mechanism, substantially as described, it consisting of the frame A, provided at its ends with slots *k* and having bearings for properly containing therein the shafts *d d* and *l l*, each shaft *d* being provided with holes *d'* and having secured to its lower end a worm-gear, *e*, which operates with a worm, *f*, secured to or forming a part of a shaft, *g*, supported in bearings *h h*, fastened to the frame A, each shaft *g* having a hand-wheel, *i*, by revolving which motion can be communicated to the shafts *d* through the gears *e* and worms *f*, and shafts *g*, all as shown and set forth.

3. The frame A, having its side bars, *m*, provided with slots *q* and series of holes *r*, and its end bars, *j*, formed with tenons on the ends to enter the slots *q*, and having holes *s* to correspond with the holes *r* to receive bolts or pins *n*, in combination with the shafts *d d* and *l l*, worm-gears *e e*, worms *f f*, and shafts *g g*, sustained in bearings secured to the frame and provided with hand-wheels *i i*, all substantially as described and represented.

383,520. PRODUCTION, TRANSMISSION, AND DISTRIBUTION OF ELECTRIC CURRENTS. CHARLES R. PEUTE, New York, N. Y. Filed Oct. 7, 1886. Serial No. 179,271. (No model.)

Claim.—1. An organized system for the production, transmission, and distribution of electric currents, consisting of the combination of apparatus for automatically producing a suitably-varying current and one or more external or working circuits connecting the opposite poles of the current producing and varying apparatus, said circuits being inductively connected to the poles through electrical condensers or devices which prevent the actual passage of the initial current from the poles over the lines or circuits, but which transmit a corresponding amount of electrical energy over the circuits by virtue of inductive through said devices from both of said poles.

2. An organized system for the production and distribution of electrical energy, consisting in the combination of apparatus for producing a suitably-varying current, and one or more lines or circuits connecting the opposite poles of the current-producing apparatus, one or more of said lines being divided into sections by condensers, each section having substantially the same potential at its ends as the undivided line would have had and being substantially a counterpart of said undivided line.

3. The combination of apparatus for producing a suitably-varying current and one or more lines or circuits connected to the opposite poles of said apparatus, one or more of said lines being divided into sections inductively united by condensers, each such section being adapted for the utilization of the current passing over it in electrical apparatus inserted in it.

4. The combination of apparatus for producing a suitably-varying current and one or more lines or circuits connected to the opposite poles of said apparatus, one or more of said lines being divided into sections inductively united by condensers, and each of said sections being practically independent of the others as regards the character of the current passing over it or through the electrical apparatus inserted in it.

5. The combination of apparatus for producing a suitably-varying current and one or more lines or circuits connecting the opposite poles of said apparatus, one or more of said lines being divided into sections inductively united through condensers, whereby each pole acts by induction over the whole line to the other pole and each assists and sustains the inductive action of the other.

6. The combination, substantially as described, of dynamo-electric apparatus for producing a suitably-varying current, two or more lines connecting the opposite poles of said apparatus through condensers, and a circuit containing the field-magnet coils of said apparatus and means for changing the varying to a straight current.

7. The combination, substantially as described, of dynamo-electric apparatus for producing a suitably-varying current and one or more lines connecting the opposite poles of said apparatus through condensers, and a circuit containing the field-magnet coils of said apparatus.

8. The combination of apparatus for producing a suitably-varying current, one or more lines or circuits connected to the opposite poles of said apparatus, and means in said circuit or circuits, but independent of or separate from the generating apparatus, for changing said varying to a continuous or straight current for use therein.

9. The combination of dynamo-electric apparatus for producing a suitably-varying current and a circuit containing its field-magnet coils in closed circuit with one or more coils of the armature, with one or more external or working circuits connected to its poles through condensers.

10. The combination, substantially as described, of apparatus for producing a suitably-varying current, one or more lines connected to the opposite poles of said apparatus through condensers for transmitting said current, and electrical receivers actuated by the impulses or currents induced by or between said condensers.

11. The combination of apparatus for producing a suitably-varying current, one or more lines or circuits connected to the poles of said apparatus through condensers, apparatus in said circuit for changing the character of the current flowing over it and sending it through a local circuit connected to said apparatus, then on, over the line, and an electrical receiver in said local circuit for utilizing said changed current.

12. The combination, substantially as described, of apparatus for producing a suitably-varying current, one or more lines connected to the opposite poles of said apparatus through condensers for transmitting said current, means for also producing a straight current, and one or more lines connected thereto for transmitting said straight current.

13. The combination, substantially as described, of apparatus for producing a suitably-varying current, one or more lines connected to the opposite poles of said apparatus for transmitting said current bodily, one or more lines connected to the poles, through condensers for transmitting said current by induction over them, means for producing a straight current, and one or more lines for transmitting said straight current.

14. The combination, substantially as described, of apparatus for producing a suitably-varying current, one or more lines connected to the opposite poles of said apparatus through condensers, and means for giving any desired potential (within the capacity of the said apparatus) to the current sent over each individual line.

15. The combination, substantially as described, of apparatus for producing a suitably-varying current, one or more lines connected to the opposite poles of said apparatus through condensers, and means for sending a current of the same potential over each of said lines.

16. The combination of apparatus for producing a suitably-varying current, one or more lines connected to the opposite poles of said apparatus through condensers, means for giving any desired potential to the current sent over each individual line, one or more lines connected to the opposite poles of said apparatus for transmitting said varying current bodily, and means for giving any desired potential to the current sent over each of said lines.

17. The combination of apparatus for producing a suitably-varying current, one or more lines connected to the opposite poles of said apparatus through condensers, means for giving any desired potential to the current sent over each individual line, means for producing a continuous current, one or more lines for transmitting said current, and means for giving any desired potential to the current sent over each of said lines.

18. The combination of apparatus for producing a suitably-varying current, one or more lines connected to the opposite poles of said apparatus through condensers, means for giving any desired potential to the current sent over each individual line, one or more lines connected to the opposite poles of said apparatus for transmitting said varying current bodily, means for giving any desired potential to the current sent over each of said lines, means for producing a continuous current, one or more lines for transmitting said current, and means for giving any desired potential to the current sent over each of said lines.

19. The combination, substantially as set forth, of apparatus for producing a suitably-varying current, one or more lines or circuits connected to the poles of said apparatus and divided into sections inductively connected through condensers, and a conductor connecting one of said sections to earth through a suitable resistance.

20. The combination, substantially as described, of apparatus for producing a suitably-varying current, one or more lines or circuits connected to the poles of said apparatus and consisting of sections inductively connected through condensers, and an electrical receiver inserted in one of said sections, whose resistance bears the same ratio to the resistance of said section as the desired difference of potential between its terminals bears to the difference of potential between the ends of said section.

21. The combination, substantially as described, of apparatus for producing a suitably-varying current, one or more lines or circuits connected to the poles of said apparatus and consisting of sections inductively connected through condensers, each section being divided into as many derived circuits and with such resistances as may be necessary to secure for the electrical receivers in them the proper strength or tension of current.

22. The combination of two or more apparatus for producing a suitably-varying current, with a suitable number of sectional lines, such as described, arranged on the multiple-wire system of conductors, substantially as set forth.

23. The combination, substantially as described, of apparatus for producing a suitably-varying current, one or more lines or circuits connecting the opposite poles through condensers, one of the sections of each wire or line being broken or open, and a conductor connecting the broken wire to earth.

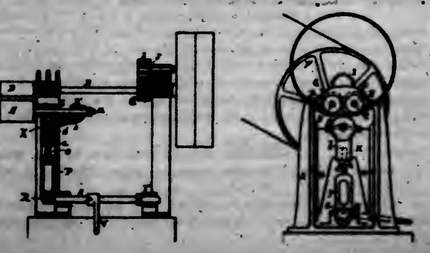
24. The combination of a line consisting of a conductor whose ends terminate in the contiguous sides or armatures of condensers, generating apparatus for producing suitably-varying electro-motive force, and connections from the two poles of said apparatus to the opposite sides or armatures of the said condensers, enabling the generating apparatus to give them correspondingly-varying electric charges, and thereby inducing currents or impulses over the conductor connecting their opposing sides or armatures.

25. The combination, substantially as set forth, of a line consisting of a suitable conductor, two condensers, each having one of its sides or armatures connected to the contiguous end of said conductor, generating apparatus for producing suitably-varying electro-motive force, and connections from the two poles of said apparatus to the other sides or armatures of said condensers, enabling said apparatus to decompose or separate the electricity of the conductor and its connections and to attract the same to the condenser-plates attached to its ends by simultaneous induction from both poles of said apparatus, the whole arranged and operating to lessen or prevent the tendency of the said electricity to escape from said conductor to earth.

26. In a system such as herein described, the combination of a line terminating in condensers and consisting of two or more sections connected by condensers, and electrical receivers in one or more of said sections and between the condensers, actuated by the currents or impulses induced by said condensers.

27. In a system such as described, the combination of an electric generator charging condensers connected to its poles, a line connected to said condensers and divided into sections, and condensers inductively uniting said sections into a sectional line and caused by the terminal condensers to reproduce the changes occurring therein, the whole arranged and operating to substitute, in place of the sending of a current over the whole distance or length of the line, the production of corresponding but separate and independent currents in and over the several sections by the simultaneous inductions of the section-condensers, whereby the electrical resistance of said line is practically reduced to a minimum.

28. In a system such as described, the combination of apparatus furnishing suitably-varying currents, electro-motive force or potential, a sectional main line conveying varying currents therefrom, a local circuit distinct from the circuit containing the generator, an induction-coil having primary coil or coils acted upon by the currents of said sectional line and secondary coil or coils in the local circuit, and one or more electrical receivers in the local circuit.



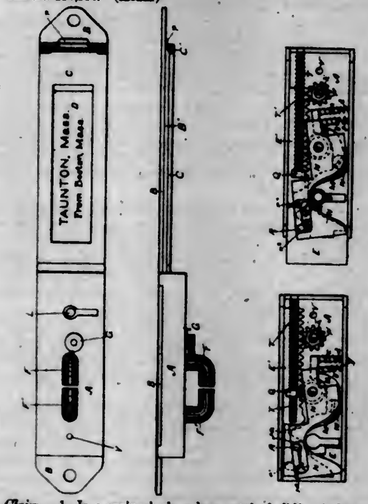
29. In a system such as described, the combination of a sectional main line, a conductor therein conveying line-currents, a local circuit distinct from the generator-circuit, and an induction-coil having primary coil or coils acted upon by the line-currents, and secondary coil or coils in the local circuit.

30. In an organized system for the production and transmission of electrical energy by repeated inductions, the combination of a generator expending a certain amount of energy in charging condensers connected to its poles, two or more sections of conductors arranged in series, condensers inductively uniting said sections into a line whose ends are connected to the terminal condensers and having capacities suitable for discharging over the sections connected to them currents having the stated amount of electrical energy, and devices properly reversing or varying the charges of said terminal condensers, the whole arranged and operating to reproduce the original amount of energy in each of the sections by the repeated inductions and electrical attractions and repulsions at the several condensers.

31. The combination of one or more sectional lines consisting of sections inductively connected through condensers, self-regulating apparatus for automatically supplying suitably-varying currents as needed on said line or lines, and connected to said line or lines through suitable polar condensers, and electrical apparatus in said line or lines utilizing said currents.

32. The combination of a sectional line consisting of sections inductively connected through condensers, self-regulating apparatus for automatically supplying suitably-varying currents as needed on said line and properly connected thereto, and suitable resistances in the sections, having the maximum section resistance properly adjusted to determine the volume of current flowing over the line.

383,521. ROLLING TIRES. PETER GREMER, Toledo, Ohio. Filed Oct. 14, 1887. Serial No. 252,694. (No model.)



Claim.—1. In a machine for the purposes described, and in combination with the frame thereof, a vertically-adjustable gate which may be elevated or lowered at will by an eccentric, substantially as and for the purposes specified.

2. In a machine for the purposes described, and in combination with the frame thereof, a gate which is vertically adjustable and provided with two boxes in line with each other, for the purpose of carrying an overhanging shaft and roll, as set forth.

3. In a machine for the purposes described, and in combination, the overhanging rolls D and E, having mechanism intervening, by means of which they are compelled to rotate in the same direction, and the overhanging roll N, having a vertical adjustability, substantially as and for the purposes set forth.

4. The combination, in a machine for the purposes described, with the frame thereof and a vertically-sliding gate, of the set-screw, nut, and standard, substantially as and for the purposes specified.

388,522. LOCK. EDWARD F. GOODWIN, Taunton, Mass., assignor to Edward F. Goodwin, trustee, same place. Filed Dec. 12, 1887. Serial No. 257,597. (Model.)

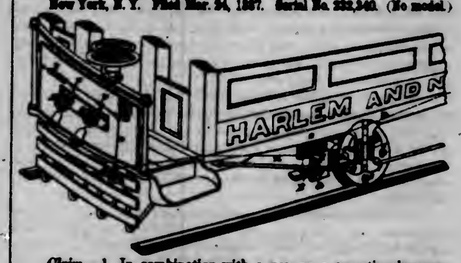
Claim.—1. In a spring-lock, a key-notched sliding bolt provided with a pin, in combination with a spring, two slotted pivoted spring-tumblers, one of which is provided with a cam, and a wedge provided with a push-button and working against the said cam, whereby the bolt is thrown out and locked in place, substantially as and for the purposes described.

2. In a lock, a key-notched sliding rack, locking-tumblers whereby the rack is secured in place, and pinions engaging with said rack and provided with locking-arms, in combination with a hasp, substantially as described.

3. In a spring-lock, a key-notched sliding bolt provided with a rack and a spring, two slotted pivoted spring-tumblers, one of which is provided with a cam, a wedge provided with a push-button and working against said cam, and pinions meshing with the rack and provided with locking-arms, in combination with a hasp, all arranged and operated substantially as and for the purposes described.

4. A mail-pouch and tag-holder lock consisting of bent revolving locking-arms provided with pinions, in combination with a key-notched sliding rack, a bolt secured thereto, and locking-tumblers, whereby a hasp is locked by said arms and the hinged top of a tag-holder simultaneously held in place by said bolt, substantially as described.

5. In a lock, a sliding key-notched rack provided with a spring and a pin, pinions engaging with said rack and provided with locking-arms, two slotted pivoted spring-tumblers, one of which is provided with a cam, and a wedge provided with a push-button and working against the said cam, in combination with a hasp, whereby, when the hasp is pressed over the locking-arms and against the push-button, the locking-arms are turned at right angles, substantially as and for the purposes described.



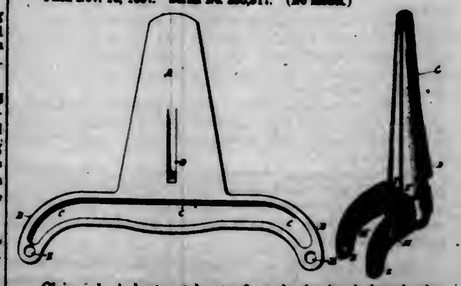
388,523. TAG-HOLDER. EDWARD F. GOODWIN, Taunton, Mass., assignor to Edward F. Goodwin, trustee, same place. Filed Dec. 12, 1887. Serial No. 257,597. (No model.)

Claim.—1. A tag-holder consisting of the combination of a card-receiving frame, a cover, C, hinged to one end thereof, said frame being provided with a retaining-bar, E, near the hinged end, a base-plate, B, and a spring, *p*, secured to said plate and bearing against the card, whereby when the cover is raised one end of the card is automatically thrown up, substantially as described.

2. A tag-holder consisting of a card-receiving frame and a retaining-cover hinged thereto, said frame being provided with a spring, free at both ends, attached to said frame, whereby one end of the spring bears against the hinged end of the cover and the other end of the spring against the card, substantially as and for the purposes described.

3. A tag-holder consisting of a card-receiving frame, A, having a plain base-plate, B, provided with an aperture, *b*, a cover, C, hinged at *c* to the plate B, and a spring, *p*, free at both ends, secured at a point intermediate of its ends to the said plate B, whereby one end of the spring works against the cover and the other end of the spring against the card, substantially as described.

388,524. AUTOMATIC CAR-ALARM OPERATOR. ISAAC H. HAHN, New York, N. Y. Filed Mar. 24, 1887. Serial No. 232,340. (No model.)



Claim.—1. In combination with a car, an automatic alarm-operator, consisting of a car-wheel attached to the running-gear, on the face of which are projecting knobs *e e e*, operating in conjunction with a horizontal bar, B, attached to a capped T-plate, A, suitably supported on the car, working on the pivot *c*, and transmitting power to the cranks *c c* by means of chains *d d*, all substantially as set forth and shown.

2. In an automatic car-alarm operator, the combination of a car and a capped T-plate, A, suitably supported on the car, and having cranks *c c*, working on pivots *f f*, to which chains *d d* are attached and connected with the bar B by means of eyebolts or other suitable method, substantially as described and shown.

3. In combination with the automatic alarm-operator, the cranks *c c*, attachments of the capped T-plate A, connected by wires *n n* on the bottom of the car, lengthwise to both dash-boards, and at their intersections, operating in conjunction with cranks *r*, suitably adjusted, cranks *w*, bells or gongs *x*, and counteracting-springs *l*, each suitably adjusted to the dash-boards and connected by wires *n n*, substantially as set forth and shown, for the purpose specified.

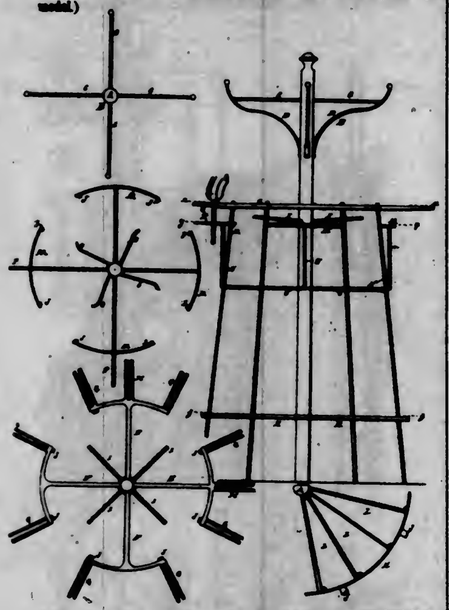
388,525. CASTER-FRAME. HERBERT C. HART, Unionville, Conn. Filed Nov. 26, 1887. Serial No. 256,317. (No model.)

Claim.—1. A sheet-metal caster-frame having its pintle and yoke-arms made in one piece, and the inner portions of the latter bent away from each other to make room for the caster-wheel between them, substantially as set forth.

2. A sheet-metal caster-frame having a retaining-spring struck up from the metal forming its pintle, which is formed in one piece with the yoke-arms of the frame, substantially as set forth.

3. A sheet-metal caster-frame having a stiffening corrugation formed in the lower end of its pintle, which is made in one piece with the yoke-arms, substantially as set forth.

4. A sheet-metal caster-frame having a continuous stiffening corrugation encircling the lower end of its pintle and extending into and terminating within the outer ends of its yoke-arms, which are made in one piece with the pintle, substantially as set forth.



5. A blank for a sheet-metal caster-frame, consisting of a tapering shank and two curved arms, respectively projecting outward from the opposite edges of the widest end of the shank, substantially as set forth.

388,526. TRACE-EYE PROTECTOR. SAMUEL M. HARTMAN, Reading, Pa. Filed Jan. 17, 1888. Serial No. 261,071. (No model.)

Claim.—The combination herein described, with a trace formed of leather or equivalent material and having two or more eyes, *A'*, of a stiffening-plate with enlarged eyes fastened to said trace, substantially as and for the purpose set forth.

388,527. RACK FOR AGRICULTURAL TOOLS. FRANK A. HENRY, Jackson, Mich. Filed Mar. 7, 1888. Serial No. 266,668. (No model.)

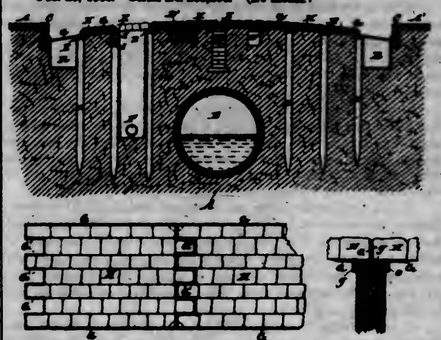
Claim.—1. The combination of the standard A, provided with the bracket B at its upper end, the brackets E and F, attached to said standard and extending radially therefrom, said brackets having laterally-extending arms at the ends which are farthest from said standard, said arms being provided with the outwardly-extending forks G H, the legs J, secured to the ends of said arms, the arms I, extending radially from the standard A toward the openings between the arms upon the brackets E F, and below said brackets the bands M, extending between alternate pairs of the legs J, below the arms upon the brackets E and F, said bands being provided with the rods N, extending from the center of said bands downward, then inward to the standard A, then outward, forming the radially-extending arms O, and the pins P, substantially as shown, and for the purpose described.

2. The combination of the standard A, the brackets E and F, attached to said standard and extending radially therefrom, said brackets having laterally-extending arms at the ends which are farthest from said standard, said arms being provided with the outwardly-extending forks G H, the legs J, secured to the ends of said arms, the bands M, extending between alternate pairs of the legs J, below the arms upon the brackets E and F, said bands being provided with the arms M, extending from the center of said bands to the standard A, then outward, forming the radially-extending arms O, substantially as shown and described.

3. The combination of the standard A, the brackets E and F, attached to said standard and extending radially therefrom, said brackets having laterally-extending arms at the ends which are farthest from said standard, said arms being provided with the outwardly-extending forks G H, and the legs J, secured to said arms, substantially as shown and described.

4. The combination of the standard A, the legs J, the bands M, secured to alternate pairs of the legs J, rods extending from the center of said bands to the standard A, then outwardly, forming the radially-extending arms O, and the pins P, said pins consisting of an extension of the said rods, substantially as shown and described.

5. The combination of the standard A, the brackets E and F, attached to said standard and extending radially therefrom, said brackets having laterally-extending arms at the ends which are farthest from said standard, said arms being provided with the outwardly-extending forks G H, legs J, secured to the ends of said arms, the bands M, extending between alternate pairs of the legs J, below the arms upon the brackets E and F, said bands being provided with the rods N, extending downward, then inward to the standard A, then outward, forming the radially-extending arms O, and the pins P, extending from the center of the bands M and being formed of a part of the rods N, substantially as shown, and for the purpose described.



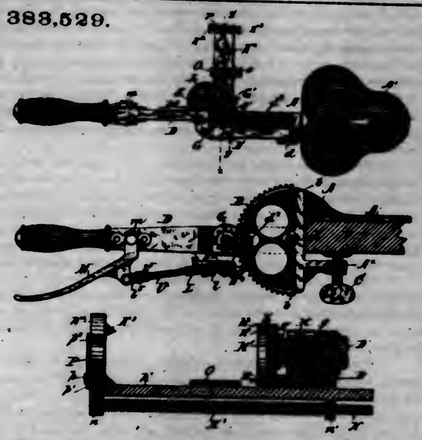
6. The combination of the standard A, the brackets E and F, attached to said standard and extending radially therefrom, said brackets having laterally-extending arms at the ends which are farthest from said standard, said arms being provided with the outwardly-extending forks G H, legs J, secured to the ends of said arms, the bands M, extending between alternate pairs of the legs below the arms of the brackets E and F, said bands being provided with the arms M, extending from the center of said bands to the standard A, then outward, forming the radially-extending arms O, substantially as shown and described.

7. The combination of the standard A, the brackets E and F, attached to said standard and extending radially therefrom, said brackets having laterally-extending arms at the ends which are farthest from said standard, said arms being provided with the outwardly-extending forks G H, legs J, secured to the ends of said arms, the bands M, extending between alternate pairs of the legs J, below the arms upon the brackets E and F, said bands being provided with the rods N, extending downward, then inward to the standard A, then outward, forming the radially-extending arms O, and the pins P, extending from the center of the bands M and being formed of a part of the rods N, substantially as shown, and for the purpose described.

8. The combination of the standard A, the brackets E and F, attached to said standard and extending radially therefrom, said brackets having laterally-extending arms at the ends which are farthest from said standard, said arms being provided with the outwardly-extending forks G H, legs J, secured to the ends of said arms, the bands M, extending between alternate pairs of the legs J, below the arms upon the brackets E and F, said bands being provided with the arms M, extending from the center of said bands to the standard A, then outward, forming the radially-extending arms O, substantially as shown and described.

9. The combination of the standard A, the brackets E and F, attached to said standard and extending radially therefrom, said brackets having laterally-extending arms at the ends which are farthest from said standard, said arms being provided with the outwardly-extending forks G H, legs J, secured to the ends of said arms, the bands M, extending between alternate pairs of the legs J, below the arms upon the brackets E and F, said bands being provided with the rods N, extending downward, then inward to the standard A, then outward, forming the radially-extending arms O, and the pins P, extending from the center of the bands M and being formed of a part of the rods N, substantially as shown, and for the purpose described.

388,528. PAVEMENT. CHARLES H. HUNT, New York, N. Y. Filed Feb. 16, 1888. Serial No. 263,893. (No model.)



Claim.—1. In a pavement, a series of receptacles, G, and piles or analogous firm supports D under their corners, in combination with inclosed paving material H, as herein specified.

2. In a pavement, the supports D with caps E, in combination with a series of pan-like receptacles, G, containing paving material H, arranged to serve as herein specified.

3. In a pavement, the caps E, having recesses *e*, in combination with the supports D and pans G, having projections *g* to engage in the said recesses, and filling material H in the said pans, all arranged to serve substantially as and for the purposes herein specified.

388,529. MACHINE FOR CUTTING AND CRIMPING CARTRIDGE-SHELLS. GEORGE D. HUNTER, Auburn, Ill., assignor of one-half to Elizabeth Hunter, same place. Filed Feb. 2, 1888. Serial No. 262,762. (No model.)

383,529.

Claim.—1. In a machine for cutting and crimping cartridge-shells, the combination of a standard or support formed with a segment-gear upon its face, a vibratory hand-lever pivoted to said support, a pivot or stud bolt supported upon said lever and adapted to fit in a central axial recess formed in a revolving pinion and crimper or chuck wheel, said pinion and wheel having a circumferential groove formed intermediate thereof, and a movable plate, also supported upon said lever and adapted to fit into said groove, substantially as described.

2. In a machine for cutting and crimping cartridge-shells, the combination of a vibratory hand-lever, a cartridge-carrier mounted upon and adapted to slide transversely of the same, a grip-lever and cord connected with said carrier for moving it in one direction, and a spring arranged intermediate of said hand-lever and the outer end of said carrier for positively moving the latter in the opposite direction, substantially as described.

3. In a machine for cutting and crimping cartridge-shells, the combination of a vibratory hand-lever, a revolving crimper or chuck wheel mounted thereon, a cartridge-carrier mounted and adapted to slide upon said hand-lever, a cord and grip-lever connected with said carrier for moving it in one direction, and a guide-rod and spiral spring for moving said carrier in the opposite direction, substantially as described.

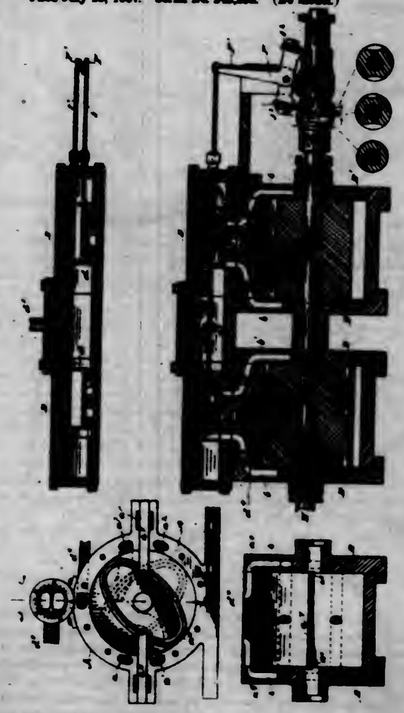
4. In a machine for cutting and crimping cartridge-shells, the combination of the vibratory hand-lever, a movable cartridge-carrier mounted and adapted to slide thereon, a grip-lever and sheave-pulley also mounted upon said lever, and a cord secured at one end to said carrier and at the other end to a compound hinge-joint secured to said grip-lever, substantially as described.

5. In a machine for cutting and crimping cartridge-shells, the combination of the vibratory hand-lever, a cartridge-carrier mounted and adapted to slide thereon, a grip-lever and sheave-pulley also mounted thereon, and a cord secured at one end to the grip-lever and at the other end to a screw-threaded thimble fastened at the outer end of said carrier by a screw-bolt, substantially as described.

6. In a machine for cutting and crimping cartridge-shells, the combination of a vibratory hand-lever, a revolvable chuck-wheel supported thereon, gearing for revolving said chuck-wheel by the movement of said lever, a cartridge-carrier mounted and adapted to slide upon said lever and provided with an abutment at its outer end having an opening, and a knife supported upon said abutment, substantially as and for the purpose described.

7. In a machine for cutting and crimping cartridge-shells, the combination of a vibratory hand-lever, a revolvable chuck-wheel mounted upon said hand-lever, a cartridge-carrier also mounted upon and adapted to slide transversely of said lever and provided with an open abutment at its outer end, and a knife pivoted to said abutment and provided with a laterally-projecting guide-flange and thumb-piece, substantially as described.

8. In a machine for cutting and crimping cartridge-shells, a revolvable chuck-wheel provided with an encircling spring which is secured at one end to the periphery thereof and which is free or disconnected at its opposite end and adapted to grip and firmly hold a cartridge and prevent the same from independently turning while being revolved, substantially as described.



9. In a machine for cutting and crimping cartridge-shells, a revolvable chuck-wheel provided with an encircling spring which is secured at one end to the periphery thereof and which is free or disconnected at its opposite end, and provided with a spur adapted to grip the rim of a cartridge and hold the same when turned in one direction and to release the same when turned in the opposite direction, substantially as described.

10. In a machine for cutting and crimping cartridge-shells, a revolvable chuck-wheel provided with an encircling spring which is secured at one end to the periphery thereof and which is free or disconnected at its opposite end, and provided with a spur having an outwardly-inclined lip and a shoulder, said spring being also provided on its lower portion with an upwardly-inclined lip, substantially as and for the purpose described.

11. In a machine for cutting and crimping cartridge-shells, the combination of the standard or support provided with the segment-gear, the vibratory hand-lever pivoted thereto, the removable chuck-wheel and pinion adapted to be supported upon said hand-lever, a sliding cartridge-carrier also supported upon said hand-lever and provided at its outer end with an abutment having a central opening, a knife pivoted adjacent to said opening, and an adjustable gage-plate mounted upon said carrier, substantially as and for the purpose described.

12. In a machine for cutting and finishing cartridge-shells, the combination of the standard or support provided with the segment-gear and also with abutment-surfaces located at the ends of the cogged rim of said gear, the vibratory hand-lever pivoted to said support and provided with a lateral extension adapted to contact with said abutment-surfaces, and a pinion adapted to rotate a crimper or chuck wheel by engagement with said segment-gear and the vibration of said hand-lever, substantially as and for the purpose described.

383,530. ROTARY ENGINE. JESSE C. JARVIS, Huntington, W. Va. Filed July 28, 1887. Serial No. 245,222. (No model.)

Claim.—1. In a rotary engine, the combination of a cylinder, an induction and an eduction passage leading to and from the cylinder on each side of a diametrical line, an elliptical piston, and a pair of partitions or abutments operated from within the cylinder in both directions directly by the piston to maintain contact therewith, as herein described.

2. The combination of a cylinder or casing having induction and eduction passages in its walls leading from and to a steam-chest through the heads of the cylinder to opposite sides of a diametrical line, an elliptical piston, and a pair of abutments operated to maintain contact with the piston by grooves in the ends thereof, as set forth.

3. In a rotary engine, the combination of a cylinder, an elliptical rotary piston extending entirely across the cylinder, and partitions or abutments within the cylinder operated in both directions to maintain contact with the piston by a coupling between the piston and abutment, as described.

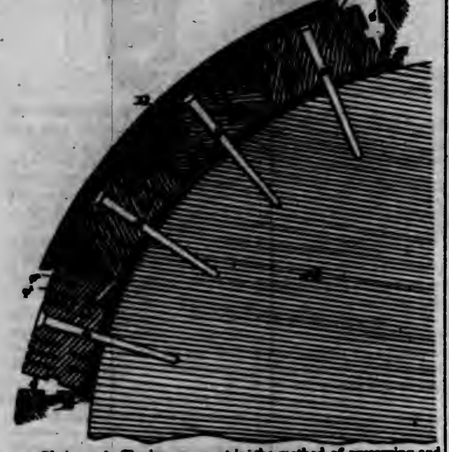
4. The combination, with a divider or abutment operated in both directions by a rotary driver, of an elastic spring-pressed packing strip or stave within the edge of the abutment for compensating for wear and maintaining close contact with the driver, as specified.

5. In a rotary engine, the combination of a valve, a reversing-cone, and connections, substantially as shown and described, for reversing the engine.

6. The combination of a valve, a valve-operating lever, and adjustable conical block connected with the driving-shaft for reversing the engine, as specified.

7. The combination of a valve, a valve-operating lever, and a cut-off cone formed on the reversing-cone, as described.

8. The combination of a valve, a valve-operating lever, an adjustable block having a variable cone-surface constituting a variable cut-off, as specified.

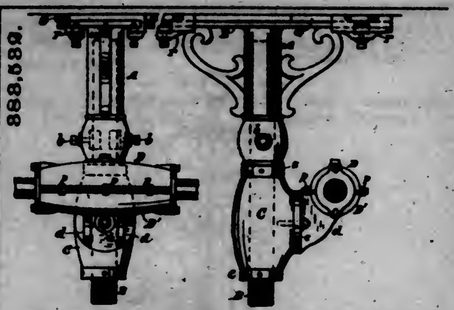


9. The combination, in a rotary engine, of a valve and a combined reversing-cone and variable cut-off cone, as specified.

10. In a rotary engine, the combination of a cylinder having induction and eduction ports or passages leading from opposite ends thereof, an elliptical rotary piston, a valve for admitting and cutting off steam, and a conical cam for operating said valve, substantially as described.

11. The combination of two rotary engines connected with the same shaft, the pistons being set at right angles to each other, valves for controlling said engines, and a double cone for operating said valves simultaneously, substantially as described.

12. In a rotary engine, the combination, with the cylinder, of a rotary piston, a valve for controlling admission of steam to said cylinder, and a cone-shaped spiral cam for producing a variable cut-off.



383,531. PRESERVING PILES. CHARLES C. LAMB, San Francisco, Cal., assignor to John H. Beale, same place. Filed Dec. 20, 1887. Serial No. 258,773. (No model.)

Claim.—1. The improvement in the method of preserving and protecting piles and other exposed wood surfaces, which consists in encircling or covering the pile or spud with a sheathing of wood prepared by first pricking or puncturing it, then treating it with a bath of preservative or protective material to permeate its substance by absorption through its pores, and then sealing up its punctures, substantially as herein described.

2. The improvement in the method of preserving and protecting piles and other exposed wood surfaces, which consists in applying a coating of preservative or protective material, then securing over said coating a sheathing of wood prepared by first pricking or puncturing it, then treating it with a bath of a preservative or protective material to permeate its substance by absorption through its pores, and then sealing up the punctures, and in finally coating the surface of the sheathing after it has been secured with a preservative or protective material, substantially as herein described.

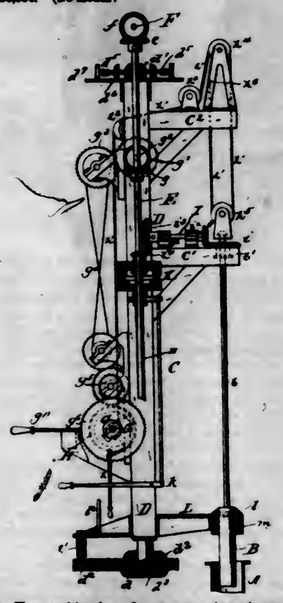
383,532. SHAFT-HANGER. ARTHUR LEMMON, St. Louis, Mo. Filed Aug. 23, 1883. Renewed Mar. 16, 1888. Serial No. 267,284. (No model.)

Claim.—1. In a shaft-hanger, a shaft-box provided with a vertical plate having a circular conical projection, *f*, in combination with a vertical cylinder which is adjustable on a depending tube, said cylinder being provided with a lateral casket on one side corresponding with said conical projection, and a central securing-bolt, substantially as and for the purpose described.

2. In combination with a hollow depending column, a vertical tube, B, adjustably secured thereto, cylinder C, adjustable on said tube and provided with a lateral casket, *g*, a shaft-box provided with brackets projecting from a vertical plate, *e*, which has a circular conical projection, *f*, which fits in casket *g*, and a central securing-bolt, *h*, substantially as set forth and described.

3. In combination with a hanging column provided with a grooved base-plate, E, a fixed plate provided with recessed retaining-bearings, in which are placed removable beveled clamping-blocks *e*, which extend into correspondingly-shaped grooves in the base-plate, and screws for pressing the clamping-blocks, substantially as set forth and described.

4. In a shaft-hanger, a shaft-box the shell of which is constructed in two parts, which are provided with partitions constructed to form annular chambers around a shaft, end plates, *k*, provided with tubular extensions to enter chambers for stuffing-boxes, at the ends of the shaft-box, and securing-bolts, all combined substantially as set forth and described.



5. The shaft-box constructed in two parts, provided with flanges *e* and rim *e'*, with suitable packing between the flanges, the two parts of the box being provided with partitions constructed to form a central annular chamber about the shaft for lubricating matter, a chamber at each side of said central chamber for filling metal, and a chamber at each end of the shaft-box to form a stuffing-box, in combination with end plates, *k*, provided with tubular extensions, substantially as and for the purposes described.

383,533. EMBROIDERING FRAME AND STAND. HERMANN C. LEBUS, New York, N. Y. Filed Mar. 3, 1887. Serial No. 229,552. (No model.)

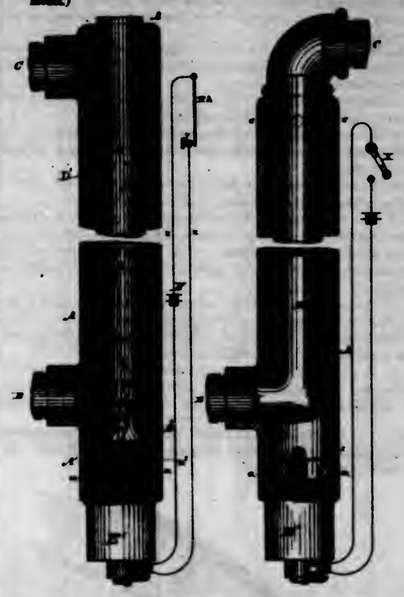
Claim.—A stretching-roller for an embroidery-frame, the body of which is divided longitudinally into two semi-cylindrical sections, one of said sections having a longitudinal groove on its flat face and provided with a longitudinal strip inserted in said groove, said strip having fixed pins, and the other semi-cylindrical section being provided with sockets for said pins, substantially as described.

383,584. PIPE-MOLDING APPARATUS. ANDREW H. McNEAL and WILLIAM A. STEBBINS, Burlington, N. J. Filed Feb. 28, 1887. Serial No. 229,066. (No model.)

Claim.—1. The combination of a crane or pivoted rotary frame, D, having near its bottom a fixed bracket, L, having a bearing for the upper end of a former, B, of a pipe-molding machine, fixed bracket C on said crane, having gear-wheel *i*, through which slides and with which rotates former extension-rod *b*, a snatch-block, A^2, swiveled on the upper end of rod *b*, rope or chain *k'*, connecting snatch-block A^2 to a winding-drum, G, for elevating and lowering rod *b* and former B, driving mechanism engaging with wheel *i* and with drum G, and actuating devices for controlling the operation of the driving mechanism, substantially as set forth.

2. The combination of frame or crane D, former B, having extension or rod *b*, a driving-shaft, a counter-shaft in gear with rod *b*, having clutch mechanism for engaging the counter-shaft with the driving-shaft to rotate former B, a snatch-block, A^2, secured to the upper end of rod *b*, a winding-drum, a chain or rope connection between the snatch-block and drum, and devices for controlling the operation of the driving mechanism, substantially as set forth.

3. The crane D, having step-bearing *d*, provided with cup or socket d^3 and disks d^4, and upper bearing, d^5, having set-screws d^6, in combination with former B and actuating devices for rotating and for raising and lowering said former, substantially as set forth.



383,585. DRESS-FORM. BENJAMIN M. MCPHERSON, Boston, Mass. Filed Dec. 10, 1887. Serial No. 257,602. (No model.)

Claim.—1. In a dress-form, the combination, with a post or standard provided with three legs or feet suitably hinged or pivoted to it, of the casting D, and a laterally-adjustable plate, E, provided with means for clamping it against the legs, substantially as described.

2. In a dress-form, the combination of the post A, sliding collar C, legs B B, suitable guides to direct and hold the legs, the screw-eye F, and the plate E, provided with a hole in its center larger than the shank of the screw-eye F, so arranged that the plate E can laterally adjust itself to and be clamped against the legs B B, substantially as described.

383,586. THERMO-REGULATOR APPARATUS FOR CONTROLLING THE TEMPERATURE OF WATER IN PIPES. EDWIN A. HOWARD, Washington, D. C., assignor to the Bowman Anti-Freezing Water Pipe Company, Chicago, Ill. Filed Dec. 30, 1887. Serial No. 259,424. (No model.)

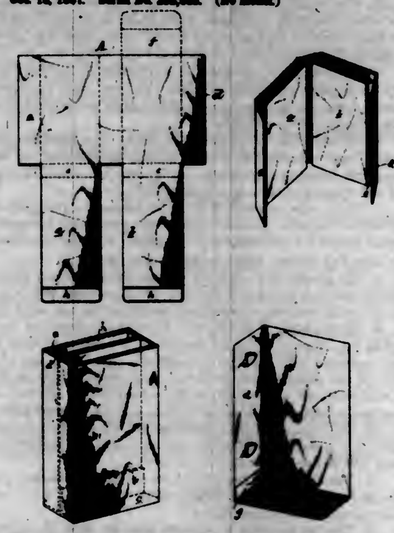
Claim.—1. The combination, substantially as hereinbefore set forth, of a water-pipe, a source of heat arranged near the pipe, and means for automatically starting and applying the heat to the pipe.

2. The combination, substantially as hereinbefore set forth, of a water-pipe, a heat-generator arranged near the pipe, and a thermostat operatively connected with the heat-generator, whereby heat may be started and applied to the pipe when the temperature near the thermostat falls.

3. The combination, substantially as hereinbefore set forth, of a water-pipe, a gas-burner arranged in close proximity to the pipe, a thermostat for turning the burner off or on, and devices for lighting the gas.

4. The combination, substantially as hereinbefore set forth, of a water-pipe, a gas-burner, a pipe or passage over the gas-burner through which the heat from the burner passes, electrical apparatus for turning on the burner and lighting the gas, and a thermostat included in the electric circuit.

5. The combination, substantially as hereinbefore set forth, of a section of water-pipe having a connection with a water-main and connected at two points with the service-pipes of a building, a heat-generator arranged in said section of pipe, and devices for automatically applying the heat when the temperature in the surrounding atmosphere falls.



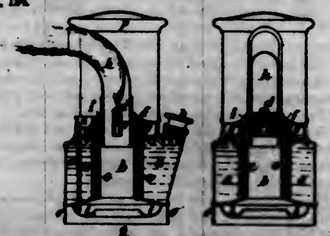
6. The combination, substantially as hereinbefore set forth, of a water-pipe, a heat-generator arranged near the pipe, an electric circuit for controlling the heat-generator, a thermostat included in the circuit, and a contact operatively connected with the thermostat to vary the electric current proportionately to the variations of the temperature.

7. The combination, substantially as hereinbefore set forth, of a water-pipe, a heat-generator arranged near the water-pipe, apparatus for turning the heat on or off, an electric circuit controlling said apparatus, and a thermostat included in the circuit for shifting it so as to turn the heat on or off.

8. The combination, substantially as hereinbefore set forth, of a water-pipe, an electric circuit passing in close proximity to the pipe, and a thermostat included in the circuit arranged to make and break the circuit according to variations in temperature.

9. The combination, substantially as hereinbefore set forth, of a section of water-pipe connected with a water-main and the service-pipes of a building, a gas-burner arranged near said pipe, an automatic electrical apparatus for turning the gas off or on and for lighting it, an electric circuit including a thermostat connected with said apparatus, a tubular passage for heat arranged within the section of water-pipe and over the gas-burner, a perforated disk or partition arranged just under the discharge-opening in the burner, and air-ports arranged under the disk.

383,587. PAPER BOX. BENJAMIN GREGORY, Newark, N. J. Filed Oct. 13, 1887. Serial No. 252,022. (No model.)



Claim.—1. A paper box consisting of a body, the bottom flaps having flaps *a b* formed integral therewith to form a central partition, and the flaps *h* integral with the flaps *a b*, as set forth.

2. A paper box constructed of a single piece of material formed with flaps *a b*, arranged when folded to form a central partition, bottom flaps, *c c*, connecting said flaps to the body, and a re-enforcing piece at the bottom, substantially as specified.

3. The box-blank described, comprising the body part, the side flaps, *d e*, the parallel central flaps, *a b*, extending at right angles to said side flaps, bottom flaps, *c c*, connecting said central flaps to the body of the blank, and the top flaps, *h h*, integral with said central flaps, substantially as shown and described.

383,588. APPARATUS FOR AUTOMATICALLY GENERATING AND BURNING INFLAMMABLE VAPORS. CLAUDE A. PAGNELLE, Paris, France. Filed June 9, 1888. Serial No. 276,691. (No model.) Patented in France May 19, 1888, No. 178,348; in Belgium May 26, 1888, No. 78,208; in Germany May 30, 1888, No. 46,194; in England May 31, 1888, No. 6,880; in Austria-Hungary Oct. 3, 1888, No. 21,333 and No. 58,033; in Spain Dec. 3, 1888, No. 10,168, and in Italy Dec. 31, 1888, XLI, 194.

Claim.—1. The reservoir *a*, traversing tube *b*, wick *c* around tube *b*, in combination with the jet-nozzle *d* and chimney *h*, substantially as described.

2. The jet-nozzle *d* in tube *b*, having dust *e*, in combination with chamber *f*, reservoir *a*, and diaphragm having perforation *g*, substantially as herein shown and described.

3. The gutter *l*, pipe *m*, and tube *b*, passing through reservoir *a*, in combination with said reservoir *a*, nozzle *d* in tube *b*, chamber *f*, and chimney *h*, all arranged and operating substantially as herein shown and described.

383,589. PENDULUM FOR CLOCKS. ALBERT L. PARMELEE, New York, N. Y. Filed Apr. 7, 1887. Serial No. 234,048. (No model.)

Claim.—1. The combination, substantially as set forth, of a driven train, a pendulum formed of a bar or strip of resilient material rigidly held at its upper end and bending in its length as it vibrates, and a escapement interposed between the pendulum and the clock-train.

2. A pendulum substantially such as herein described, formed of a flat elongated strip of resilient material adapted to be rigidly held at one end in its support and capable of bending in its length.

3. A pendulum substantially such as herein illustrated, consisting of a bar or strip of resilient material of uniform or substantially uniform cross-section rigidly held at its upper end in its support and bending in its length as it vibrates.

4. A pendulum substantially such as herein described, consisting of a bar or strip of resilient material rigidly held in its support at its upper end, having a suitable bob, and capable of bending in its length as it vibrates.

5. The combination, substantially as set forth, of a driven train, a pendulum formed of a bar or strip of resilient material capable of bending throughout its entire length as it vibrates, and a escapement interposed between the pendulum and train.

383,540. AXLE-BOX-MILLING MACHINE. ANDREW PATERSON, McKeesport, Pa., assignor to the National Tube Works Company, Boston, Mass. Filed Mar. 7, 1888. Serial No. 266,661. (No model.)

Claim.—1. In an axle-box-milling machine, the combination, substantially as set forth, of a bed, a pair of head-stocks fitted for sliding at the ends thereof and carrying each a cutter-spindle, cutter-chucks on the inner ends of the spindles, and a chuck disposed upon the bed between the head-stocks and provided with a pair of jaws facing each other.

2. In an axle-box-milling machine, the combination, substantially as set forth, of a bed, a pair of head-stocks fitted for sliding at the ends thereof and carrying each a cutter-spindle, cutter-chucks on the inner ends of the spindles, a saddle secured to the bed between the head-stocks and provided with a slideway transverse to the bed, a chuck-slide fitting said slideway, means, substantially as described, for moving the chuck-slide in the saddle, and a pair of chuck-jaws facing each other and carried by said chuck-slide.

3. In an axle-box-milling machine, the combination, substantially as set forth, of a bed, a pair of head-stocks fitted for sliding at the ends thereof and carrying each a cutter-spindle, cutter-chucks on the inner ends of the spindles, a saddle secured to the bed between the head-stocks and provided with a slideway transverse to the bed, a chuck-slide fitted to slide in said slideway, means, substantially as described, for moving the chuck-slide in the saddle, a pair of chuck-jaws facing each other and carried by the chuck-slide, and a dowel arranged to hold said chuck-slide in normal working position in the saddle.

4. In an axle-box-milling machine, the combination, substantially as set forth, of a bed, a pair of head-stocks fitted for sliding at the ends thereof and carrying each a cutter-spindle, cutter-chucks on the inner ends of the spindles, a chuck disposed upon the bed between the head-stocks and provided with a pair of jaws facing each other, and a gage-tongue at one of said jaws, adapted to be projected at one of the ends of said jaw beyond its face and to be withdrawn from such projection.

5. In an axle-box-milling machine, the combination, substantially as set forth, of a bed, a pair of head-stocks fitted for sliding at the ends thereof and carrying each a cutter-spindle, cutter-chucks on the inner ends of the spindles, a chuck upon the bed between the head-stocks, and a cutter at each of said cutter-chucks, having a notched disk and having a shank engaged by the cutter-chuck.

6. In an axle-box-milling machine, the combination, substantially as set forth, of bed A, head-stocks B C, with their spindles, shifting devices, and cutter-chucks, jaw-brackets N and O, with their jaws, sleeve Q, clamped in one of the jaw-brackets, and gage-tongue S, pivoted in said sleeve.

7. In an axle-box-milling machine, the combination, substantially as set forth, of bed A, head-stocks B C, with their spindles, shifting devices, and cutter-chucks, saddle J on the bed between the head-stocks and provided with a slideway, dowel M in the saddle and having a rod projecting downwardly and adapted to be attached to a treadle, and chuck-slide K, fitted to slide in the saddle and carrying a pair of chuck-jaws facing each other, and having a dowel-hole to be engaged by said dowel when the chuck is in normal working position with reference to the axis of the head-stock spindles.

383,541. CULTIVATOR. CHARLES H. PAYNE, Springfield, Ohio. Filed Dec. 26, 1887. Serial No. 259,256. (No model.)

Claim.—1. In a wheeled cultivator, a tongue or frame, A, draw-bars F F, and shovels attached thereto, combined with arches D and G, each provided with rigid journals and either adapted to receive the wheels, substantially as and for the purpose described.

2. The shovels K K, combined with the double standard *a d*, made of a single bar of wrought-iron or other suitable material, bent as shown, and with the bar E, and the intermediate standard, *d*', connecting the horizontal bars and carrying a shovel, for the purposes set forth.

3. The double standard *a d*, made of a single bar of wrought-iron, combined with the cap-plate E, bolted to the horizontal part of said standard and the cross-bar E, said plate and bar being provided with the sockets *g r*, and the joint-plate N, provided with the cones *s m* and tightening-bolt, substantially as set forth.

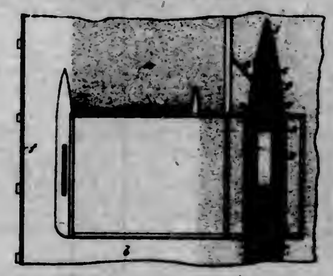
4. The shovel-standards rigidly connected together, and the parallel draw-bars F F, to which said standards are pivoted on two parallel vertical axes, combined with the handle D', mounted on the transverse bar of said standards, and means, substantially as described, whereby the handle may be adjusted to any desired lateral angle and partake of the parallel motion of the shovels and their standards.

5. The drag-bar F, the sleeve E, and the shovel-standard *a d*, rigidly but pivotally connected, combined with long joints composed of conical pintles *s m*, and the corresponding sockets, *g r*, and tightening-bolts, substantially as set forth.

6. The draw-bar F, coupled at its end by long axis-joints, composed of conical pintles *s m*, pointing in the same direction and combined with corresponding sockets, *g r*, in axial line with each other, and the tightening-bolts *s*, as set forth.

7. The parallel drag-bars F F and standards of a cultivator rigidly secured together, provided with parallel joints, each composed of conical pintles *s m* and sockets *g r*, combined with the joint-bolts *s*, the bar-nut O, and the spring-keeper *t*, as set forth.

8. The standards *a d*, made in a single piece, combined with the plate E, provided with lugs *c*', the cross-bar E, provided with lugs *c*², and the center standard, *c*³, detachably secured to said lugs, as set forth.



9. The draw-bars F, the sleeve E, to which said draw-bars are attached, the cross-arm L, and the draft rods or chains *u v* at their rear ends, connected with said arm L at different sides of the axis of the sleeve E, and united at their front ends by a pendent draft-rod, M, or its equivalent, and means, substantially as described, for adjusting said front ends of the parts *u v* vertically upon said rod M, as set forth.

10. The plate F', provided with a slot and a lever pivoted thereto and swinging parallel with the plate and across the slot, said lever provided with fingers, for the purposes set forth.

11. The draw-bar F, the sleeve E, its arm *g*, the balancing-spring EP, and the rod EP, combined with a plate, F', having a slot, *i*', and a lever provided with fingers *f f*.

12. The bracket-plate F', provided with the hood *f*³, to cover, protect, and secure the arch D, and the lever with fingers *f' f'*, as set forth.

383,542. GRAIN-DIVIDER. SEVERE RAY, Albany, Wis. Filed Dec. 13, 1887. Serial No. 257,797. (No model.)

Claim.—1. The combination, with the main wheel of a harvester, of the grain-divider composed of two side bars converging at their front ends, and having their rear ends connected with the wheel-frame of the harvester, and the connection between said front end and the upright frame of the harvester, substantially as described.

2. The combination, with the main wheel of a harvester, of the grain-divider having side bars, the rear ends of the side bars being bent back on themselves, and means for connecting the bent ends with the harvester-frame, substantially as described.

3. The combination, with the main wheel of a harvester, of the side bars, C, having their front ends converging and having their rear ends bent back upon themselves and curving inward, the short bar *l*, the rod Q, having a hook on its inner end, the short chain, and means, as the eyebolts *o* and yoke P, for securing the side bars to the frame of the harvester, substantially as described.

4. The herein-described grain-divider, composed of the elastic converging side bars having their rear ends bent back on themselves and curved inwardly, the short bar *l* at their points, and the rod Q, having a hook at its free end, substantially as described.

383,543. COMBINED BOOK AND INDEX. ROBERT H. ROSE, Kansas City, Mo. Filed Mar. 7, 1887. Serial No. 230,015. (No model.)

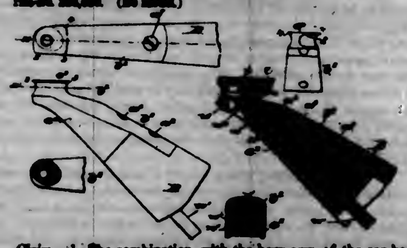
Claim.—In a combined book and index, the combination, with a book provided with a leaf, C, free of the book-cover, to its rear edge, of an index provided with a leaf or cover, F, the free edge of the latter being flexibly united to the free edge of the leaf C, whereby the index is independent of the book-cover and may be inserted and confined between the book-cover and the leaf C, with the front edges of its leaves outermost, substantially as described.

383,544. PIPE-WRENCH. JAMES ROSS, Franklin, Mass. Filed Mar. 26, 1888. Serial No. 268,511. (No model.)

Claim.—A pipe-wrench the handle portion or shank of which has a toothed jaw, B, and two slotted abutments, E F, said handle portion having pivoted to it a strap, L, which receives the shank K of the fellow jaw and connects it to the said shank or handle portion D, the shank K being pivoted to a screw which extends through the slotted abutments E F and engages with a nut, H, arranged between them in the manner shown, all being arranged and constructed and for use substantially as shown and described.

383,545. FILE-WIRE FOR LOOMS. GERARD SWEARINGEN, Yonkers, N. Y., assignor to the Wesing Hat Manufacturing Company, same place. Filed Feb. 15, 1888. Serial No. 264,071. (No model.)

Claim.—1. The combination, with a pile-wire having an enlarged and flattened end, of a head the shank of which is provided with a tapering recess, forming spring-jaws for engaging the enlarged end of the wire, substantially as set forth.

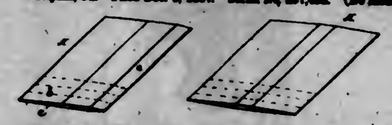


2. The combination, with a pile-wire having an enlarged and flattened end, of a head the shank of which is provided with tapering spring-jaws for engaging the end of the pile-wire, substantially as set forth.

3. The combination, with a pile-wire having an enlarged and flattened end, of a head or eye the shank of which is provided with a tapering recess having an enlarged rear portion or eye, and with grooves in the faces of the recess, so as to form spring-jaws for engaging the enlarged end of the wire, substantially as set forth.

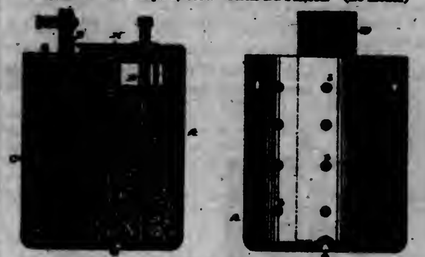
4. A head for pile-wires, the shank of which is provided with tapering spring-jaws having grooved faces, substantially as set forth.

5. A head for pile-wires, the shank of which is provided with a tapering recess having grooved edges and an enlarged rear portion or eye, substantially as set forth.



383,546. WORK-HOLDING HOOK FOR SHOE-SEWING MACHINES. HOWE I. SPRAGUE, Boston, and GEORGE B. PEARL, Lynn, Mass.; said Pearl assignor to said Sprague. Filed Feb. 18, 1887. Serial No. 228,023. (No model.)

Claim.—1. The combination, with the hero-arm, of the cap having a tip, *c*', provided with irregular flanges extended outwardly at its top, the said flanges acting in and laying or turning back the lip or flap of an inner sole as the latter is moved over the hero, the tip following in the said channel and operating substantially as described.



1. A hero-arm having a substantially horizontal surface, *p*, which terminates short of the rear side of the pinion used to rotate the wheel, combined with a cap having an attached tip, *c*', connected at its sides irregularly, substantially as described, to gradually lay back or lift the channel-covering lip or flap of the inner sole both along its sides and about its ends as the sole is moved on the hero, substantially as described.

383,547. MANUFACTURE OF FILES. WILLIAM WARNER, Philadelphia, Pa. Filed Dec. 9, 1887. Serial No. 257,032. (No model.)

Claim.—The within-described improvement in the manufacture of file-blanks, the same consisting in first making a plate having the transverse section corresponding to the longitudinal section of the desired blanks, and in then severing said section transversely to detach sections equal in width to the desired blanks, substantially as set forth.

383,548. ELECTRIC BATTERY. EDWARD A. WEBB, Long Island City, N. Y. Filed Sept. 3, 1887. Serial No. 248,552. (No model.)

Claim.—1. The combination, with a battery-cell, of a partition extending across the cell, so as to separate the electrodes, made of a material impervious to the liquid of the cell and provided with perforations, substantially as set forth.

2. The combination, with a battery-cell, of a partition extending across the cell, so as to separate the electrodes, and fitting loosely at its sides and bottom and made of a material impervious to the liquid of the cell, substantially as set forth.

3. The combination, with a battery-cell, of a perforated glass partition extending across the cell, so as to separate the electrodes, substantially as set forth.

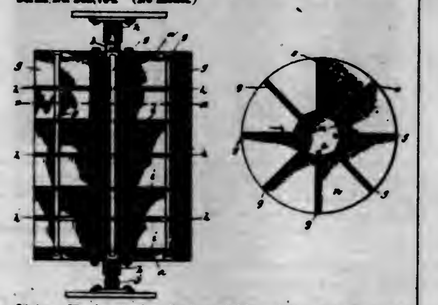
4. The combination, with a battery-cell, of an element of fragmentary material and a liquid solution therein, and a partition extending across the cell and inclosing said fragmentary element, said partition being made of a material impervious to the liquid of the cell and provided with perforations, substantially as set forth.

5. The combination, with a battery-cell, so as to separate the electrodes, of a perforated partition extending across the cell and fitting loosely at its sides and bottom, and made of a material impervious to the liquid of the cell, substantially as set forth.

383,549. FASTENER FOR THE MEETING-RAILS OF SASHES. GAYTON WEBSTER, Hartford, Conn. Filed Nov. 10, 1887. Serial No. 254,744. (No model.)

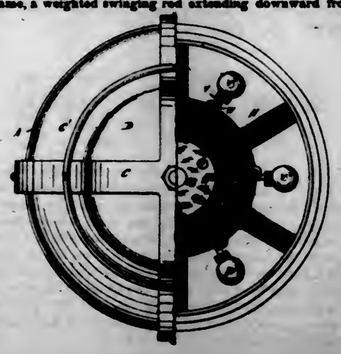
Claim.—1. In a fastening device, in combination with the base-plate having a raised central portion with a pivot-hole, and also a curved slot terminating in an angular projection, the bearer having a central pivot-opening and a radial slot and a socket adapted to receive and hold a sliding latch, a sliding latch having an inner end fitting within the bearer-socket, with a slot on one side of which are arranged a number of teeth and bearing a downward-projecting pin, the cap fitting upon the bearer-plate bearing on its under side a pinion with teeth engaging the teeth of the latch, and the shouldered pivot whereby the several parts are held together, and the lever-handle, all substantially as described.

2. In a fastening device, in combination with a base-plate having a circular slot with angular projection, a rotary cap pivoted on the base-plate, the bearer interposed between the base-plate and cap, and bearing a sliding latch having a pin projecting through the slot in the bearer and into the slot in the base-plate, all substantially as described.



388,550. REVERSIBLE VEST FOR LADIES' GARMENTS. SAMUEL WOOLF, New York, N. Y. Filed Feb. 15, 1888. Serial No. 264,068. (No model.)

Claim.—1. The combination, with a lady's jersey or other garment having hooks at the under side of its overlapping edges, of a detachable and reversible vest formed of folding sections provided with eyes along the edges of each section, substantially as set forth.



2. A detachable and reversible vest for ladies' garments, composed of folding sections stitched together at the edges and provided with fastening devices along the edges of each section, substantially as set forth.

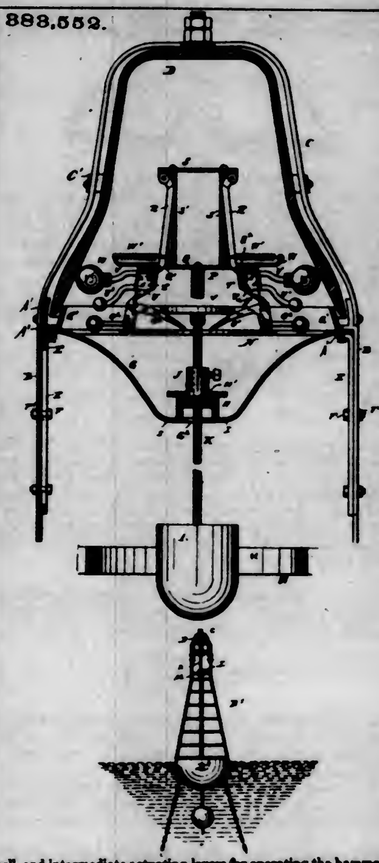
388,551. RACK FOR USE IN THE MANUFACTURE OF BOOTS AND SHOES. ALBERT RAYMOND, Campello, Mass. Filed Feb. 2, 1888. Serial No. 262,734. (No model.)

Claim.—The herein-described revolvable rack for use in the manufacture of boots and shoes, comprising the end or top and bottom plates provided with journal studs or hubs, and having radial grooves, as described, a rod or rods connecting said plates, vertical partitions having their ends engaged with said grooves and provided with grooves in their sides, shelves constructed to slide into the grooves of the partitions, and supports *j k* for said journal studs or hubs, as set forth.

388,552. BELL-RINGING DEVICE FOR BOOTS AND BOATS. GUSTAV BEMMER, Stapleton, N. Y. Filed Feb. 20, 1888. Serial No. 265,707. (No model.)

Claim.—1. The combination, with a bell, of a series of hammers in the same, a weighted swinging rod extending downward from the bell, and intermediate actuating-levers for operating the hammers from the upper end of said rod, substantially as herein shown and described.

2. The combination, with a bell, of a series of hammers in the same, a weighted swinging rod extending downward from the bell, a disk on the upper end of said rod, and intermediate levers for operating the hammers from said disk, substantially as herein shown and described.



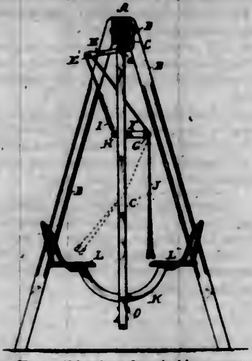
3. The combination, with a bell, of a series of swinging levers in the same, pivoted latches for moving the hammers from the sides of the bell, a weighted swinging rod extending downward from the bell, a disk on the upper end of said rod, which disk depresses the ends of said latches, whereby the opposite ends of said latches move the levers from the inner side of the bell, substantially as herein shown and described.

4. The combination, with a bell, of a series of levers pivoted to the same, springs acting on the levers and moving them toward the inside of the bell, hammer-heads on the lower ends of said levers, triggers pivoted to said hammer-heads, and pivoted latches adjacent to said triggers and serving to move the said triggers and hammers from the inner surface of the bell, and a weighted swinging rod extending downward from the bell and provided on its upper end with a disk that can depress the inner ends of the latches, whereby the outer ends are moved from the inner surface of the bell, and thereby move the inner ends of the hammers in the same direction, substantially as herein shown and described.

5. The combination, with a bell, of a plate secured transversely in the mouth of the bell, a frame on said plate, hammer-levers pivoted to said frame, latches pivoted on the plate and serving to move the hammers from the inner surface of the bell, and a weighted rod extending downward from said plate, provided on its upper end with a disk that actuates the latches, substantially as shown and described.

6. The combination, with a bell, of a plate in the mouth of the same, a weighted swinging rod passed through an aperture in said plate, a collar on said rod, a seat for the collar being formed on the

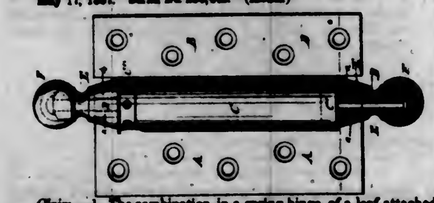
388,553.



plate, swinging hammers on a frame supported on the plate within the bell, and latches on the plate, which latches are operated from the swinging rod and serve to operate the hammers, substantially as herein shown and described.

7. The combination, with a bell, of standards supporting the same at its top, leaving the bell-mouth open, sliding bars on said standards, mounted to slide toward and from the mouth of the bell, a plate secured on said sliding bars and adapted to fit in the mouth of the bell, and bell-ringing hammers, and mechanism for actuating the same on the top of said plate, substantially as herein shown and described.

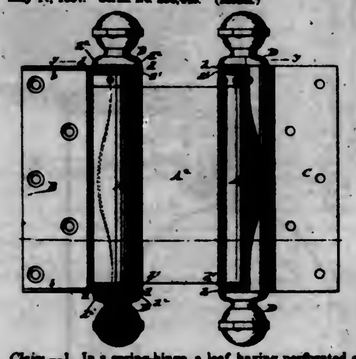
8. The combination, with the bell D, of the plate G, the spider-frame N, the latches O, pivoted on the frame N, the plate P, the plate S, the levers R, pivoted on the plate S, the hammer-heads V' on the levers R, the triggers U, pivoted to the levers R, the springs W', connected with the levers R, the weighted swinging rod K, and the disk Y on the upper end of the same, substantially as herein shown and described.



388,553. SWING. ALEXANDER BEVIS, Kansas City, Mo. Filed Nov. 7, 1887. Serial No. 254,513. (No model.)

Claim.—1. The combination of a suitable support, a single hanger secured thereto, a suspending-bar carrying a seat or seats at its lower end, and the upper end of which is pivoted to said hanger, a bracket located on said bar intermediate of the seats and its pivotal point, a roller carried by said bracket, an arm projecting from said hanger on the opposite side of said bar to that upon which said bracket is located, and a cord or rope connected to the said suspending-bar at a point intermediate of the seats and its upper end and passed over a roller carried by the outer end of said arm, and also over the roller carried by the bracket, substantially as set forth.

2. In a swing, the hanger C, pivoted to support A, and having arm E formed integral therewith, roller E', located in the outer end of said arm, in combination with suspending-bar C', the upper end of which is pivoted to said hanger, bracket F, projected from one side of said bar, roller G, carried by the outer end of said bracket, spring J, having one end connected to said bar, and cord J, connected to the other end of said spring and passed over said rollers, substantially as set forth.

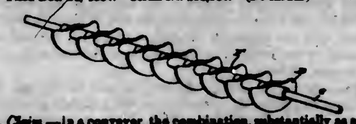


388,554. SPRING-HINGE. LEMUEL BENNER, Brooklyn, N. Y. Filed May 17, 1887. Serial No. 238,443. (Model.)

Claim.—1. The combination, in a spring-hinge, of a leaf attached to the door frame or casing; said leaf having pintle-sleeves made integral therewith, pintle-sockets having interior cylindrical cavities and lateral recesses fitting over the pintle-sleeves of the leaf, and a pintle passing through said sleeves and sockets and being rigidly attached to the latter, substantially as set forth.

2. In a spring-hinge, the combination of a leaf having pintle-sleeves made integral therewith, pintle-sockets having interior cavities and lateral recesses fitting over said pintle-sleeves, a pintle passing through said pintle-sleeves and sockets and attached to the latter, and detachable caps applied to the screw-threaded shanks or ends of the pintle-sockets, substantially as set forth.

388,555. SPRING-HINGE. LEMUEL BENNER, Brooklyn, N. Y. Filed May 17, 1887. Serial No. 238,442. (Model.)



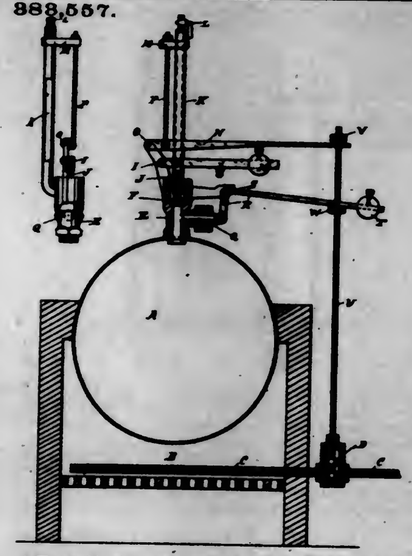
Claim.—1. In a spring-hinge, a leaf having perforated ears bent at right angles to and integral with the body of said leaf, and a bent-up stop-flange having recesses for the stop-pins, said flange extending from one ear to the other, substantially as set forth.

2. In a spring-hinge, the combination of a leaf having perforated ears with pintle-sockets having pins which engage holes in said ears, washers interposed between the pintle-sockets and the spring-sockets of the barrel, and a pintle attached to said pintle-sockets, substantially as set forth.

3. In a spring-hinge, the combination of a leaf having centrally-perforated ears and holes at some distance from the central perforation; washers having holes registering therewith, pintle-sockets having pins engaging the holes of the ears and washers, and a pintle attached to said sockets, substantially as set forth.

388,556. CONVEYER. ANNE E. BRAINARD, Hyde Park, Mass. Filed Dec. 31, 1887. Serial No. 259,557. (No model.)

Claim.—In a conveyer, the combination, substantially as set forth, of a trough to receive the material to be conveyed, a bearing for the support of a rotary conveyer-shaft, means for rotating such shaft, and a series of vanes secured to said shaft, said vanes being arranged parallel to each other and oblique to the axis of the shaft, the vanes corresponding to a portion only of the conveyer-circle, so that one longitudinal side of the conveyer is free from vanes, whereby when the conveyer-shaft is so turned that the vanes project upwardly from the shaft no vanes will project downwardly into said trough.



388,557. AUTOMATIC FUEL-REGULATOR FOR BOILERS. GEO. B. BENNETT, Rochester, N. Y., assignor of one-third to William A. Wilson, same place. Filed Aug. 6, 1887. Serial No. 246,570. (No model.)

Claim.—1. The combination, with a steam-boiler and its furnace, of a valve connected to the boiler and rising when the steam exceeds a given pressure, a valve for supplying fuel to the boiler-furnace, and a metallic pipe connected to the said steam-valve at one end and having its other end connected to the fuel-supply-valve spindle, whereby the expansion of the said pipe will close the fuel-supply valve when steam is admitted to the said pipe, substantially as set forth.

2. The combination, with a steam-boiler and its furnace, of a valve connected to the boiler and rising when the steam exceeds a given pressure, a valve for supplying fuel to the boiler-furnace, and a metallic pipe connected to the said steam-valve at one end, and having its other end provided with an adjustable outlet for condensed water and connected to the fuel-supply-valve spindle, whereby the expansion of the said pipe will close the fuel-supply valve when steam is admitted to the said pipe, substantially as set forth.

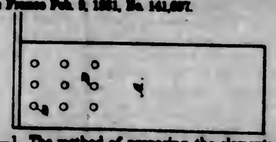
3. The combination, with a steam-boiler and its furnace, of a steam-valve casing connected to the boiler, the metallic expansion-pipe secured to the steam-valve casing, the weighted steam-valve seated in the said casing below the lower open end of the said pipe, a lever pivoted to the casing and connected to the upper end of the expansion-pipe, a plunger working steam-tight within the casing below the valve, a weighted bell-crank lever pivoted to the said casing and to the end of the plunger, and the valve for regulating the feed of the fuel, provided with a stem and actuated by the free ends of the said levers, substantially as and for the purpose set forth.

383,557.

4. The combination, with a steam-boiler and its furnace, of a steam-valve casing connected to the boiler, the metallic expansion-pipe secured to the steam-valve casing, the weighted steam-valve seated in the said casing below the lower open end of the said pipe, a lever pivoted to the casing and connected to the upper end of the expansion-pipe, a plunger working steam-tight within the casing below the valve, a weighted bell-crank lever pivoted to the said casing and to the end of the plunger, the valve for regulating the feed of the fuel, provided with a stem, and the adjustable tappets secured upon the said stem and actuated by the free ends of the said levers, substantially as and for the purpose set forth.

5. The combination, with a steam-boiler and its furnace, of a valve for supplying fuel to the boiler-furnace, and a metallic pipe rigidly supported at one end by the boiler and communicating with its steam-space, and having its other end connected to the fuel-supply-valve spindle, whereby the feed of the fuel will be regulated and proportioned by the expansion and contraction of the said pipe, substantially as set forth.

383,558. LUBRICATING ATTACHMENT FOR RAILWAY-CARS. James A. Criswell, Philadelphia, Pa. Filed July 30, 1887. Serial No. 245,782. (No model.)



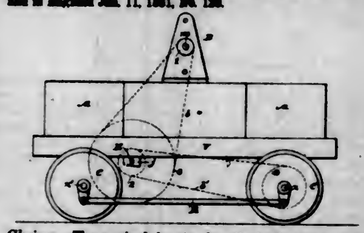
Claim.—1. The combination, with the car-body and wheels having their axles connected to the body in the usual manner, of the tank secured to the car-body, the valve-chamber communicating by a pipe, *c*, with the tank, the pipes *c*, running from the valve-chamber, and having their discharge-orifices over the rails in front or outward from the adjoining wheels, the piston-rod P and its reciprocatory valve-rod *f*, the treadle journaled upon brackets secured to the car-platforms and acting substantially as described upon the valve, and the spring G, whereby the valve-rod is moved in the direction opposite to the motion imparted by the treadle when released from the latter, substantially as specified.

2. The combination with the car-body, wheels, and tank secured to the car-body, of the spring-elevated treadle I, attached to the platform of the car and provided with the depending arm *i*, the valve-chamber E, the pipe *c*, connecting the tank and valve-chamber, the pipes H, the piston-valve P and its stem *f*, the spring G, surrounding the end part of the valve-stem, the angle-lever K, and the link-rod F, having its lower end adjustable on the depending part of the angle-lever, all constructed and arranged substantially as and for the purpose specified.

383,559. BISULPHATE. Arthur Duvall and Chas. H. Hall, Westminster, England. Filed Sept. 10, 1887. Serial No. 249,301. (No specimens.)

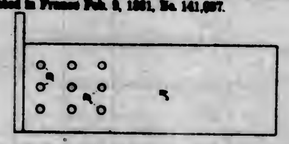
Claim.—As a new composition, a management of the alkalies combined with sulphate of magnesia, in about the proportions specified.

383,560. SECONDARY BATTERY. Camille A. Faure, Paris, France, assignor to The Electrical Accumulator Company, of New York. Original application filed Apr. 20, 1881, Serial No. 81,577. Divided and this application filed Oct. 7, 1881. Serial No. 67,691. (No model.) Patented in France Feb. 9, 1881, No. 141,697.



Claim.—1. The method of preparing the elements of secondary batteries, which consists in applying to the plates or supports the active material in the form of a paste prior to immersion of the elements in the battery-fluid, substantially as described.

2. The method of preparing the elements of secondary batteries by applying to the plates active material consisting of red lead in the form of a paste prior to the immersion in the battery-fluid, substantially as described.

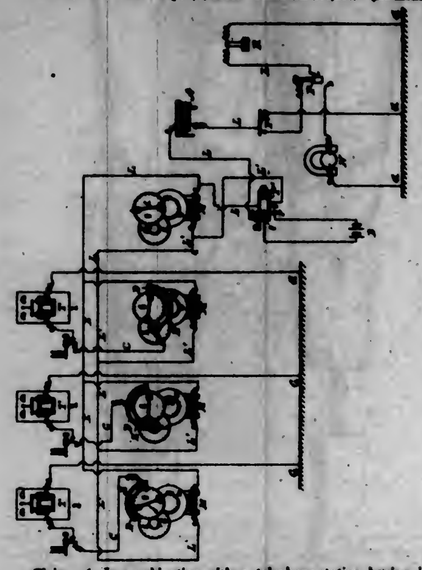


3. The process of construction of a secondary battery, which consists in first preparing the active material as a paste, then combining the same with the electrodes, and then placing the same in a battery-cell containing an electrolytic liquid, in which such active material is practically insoluble, substantially as described.

383,561. PROPELLING VEHICLES BY ELECTRICITY. Camille A. Faure, New York, N. Y., assignor to The Electrical Accumulator Company, of New York. Original application filed May 20, 1887, Serial No. 238,312. Divided and this application filed Jan. 12, 1888. Serial No. 261,261. (No model.) Patented in France Oct. 20, 1886, No. 180,264, and in England Jan. 11, 1881, No. 128.

Claim.—The method herein described of operating a vehicle propelled by an electric motor supplied with a current from a secondary battery carried by the vehicle, consisting in braking the vehicle and returning current to the secondary battery to recharge it by decreasing the electro-motive force of the battery until the counter electro-motive force of the motor exceeds it when the vehicle is on a downgrade or slowing down.

383,562. SECONDARY BATTERY. Camille A. Faure, New York, N. Y., assignor to the Electrical Accumulator Company, of New York. Original application filed Apr. 20, 1881, Serial No. 81,577. Divided and this application filed Apr. 13, 1882. Serial No. 57,269. (No model.) Patented in France Feb. 9, 1881, No. 141,697.



Claim.—1. A secondary battery consisting of a suitable containing-cell, an electrolytic fluid in which the elements are practically insoluble, such as sulphuric acid and water, and two or more elements, each of which contains a plate or conductor and a previously-prepared paste of active material in contact therewith.

2. A secondary battery composed of two elements, each element consisting of a support or conductor and a previously-prepared paste of red lead, and an containing-cell containing an electrolytic liquid in which the elements are practically insoluble.

3. An element for a secondary battery, composed of a plate, support, or conductor and a previously-prepared paste of red lead applied thereto, substantially as described.

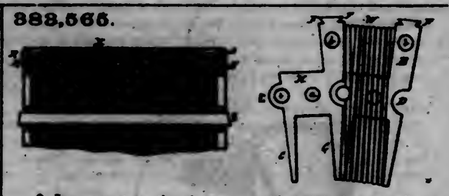
383,563. TELEPHONE CALL-BELL SYSTEM. Frank E. Pierce, Detroit, Mich. Filed Sept. 14, 1885. Serial No. 177,177. (No model.)

Claim.—1. In combination with a telephone-station having its bell-circuit normally open, an electric motor constructed to work with a continuous current, and adapted, when set in motion, to close said bell-circuit, a line-wire connected with said motor, and a second line-wire, also connected with said motor and with the telephone, substantially as set forth.

2. In combination with a line-wire, two or more telephone-stations connected with said line-wire, and each having its bell-circuit normally open, and a continuous-current electric motor situated at each telephone and adapted to close the bell-circuit thereof, and a second line-wire, not connected directly with the telephones, said motors being connected in multiple arc with said two line-wires.

3. In combination with two or more telephones, a continuous-current electric motor located near each telephone and adapted to close the bell-circuit thereof, and two line-wires connected with each other at the further telephone, said motors being arranged in multiple arc in said line-wires, and said telephones being connected with one of said line-wires, substantially as shown and described.

383,564. ARMATURE FOR ELECTRIC MOTORS. Frank E. Pierce, Detroit, Mich. Filed Dec. 12, 1882. Serial No. 281,494. (No model.)

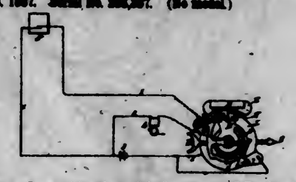


Claim.—1. In combination with the armature-ring S, carrying the wire bobbins 5, the magnetic metal strips 10, placed over the bobbins, substantially as shown and described.

2. In an electric motor, an armature having thereon bobbins of insulated wire, and a magnetic metal plate over each bobbin, whereby as the armature rotates the magnetic metal plate will be between the bobbin and the poles of the field-magnet, substantially as shown and described.

383,565. DYNAMO-ARMATURE. Frank E. Pierce, Detroit, Mich. Filed Oct. 3, 1887. Serial No. 251,241. (No model.)

Claim.—1. An armature-section made up of thin iron plates A, each provided with an upward projection, B, and two downward projections, C C, having holes *b b* to receive the rods R R, and having the concavity D and convex projection E, substantially as shown and described.



383,566.

2. In an armature, the plates A, provided with the upward projections B, having dovetail grooves F F therein, substantially as shown and described.

3. An armature in which the separate sections are made up of thin iron plates A, provided with upward projections B and downward projections C C, and having holes *b b* to receive the rods R R, each plate having the concavity D and convex projection E, each section being detachably secured to wheels G G, substantially as described.

383,566. ANNUNCIATOR. Frank E. Pierce, Detroit, Mich. Filed Oct. 25, 1887. Serial No. 253,257. (No model.)

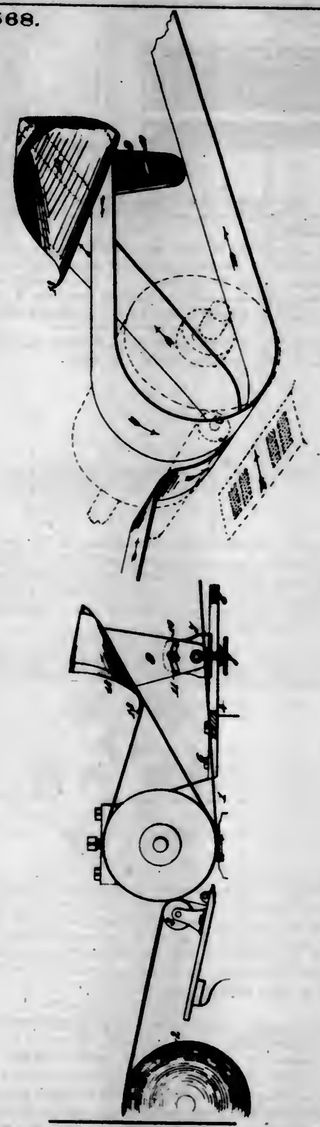
Claim.—In combination with the magnet I D, the diamagnetic plate E, having thereon the detent F and the slot S therethrough, the needle-bar A, passing through slot S and leg I of the magnet, and an armature, H, secured to the end of the needle-bar A, having thereon the tooth T and extending near to both poles of the magnet, substantially as shown and described.

383,567. ARMATURE FOR DYNAMOS. Frank E. Pierce, Detroit, Mich. Filed Oct. 25, 1887. Serial No. 253,260. (No model.)

Claim.—1. In a ring-armature having projecting studs between which the bobbins are wound, dovetail grooves on the opposing faces of the said studs and metal plates adapted to slide into the said grooves, substantially as and for the purpose described.

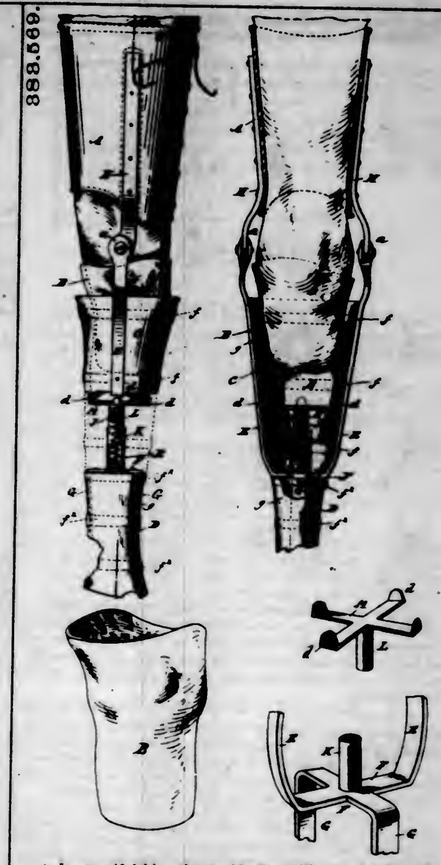
2. In combination with the armature A, having bobbins C and projections E thereon, the dovetail grooves D and plates B, substantially as shown and described.

383,568. WEB TURNING AND REVERSING DEVICE FOR PRINTING-MACHINES. Joseph C. Fowler and Edward A. Rundle, Washington, D. C. Filed July 14, 1887. Serial No. 244,203. (No model.)



Claim.—1. In a printing-press, a web turning and reversing device consisting of a metallic body of substantially conoidal form flattened upon one side, and mounted upon a plate having pivoted adjustment, substantially as described.

2. In a printing-press, the combination, with the press-bed, of a web turning and reversing device consisting of a hollow stationary body of substantially conoidal form, having one side flattened, and provided with a pivotally-mounted plate, a set-screw adjustably connecting said plate to the press-bed, and means, substantially as described, for giving pivotal adjustment to said plate, substantially as described.



3. In a printing-press, the combination, with the press-bed having a longitudinal slot, of a bracket having a set-screw moving in said slot, a plate pivotally mounted on said bracket and having a curved slot through which a set-screw passes into the bracket, and a web turning and reversing device mounted on the end of said plate, substantially as described.

4. The web-turning and reversing device described, consisting of the metallic body 12, of substantially conoidal form, having one side flattened and prolonged in the direction of the base of the device, substantially as described.

388,568.

388,569.

388,569. ARTIFICIAL LEG. ALEXANDER GAWLE, Medford, Mass. Filed Nov. 21, 1887. Serial No. 255,792. (No model.)

Claim.—1. In an artificial limb, a socket for receiving the stump of an amputated leg, formed and suitably shaped of hard molded india-rubber or gutta-percha, substantially as described.

2. In an artificial leg, the combination, with an ankle-piece, D, having a vertical guiding-socket, a spring, and outer socket, C, and appliances for supporting said outer socket, of a stump-socket having a downward projection playing upon said guiding-socket against said spring, substantially as and for the purposes described.

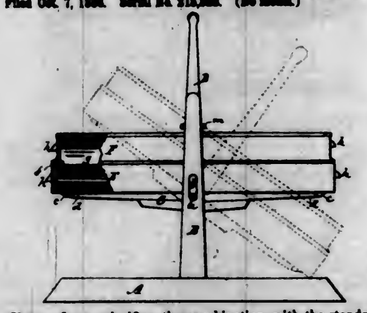
3. In an artificial leg, the combination, with ankle-piece D, having an upwardly-projecting socket, and means for supporting said ankle-piece, of a frame provided with a tube projecting downwardly within the socket of the ankle-piece, a spring in said socket and tube, and a stump-socket resting upon the said frame, substantially as herein shown and described.

4. In an artificial leg, the combination, with an ankle-piece, D, having a vertical guiding-socket, K, and a spiral spring, J, therein, and an outer socket, C, and appliances for supporting said outer socket, of a frame having upwardly-extended lugs *d d* and a downwardly-extended tube, L, playing within said guiding-socket K against said spring, and a stump-socket, B, resting on said frame, substantially as and for the purpose described.

5. In an artificial leg, the combination, with an ankle-piece, D, having secured thereto a frame, F, provided with upwardly-extended brace-bars E E, a thigh-socket, A, pivotally secured to said brace-bars, and an outer socket, C, secured to and supported by said brace-bars, of a stump-socket fitting loosely within said socket C, and a spring between said frame F and said stump-socket for forcing said stump-socket upwardly, substantially as and for the purpose described.

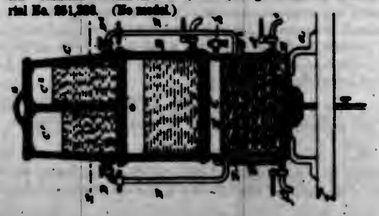
6. In an artificial leg, the combination, with an ankle-piece, D, a frame, F, provided with downwardly-extended brace-bars G, lying along and secured to said ankle-piece, said frame also having upwardly-extended brace-bars E E, a thigh-socket, A, pivotally secured to said brace-bars E, and an outer socket, C, secured to and supported by said brace-bars, of a stump-socket fitting loosely within said socket C, and a spring between said frame F and said stump-socket for forcing said stump-socket upwardly, substantially as and for the purpose described.

388,570. FIRE-ESCAPE. JOHN GRANT, Beverly, Mass. Filed Mar. 27, 1888. Serial No. 268,669. (No model.)



Claim.—1. A fire-escape consisting of a frame having a bifurcated lower end adapted to engage opposite sides of a window-sill, a drum pivoted in the upper end, provided with a central flange, a pulley mounted upon one end of the drum, an endless rope or chain resting upon said pulley, a hammock suspended from the drum, and a brake-shoe pivoted to the frame, engaging the pulley, substantially as and for the purpose specified.

388,570.



2. In a fire-escape, the combination, with a frame having bifurcated lower ends, the members whereof are oppositely curved and one shorter than the other, a drum pivoted in the upper end of the frame, provided with a central flange, a finger projected from the frame engaging said flange, and a grooved pulley attached at one end of the drum, of a hammock provided with a rear extension and throat-strap suspended from the drum, a brake having an attached rope pivoted to the frame beneath the pulley, and an endless belt or band passing over the pulley, all adapted for operation substantially as shown and described.

388,571. ASH-SIFTER. HENRY B. GRIFFIN, Rochester, N. Y. Filed Oct. 7, 1886. Serial No. 215,888. (No model.)

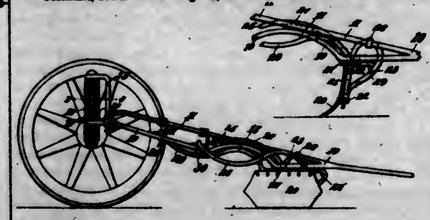
Claim.—In an ash-sifter, the combination, with the standards B, rocking frame C, and boxes E F, of the lever D, attached to the rocking frame, and the bar G, pivoted to the lever and provided with the right-angled stirrup *m*, said bar fastening the boxes to the rocking frame when turned down, and fastening the lever to the standard when turned up, as herein shown and described.

388,572. RECEPTACLE AND HEATER FOR TEA, COFFEE, MILK, &c. CHARLES W. HELLENBRAND, Salem, Oreg. Filed Oct. 3, 1887. Serial No. 251,309. (No model.)

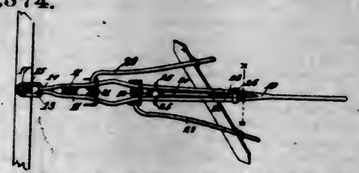
Claim.—1. A heater for tea and coffee, comprising the hot-water vessel A, having a removable cover, *c*, the separate and independent vessel C, above the hot-water vessel, and having a cock, D, on its outside, and a pipe leading into and through the vessel A from said outside cock, substantially as set forth.

2. A heater for tea, coffee, and milk, comprising the hot-water vessel A, the removable milk-vessel B upon the vessel A, and having a cock, *d*, and the vessel C upon the vessel B, and having a cock, D, on its outside, and the pipe E, leading from the said cock D into and through the hot-water vessel, and provided with a cock, *f*, substantially as set forth.

388,573. TWINE-HOLDER. JONATHAN RUIZ, New York, N. Y. Filed Jan. 5, 1886. Serial No. 288,868. (No model.)



Claim.—1. In a twine-holder, the combination, with the supporting-chain, of the lever B, fulcrumed on the latter and provided with an eye at each end, the twine-cup suspended from the eye at the short arm of said lever, and the twine-guide chain E, pendent from the cup-connection, as shown and described.

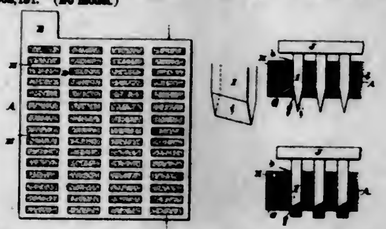


2. In a twine-holder, the combination, with a supporting-chain and a lever provided with a graduated sleeve fulcrumed upon said chain, of a twine-cup suspended from the short arm of said lever and a guide-chain pendent from the cup-connection adjacent to the lever, substantially as and for the purpose herein set forth.

3. In a twine-holder, the combination, with a supporting-chain and a lever fulcrumed upon said chain, provided with a graduated sleeve, and having an eye at the extremity of the longer arm, of a twine-cup supported from the short arm of the lever by a rod and short length of chain and a guide-chain pendent from the aforesaid short length of chain adjacent to the lever, substantially as shown and described, whereby the cord may be passed from the cup through a link of the guide-chain, through the eye of the lever, and downward, as set forth.

388,574. DETURNER AND GRADER. JAMES M. HOLLAND, Mount Pleasant, Iowa. Filed Aug. 24, 1887. Serial No. 247,726. (No model.)

383,574.



Claim.—1. In a ditcher and scraper, upper and lower bars, 10 11, rigidly connected at their front and rear ends, in combination with the shovel pivotally connected at or near its center to the rear ends of said arms, and the outer bars, 28 29, pivotally connected with the shovel at opposite sides of its center at their rear ends, and detachably connected at their forward ends to the frame formed by the said rigidly-connected bars, substantially as set forth.

2. The combination, with the frame comprising the upper and lower longitudinal bars, 10 11, rigidly connected together and provided with hooks 31, one in advance of the other, of the shovel 20, centrally pivoted to the rear end of the frame, and the rods 28 29, bent downward at their rear ends and pivotally connected to the shovel at opposite sides of its center and bent inward at their front ends to engage the said hooks, substantially as set forth.

3. The combination, with a clevis-link or slide, of bars 10 and 11, a knob connected to the forward ends of said bars, a shovel, 20, the standard of which passes between the bars 10, a wear-plate or washer, 27, connections between the standard and the shovel, bars 28 and 29, formed with hooks 30, and the hooks 31, substantially as described.

383,575. MANUFACTURE OF SECONDARY BATTERIES.

RUDOLPH M. HUNTER, Philadelphia, Pa., assignor to the Electric Car Company of America, of Pennsylvania. Filed Jan. 27, 1888. Serial No. 262,131. (No model.)

Claim.—1. The method of forming an element for a secondary battery, which consists in placing hardened pieces of active material in holes or perforations in a metal plate of ductile material and then bending the edges of said plate adjacent to the active-material pieces partly over them, to hold them in place and leave a large area of the active material exposed.

2. The method of forming an element for a secondary battery, consisting in making a metal plate of the proper shape and perforating it, then placing in said perforations or apertures pieces of active material in a hardened condition, and finally subjecting the metal of the plate between the active material to pressure, causing it to spread, so as to form lips which partly extend over the pieces of active material and hold them in place and expose said active material upon each surface of the plate.

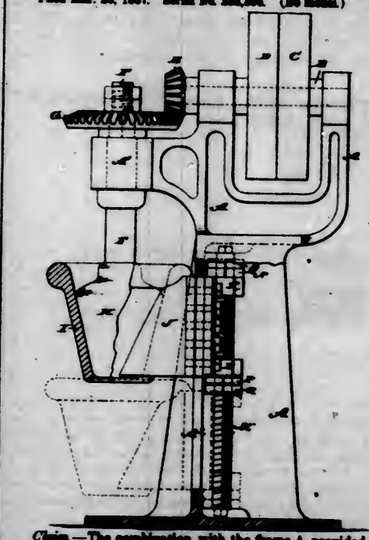
3. The method of forming an element for a secondary battery, consisting in making a metal plate of the proper shape and perforating it with a series of parallel apertures, then placing in said perforations or apertures pieces of active material in a hardened condition and formed like small cylinders or bars of any cross-section, and finally subjecting the metal of the plate between the active material to pressure, causing it to spread, so as to form lips, which partly extend over the pieces of active material and hold them in place and expose said active material upon each surface of the plate.

4. The method of forming an element for a secondary battery, which consists in stamping from a sheet of lead a plate of the proper shape, then perforating it to form a large number of apertures, then placing hardened pieces of active material in said apertures, and finally subjecting the metal between the apertures to the action of spreading-dies, which spread the metal over the active material in the form of small lips to hold the active material in place.

5. The method of forming an element for a secondary battery, which consists in stamping from a sheet of lead a plate of the proper shape, then perforating it to form a large number of elongated apertures arranged in parallel rows, and each row formed of a series of such apertures arranged parallel to each other, then placing hardened elongated pieces of active material in said apertures, and finally subjecting the metal between the apertures to the action of spreading-dies, which spread the metal over the active material in the form of small lips to hold the active material in place.

6. The method of forming an element for a secondary battery, which consists in forming a lead plate with a series of apertures, then placing previously-hardened active-material pieces within said apertures, and finally subjecting the plate to the action of dies to force the lead to spread partly over the active-material pieces, to hold them in place and expose said active material upon each surface of the plate.

7. The method of forming an element for a secondary battery, which consists in forming a lead plate with a series of elongated parallel apertures, then placing previously-hardened active-material pieces of elongated shape within said apertures, and finally subjecting the plate to the action of dies to force the lead to spread partly over the active-material pieces, to hold them in place and expose said active material upon each surface of the plate.



8. The method of forming an element for a secondary battery, which consists in forming a lead plate with a series of elongated apertures, then placing previously-hardened active-material pieces of elongated shape within said apertures, and finally subjecting the plate to the action of dies to force the lead to spread partly over the active-material pieces, to hold them in place and reduce the thickness of the lead between the pieces of active material.

9. The method of making perforated plates for an element of a secondary battery, which consists in, first, perforating a plate of lead or other suitable metal or combination of metals of uniform thickness, and then subjecting it to pressure to reduce the thickness of the metal between the apertures and force the edges of the perforations to spread inwardly, to form overhanging lips without touching each other, and adapted to hold the active material in place.

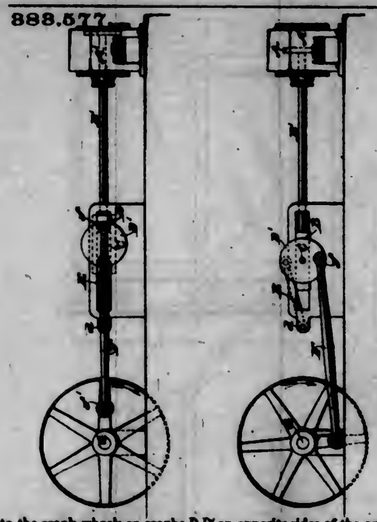
10. The method of making an element for a secondary battery, which consists in perforating a plate of lead and subjecting it to the action of pressure at points or lines between the perforations, to cause the metal to flow inwardly toward the apertures, and filling such apertures with active material.

383,576. INK-MILL.

T. RUDDIMAN JOHNSTON, Edinburgh, Scotland. Filed Mar. 20, 1887. Serial No. 231,256. (No model.)

Claim.—The combination, with the frame A, provided with vertical guides A^2 at one side, a vertical screw, M, within the frame adjacent to said guides, and the bracket A' above said guides, of the vertical shaft F, journaled in said bracket and having a grinder, H, on its lower end, the grinding-pot I, provided with a bracket, J, working in said guides, eyes K L on said bracket and sliding freely on the screw M, and the nuts on said screw for adjusting the position of the grinding-pot, substantially as set forth.

383,577. MECHANICAL MOVEMENT.



MARSHALL B. KELLOGG, San Francisco, Cal. Filed July 20, 1887. Serial No. 245,052. (No model.)

Claim.—1. The sliding cross-head B, provided with crank-wheels or cranks D D', connected to a revolving axis, C, carried by the cross-head, in combination with the link E and connecting-rod F, pivoted to the crank-wheels or cranks D D' on opposite sides of the axis C, substantially as described.

2. The sliding cross-head B, carrying two crank-wheels or cranks, combined with the connecting-rod of a motor connected to the cross-head, and the connecting-rod F, all arranged to operate substantially as described.

3. The sliding cross-head B, operated directly from the motor and provided with the revolving axis C, having two cranks projecting in opposite directions, substantially as described.

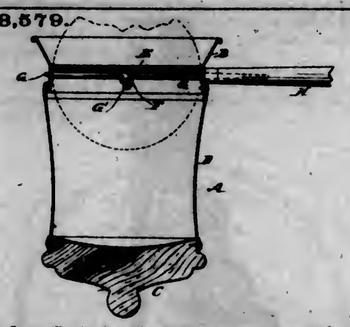
383,577.

383,578. ROLL-PAPER HOLDER.

HENRY H. KIRK, Adrian, assignor of one-half to John R. Bellas, Detroit, Mich. Filed Jan. 31, 1888. Serial No. 262,622. (No model.)

Claim.—1. In a roll-paper holder, the combination, with a frame having journal-bearings for receiving the ends of a supporting-roller, of a roller or bar journaled in pendent arms, spring-arms engaged with said pendent arms and adapted to force the roller or bar to bear upon and follow in against the paper on the roll, a fixed covering-bar, and a spring-controlled roller or bar back of the same, substantially as described.

2. The combination of a frame adapted to support a roll of paper, a roller or bar, D, journaled in pendent arms D', spring-arms D², connected with said pendent arms, with a fixed covering-bar, E, spring-arms F², and a roller or bar, F, journaled therein to force the paper into firm contact with the back of the covering-blade, substantially as described.

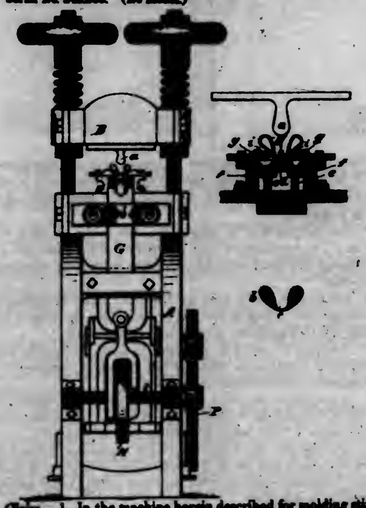


383,579. COLLECTING-BOX.

FRIEDRICH A. KETTELL, Hollidaysburg, Pa. Filed Feb. 24, 1888. Serial No. 265,154. (No model.)

Claim.—1. A collection-box provided with an upper tilting bottom, a lower bottom, and a rotary supporting-handle adapted to upset the tilting bottom, substantially as described.

2. In a collection-box, the combination, with a pendent box-body having a main bottom, of a rotary supporting-handle mounted transversely in the body above its bottom, and a movable false bottom in the body above the main bottom, adapted to be moved by the rotary handle, so as to discharge upon the lower bottom, substantially as described.



383,579.

3. In a collection-box, the combination, with a box-body having a main bottom, of an upper tilting false bottom therein provided with a sleeve, a pivot-rod passed through said sleeve and mounted to turn in the body, a handle attached to said rod, and means for locking the rod in the sleeve, substantially as described.

383,580. MACHINE FOR MOLDING HEEL-STIFFENERS FOR BOOTS OR SHOES.

GEORGE A. KIRK, Lynn, Mass. Filed July 5, 1887. Serial No. 243,269. (No model.)

Claim.—1. In the machine herein described for molding stiffeners for boots and shoes, a reciprocating male mold, a flexible female mold, *b*, a yielding bed for the latter, and cam-blocks *g* to engage the sides of the flexible female mold to press its sides inward or laterally as it yields on its bed to the pressure of the male mold, all combined and operating substantially as and for the purpose set forth.

2. The herein-described mold for molding counters or stiffeners for boots and shoes, having rigid sides and being flexible at its bow-point *c*, substantially as set forth.

3. In the machine herein described for molding stiffeners for boots and shoes, the molds, a reciprocating slide for ironing down and setting the flange, mechanism, substantially as set forth, for holding the slide with a yielding pressure against the face of the die as the slide is moved to set the flange, and mechanism, substantially as described, for relieving the slide of such pressure as it is moved backward after having set the flange, all combined and operating substantially as and for the purpose set forth.

4. In the machine herein described for molding counters or stiffeners for boots and shoes, a male mold, a female mold having practically rigid sides flexibly connected at the bow-point, a yielding bed for the female mold, and cam-blocks to engage the sides of the female mold to press its sides inward or laterally as it yields on its bed to the pressure of the male mold, all combined and operating substantially as and for the purposes hereinbefore set forth.

383,581. POOL-REGISTER.

CHARLES S. KRAPFF, Albany, N. Y. Filed Jan. 6, 1888. Serial No. 259,893. (No model.)

388,581.

Claim.—1. The locking-lever D, hinged at *b*, and the holder or clasp *b'*, in combination with registering mechanism, and a rod, F, connecting the said lever with the registering mechanism, substantially as described.

2. The locking-lever D, hinged at *b*, the holder or clasp *b'*, and the hook *D'*, in combination with registering mechanism, and a rod, F, connecting said lever with the registering mechanism, substantially as described.

3. The lever G, acted upon by a spring, H, in combination with the locking-lever D, disk Q, and rod F, connecting the lever G to the said disk and locking-lever, substantially as described.

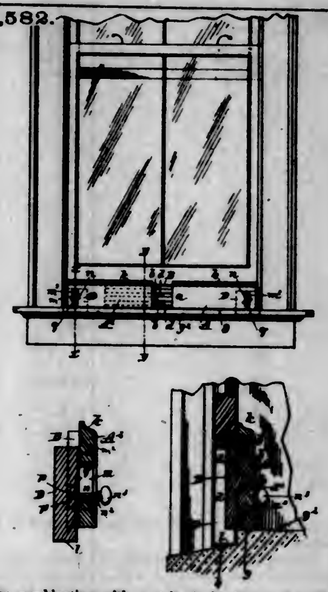
4. The lever G, spring H, connected thereto, the locking-lever D, and disk Q, in combination with the rod F, gong K, hammer J, and the spring-trip *g*, substantially as described.

5. In a register, the lever G, spring H, connected thereto, locking-lever D, and disk Q, in combination with the rod F, ratchet-wheel L, dial B, arbor L', and hands L^2, substantially as described.

6. In a register, the lever G, spring H, connected thereto, locking-lever D, disk Q, and rod F, in combination with the gong K, hammer-dog J, ratchet-wheel L, arbor L', pawl *l*, dial B, and hands L^2, substantially as described.

7. In a register, the lever G, spring H, connected thereto, lever D, disk Q, and rod F, in combination with the shelf C, and means for communicating motion from the lever G to the said shelf, substantially as described.

8. In a register, the lever G, spring H, connected thereto, lever D, disk Q, and rod F, in combination with the gong K, sliding shelf C, hands L^2, and means, substantially as described, for operating the hands and shelf and striking the gong from the lever G, substantially as described.



9. The lever G, spring H, connected thereto, lever D, disk Q, and rod F, in combination with registering mechanism, the electric wires N N', and a circuit-breaker operated by the lever, substantially as described.

10. The rod F, having hook *p*, and the disk Q, having prongs *q q* and projection *q'*, in combination with the lever D, having shoulders *d d'*, substantially as described.

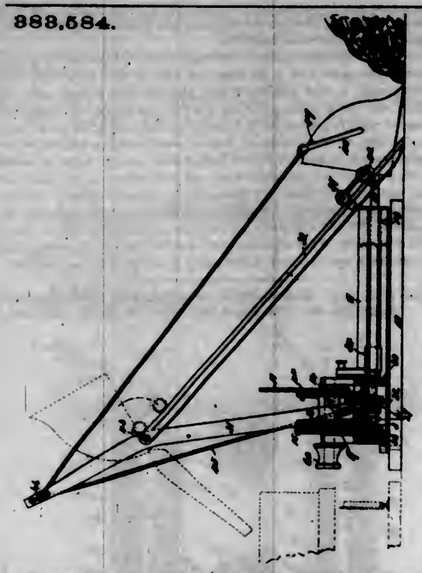
388,582. WINDOW-VENTILATOR. CHARLES B. LOSS, Louisville, Ky. Filed Nov. 16, 1887. Serial No. 255,561. (No model.)

Claim.—1. The combination, with a strip, A, having an outwardly-extended longitudinal strip or rib, B, and a strip, A^2, adapted to slide longitudinally on said strip B, of blocks D D, lying against the outer side of said strips A A^2, vertically adjustable thereon, and of fastening devices, substantially as described, for securing said blocks and said strips against movement the one upon the other, substantially as and for the purpose described.

388,582.

2. The combination, with a strip, A, having an outwardly-extended longitudinal strip or rib, B, and a strip, A^2, adapted to slide longitudinally on said strip B, said strips A A^2 having vertical slots *m* through them, of blocks D D, having screw-sockets *p*, and thumb-screws *n*, passing through said slotted strips A A^2 into said screw-socketed blocks, substantially as and for the purpose described.

388,583. ELECTRO-MAGNETIC REGISTER. JAMES F. MCLAUGHLIN, Philadelphia, Pa. Filed Mar. 19, 1887. Serial No. 231,554. (No model.)



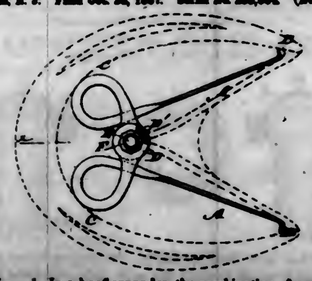
Claim.—The combination, with an electric circuit and a circuit-controller therefor, of an electro-magnet included in said circuit, an adjustably-pivoted armature pawl-lever controlled by said electro-magnet, limiting and retracting agencies for said pawl-lever, actuating and check pawls carried by said pawl-lever, a ratchet-wheel controlled by said pawls, an index-hand operated by said ratchet-wheel, a second ratchet-wheel rotated at every complete revolution made by the first-mentioned ratchet-wheel, a second index-hand controlled by said second ratchet-wheel, spring-dogs for severally retarding the rotation of the two ratchet-wheels, a bell-rod rigidly attached to said armature pawl-lever, a sounding-gong operated by said bell-rod, whereby each movement of an index-hand is announced, and the friction-clutch mounted on the central shaft, whereby the index-hands may be set at any desired point on the dial-face without disturbing the interior mechanism of the registor, substantially as described.

388,584. SEWAGE SEWERLING DEVICE. ANDREW HUTTER, Port Arthur, Ontario, Canada. Filed Sept. 28, 1887. Serial No. 250,603. (No model.)

Claim.—1. The combination of a pivoted inclined way, a hinged

388,584.

shovel mounted thereon, a hoisting apparatus connected to the shovel, and a slide connected to the lower end of the inclined way and operated from the hoisting apparatus, substantially as herein shown and described.

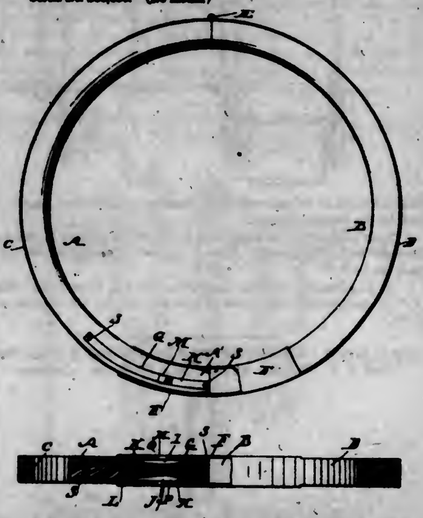


2. The combination of a pivoted inclined way, a trunk mounted thereon, a shovel hinged to the trunk, a hoisting apparatus connected to the shovel, and a sliding cross-head connected to the lower end of the inclined way, substantially as and for the purpose set forth.

3. The combination, with a bed-plate, a horizontal frame pivotally mounted thereon, and a supporting-frame pivotally connected to the horizontal frame, of an inclined way pivoted to the supporting-frame, a threaded shaft, a nut carried by the shaft, a cross-head connected to the nut and to the lower end of the inclined way, a truck mounted upon the way, a shovel connected to the truck, a drum, a cord extending from the drum to the shovel, and means for operating the said drum and shaft, substantially as herein shown and described.

4. In a hoisting apparatus, the combination, with a main shaft, of fixed gears carried thereby, a threaded shaft, two gears loosely mounted thereon, one of which is engaged by one of the gears of the main shaft, a gear interposed between the other gear of the main shaft and the other loosely-mounted gear of the threaded shaft, clutch-sections formed upon the gears of the threaded shaft, a double clutch-section mounted between said gears, and an operating-lever, substantially as described.

5. The combination, with an inclined way provided with stops in its upper and lower ends, of a truck mounted upon said way, a shovel, and a triple-leaved hinge connected to the shovel and to the truck, substantially as described.



388,585. ROOF-EXPANDER. LAWRENCE MORARAN, Jr., Morris Plains, N. J. Filed Oct. 26, 1887. Serial No. 253,094. (No model.)

Claim.—1. In a beef-expander, the combination of spring-legs A, having prongs B, and interlocking disks D D', substantially as shown and described.

2. In a beef-expander, the combination of spring-legs A, having prongs B, disks D D', having pivot-holes, a pivot-bolt, E, and a clamp-nut, F, substantially as shown and described.

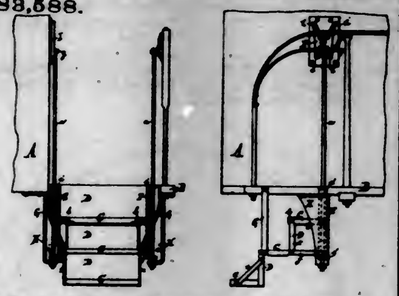
388,586. MAST-HOOP. CHARLES S. MOTT, Patchogue, assignor to himself and George H. Shaffer, Brooklyn, N. Y. Filed Mar. 3, 1888. Serial No. 265,959. (No model.)

Claim.—1. An improved mast-hoop consisting of two semicircular wooden sections and two outer metallic band-sections, the two sections being hinged together and provided at their ends, respectively, with a slotted socket and a catch for engaging the slot in said socket, substantially as herein shown and described.

2. In a mast-hoop, the combination, with two semicircular hoop-sections jointed together at their one ends, of a segmental slotted sleeve received partly on the free end of one section, the free end of the other section adapted to enter said sleeve, and having a segmental groove in its side deepened to form a recess at its middle, a flat segmental spring seated in said groove, fastened at its ends therein and free to yield inward into the said recess, and a beveled catch formed thereon on the spring and adapted to engage the slot in the sleeve, substantially as described.

3. In a mast-hoop, the combination, with two semicircular hoop-sections connected at their one ends by a joint, of a segmental oppositely-slotted socket on the free end of one section, the free end of the other section adapted to enter said socket and having segmental medially-deepened grooves in its opposite sides, flat segmental springs seated in said grooves and having medial catches, and rivets passed through the corresponding ends of both springs and through the intervening body of the hoop, substantially as described.

388,587. BELL-CORD ATTACHMENT. GEORGE W. HAYLER, Jersey City, N. J. Filed Aug. 24, 1887. Serial No. 247,736. (No model.)



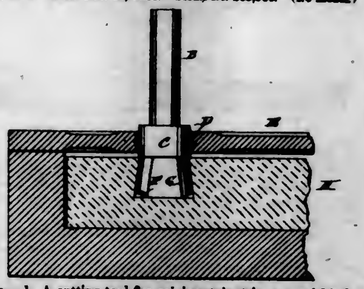
Claim.—1. The combination, with a railway-car or similar vehicle and the bell-cord, of a lever or series of levers pivoted between the windows, having lateral motion, the upper end of which lever or levers is secured to the bell-cord, the lower constituting a handle to manipulate the same, as and for the purpose herein set forth.

2. The combination, with a car or similar conveyance and the bell-rope, of a lever pivoted in a bracket attached between the windows, the lower end of which is extended downward in the direction of the seat to constitute a handle, the upper end being curved upward and inward and secured to the bell-rope, substantially in the manner and for the purpose herein set forth.

388,588. ADJUSTABLE CAR-SEAT. WILLIAM RUSSAMS, St. Louis, Mo. Filed July 11, 1887. Serial No. 244,003. (No model.)

Claim.—1. The car-steps C C C and risers D D D, when con-

383,588.



structed so as to be convertible at pleasure into steps or guards, as and for the purpose set forth.

2. In adjustable car-steps, links *c c'* and sliding bars E, in combination with sliding rods *a*, clamp I, and links *f*, as and for the purpose set forth.

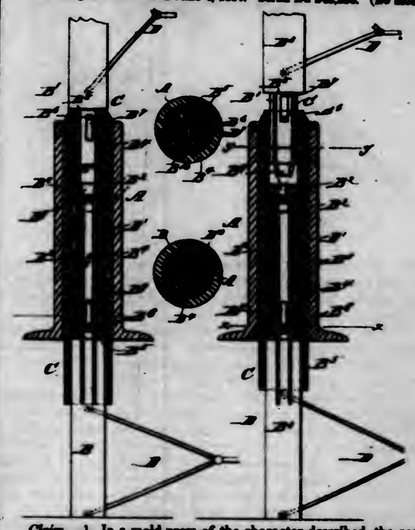
3. In adjustable car-steps, suspending-links G, links *f*, and links *c c'*, in combination with metal guards *l*, as and for the purpose set forth.

383,589. GROOVE-CUTTING TOOL. WILLIAM H. FARRY, New York, N. Y. Filed Feb. 10, 1888. Serial No. 263,586. (No model.)

Claim.—1. A cutting-tool for gaining stair-stringers and kindred purposes, consisting of a holding-shank, a cylindrical head, and groove-cutters having side cutting-edges and inclined bottom cutting-edges projecting from the outer end of the head, the head and cutters formed on a single piece of steel, substantially as described.

2. A groove-cutting tool consisting of a shank, a head, and opposite downward-diverging cutters projecting from the outer end of the head, said cutters having diagonally-opposite side cutting-edges and oppositely-inclined bottom cutting-edges, the head and cutters formed of a single piece of steel, substantially as described.

3. As an improved article of manufacture, a groove-cutting tool formed of a single piece of steel and consisting of a shank, a solid cylindrical head, and cutters in the shape of cylindrical segments projecting from diametrically-opposite points of the outer end of the head, the outer convex faces of the cutters being formed reversely eccentric, so as to form diagonally-opposite cutting side edges and other diagonally-opposite retreating side edges, and the lower ends of the cutters being beveled upward and outward and inclined oppositely lengthwise to form the bottom cutting-edges, substantially as described.



383,590. SPOKESHAVE. JAMES H. POLHEMUS and BENJAMIN F. POLHEMUS, Brooklyn, N. Y. Filed Jan. 20, 1888. Serial No. 261,577. (No model.)

Claim.—1. In a spokeshave, the combination, with the body having a recess in the upper face, a threaded rod held to turn in the body-recess, and a rectangular nut traveling upon said rod in said recess, of a blade adapted to slide upon the body above the recess, having a slot cut therein to receive the nut, an adjusting-plate held to slide upon the knife, provided with guide-slots and guide-screws, a cap-plate resting upon said blade, slotted to accommodate the guide-screws, and a set-screw passing through the cap-plate and blade into the body, substantially as shown and described.

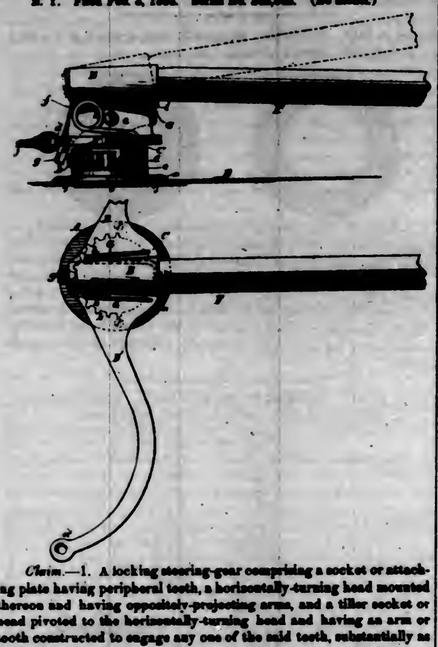
2. In a spokeshave, the combination, with the body having a recess in the upper face, a threaded rod held to turn transversely and horizontally in said body-recess and provided with a head upon the outer end, and a rectangular nut traveling upon said rod in said recess, of a blade adapted to slide upon the body above the recess, having a series of central slots cut therein, one of which is adapted to receive the nut, an adjusting-plate held to slide upon the knife, provided with a central slot, side guide-slots, and guide-screws, a cap-plate resting upon the said blade, provided with shoulders at opposite ends engaging the body, and a central slot and side slots accommodating the guide-screws, and a set-screw passing through the slot of the cap-plate, the central slot of the adjusting-plate, and through the registering slot in the knife into the body, substantially as shown and described.

383,591. TILE-MACHINE. BENJ. PORTER and ROBERT HOFFMAN, Washington, Ia. Filed June 4, 1887. Serial No. 240,269. (No model.)

Claim.—1. In a mold-press of the character described, the combination of a movable former, a valve in the pressure-head of the same, means connections allowing a limited movement only of the valve with respect to the former, and a device for withdrawing the movable former from the mold, said device connected directly to the valve and operating thereby indirectly upon the former, substantially as described.

2. In a mold-press of the character described, the combination of the outer part, B^1, of the former, provided with an opening, B^2, and the inner part, B^3, of the former, provided with a plug or valve, B^5, and air-channels B^{10}, substantially as shown and described.

3. In a mold-press of the character described, the combination of the mold-chamber A, the former B, made in two parts, B^1 and B^3, movable upon each other, and the follower C, adapted to enter the space between the chamber and the outer of said parts B^1 B^3, substantially as shown and described.

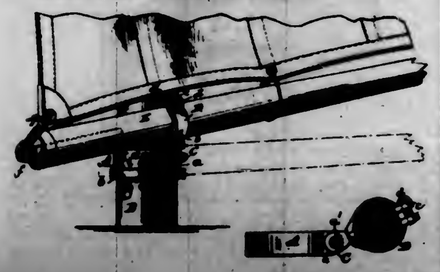


383,592. VENTILATOR. JOHN H. REYBOLD, Troy, N. Y. Filed Mar. 3, 1888. Serial No. 265,833. (No model.)

Claim.—In a ventilator-cap, the combination of two dome-like members—having substantially the same form—fixed one above the other to produce a circumferential opening between them, and the convex faces of both members being fixed uppermost, a ventilator-pipe which passes centrally through the lower dome to form a cylindrical

standing rim whose upper end is above the level of the under side of the gutter of the upper member, and a bolt which concentrically surrounds said cap opposite to said circumferential opening, as and for the purpose herein specified.

383,593. LOCKING STEERING-GEAR. JOHN H. REMPER, Canton, N. Y. Filed Feb. 3, 1888. Serial No. 263,262. (No model.)

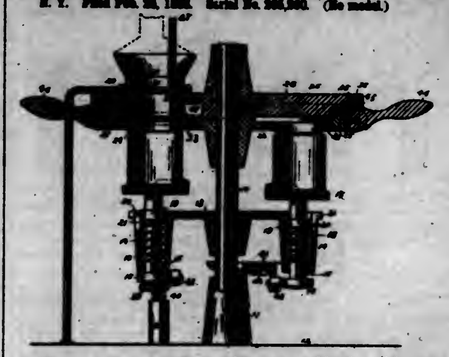


Claim.—1. A locking steering-gear comprising a socket or attaching plate having peripheral teeth, a horizontally-turning head mounted thereon and having oppositely-projecting arms, and a tiller socket or head pivoted to the horizontally-turning head and having an arm or tooth constructed to engage any one of the said teeth, substantially as set forth.

2. The combination, with the internally-screw-threaded socket or attaching plate having peripheral teeth, of a screw-threaded head turning horizontally therein and having oppositely-projecting arms, and a vertically-rocking tiller socket or head pivoted on the upper end of the horizontally-turning head and having a downwardly-extending arm engaging one of said teeth, substantially as set forth.

3. A locking steering-gear consisting of the internally-screw-threaded socket A, having the peripheral teeth *b*, the screw-threaded head C, turning horizontally in the socket A and formed with ears *c c* on its upper side and horizontally-projecting arms D D', the tiller-socket E, having a flange on its under side pivoted between ears *c c*, and having a downwardly-projecting arm, *d*, engaging a tooth, *b*, and the double spring G, bearing on the head C and on the socket E, substantially as set forth.

4. The combination, with a head having a vertically-swinging tiller pivoted to its upper side and having a locking-arm at its pivotal end, and a socket upon which the said head turns horizontally, provided with teeth engaged by said locking-arm, whereby the tiller may be locked in any desired position, substantially as set forth.



383,594. BOOK-FASTENING. JOHN H. REMPER, Canton, N. Y. Filed Feb. 3, 1888. Serial No. 263,264. (No model.)

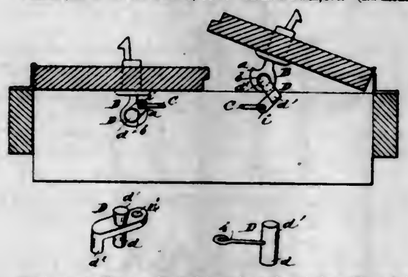
Claim.—1. A beam-fastening formed of the ring A, provided with the apertured ears *a*, the clamp D, provided with the eye C and adapted to receive the beam B, and the spring-key *d'*, passing through said ears and eye and forming the pivot of said eye and clamp, substantially as described.

2. The combination, with the mast B and beam E, of the collars *b*, embracing the mast, the ring A, provided with apertured ears *a* and received on the mast B between the collars *b*, the clamp D, adapted to receive and clamp the beam E and provided with the eye C, pivoted between the ears *a* and upon the spring-key *d'*, and the spike F, inserted in the end of the beam and provided with a rounded apertured head, *f*, substantially as herein shown and described.

383,595. CAN-FILLING MACHINE. CONRAD SIEBEL, Brooklyn, N. Y. Filed Feb. 28, 1888. Serial No. 265,960. (No model.)

Claim.—1. In a can-filling machine, the combination, with a central spindle and a fixed top, of a lower disk secured to said spindle, provided with a series of spring-actuated can-carrying tables, an upper disk apertured in alignment with the tables, having downwardly-projecting collars surrounding said apertures, a delivery-chute attached to the top, registering with the consecutive apertures in the upper disk, and means for gradually elevating the tables, as and for the purpose specified.

2. In a can-filling machine, the combination, with a central spindle and a fixed top, of a lower disk secured to said spindle, provided with a series of can-carrying tables having spring-actuated rods projecting downward from said tables, an upper disk apertured in alignment with the tables and having downwardly-projecting collars surrounding said apertures, a delivery-chute attached to the top and registering with the consecutive aperture in the upper disk, and means for gradually elevating the tables, as and for the purpose specified.

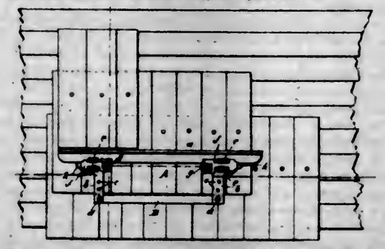


3. In a can-filling machine, the combination, with a central spindle and a fixed top provided with a feed-aperture and a chute surrounding said aperture, of a lower disk secured to said spindle, provided with a series of can-carrying tables having spring-actuated rods projecting downward from said tables, an upper disk also secured to the spindle and apertured in alignment with the tables, and also having downwardly-projecting collars, the said apertures adapted to consecutively register with the feed-aperture, and means for gradually elevating the tables and vibrating the same, substantially as shown and described.

4. In a can-filling machine, the combination, with a central spindle and a fixed top provided with a feed-aperture, a chute leading into said aperture, and a spring-actuated packing-ring below the same, of an apertured lower disk secured to said spindle, flanged can-carrying tables secured to spring-actuated rods, an upper disk also secured to the spindle, apertured in alignment with the tables, and having downwardly-projecting collars adapted to consecutively register with the feed-apertures, means for gradually elevating the tables, and means for gradually lowering and vibrating the same, substantially as shown and described.

5. In a can-filling machine, the combination, with a central spindle and a fixed top provided with a feed-aperture, a chute leading into said aperture, and a spring-actuated packing-ring below the same, of a lower disk secured to said spindle, vertically-reciprocating spring-actuated rods held in said disk and provided with flanged can-carrying tables secured to the upper end of said rods, said rods having a button and a friction-roller secured to their lower ends, an upper disk also secured to the spindle, apertured in alignment with the table, and having downwardly-projecting collars, and oppositely-arranged tracks, one plain and the other corrugated, adapted to be respectively engaged by the buttons and rollers to elevate and vibrate the tables, substantially as and for the purpose specified.

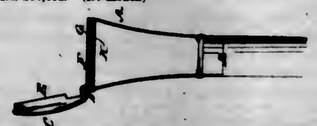
6. In a can-filling machine, the combination, with a central spindle and a fixed top provided with a feed-aperture, a chute leading into said aperture, and a spring-actuated packing-ring below the same, of a lower disk secured to said spindle, vertically-reciprocating spring-actuated rods held in said disk and provided with flanged can-carrying tables secured to the upper ends of said rods, a button and a friction-roller secured to their lower ends, an upper disk also secured to the spindle, apertured in alignment with the table, having downwardly-projecting collars, and oppositely-arranged tracks, one plain and the other corrugated, adapted to be respectively engaged by the buttons and rollers to elevate and vibrate the tables, the plain track being pivoted at one end and upheld by a spring at the other, substantially as and for the purpose specified.



383,596. WINDOW-BLIND FASTENER. WILLIAM SEBRONIS, Yonkers, N. Y. Filed June 26, 1887. Serial No. 242,476. (No model.)

Claim.—1. The staple C, driven into the window-sill, and the fastening device D, placed loosely thereon and formed with a projection, *d*, in combination with the fastener B, formed with the eye *b* and hook *a* to engage with the staple C, substantially as described.

2. As a new article of manufacture, the fastening device D for blinds, formed with the projections *d d'*, to enter the eye of the hook B, the former for locking the hook in engagement with the staple, the latter for holding the blind partially open, substantially as described.



383,597. SHINGLING-GAGE. MCQUIER SLAFF, La Cinta, N. Mex. Filed Dec. 29, 1887. Serial No. 259,207. (No model.)

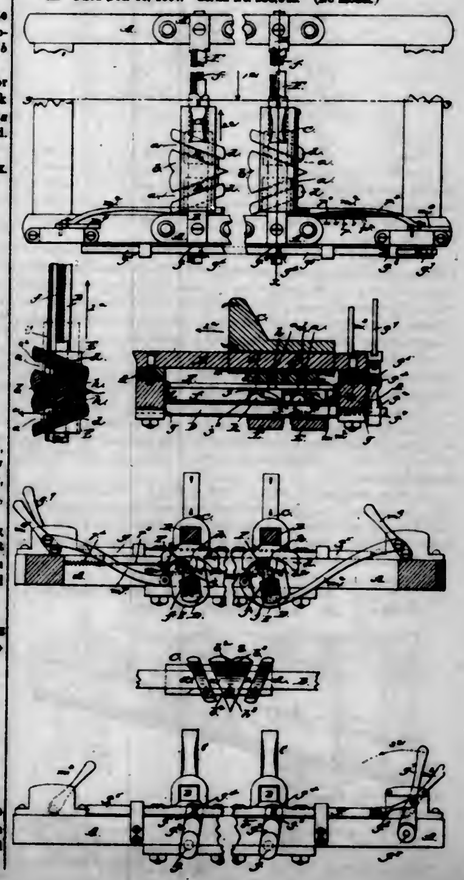
Claim.—1. In a shingling-gage, the combination, with the bar *a*, provided with arms *b*, of the bar B, arranged to abut against the row of shingles, the levers *f*, adapted to receive the blows of a hammer, and the pointed pins *g*, pivoted in and projecting above the levers, substantially as described.

2. In a shingling-gage, the combination of the body A, consisting of the angled bar *a*, provided with the apertured arms *b*, projecting at right angles therefrom, the levers *f*, pivoted in ears projecting from the said arms *b*, and the pins *g*, pivoted in the levers *f* and adapted to be driven into the shingles, substantially as described.

383,598. UTENSIL-HEAD FOR CANES, &c. MORITZ STERNBERG and ADOLPH MILLER, Sebastopol Park, N. Y. Filed Mar. 19, 1888. Serial No. 267,632. (No model.)

Claim.—1. The herein-described utensil-head for canes and the like, consisting of a box for matches, an outside lid for the same, an inner cover, and a match-igniter outside the inner cover, all combined and arranged substantially as and for the purpose specified.

2. In a utensil-head for canes and the like, the combination of a hollow body adapted to be attached to a cane-stick or the like, and to form a box for matches, and an inner cover, and an outside lid hinged at a common point to the box, the inner cover arranged to hold a mirror or photograph on its inner face and a match-igniter on its outer face, and the outside lid adapted to receive and hold the inner cover, substantially as described.



383,599. COVERING. WILLIAM M. SUHR, Brooklyn, N. Y. Filed Sept. 2, 1887. Serial No. 248,567. (No model.)

Claim.—1. The improved non-conducting covering consisting of parallel layers or covers of asbestus paper and linings of wire-netting and an interposed filling of asbestus fiber, all as shown and described.

2. As a new article of manufacture, a non-conducting covering consisting of outer and inner covers formed of asbestus paper, a filling of asbestus fiber inclosed by the said covers, and a piece of pliable stiffening material, which is arranged in the midst of said filling intermediate of the covers, as shown and described, for the purpose specified.

383,600. HEAD-BLOCK FOR SAW-MILLS. IRWIN SWANK, Paris, Ill. Filed Dec. 16, 1887. Serial No. 258,048. (No model.)

Claim.—1. In a head-block for saw-mills, the combination, with the cross-bar B and the knee C, adapted to slide thereon, provided with angularly-arranged grooves *a a*, of a rocker-bar having a rack, blocks E E, adapted to slide on said bar, provided with projections engaging said grooves and pawls adapted to engage said rack, and means for oscillating said rocker-bar, substantially as and for the purpose described.

2. The combination, with a suitably-guided part provided with angularly-arranged grooves *a a*, of a suitably-journaled rocker-bar having a rack and provided with a crank-arm, a lever and connection between said crank-arm and lever, and blocks adapted to slide on said rocker-bar, provided with projections engaging said grooves and having pawls, substantially as and for the purpose described.

3. The combination, with a suitably-guided part provided with angularly-arranged grooves *a a*, of a rocker-bar having a rack, blocks adapted to slide thereon, provided with projections engaging said grooves, and having pawls pivoted thereto and adapted to engage said rack-teeth, a tilting bar journaled on said rocker-shaft and bearing on said pawls, and means for securing an oscillation of said bar, substantially as and for the purpose described.

4. The combination, with a head-block knee provided with angularly-arranged grooves *a a*, of a suitably-journaled rocker-bar, D, having a rack and provided with crank-arm g^1, a bar, F, journaled on said rocker-shaft, provided with crank-arm *m*, blocks E E, adapted to slide on said rocker-bar, provided with projections A, engaging said grooves and having pawls *j j*, pivoted levers g^2 and m^2, and connections between said levers and said crank-arms g^1 and *m*, respectively, all substantially as and for the purpose described.

5. The combination, with a head-block knee provided with angularly-arranged cam-grooves *a a*, of a rocker-bar having a rack, the bar F, journaled thereon, the blocks E E, adapted to slide on said bar and provided with projections A, engaging said grooves, double-acted pawls pivoted in said blocks, and means for oscillating said bar F, substantially as and for the purpose described.

6. The combination, with a head-block knee provided with the triangular-shaped block *b*, having a slot, b^2, and set-screw, and the angularly-arranged strips *d d*, of a rocker-bar having a rack, blocks E E, adapted to slide on said bar, provided with projections engaging said grooves, pawls adapted to engage said rack, and means for oscillating said rocker-bar, substantially as and for the purpose described.

7. In a head-block for a saw-mill, the combination, with the cross-bar B and the knee C, adapted to slide thereon, provided with angularly-arranged grooves *a a*, of a rocker-bar having a rack, blocks E E, adapted to slide on said bar, provided with projections engaging said grooves and pawls adapted to engage said rack, and means for oscillating said rocker-bar, substantially as and for the purpose described.

8. In combination, two head-blocks, each comprising the cross-bar B, the knee C, adapted to slide on said bar B, provided with angularly-arranged grooves *a a*, the racked rocker-bar D, blocks E E, adapted to slide on said bar D, provided with projections engaging said grooves and having pawls adapted to engage said rack-teeth, a connection between the rocker-bars, and a means for securing its reciprocation, substantially as and for the purpose described.

9. In combination, two head-blocks, each comprising the cross-bar B, the knee C, adapted to slide thereon, provided with angularly-arranged grooves *a a*, the racked rocker-bars D, provided with the tilting bar F, journaled thereon, blocks E E, adapted for a slide thereon, provided with projections engaging said grooves and having pawls adapted to engage said rack-teeth, and a connection between said rocker-bars and a means for securing its vibration, and a means for securing a tilt of said bar E, substantially as and for the purpose described.

383,601. DASH-BOARD. BENJAMIN F. THOMAS, Delaware, Ohio. Filed Sept. 12, 1887. Serial No. 249,692. (No model.)

Claim.—1. A dash-board formed entirely of wood pulp and having an integral molding along the sides and across the top of one of its surfaces, its other surface being plain, for the purposes set forth.

2. A dash-board formed entirely of wood pulp, one of its surfaces being plain and its other surface having a molded depression or rabbet across the bottom, and provided with an integral molding along the sides and across the top, for the purposes set forth.

Claim.—1. The combination, with a suitably-guided part provided with angularly-arranged grooves *a a*, of a rocker-bar having a rack, blocks adapted to slide thereon, provided with projections engaging said grooves and having pawls adapted to engage said rack, and a means for oscillating said racked bar, substantially as and for the purpose described.

2. The combination, with a suitably-guided part provided with angularly-arranged grooves *a a*, of a suitably-journaled rocker-bar having a rack and provided with a crank-arm, a lever and connection between said crank-arm and lever, and blocks adapted to slide on said rocker-bar, provided with projections engaging said grooves and having pawls, substantially as and for the purpose described.

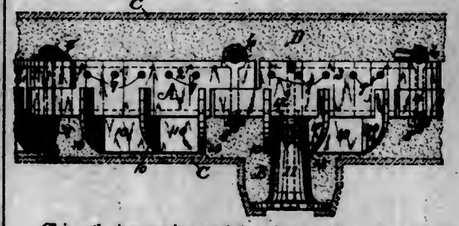
3. The combination, with a suitably-guided part provided with angularly-arranged grooves *a a*, of a rocker-bar having a rack, blocks adapted to slide thereon, provided with projections engaging said grooves, and having pawls pivoted thereto and adapted to engage said rack-teeth, a tilting bar journaled on said rocker-shaft and bearing on said pawls, and means for securing an oscillation of said bar, substantially as and for the purpose described.

4. The combination, with a head-block knee provided with angularly-arranged grooves *a a*, of a suitably-journaled rocker-bar, D, having a rack and provided with crank-arm g^1, a bar, F, journaled on said rocker-shaft, provided with crank-arm *m*, blocks E E, adapted to slide on said rocker-bar, provided with projections A, engaging said grooves and having pawls *j j*, pivoted levers g^2 and m^2, and connections between said levers and said crank-arms g^1 and *m*, respectively, all substantially as and for the purpose described.

5. The combination, with a head-block knee provided with angularly-arranged cam-grooves *a a*, of a rocker-bar having a rack, the bar F, journaled thereon, the blocks E E, adapted to slide on said bar and provided with projections A, engaging said grooves, double-acted pawls pivoted in said blocks, and means for oscillating said bar F, substantially as and for the purpose described.

6. The combination, with a head-block knee provided with the triangular-shaped block *b*, having a slot, b^2, and set-screw, and the angularly-arranged strips *d d*, of a rocker-bar having a rack, blocks E E, adapted to slide on said bar, provided with projections engaging said grooves, pawls adapted to engage said rack, and means for oscillating said rocker-bar, substantially as and for the purpose described.

7. In a head-block for a saw-mill, the combination, with the cross-bar B and the knee C, adapted to slide thereon, provided with angularly-arranged grooves *a a*, of a rocker-bar having a rack, blocks E E, adapted to slide on said bar, provided with projections engaging said grooves and pawls adapted to engage said rack, and means for oscillating said rocker-bar, substantially as and for the purpose described.



8. In combination, two head-blocks, each comprising the cross-bar B, the knee C, adapted to slide on said bar B, provided with angularly-arranged grooves *a a*, the racked rocker-bar D, blocks E E, adapted to slide on said bar D, provided with projections engaging said grooves and having pawls adapted to engage said rack-teeth, a connection between the rocker-bars, and a means for securing its reciprocation, substantially as and for the purpose described.

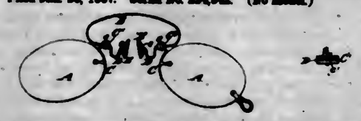
9. In combination, two head-blocks, each comprising the cross-bar B, the knee C, adapted to slide thereon, provided with angularly-arranged grooves *a a*, the racked rocker-bars D, provided with the tilting bar F, journaled thereon, blocks E E, adapted for a slide thereon, provided with projections engaging said grooves and having pawls adapted to engage said rack-teeth, and a connection between said rocker-bars and a means for securing its vibration, and a means for securing a tilt of said bar E, substantially as and for the purpose described.

383,602. CARBON CONDUCTOR FOR ELECTRIC LAMPS. HANS JOACHIM VON MIERBACH, New York, N. Y. Filed Dec. 6, 1887. Serial No. 257,196. (No specimens.)

Claim.—A carbon for galvanic batteries, composed of one part of coke, one part of anthracite coal, one part of gas-house carbon, and one-sixth silicate, molded together, as herein set forth.

383,603. CORE-ARBOR FOR HOLLOW CASTINGS. WARREN R. WARNER and FRANK A. ALDEN, Syracuse, N. Y., assignors to the J. P. Pease Furnace Company, same place. Filed Nov. 3, 1887. Serial No. 254,155. (No model.)

Claim.—1. A core-arbor consisting of removably-connected hollow sections provided at their meeting ends with an overlapping part adapted to come in horizontal meeting contact with an adjacent overlapping part, and with a suitable space left between the adjacent upper and lower vertical faces of the meeting sections to permit of longitudinal expansion under heat, substantially as described.



2. In a core-arbor, in combination, two or more rectangular hollow sections provided at their meeting ends with an overlapping part that comes in horizontal meeting contact with an adjacent overlapping part, and provided with an open space between their adjacent upper and lower vertical faces, and a key-bolt provided with a wedge inserted through the eye of its head, passing through perforations formed in the overlapping parts of the aforesaid meeting ends, said connections being adapted to secure the sections together unyieldingly vertically, and yet allow for their longitudinal expansion under heat, substantially as described.

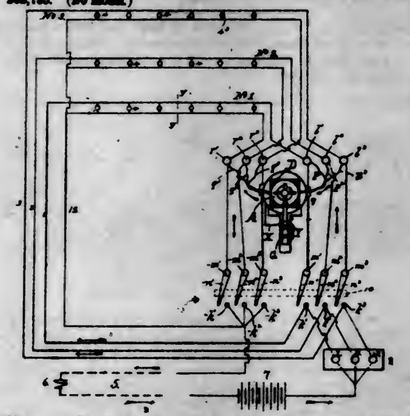
3. A hollow core-arbor section of rectangular form in cross-section, with perforations in its shell, and constructed with an upper horizontally-projecting portion provided with an oblong aperture at one end and a lower horizontally-projecting portion provided with a circular aperture at its opposite end, and provided with a central longitudinal rib and transverse intercepting ribs upon its lower exterior surface, in combination, substantially as described.

4. A core-arbor consisting of sections bolted together and mounted upon and connected to a supporting-standard by a ball-joint, substantially as described.

5. A core-arbor mounted upon and connected to a supporting-standard by a ball-joint, substantially as described.

383,604. HYDROMETER. WALTER S. WELLS, New York, N. Y. Filed Jan. 30, 1887. Serial No. 234,942. (No model.)

Claim.—1. The combination, with the glasses or lenses A, the posts or brackets C, and the bow-spring B, of arms D, of ductile metal, each pivoted at one end, at *c*, to a post to swing in a substantially-horizontal plane, and each carrying at its free end a nose-pad, as E, and constituting the sole support of said pad, substantially as herein described.



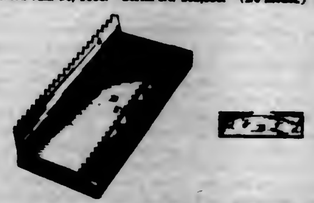
2. The combination, in eyeglasses or spectacles, of nose-pads or nose-pieces each consisting of an open ring arranged to bear with its face or flat portion upon the nose, and arms supporting the nose-pads at their outer ends and forming the sole supports for the pads, and at their inner ends secured to the posts, whereby the bow-spring is connected with the glasses or lenses by substantially-vertical pivots, so as to swing in a substantially-horizontal plane, as herein described.

3. The combination, in eyeglasses or spectacles, of nose-pads and arms each pivoted at one end to swing in a substantially-horizontal plane transverse to the plane of the glasses or lenses, and at its outer or free end supporting a nose-pad of which it forms the sole support, substantially as herein described.

4. The combination, in eyeglasses or spectacles, of a bow-spring, beam or other suitable joints receiving the ends of the spring, and nose-pads or nose-pieces each supported by an arm pivoted within a box or joint, the said beams or joints being provided with cam-surfaces which

hold said arms in substantially the same plane with the glasses, and which provide for swinging the arms into planes oblique to the glasses, substantially as herein described.

383,605. APPARATUS FOR TESTING ELECTRIC CIRCUITS. ALBERT D. WHEELER, Hyde Park, Mass. Filed Feb. 2, 1888. Serial No. 262,786. (No model.)



Claim.—1. In combination with a series of duplex open circuits, a series of simultaneously-moving switches which control said circuits at a designated point, and the lever connecting said switches with a circuit-testing apparatus and operating both the switches and testing apparatus, a circuit-testing apparatus, as described, having a rotary disk carrying closers, the fixed circuit-terminals, and a series of secondary wires which unite said testing apparatus with the main circuits, whereby movement of the switches serves to open the circuits and release the circuit-testing apparatus, said circuits being successively short-circuited therethrough, for purposes herein set forth and specified.

2. The combination, with a series of duplex open circuits, a series of switches, their operating-lever, the current-generator 7, annunciator 8, and the co-operating fire-alarm system 5, of a circuit-testing apparatus actively set in motion by the switch-lever and composed of a rotary disk, its actuating mechanism, the recording-dial and circuit-closers, which wipe successively the insulated terminals of said duplex open circuits, the electro-magnet common to the latter, and a vibrating marker or movable stylus actuated at each successive test, one of said circuit-closers operating with all the terminals a' a^2 of one set, and the other circuit-closer operating with all the terminals b' b^2 of the other set in the several circuits upon simultaneous movement of a series of switches, n' n^2 and $-n'$ $-n^2$, to open the main circuits as herein specified.

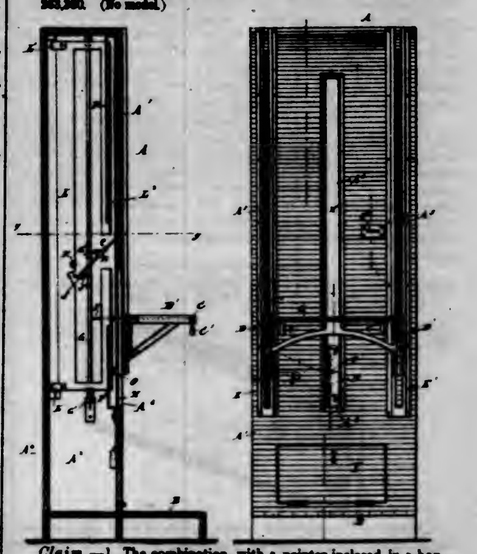
3. The combination, in an electric duplex system having a pair of switches, n' $-n'$ and the lever E, interconnecting with a circuit-testing apparatus and simultaneously operating said switches and testing apparatus, of a circuit-testing apparatus, 9, substantially as described, and the secondary wires p' q', which short-circuit the current on movement of said switches to open every circuit at a designated point, and the marker F, common to each system, actuated intermittently by such movement and at each successive test of the individual circuits when intact, for purposes herein set forth and described.

383,606. CONFECTIONERY-BOX. WILLIAM J. WHITE, Cleveland, Ohio. Filed Jan. 30, 1888. Serial No. 262,295. (No model.)

Claim.—1. In confectionery-boxing, an outside box having a lid hinged at its side, in combination with an inside box provided with lids having ornamental covering, each of said lids extending inward toward the center of the box about one-third the width of the box, substantially as set forth.

2. A confectionery-box having stiff lids hinged on its sides and provided with lace or ornamental covering, each of said lids extending inward toward the center of the box about one-third the width thereof, substantially as set forth.

383,607. HILLSIDE-CULTIVATOR. EDGAR C. WILEY, Independence, Va. Filed Mar. 1, 1888. Serial No. 265,791. (No model.)



Claim.—1. In a hillside plow or cultivator, the combination, with a central beam, of side beams having a pivotal and sliding connection with the central beam at their forward ends, a bar pivoted at its center to the rear end of the central beam and having its ends connected to the side beams, and means for locking the said bar in position, substantially as described.

2. In a hillside-cultivator, the combination, with a central beam provided with rods on opposite sides near its forward end, of sliding blocks on said rods, side beams pivoted to said sliding blocks, a bar pivoted at its center to the rear end of the central beam and having its ends connected to the side beams, and means for locking the said bar in position, substantially as described.

3. In a hillside-cultivator, the combination, with a central beam and side beams having a pivotal and sliding connection with the central beam at their forward ends, of a bar pivoted at its center to the rear end of the central beam, plates pivoted to the ends of the bar and provided with slots, through which pass the side beams, and means for locking the said bar at different angles to the said central beam, substantially as herein shown and described.

4. In a hillside-cultivator, the combination, with a central beam and side beams having a pivotal and sliding connection at their forward ends with the central beam, of the bar E, having a central loop, e, and bifurcated ends e', and pivoted to the rear end of the central beam, the plates F, pivoted between the bifurcations of the bar E and provided with slots, through which pass the side beams, and the hook D, adjustably pivoted to the central beam and engaging the bar E, substantially as herein shown and described.

383,608. COIN-CONTROLLED WEIGHT-MEASURING MACHINE. CHARLES B. WILLIAMS, Newark, N. Y. Filed Feb. 8, 1888. Serial No. 263,260. (No model.)

Claim.—1. The combination, with a pointer inclosed in a box, brackets held to slide on the outside of the box and supporting the said pointer, and a graduated scale on which said pointer indicates, of a plate adapted to swing in front of the said pointer and scale, substantially as shown and described.

2. The combination, with a pointer adapted to slide vertically and a graduated scale on which the said pointer indicates, of a plate adapted to swing in front of the said pointer, and a lever connected with the said plate and operated by a coin, so that the introduction of the proper coin imparts a swinging motion to the said lever, whereby the said plate swings away from the said pointer and scale, substantially as shown and described.

3. The combination, with a box and a fixed platform on the front of the said box, of brackets held to slide on the front of the said box, a pointer supported by the said brackets on the inside of the box, a graduated scale secured in the said box behind the said pointer, the graduation on the said scale counting from the top of the said platform, and a hinged plate or flange adapted to swing in front of the said pointer on the inside of the box, substantially as shown and described.

4. The combination, with a box and a fixed platform on the front of the said box, of brackets held to slide on the front of the said box, a pointer supported by the said brackets on the inside of the box, a graduated scale secured in the said box behind the said pointer, the graduation of the said scale counting from the top of the said platform, a hinged plate or flange adapted to swing in front of the said pointer on the inside of the box, and a mechanism for operating the said plate by the introduction of a coin into the said box, substantially as shown and described.

5. The combination, with a box and a fixed platform on the front of the said box, of brackets held to slide on the front of the said box, a pointer supported by the said brackets on the inside of the box, a graduated scale secured in the said box behind the said pointer, a hinged plate or flange adapted to swing in front of the said pointer on the inside of the said box, a lever connected with the said plate or flange, and a chute secured to the front of the said box and discharging on the said lever, so that the introduction of the proper coin into the said chute operates the said lever and causes said plate or flange to swing away from the front of the said pointer, substantially as shown and described.

6. The combination, with a box and a fixed platform on the front of the said box, of brackets held to slide on the front of the said box, a pointer supported by the said brackets on the inside of the said box, a graduated scale secured in the said box behind the said pointer, a plate or flange adapted to swing in front of the said pointer on the inside of the said box, a lever connected with the said plate or flange, and a spring for locking the said lever in position, substantially as shown and described.

7. The combination, with a box and a fixed platform on the front of the said box, of brackets held to slide on the front of the said box, a pointer supported on the said brackets on the inside of the said box, a graduated scale secured in the said box behind the said pointer, a hinged plate or flange adapted to swing in front of the said pointer, a lever operated by a coin and connected with the said plate or flange, a bolt for locking the said lever in position, and an arm carrying the said bolt and operated on from the outside of the said box, substantially as shown and described.

8. The combination, with a chute, of a retaining-plate held to slide in the said chute, an arm carrying the said retaining-plate and secured to a vertical hinged bar, and a rod abutting against the said bar and having a sliding movement, so as to impart a swinging movement to the said bar and its arm, substantially as shown and described.

9. The combination, with a chute, of a retaining-plate held to slide in the said chute, an arm carrying the said retaining-plate and secured to a vertical hinged bar, a rod abutting against the said bar and having a sliding movement, so as to impart a swinging movement to the said bar and its arm, and a spring acting on the said arm for imparting a return motion to the said bar and its arm, substantially as shown and described.

10. The combination, with a vertical hinged bar provided with an arm carrying a retaining-plate and a locking-bolt, of a rod abutting against the said bar, an eccentric-pin operating against the said rod, and a rod mounted to turn and carrying the said eccentric-pin, substantially as shown and described.

11. The combination, with a vertical hinged bar provided with an arm carrying a retaining-plate and a locking-bolt, of a rod abutting against the said bar, an eccentric-pin operating against the said rod, a rod mounted to turn and carrying the said eccentric-pin, and handles held on the said last-named rod for turning it in its bearings, substantially as shown and described.

12. In a coin-operated measuring-machine, a chute provided in its lower part with a top plate, two side flanges, each having an inwardly-extending rib, and an end flange having an opening for the passage of improper coins, substantially as shown and described.

13. In a coin-operated measuring-machine, the combination, with a money-pan held at the end of a lever, of a money-chute discharging at its lower end at one side on the said pan, said chute being provided at its lower end with a flange having an opening for discharging the proper coins on the said pan, and having a second opening for carrying the improper coins over the said pan, substantially as shown and described.

383,609. CONCENTRIC-PISTON STEAM-ENGINE. ASHER D. BAKER and FRANKLIN P. HOYT, Swanton, assignors of one-third to Albert B. Roberts, Norwalk, Ohio. Filed Dec. 1, 1887. Serial No. 256,602. (No model.)

Claim.—1. In an engine, a cylindrical ring-valve mounted in the cylinder-head and having ports cut through it and adapted to move by steam-pressure endwise on its seat, substantially as set forth.

2. In an engine, a cylindrical ring-valve mounted in the cylinder-head and having ports cut through it in line with each other endwise and adapted to slide upon a seat by pressure of steam on its ends, substantially as set forth.

3. In an engine, a cylindrical ring-valve mounted in the cylinder-

head and having a series of oblong ports cut through it in a line with its edges and near its center of length, the valve being adapted to move endwise on its seat by direct steam-pressure on each end alternately, substantially as set forth.

4. In an engine, a cylindrical ring-valve mounted in the cylinder-head and having a series of elongated slots made through it at intervals, the slots being located near the center of length of the valve to serve as ports, the valve being adapted to reciprocate periodically endwise on its seat by direct steam-pressure, substantially as set forth.

5. In an engine, a valve having its body of a cylindrical form, ports cut through the body in line with each other and parallel to the ends of the valve, and cavities made in the body that are intersected by holes formed transversely of the body inwardly from each end, substantially as set forth.

6. In an engine, the combination, with a main valve of cylindrical form and a cylindrical head that is a valve-chest, ports in the valve, and ports and steam-passages in the head with which the cylinder-valve ports may register, of exhaust and live steam ports in the head made to register with an auxiliary ring-valve, and an auxiliary ring-valve adapted to be rotatively moved to admit and discharge the steam which slides the main valve endwise and cushions it at each end, substantially as set forth.

7. In an engine, an auxiliary ring-valve rotated by the piston-hub and controlling steam which operates a main cylindrical valve to reciprocate it periodically, substantially as set forth.

8. In an engine, the combination, with a cylindrical main valve, a cylinder-head that is a valve-seat, live-steam and exhaust ports in the face of the head that are continued as passages in the head and made to register with ports in the valve, and elongated ports in the main valve that are in line with the ends of the valve and cut through the valve near its center of length, of a shaft, a piston-hub mounted on this shaft, and an auxiliary ring-valve that is moved by the piston-hub to control steam which reciprocates the main valve, substantially as set forth.

9. In an engine, the combination, with a cylindrical main valve, a cylinder, pistons affixed to the cylinder, a cylinder-head with exhaust and live steam passages in it, and another cylinder-head with exhaust and live steam passages in it and adapted to receive a cylindrical valve, of a cylindrical ring-valve having ports in it to register with exhaust and live steam passages in the cylinder-head, a center shaft, a hub with radial pistons on it that lie alternately opposite the cylinder-pistons, and a means of controlling steam to reciprocate the cylindrical ring-valve which regulates the rotary movement of the cylinder and hub pistons, substantially as set forth.

10. In an engine, the combination, with a hub and pistons integral with this hub, of an auxiliary ring-valve doweled to the hub at one end and seated in the recessed end of the hub, substantially as set forth.

11. In an engine, an auxiliary valve having a live-steam port cut through its body endwise and a channel cut in its face diametrically opposite the live-steam ports to join a live-steam passage, and an exhaust-passage with which the groove is made to register, substantially as set forth.

12. In an engine, the combination, with a cylinder-head, which is also a valve-chest and has live-steam and exhaust passages and ports formed in it, of an auxiliary valve, a hub, pistons on the hub, a cylinder, pistons on the cylinder, and exhaust-passages made endwise through these pistons, substantially as set forth.

13. In an engine, a cylinder having pistons or abutments projecting radially toward its diametrical center, which pistons are perforated throughout the length of their bodies, substantially as set forth.

14. In an engine, a clutch-hub attached to a projecting sleeve and its hub, which has radial pistons projecting from its peripheral surface, substantially as set forth.

15. In an engine, the combination, with a piston-hub, pistons that are formed radially at opposite points on this hub, and an integral sleeve that extends from one side of the piston-hub, of a clutch-hub that is provided with radial arms or flanges and a hard cylindrical rim secured to or integral with the radial arms, substantially as set forth.

16. In an engine, the combination, with a piston-hub, pistons formed or affixed to this hub, and a sleeve projecting from one side of the piston-hub, of a clutch-hub provided with arms and a cylindrical rim, a clutch-disk; a series of wedge-shaped inclines on the inner surface of this disk, and a series of bracket and spring-actuated rollers that are adapted to lock the clutch-hub and clutch-disk together, substantially as set forth.

17. In an engine, the combination, with a clutch-hub of a stationary disk and locking devices carried by the clutch-disk, of a stationary clutch shell or case and locking devices secured to the stationary clutch-case to lock the clutch-hub, substantially as set forth.

18. In an engine, the combination, with a stationary clutch shell or case, of a clutch-hub, a center shaft, and two clutch-disks attached to the shaft to rotate with it, substantially as set forth.

19. In an engine, the combination, with a stationary clutch case or shell, a cylinder, a clutch-hub, and a series of locking devices secured to the stationary clutch-case to lock it to the clutch-hub and cylinder, of a central shaft, two clutch-disks attached by their hubs to the shaft, and a series of locking devices attached to these clutch-disks that are adapted to lock to the clutch-hub and cylinder oppositely to the locking devices secured to the stationary case, substantially as set forth.

20. In an engine, the combination, with a base-plate, bracket-stands, and boxes to support a shaft, of a shaft, a stationary clutch-case, and two clutch-disks secured to the shaft, substantially as set forth.

21. In an engine, the combination, with a stationary clutch-case, a base-plate, two bracket-stands furnished with boxes, and a shaft supported to rotate in these boxes, of two series of locking-rollers secured in place on the inner surface of the stationary clutch-case near each end of the case, substantially as set forth.

22. In an engine, the combination, with a base-plate, bracket-arms projecting from the base-plate to give revolvable support to a shaft, and a shaft, of a stationary clutch-case secured to the base-plate, and two sets of self-adjusting locking-rollers, and an equal number of wedge-shaped inclines adapted to engage the rollers, the rollers and inclines being located near the ends of the stationary clutch-case in a manner to lock in the same direction, substantially as set forth.

23. In an engine, a stationary clutch-case having live-steam and exhaust passages formed in it near its center of length and breadth, substantially as set forth.

24. In an engine, the combination, with a stationary clutch-case and live-steam and exhaust conduits formed in it near its center, of two sets of locking-rollers and two sets of inclines, all secured to the stationary clutch-case to lock on a clutch-hub and cylinder in the same direction, substantially as set forth.

25. In an engine, the combination, with a stationary clutch-case, a base-plate, a shaft revolubly supported upon the base-plate, to be nearly central with the stationary clutch-case considered diametrically, and clutch-disks secured by their hubs to this shaft, of a cylinder, pistons on this cylinder, a hub with radial pistons projecting from it to engage the inner surface of the cylinder, the piston-hub and cylinder being concentric with each other and the shaft on which they are loosely mounted, a clutch-hub, and locking-rollers secured to the inner surfaces of the clutch-disks and stationary clutch-case to lock upon the clutch-disks and cylinder, substantially as set forth.

26. In an engine, the combination, with a stationary clutch-case, a cylinder, a clutch-hub, and spring-actuated rollers and inclines that are adapted to lock upon the surface of the clutch-hub and cylinder in one direction, of two clutch-disks, a center shaft supported to rotate with the clutch-disks and secured to them, and a set of self-adjusting spring-actuated rollers and inclines that are secured to the clutch-disks on their inner surfaces opposite the peripheries of the cylinder and clutch-hub, so as to lock upon them in a direction opposite to the locking action of the rollers mounted on the stationary clutch-case, substantially as set forth.

27. In an engine, a ring-shaped cut-off valve adapted to control the flow of steam through the cylindrical main valve of a concentric-piston engine, substantially as set forth.

28. In an engine, a ring-shaped cut-off valve having steam-ports cut through it and adapted to cut off steam from the cylindrical main slide-valve of a concentric-piston engine, substantially as set forth.

29. In an engine, a ring-shaped cut-off valve having live-steam ports cut through it and adapted to slide on a guide-bar, so as to throw it into or out of service as a cut-off, substantially as set forth.

30. In a steam-engine, the combination, with a cylinder-head having steam-ports in it and a main cylindrical slide-valve, of a ring-shaped cut-off valve that is adapted to cut off steam from the main cylindrical slide-valve of a concentric-piston engine, substantially as set forth.

31. In an engine, the combination, with a cylinder-head having steam ports and passages in it, a main cylindrical ring-valve that slides in a channel formed in the cylinder-head, and an auxiliary valve that controls the reciprocal movement of the main slide-valve, of a ring-shaped cut-off valve adapted to cut off steam from the main cylindrical slide-valve of a concentric-piston engine, substantially as set forth.

32. In an engine, the combination, with a cylinder, a cylinder-head having steam passages and ports formed in it, and an annular channel to receive a cylindrical ring main slide-valve, a cylindrical ring-valve having ports cut through it to register with the steam-passages in the cylinder-head, and an auxiliary annular valve that controls the influx and discharge of steam to actuate the main slide-valve reciprocally, of a ring-shaped cut-off valve adapted to cut off steam from the main slide-valve at any point in the revolution of the cylinder and hub pistons of a concentric-piston engine, substantially as set forth.

33. In an engine, the combination, with a cylinder of a cylinder-head having an annular live-steam passage through it adapted to mate a similar passage in a hub-piston, an annular exhaust-channel which communicates with longitudinal exhaust-passages in pistons of the cylinder, and two diametrically-opposite pistons formed upon or secured to the inner surface of the cylinder, substantially as set forth.

34. In an engine, the combination, with a cylinder, of a cylinder-head that has a cylindrical slide-valve located in it, a cylindrical slide-valve, and steam and exhaust passages in the head and valve, and another cylinder-head secured to the opposite end of the cylinder and provided with live-steam and exhaust passages in it, substantially as set forth.

35. In an engine, the combination, with a stationary clutch-case, of a revolving cylinder and integral live-steam and exhaust conduits formed in the clutch-case to register with an attached head of the cylinder, substantially as set forth.

36. In an engine, the combination, with a stationary clutch-case, a base-plate, and a shaft revolubly supported on the base-plate, of integral live-steam and exhaust passages formed in the stationary clutch-case, a cylinder supported to revolve in the clutch-case, a hub-piston concentrically located in the cylinder, a cylinder-head adapted to hold a cylindrical slide-valve and convey steam to and through it previous to its admission into the cylinder, and another cylinder-head furnished with a live-steam passage that is made to connect with the integral live-steam passage in the stationary clutch-case, and an exhaust-channel that communicates with the exhaust-conduit made in the clutch-case, substantially as set forth.

37. In an engine, a hub-piston having an annular live-steam passage formed in it from one end to the other, substantially as set forth.

38. In an engine, a hub-piston having two opposite pistons, each piston provided with self-adjusting packing-strips, the hub also having an annular channel for live steam formed lengthwise of its body from end to end, substantially as set forth.

39. In an engine, the combination, with a stationary clutch-case, of a series of double inclines so disposed as to lock a series of spring-actuated rollers upon a cylinder and clutch-hub from motion either forward or backward, substantially as set forth.

40. In an engine, the combination, with a stationary clutch-case and clutch-disks that revolve with a shaft, of a cylinder, a clutch-hub, and a series of spring-actuated locking-rollers adapted to lock the clutch-case and clutch-disks fast to the cylinder and clutch-hub and cause a rotary motion of the shaft in either a forward or backward direction, as may be desired, substantially as set forth.

41. In an engine, the combination, with a stationary clutch-case, two clutch-disks, and double-inclined planes formed on the inner surfaces of the clutch case and disks, of a cylinder, a clutch-hub, and a series of spring-actuated locking-rollers supported on rings to permit the rollers to be moved and engage either set of inclines, substantially as set forth.

42. In an engine, the combination, with a clutch-disk, a stationary clutch-shell, a cylinder, and a clutch-hub, of a series of locking devices adapted to lock the working parts and run the engine-shaft in a forward or rearward direction, substantially as set forth.

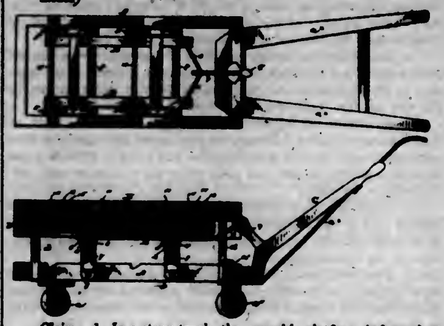
43. In an engine, a series of spring-actuated rollers adapted to lock the stationary clutch-shell and rotary clutch-disks of a concentric-piston engine upon the cylinder and clutch-hub in a manner to allow the motion of the engine to be reversed, substantially as set forth.

44. In an engine, a cylindrical main ring-valve that is moved by steam and controlled by an auxiliary valve, substantially as set forth.

45. In an engine, an auxiliary valve to control a main cylindrical valve, said auxiliary valve having one steam-passage through it and an exhaust-channel formed on its face, substantially as set forth.

46. The combination, with a cut-off valve, of a pusher-rod, two rings connected by parallel rods, and a lever to slide the cut-off valve, substantially as set forth.

47. The combination, with a cut-off valve having a ring-shaped body and two steam-ports cut through it, and a guide-rod attached to this valve, said rod engaging a rotary piston-hub to transmit rotary motion to the cut-off valve and allow the cut-off valve to slide longitudinally, of a lever mechanism to move the cut-off valve endwise off of its seat and secure it in such a position at will, substantially as set forth.



48. In an engine, the combination, with a stationary clutch shell or case, a clutch-hub, a shaft held to revolve upon bracket-stands, and a base-plate that supports and is attached to the stationary clutch-case and bracket-stands, of a cylinder, a hub-piston, radial pistons fixed upon the cylinder and hub-pistons to be alternately opposite each other, a cylindrical main slide-valve located in one of the cylinder-heads, an auxiliary ring-shaped valve that controls steam employed to operate the main valve, and a cut-off valve of annular form adapted to cut off steam from the main valve to work the engine by expansion of steam at any predetermined point in the stroke of the concentric pistons, substantially as set forth.

49. The combination, with a cylinder having inwardly-projecting wings or abutments and a hub having outwardly-projecting wings or abutments, of clutching devices for alternately locking the cylinder and hub to a shaft.

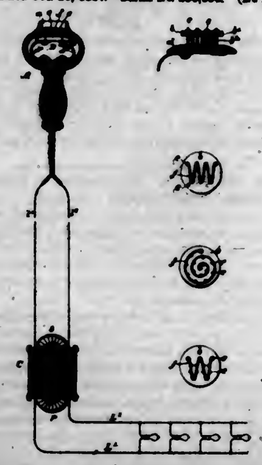
50. The combination, with a hub and a concentric cylinder surrounding same, the hub having outwardly-projecting wings or abutments, the outer edges of which rest in close contact with the inner face of the cylinder, and a cylinder having inwardly-projecting wings or abutments resting in close contact with the outer face of the hub, of clutching devices for alternately locking the cylinder and hub to a shaft.

51. An engine having piston-wings attached to the hub and to the cylinder, which alternately form abutments and moving pistons, which pistons make a stroke forward, then form abutments, and the former abutments become moving pistons, which make strokes forward successively and changing their position from a fixed point indefinitely.

383,610. STOVE-TRUCK. JOSEPH H. BELL and ALPHEUS L. GRIMES, Hamden, N. C. Filed Dec. 6, 1887. Serial No. 257,182. (No model.)

Claim.—1. In a stove-truck, the movable platform independent of the truck frame or body and capable of being raised and lowered, as shown and described.

2. As an improvement in trucks of the class herein described, the platform having adjustable boards, substantially as shown and described.



3. As an improvement in trucks of the class herein described, the platform having the adjustable boards and the telescoping rods, substantially as shown and described.

4. The combination, with the truck frame or body, of the pivoted U-shaped frames carrying rollers, the movable platform, and the lever, substantially as shown and described.

5. The combination, with the truck-frame or body, of the elevating-frame, the rods or axles carried thereby, the rollers, the pivoted U-shaped frames, and the platform, substantially as shown and described.

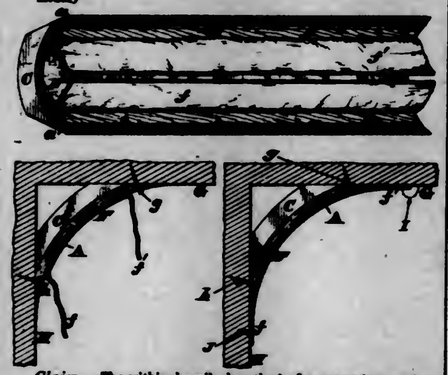
6. The combination, with the truck frame or body and the frame carrying the rods or axles, of the pivoted U-shaped frames carrying rollers, the platform having grooves or recesses, and the operating-lever, substantially as shown and described.

383,611. ELECTRIC CHAR-LIGHTER. REGINALD BELFIELD, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Oct. 20, 1887. Serial No. 253,093. (No model.)

Claim.—1. An electric cigar-lighter consisting of an electric converter, an incandescing electric conductor, a moving support for the same, a contact upon the support constituting one terminal of the secondary circuit of the converter, and a contact-point constituting the other terminal, against which the first contact is placed by pressure against the support.

2. An electric cigar-lighter consisting of an incandescing conductor and a circuit-closer for closing the connections through the conductor by pressure upon the same, consisting of a contact-point connected through the conductor and moving therewith, and a second contact connected with the other terminal of the conductor through a suitable source of electric currents, and against which the first contact may be placed.

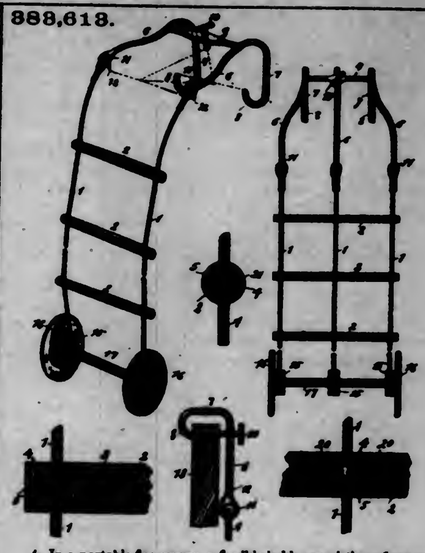
3. The combination, with the incandescing wire and the pins, with the base supporting the same, of the bed of asbestus beneath the wire, the yielding support for the pins, and a circuit-closer operated by pressure upon the wire and the pins, substantially as described.



4. An electric cigar-lighter consisting of a section of wire adapted to be heated by the passage of electric currents, a circuit-closer operated by the pressure of the cigar against the wire, and a support for the wire and the circuit-closer, substantially as described.

5. An electric cigar-lighter consisting of a handle or support, an incandescing conductor, a non-conducting support, pins extending from said support and carrying said conductor, and a bed of refractory material surrounding the pins and upon which the conductor rests, substantially as described.

6. An electric cigar-lighter consisting of the holder A, the incandescing wire *f*, the supporting-pins *e*, carrying the wire, the bed *b*, upon which the wire rests, and the conductors l^2 l^3, for supplying currents to the incandescing wire.



7. The combination, with the incandescing wire of an electric cigar-lighter, of supporting-pins therefor projecting beyond the plane of the wire and designed to enter the end of the cigar, substantially as described.

383,612. METHOD OF CONSTRUCTING CORNICES. HENRY BRETLING, Cincinnati, Ohio. Filed Feb. 13, 1888. Serial No. 263,701. (No model.)

Claim.—The within-described method of constructing cornices, which method consists in attaching ribs or stiffeners to the rear of a backing, to the front of which latter a relatively-wider flexible facing is cemented, which facing has free edges or flaps, then securing the cornice in place, and finally cementing said flaps to the wall, ceiling, and uncovered portions of said backing, thereby concealing the fastenings and joints, substantially as herein described, and for the purpose stated.

383,613. FIRE-ESCAPE. WILLIAM ROSE, St. Petersburg, Russia. Filed Apr. 2, 1888. Serial No. 269,291. (No model.)

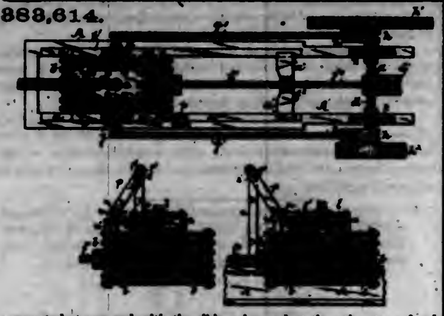
Claim.—1. A portable fire-escape consisting of an attachable frame to engage a window-sill or other support, a flexible ladder having one end attached thereto, and a frame to which the other end of the ladder is secured and upon which it is adapted to be wound, formed of a rod having rollers, and disks at its ends of greater diameter than the rollers, substantially as described.

2. In a portable fire-escape, a frame upon which a flexible ladder may be wound, consisting of a rod having rollers, and disks at its ends of greater diameter than the rollers, substantially as described.

3. In a portable fire-escape, a flexible ladder consisting of ropes and hollow rounds, the ropes being secured to the rounds by passing through them, and having a projection within the round, the projection and rope within the round being embedded in solder, substantially as described.

4. In a portable fire-escape, a flexible ladder consisting of ropes 1 and hollow rounds 2, through which the ropes 1 pass adjacent to their outer ends, the ends of the rounds 2 having a plug, 3, inserted therein, and the cavity formed thereby filled with solder inclosing the rope 1, and a pin, 4, projecting through it, substantially as shown and described.

5. In a portable fire-escape, the joint for securing hollow rounds to flexible ropes, consisting of a hollow round, 2, a rope, 1, passing through the round, an opening, 21, in the side of the round, a plug, 20, in round 2, on either side of the opening 21, a pin, 4, projecting through the rope 1, and solder, 5, inclosing the pin 4 and rope 1 within the round, substantially as shown and described.

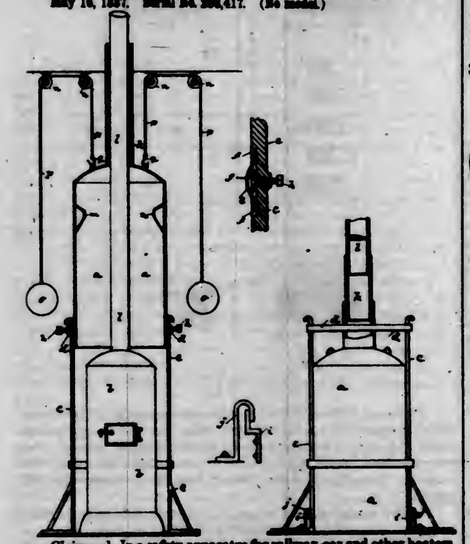


6. In a portable fire-escape, an attachable frame to engage a window-sill or other support, consisting of rods formed with the vertical portions 6, having eyes 11, with spurs 12, and connected by cross-bar 9, having clamping-screw 10, and the horizontal portions 7, with hooked ends 8, substantially as shown and described.

7. In a portable fire-escape, a flexible ladder consisting of wire ropes 1 and hollow rounds 2, the ropes passing through the rounds, and the central rope being connected to the rounds 2, having opening 21, by solder, 5, filling the round 2 between plugs 20 therein, and inclosing the rope 1, and a pin, 4, projecting through the rope 1, and the side ropes connected to the rounds 2 by solder, 5, filling a cavity formed in the end of the round by a plug, 3, and inclosing the rope 1, and a pin, 4, projecting through it, substantially as shown and described.

8. In a portable fire-escape, a frame upon which a flexible ladder may be wound, consisting of hollow rod 17, rollers 15, mounted thereon, and disks 16 on the ends of the rods 17, of greater diameter than the rollers 15, substantially as shown and described.

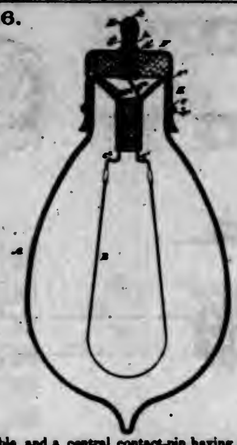
9. A portable fire-escape consisting of an attachable frame to engage a window-sill or other support, formed of rods with vertical portions 6, having eyes 11 and spurs 12, and connected by cross-bar 9, having clamping-screw 10, and horizontal portions 7, with hooked ends 8, in combination with a flexible ladder formed of wire ropes 1, connected to eyes 11, and hollow metallic rounds 2, through which the ropes pass at their center and adjacent to their ends, and fastened thereto at the center of the rounds by a pin, 4, projecting through the rope and embedded in solder, 5, filling the round between plugs 20 and opposite an opening, 21, in the round, and at the ends of the rounds by a pin, 4, projecting through rope 1 and embedded in solder, 5, filling the cavity in the end of the round formed by an inserted plug, 3, and a frame on which the flexible ladder is to be wound, consisting of a hollow rod, 17, having rollers 15 mounted thereon, to which the ropes 1 are fastened, and disks 16 at the ends of rod 17, of greater diameter than the rollers 15, substantially as shown and described.



383,614. STEAM-ENGINE. DAVID SCOTT, Shenango, Pa. Filed July 1, 1887. Serial No. 243,102. (No model.)

Claim.—1. In steam-engines, the combination of an engine-bed, the cylinder sliding longitudinally thereon, the steam-chest and the slide-valve mounted thereon, and lever-connections between the slide-valve and engine-bed, said lever being fulcrumed on the cylinder and connected at one end with the slide-valve and at the other to a fixed pivot, substantially as and for the purpose set forth.

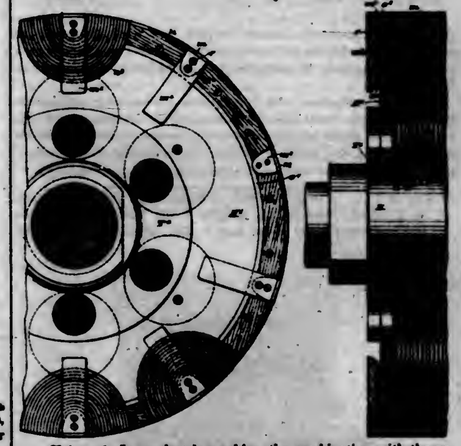
2. In steam-engines, the combination of the engine-bed, the cylinder sliding longitudinally thereon and having a steam-chest, a slide-valve within the steam-chest, the shaft *n*, carrying the lever *m*, lever *p*, and standard *r*, substantially as and for the purpose set forth.



383,615. SHIELD OR COVER FOR HEATERS AND STOVES FOR USE ON RAILWAY-CARS. GEORGE A. BROWN, Pittsburg, Pa. Filed May 16, 1887. Serial No. 238,417. (No model.)

Claim.—1. In a safety apparatus for railway-car and other heaters, the combination of the vertically-movable shield *a*, friction devices for holding the said shield suspended, the vertical standards *c*, the braces, *n*, fixed to the interior of the shield, the hooks *i*, and spring-catches for holding the shield over the heater after the shield falls, substantially as specified.

2. The combination of a heater, a shield to cover the same, the vertical standards *c*, friction-holders for sustaining the shield elevated, the braces *n*, the holding-down devices *i j*, and the pulleys and loaded cords for elevating the shield, all substantially as specified.



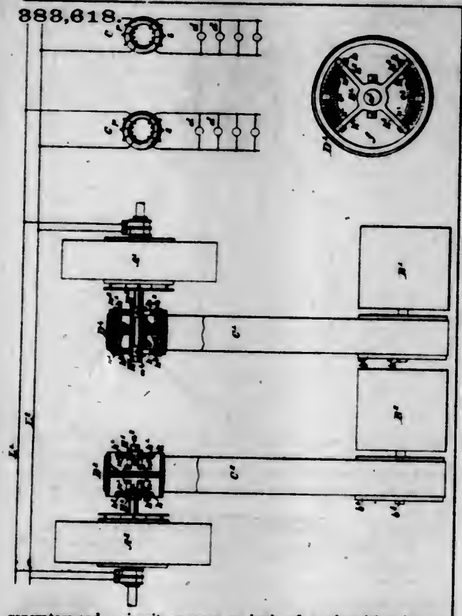
383,616. INCANDESCENT LAMP. HENRY M. BYLLESBY and PHILIP LANGE, Pittsburg, Pa., assignors to the Westinghouse Electric Company, same place. Filed Sept. 1, 1887. Serial No. 248,468. (No model.)

Claim.—1. The combination, with the globe of an incandescent electric lamp, of a metallic thimble cemented thereto, a glass block span or otherwise fastened into the end of the thimble, a central contact-pin having a neck extending through the center of the glass block and expanded upon its inner surface, and having a shoulder resting upon the outer surface of the block, and having a perforation through its length, and the leading-in wire passing through said perforation and soldered at the outer end of the pin.

2. The combination, with a thimble for incandescent-electric-lamp bulbs, of a non-conducting bottom block, span or otherwise fastened into the thimble, and a central contact-pin having a neck extending through the center of the block and expanded upon its inner surface, and having a shoulder resting upon the outer surface of the block, and having a perforation through its length for receiving the leading-in wire.

383,617. ARMATURE FOR DYNAMOS AND MOTORS. HENRY M. BYLLESBY, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Sept. 1, 1887. Serial No. 248,474. (No model.)

Claim.—1. In an electric machine, the combination, with the armature-core and wires wound upon the face thereof and down upon the ends, of overhanging clips of glass beneath which the wires upon the ends of the armature pass.

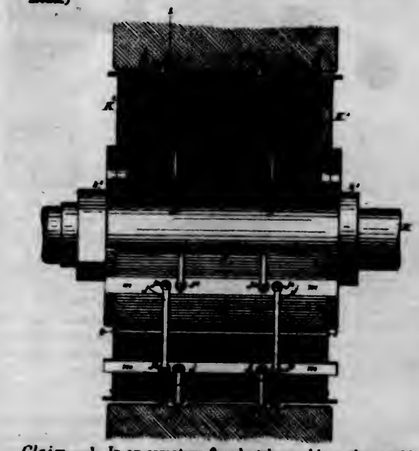


2. In an electric machine, the combination, with the armature-core, and plates therefor, and rings of metal at the outer ends or corners of the core, of wires wound upon the face thereof and down upon the ends, overhanging clips of glass beneath which the wires upon the ends of the armature pass, and legs of non-frangible non-conducting material intervening between the metallic end rings of the armature-core and the overhanging clips, substantially as described.

383,618. SYNCHRONIZING DEVICE FOR ALTERNATE-CURRENT DYNAMOS. HENRY M. BYLLESBY, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Sept. 1, 1887. Serial No. 248,476. (No model.)

Claim.—1. The combination, with an electric circuit and two or more alternate-current electric generators delivering currents to said circuit, of a source of power for driving the same, and yielding connections between the source of power and said machines, respectively, substantially as described.

2. The combination, with two or more alternate-current electric

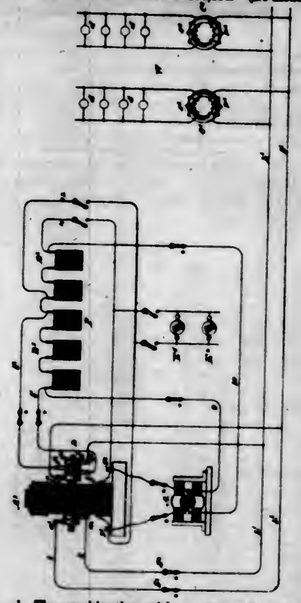


383,618.

generators and a circuit common to both, of synchronizing devices consisting of two driving-pulleys and yielding connections between said pulleys and the shafts of said generators, respectively, substantially as described.

3. The combination, with two or more alternate-current electric generators and a circuit common to both, of two pulleys respectively applied to the shafts of said generators, spring-connections between said pulleys and said shafts, and means for revolving said pulleys at an approximately constant speed, substantially as described.

383,619. ARMATURE FOR DYNAMOS AND MOTORS. HENRY M. BYLLESBY, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Sept. 1, 1887. Serial No. 248,476. (No model.)



Claim.—1. In an armature for electric machines, the combination, with the armature-coils wound upon the surface parallel with its axis, of strips or lugs extending parallel with the axes, about which the coils are arranged, and binding-strips extending between the respective longitudinal strips and holding the wire in position, substantially as described.

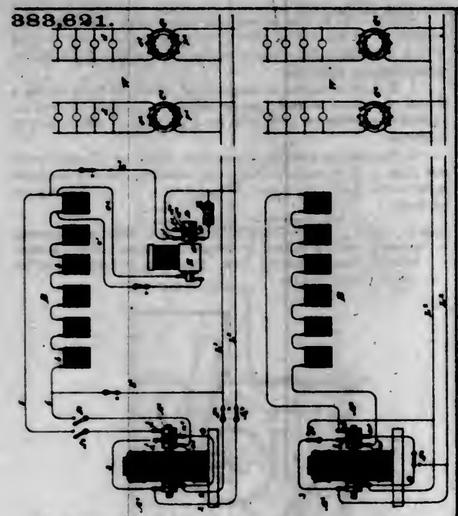
2. The combination, with the armature-coils of an electric machine and longitudinal strips about which they are wound, of transverse binding-strips secured to the respective longitudinal strips, substantially as described.

3. The combination, in an armature for electric machines built up of alternate sheets of soft iron and insulating material, of one or more heavier plates intermediate in the series and longitudinal strips or lugs secured thereto, substantially as described.

4. The combination, in an armature for electric machines built up of alternate sheets of soft iron and insulating material, of one or more heavier plates intermediate in the series, longitudinal strips or lugs secured thereto, and binding-strips secured at their respective ends to adjacent longitudinal strips.

383,620. COMBINED ALTERNATE-CURRENT AND STORAGE SYSTEM OF ELECTRICAL DISTRIBUTION. HENRY M. BYLLESBY, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Oct. 1, 1887. Serial No. 251,192. (No model.)

Claim.—1. The combination, with a system of electric conversion and distribution, of a source of alternating electric currents for supplying the same, a source of direct electric currents, a storage-battery charged from the last-named source, and a rheotome or current-controller through which the battery may be connected with said system.



2. The combination of a system of electric conversion or distribution by alternating, intermittent, or pulsatory electric currents, an alternate-current electric generator, a direct-current generator for exciting the field-magnets of the same, a storage-battery charged from the last-named generator, and a rheotome or current-reverser, through which currents are delivered from the battery to the system of distribution or conversion.

3. The combination, with a source of alternating, intermittent, or pulsatory electric currents and a direct-current exciter for the same, of a storage-battery charged by currents from said exciter, a system of secondary electric distribution operated by currents from said source, a rheotome through which a portion of said battery may be connected with said system, and means for connecting a portion of the battery through the field-magnet coils of the generator.

383,621. ALTERNATE-CURRENT AND STORAGE SYSTEM OF ELECTRICAL DISTRIBUTION. HENRY M. BYLLESBY, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Oct. 1, 1887. Serial No. 251,193. (No model.)

Claim.—1. The combination of a source of alternating electric currents, a current-rectifier connected therewith, a storage-battery supplied with currents through such rectifier, a system of electric distribution and conversion, a rheotome for transforming the currents from the storage-battery into alternating, pulsatory, or intermittent currents, and means for discharging said battery into said system through said rheotome.

383,621.

2. The combination, with a system of electric distribution operated by alternate, intermittent, or pulsatory electric currents, of a storage-battery, means for charging the same by currents from the source of supply of said system, a rheotome for rendering discontinuous the currents from the battery, means for driving the same, and connections from the rheotome with said system, substantially as described.

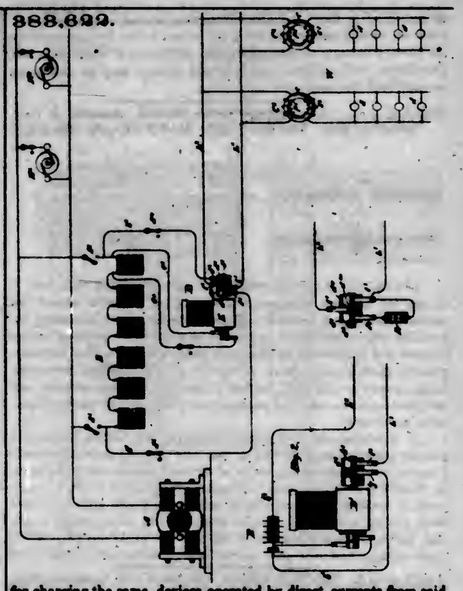
3. The combination of a source of alternate electric currents, a system of secondary distribution operated by currents therefrom, a storage-battery, a converter for changing the potential of currents derived from the said generator, and a current-rectifier connected with the converter and delivering rectified currents to the storage-battery.

4. The combination, with a source of alternating, intermittent, or pulsatory electric currents and a work-circuit supplied therefrom, of a storage-battery, a current-rectifier through which currents are delivered from said source to said battery, a system of secondary distribution operated by currents from the generator, and a rheotome for rendering pulsatory, intermittent, or alternating currents from said battery and delivering them to said system of distribution, said rheotome moving synchronously with said generator, substantially as described.

5. The combination, with a source of alternating, intermittent, or pulsatory electric currents and a work-circuit supplied therefrom, of a storage-battery, a current-rectifier through which currents are delivered from said source to said battery, a system of secondary distribution operated by currents from the generator, and means for connecting said storage-battery with the work-circuit through said rectifier.

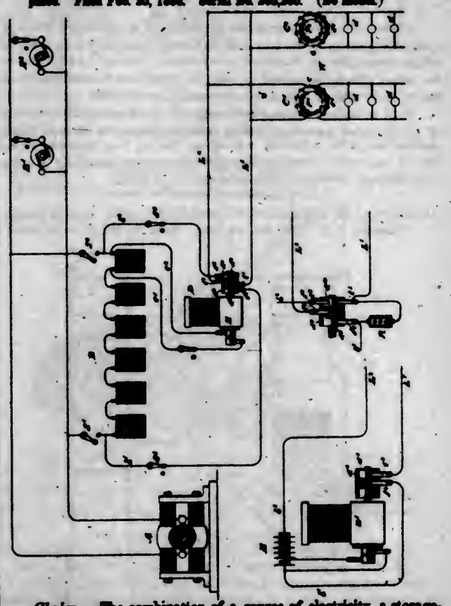
383,622. ALTERNATE-CURRENT AND STORAGE SYSTEMS OF ELECTRICAL DISTRIBUTION. HENRY M. BYLLESBY, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Oct. 1, 1887. Serial No. 251,202. (No model.)

Claim.—1. The combination of a source of electricity, a storage-battery, means for connecting the same with the source, a system of intermittent, pulsatory, or alternate-current electric distribution, and a rheotome through which the storage-battery is connected with the supply-conductors of said system.



2. The combination, with a source of electricity, of a storage-battery, means for connecting the same with the source, a system of translating devices designed to be operated by alternating current, electric converters having their secondary coils connected with such translating devices, a rheotome, and means for connecting the primary coils of such converters with said storage-battery through said rheotome.

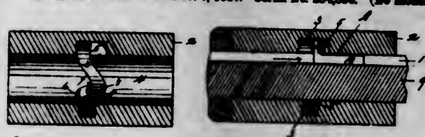
3. The combination of a source of electricity, a storage-battery, means for charging the same from said source, a rheotome for transforming direct into alternating, intermittent, or pulsatory currents, an alternate-current system of distribution and translation, and means for connecting the storage-battery with said system through said rheotome.



4. The combination, with a system of distribution and translation by secondary electric currents, of a storage-battery, a direct-current generator for supplying direct electric currents to the storage-battery for charging the same, devices operated by direct currents from said generator, a rheotome, and switches for connecting the storage-battery through the rheotome with the distributing system.

5. The combination, with a source of electricity, of a storage-battery charged from said source, a system of electric distribution requiring intermittent or pulsatory electric currents, a rheotome for transforming currents from said storage-battery into alternating, intermittent, or pulsatory currents, and an electric motor for driving the rheotome operated by currents from the storage-battery.

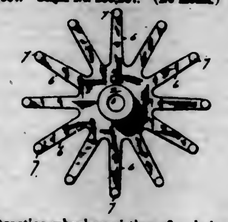
383,622.



383,623. COMBINED ALTERNATE-CURRENT AND STORAGE SYSTEM OF ELECTRICAL DISTRIBUTION. HENRY M. BYLLESBY, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Feb. 25, 1888. Serial No. 265,305. (No model.)

Claim.—The combination of a source of electricity, a storage-battery, means for charging the same from said source, a rheotome

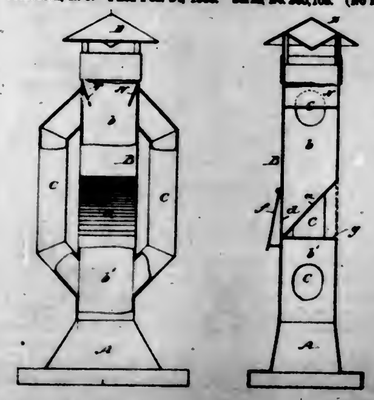
for transforming direct into alternating, intermittent, or pulsatory currents, an electric motor operating the same, driven by currents from the storage-battery, an alternating-current system of distribution and translation, and switches whereby said system may be connected through said rheotome with said source.



383,624. RATCHET-AND-PAWL DEVICE. ADELBERT B. CARR, Springfield, Mass. Filed Nov. 7, 1887. Serial No. 254,596. (No model.)

Claim.—1. A ratchet-and-pawl device consisting of a hub, 2, having the annular enlargement 3, having on one side thereof the ratchet-teeth 5, and between said teeth the recesses 8, extending beyond the base of said teeth, and on its opposite side a series of curved recesses and projections, as described, combined with a longitudinally-grooved shaft, 9, and a pawl, A, capable of a longitudinal movement in the groove in said shaft, having a tooth, 12, thereon entering said enlargement in the hub and engaging with said ratchet-teeth, substantially as set forth.

2. A ratchet-and-pawl device consisting of a hub, 2, having the annular enlargement 3, having on one side thereof the ratchet-teeth 5 and on its opposite side a series of curved recesses and projections, as described, combined with a longitudinally-grooved shaft, 9, and a pawl, A, capable of a longitudinal movement in the groove in said shaft, having a tooth, 12, thereon entering said enlargement in the hub, having its face *d* inclined, as described, whereby one edge of the tooth engages first with said ratchet-teeth, substantially as set forth.

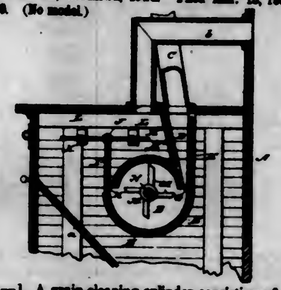


383,625. TRACTION-WHEEL. ADELBERT B. CARR, Springfield, Mass. Filed Dec. 29, 1887. Serial No. 259,267. (No model.)

Claim.—1. A traction-wheel consisting of a hub and a series of spokes or arms connected to and radiating from said hub, each of which spokes has on its extremity a tread-bar having the thickness of the end of the spoke extending laterally therefrom substantially in a line with the axis of said hub, substantially as set forth.

2. A metallic traction-wheel integrally constructed and consisting of a hub and of a series of spokes radiating therefrom, each of which spokes has on its extremity a tread-bar having the thickness of the end of the spoke extending laterally therefrom substantially in a line with the axis of said hub, substantially as set forth.

383,626. CHIMNEY COWL AND VENTILATOR. JOHN D. CARRILL, Princeton, N. J. Filed Feb. 24, 1888. Serial No. 265,103. (No model.)



Claim.—1. A cowl or ventilator formed with upper and lower sections, *b b'*, connected by pipes C, the upper section being provided with a door below the entrance of the pipes to said upper section, substantially as described.

2. A cowl or ventilator composed of a main body, B, having a sloping partition, *a*, door *d f*, upper and lower sections, *b b'*, and the pipes C, connecting the lower with the upper section, substantially as described.

3. The cowl or ventilator divided into sections *b b'*, united by the side pipes, C, in combination with the deflecting-plates N, arranged in the section *b* over the pipes C, substantially as and for the purposes set forth.

383,627. GRAIN-CLEANING CYLINDER. WILLIAM P. CLIFFORD, Ottumwa, assignor to David W. Templeton, Fairfield, and the Western Machine Works, Ottumwa, Iowa. Filed Mar. 15, 1888. Serial No. 186,969. (No model.)

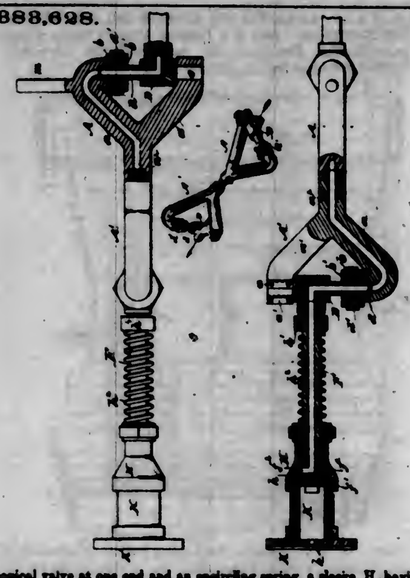
Claim.—1. A grain-cleaning cylinder consisting of an upper and lower section, the upper section being of a shorter radius than the lower one, forming longitudinal inlet and discharge openings, in combination with a beater therein, substantially as herein shown and described.

2. A grain-cleaning cylinder consisting of an upper and lower section, each formed of grooved end plates and a series of rods held in the grooves of the said plates, the upper section being of a shorter radius than the lower one, forming longitudinal inlet and outlet openings, in combination with a beater in said cylinder, substantially as herein shown and described.

3. The combination of a grain-cleaning cylinder having its upper part formed on a shorter radius than the lower part, forming longitudinal inlet and discharge openings, a hinged and weighted valve at the discharge-opening, and a beater in the said cylinder, substantially as herein shown and described.

4. The combination, with a cylinder composed of parallel iron rods secured to end plates, the upper part being of a shorter radius than the lower part, forming longitudinal inlet and discharge openings at opposite sides, and a beater in said cylinder, of a valve at the discharge-opening and adjustable weights for holding the valve closed and regulating the discharge of grain from the cylinder, substantially as herein shown and described.

5. The combination, with the cylinder E F, having the inlet and discharge openings G H, of the pivoted rod J, provided with the cross-rod K, the valve I, secured to the rod J, and the weights L, adjustably secured on the rod K, substantially as herein shown and described



383,628. STEAM-COUPLING FOR RAILROAD-CARS. JAMES I. COLLINS, Amsterdam, N. Y. Filed Sept. 7, 1887. Serial No. 249,081. (No model.)

Claim.—1. A coupling for heating or ventilating pipes of cars, consisting of two essentially Y-shaped conductors secured to one another at right angles and one of them pivotally connected to the pipes, a tubular rod pivotally connected to the other conductor, a tube provided with an apertured disk and connected to the tubular rod, and a valve in the extremity of the said tubular rod, substantially as described.

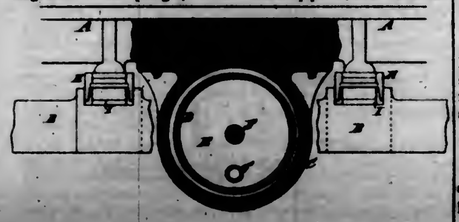
2. A coupling for heating or ventilating pipes of a car, consisting of two essentially Y-shaped conductors secured to each other at right angles and one of them pivotally connected to the pipes, a tubular rod pivoted to the other conductor and provided with a conical end having peripheral grooves, a spring-actuated sleeve having a flaring mouth, a tube connected to the sleeve, and an apertured disk on the end of the said tube, substantially as herein shown and described.

3. The combination, with a railway-car and the heating or ventilating pipes, of a coupling consisting of the essentially Y-shaped conductors A A', having one solid and one tubular member and connected at right angles to each other, an L pivoted between the members of each conductor, the inner L being adapted for connection with the said pipes, a tubular rod, F, secured to the outer L, provided with a

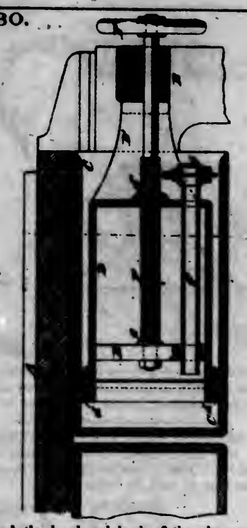
383,628.

conical valve at one end and an encircling spring, a sleeve, H, having a flaring mouth, adapted to reciprocate upon said rod over the valve and bear against said spring, a tube, K, secured to said sleeve, and an apertured disk attached to the tube, having attached peripheral fingers, substantially as and for the purpose herein set forth.

383,629. TRANSPLANTING IMPLEMENT. THOMAS R. CORY, Head River, Oreg. Filed Oct. 20, 1887. Serial No. 253,319. (No model.)



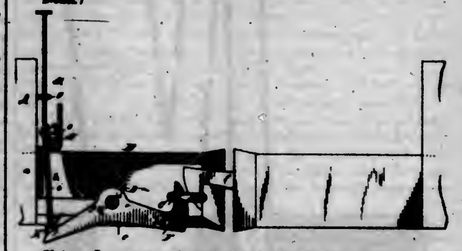
Claim.—An improved transplanter consisting of the blade D, formed of a spring-head having a sharpened lower edge, and the pivoted handles B, having their end portions secured to the end portions, *b*, of the blade, substantially as herein shown and described.



383,630. AIR SPRING OR CUSHION FOR PRINTING-MACHINES. CHARLES P. COTTRELL, Stonington, Conn., assignor to C. B. Cottrell & Sons, same place. Filed Oct. 26, 1887. Serial No. 253,055. (No model.)

Claim.—1. The combination, with the bed and frame of a printing-machine, of an air-spring mechanism for stopping the bed at the end of its movement, consisting of a cylinder and a cup-shaped plunger having its open end presented toward the cylinder, one of said two parts being secured to the bed and the other to the frame, and a head fitting the interior of the cup-shaped plunger and movable lengthwise therein to vary the air-space between the cylinder and plunger, substantially as herein described.

2. The combination, with the frame B and bed A, of the cylinder C on the bed, the cup-shaped plunger D on the frame, the head E, fitting the interior of the plunger, the screw F, for shifting the head lengthwise of the plunger, and the vacuum-pipe G', and valve ex-



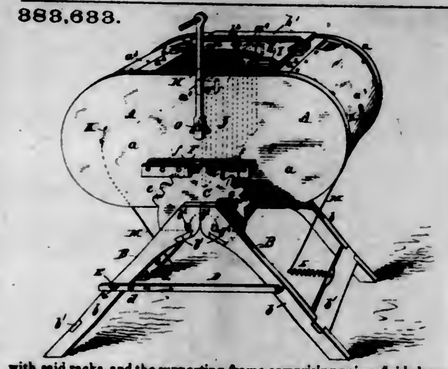
383,630.

tending through the head and back of the plunger, substantially as herein described.

383,631. CAR-COUPLING. JOHN R. CRANE, South West City, Mo. Filed Jan. 4, 1887. Renewed Nov. 26, 1887. Serial No. 256,209. (No model.)

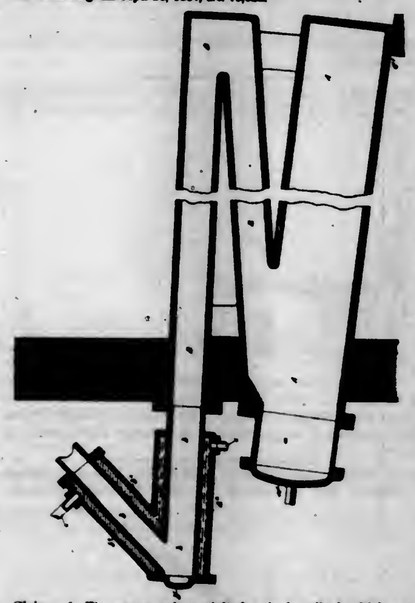
Claim.—In a car-coupling, the herein-described elements, consisting, essentially, of the vertical lever M, transverse lever N, staple O, guides *n n*, rod *i*, loop *o*, coupling-hooks F, slotted bumper B, partitions E, pin G, and coupling-links C, all arranged and operating as set forth.

383,632. LAWN-MOWER ATTACHMENT. BYRON A. CROSIER, Sandusky, Ohio. Filed July 13, 1887. Serial No. 244,151. (No model.)



Claim.—The combination, with the side pieces of the frame of a lawn-mower, of the shield E, the attaching-clips *c'*, for securing the said shield to the mower-frame, the receptacle D, constructed as set forth, the pins 1 and 2, and the wire catch F, substantially as described.

383,633. CHURN. OTHO M. DORSEY and RUTH R. DORSEY, New Garden, Ohio. Filed June 27, 1887. Serial No. 243,042. (No model.)

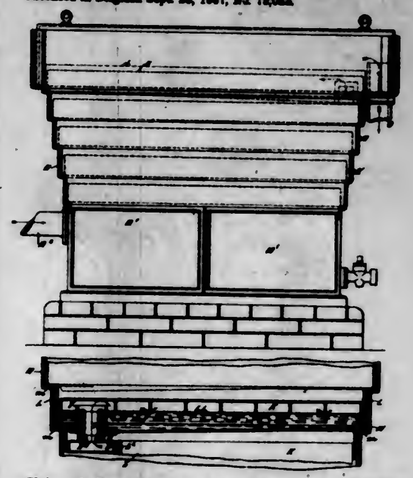


Claim.—The combination, with the churn, substantially as described, to the sides of the body of which are secured racks, of the plates or disks provided with segmentally-arranged teeth meshing

383,633.

with said racks, and the supporting-frame comprising pairs of side bars pivoted to said disks or plates and adjustably connected together, substantially as shown and described, and for the purpose set forth.

383,634. PROCESS OF MANUFACTURING ILLUMINATING-GAS FROM COAL. JOHN H. R. DUNNOSE, Liverpool, County of Lancaster, England. Filed Jan. 4, 1888. Serial No. 259,803. (No model.) Patented in Belgium Sept. 26, 1887, No. 79,022.



Claim.—1. The process substantially herein described, which consists in subjecting gas after it is distilled to contact with a chilled surface composed of a material inert in the presence of said gas, for the purpose of condensing and arresting the less permanent particles, and subsequently reheating and gasifying said particles and also reheating said gas.

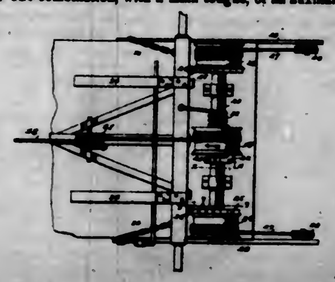
2. The process substantially herein described, which consists in subjecting gas after it is distilled to contact with a chilled surface composed of a material inert in the presence of said gas, for the purpose of condensing and arresting its less permanent particles, and then causing said particles to flow under the influence of gravity into contact with a heated surface and gasifying the same, and also causing said gas subsequently to pass in contact with a heated surface composed of a material inert in the presence of said gas.

3. The process substantially herein described, which consists in distilling coal and converting the distillation into a fixed gas by alternately cooling and heating the same and returning the condensed portions into contact with a heated surface and thereby gasifying the same.

383,635. APPARATUS FOR WASHING AND PURIFYING ILLUMINATING-GAS. JOHN H. R. DUNNOSE, Liverpool, County of Lancaster, England. Filed Jan. 4, 1888. Serial No. 259,804. (No model.) Patented in Belgium Sept. 26, 1887, No. 79,023.

Claim.—1. In an apparatus for washing gas, the combination of a vessel containing a washing-fluid and a tray of less specific gravity than said fluid, and supported on the surface thereof by its own buoyancy, said tray being provided with partitions dividing said tray into a plurality of separate and independent compartments having no communication with each other except through said washing-fluid, substantially as described.

2. In an apparatus for washing gas, the combination of a vessel containing a washing-fluid, a tray divided into a plurality of separate and independent closed compartments supported on the surface of said fluid, a vertical inlet-pipe extending up through the bottom of said vessel and through said fluid, and open at its top, substantially as described.



3. In an apparatus for washing gas, the combination of a bath of washing-fluid, a tray divided into a plurality of separate and independent closed compartments supported on the surface of said fluid, a vertical gas-inlet pipe open at its top and extending up through the bottom of said vessel and through said fluid, and a sleeve open at the bottom surrounding said inlet-pipe, substantially as described.

4. In an apparatus for washing gas, the combination of a plurality of baths of washing-fluid, set one above the other, gradually increasing in length and breadth as they ascend, each of said baths being provided with a tray divided into a plurality of separate and independent compartments supported above the surfaces of said fluid, substantially as described.

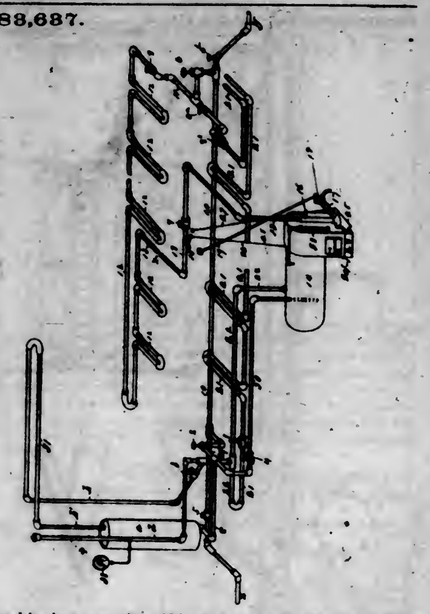
383,636. DEVICE FOR LOADING VEHICLES. WILLIAM B. DUNN, Moberly, Mo. Filed May 17, 1887. Serial No. 238,471. (No model.)

Claim.—1. In a loading device for vehicles, the combination, with the shaft and its weight-raising drums and ropes and its turning or actuating rope, of a sheave or pulley around which is passed or coiled the latter rope, and a loose drum or pulley having a pawl-and-ratchet connection with said latter shaft, and to which is also connected the said latter rope, and the slack-take-up spring applied to said loose drum or pulley and to a fixture, substantially as set forth.

2. The combination, with a main tongue, of an auxiliary extensible tongue connected thereto, a guide carried by the main tongue, a plate carried by the auxiliary tongue, said plate being grooved to receive the guide, a hook carried by the plate, a bail carried by the main tongue, a doubletree carried by the plate, a rope connected to the auxiliary tongue and leading to a drum that is loosely mounted on a drum-shaft, said drum and drum-shaft, and hoisting-ropes connected to other drums carried by the drum-shaft, the several drums being provided with ratchets, substantially as described.

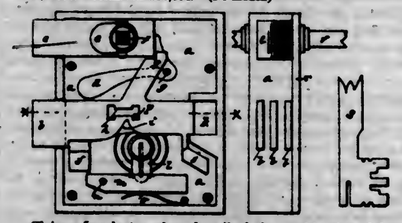
3. The combination, with an extensible tongue, substantially as described, of a drum-shaft, a drum loosely mounted thereon, a ratchet carried by the shaft, a pawl carried by the drum, a spring arranged in connection with the drum, a rope leading from the extensible tongue to the loose drum, drums fixed to the shaft, hoisting-ropes connected to the fixed drums, sheaves over which the hoisting-ropes pass, and ratchets and pawls arranged in connection with the fixed drum, substantially as described.

4. In a vehicle-loader, the combination of the following elements: a main tongue, 10, an auxiliary tongue, 11, connected thereto, a hook connected to the auxiliary tongue, a bail connected to the main tongue, a doubletree connected to the auxiliary tongue, a shaft, 20, and drum 19, mounted upon said shaft, a rope, 18, leading to said drum, a ratchet, 21, mounted upon the shaft 20, a pawl, 22, carried by the drum 19, a spring, 23, connected to the drum 19, the shaft 20, fixed drums 25 and 24, provided with ratchets 25, pawls 26, which engage said ratchets, ropes 27, connected to the drums 25 and 24, upwardly-extending bars 29, sheaves carried by said bars, over which the ropes 27 pass, braces 34, and a sheave, 31, all substantially as described.



383,637. HEATING SYSTEM FOR RAILWAY-CARS. JAMES BEMENT, Williamsett, Mass. Filed July 12, 1888. Serial No. 277,827. (No model.)

Claim.—1. The within-described improved means for warming railway-cars by steam, which consist of a main steam-pipe, 10, running through the car, a series of car-heating pipes, 12 and 21, connected with said pipe 10, combined with a steam-boiler, 14, suspended under the car, a steam-pipe, 22, connecting said boiler with said heating-pipes, one or more drip-pipes connecting said heating-pipes and boiler, connecting-pipes and stop-valves, substantially as described, for controlling the flow of steam from said boiler through said heating-pipes, and a condenser-circulation consisting of the pipe 31, connected with said heating-pipes as located outside the car and higher than said heating-pipes, and having no outlet except at its connected ends, substantially as set forth.

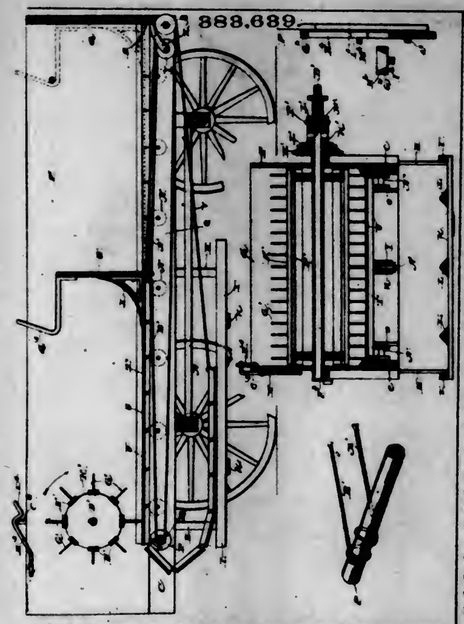


2. The within-described improved means for warming railway-cars by steam, which consist of a main steam-pipe, 10, running through the car, a series of car-heating pipes, 12 and 21, connected with said pipe 10, combined with a steam-boiler, 14, suspended under the car, a steam-pipe, 22, connecting said boiler with said heating-pipes, one or more drip-pipes connecting said heating-pipes and boiler, connecting-pipes and stop-valves, substantially as described, for controlling the flow of steam from said boiler through said heating-pipes, and a condenser-circulation consisting of the pipe 31, connected with said heating-pipes and located outside the car and higher than said heating-pipes, and having no outlet except at its connecting ends, and a water-reservoir, 0, connected with said pipe 31, substantially as set forth.

3. The combination, with a locomotive and a car, of an auxiliary boiler located on the car, a circuit of heating-pipes in communication with said boiler, and a pipe leading from the locomotive, and communicating at one end with the pipes of the circuit and at the other end with the steam and water spaces of the locomotive-boiler, substantially as described.

383,637.

383,638. LOCK. GEORGE R. M. POUND, Pittsburg, Pa. Filed Nov. 26, 1887. Serial No. 256,151. (No model.)



Claim.—In a lock such as described, the combination of the three bolts *b*, having each an opening, *h*, formed therein, the tumblers *u*, arranged between the bolts *b*, provided on their lower edge with suitable wards, *t*, with the revolving key-barrel *l*, and locking-piece *m*, actuated by a spring, *o*, the weights *j*, attached to the tumblers *u*, the extension or projection *g* of one of the bolts *b*, for locking the latch *c*, and the weight *d*, substantially as and for the purpose set forth.

383,639. MANURE-DISTRIBUTER. STEPHEN M. GARST, Greenville, Ohio. Filed July 6, 1887. Serial No. 243,502. (No model.)

Claim.—1. In a manure-spreader, the body having the sliding flexible platform forming the bottom therefor, the drum P, and the ropes A' B', both connected to the front end of the platform and wound in reverse directions on the drum P, as set forth.

2. In a manure-spreader, the body having the sliding flexible platform forming the bottom of the body, the drum P, the ropes A' B', wound in reverse directions on the drum and connected to opposite sides of the front end of the platform, and the rope V, connected at its ends to the ends of the platform and passed around a roller at an intermediate point, as set forth.

383,639.

3. In a manure-spreader, the body having the sliding flexible platform forming the bottom therefor, the drum P at the rear end of the body, over which drum the platform passes to turn the platform beneath the body, ropes connecting the drum with the platform, and a depending guide-frame below the body to receive the platform as it leaves the drum, as set forth.

4. In a manure-spreader, the body having the sliding flexible platform forming the bottom therefor, and the depending guide-frame below the body formed with the angular-shaped slots L, as set forth.

5. In a manure-spreader, the body having the sliding flexible platform forming the bottom for the body, and the hangers H, depending from the body and carrying a horizontal guide-frame, I, which is composed of an open frame-work entirely independent of and entirely below the body, as set forth.

6. In a manure-spreader, the body having the sliding flexible platform forming the bottom for the body, the guide-frame depending from the body and open at both ends, said platform passing over and resting upon the supporting-frame as it leaves the body, the rope V, connecting the ends of the platform, the drum P at the rear end of the body, over which drum the platform passes as it leaves the body, and the ropes A' B', wound in reverse directions on the drum and connected to the front end of the platform at different points, as set forth.

7. The combination of the drum P, for operating the sliding bottom, having the ratchet-wheels X', the oscillating levers A^2, having the pawls engaging the said ratchet-wheels, the oscillating lever G^2, having the vertically-movable rack-bar L^2, the rods connecting the said lever G^2 to the levers A^2, the pinion engaging the rack-bar L^2, and means for rotating the said pinion; and thereby adjusting the rack-bar, for the purpose set forth, substantially as described.

8. In combination with the body, the flexible platform forming the bottom therefor, the drum P, connecting with the platform for working the same, the revolving cylinder E, the pawl-and-ratchet mechanism for moving the drum P, the oscillating lever G^2, the vertically-movable bar L^2, carried by the bar G^2, the pitman connecting with the lever G^2, and the rods connecting the oscillating lever, to the pawl-and-ratchet mechanism of the drum, as set forth.

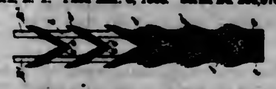
9. In a manure-distributer, the body, in combination with the flexible platform forming the bottom for the body, the rotating cylinder at one end of the body, the drum P, for operating the platform, the pawl-and-ratchet mechanism for working the drum, the oscillating lever G^2, the sliding block carried by the lever, the vertically-movable rack-bar L^2, connected to the sliding block, the pitman connecting the shaft of the rotating cylinder to the sliding block, the rods connecting the lever G^2 to the said pawl-and-ratchet mechanism, and hand operating mechanism for moving the bar L^2, and thereby adjusting the throw of the oscillating lever G^2, as set forth.

10. The combination, in a manure-distributer, of the bed or body having the sliding flexible platform constituting its bottom, said platform having the tappet-arm G^2 at its front end, the drum P, arranged at the rear end of the bed or body and on which the sliding platform is supported, the said drum being provided with the ratchet-teeth Y' and Z', extending in opposite directions, the oscillating levers A^2, having the double-ended dogs or pawls adapted to engage either of the series of ratchet-teeth on the wheels X', the spring-actuated lever A^3, adapted to reverse the dogs, and thereby impart retrograde rotation to the drum, for the purpose set forth, and the detent H^2, to normally secure the lever A^2 out of the engagement with the dogs or pawls, the said detent having the arm I^2 arranged in the path of the tappet-arm G^2, for the purpose set forth, substantially as described.

11. The combination, with the body having the depending frame, of the sliding platform forming the bottom of said body and adapted to be turned to rest on the depending frame, the drum P, for operating the sliding platform, and having the ratchet-wheels X', provided with the ratchet-teeth Y' and Z', extending in opposite directions, the oscillating levers A^2, having the double-ended pawls or dogs normally engaging the teeth Y', the sliding platform having the tappet-arm G^2 at its front end, the bell-crank lever A^3, having the cross-bar B^2, adapted to engage the dogs or pawls and trip the same, the lever C^2, connected with the bell-crank lever, the spring F^2, normally bearing forward against the said lever C^2, the spring-detent H^2, to lock the said levers B^2, and having the inclined arm I^2 arranged in the path of the tappet-arm G^2, for the purpose set forth, substantially as described.

12. In combination with the bed or body, the sliding flexible platform forming the bottom therefor, mechanism for sliding the platform in one direction, and tripping devices to cause the said mechanism to bring the platform back to its initial position, and the head-board W for the front end of the platform, as set forth.

13. In combination with the bed or body, the sliding platform therefor, the gearing for working the platform, the ratchet mechanism engaging with said gearing to determine the direction of movement of the platform, and the tripping devices to engage the ratchet mechanism when the platform reaches a certain point to change the direction of movement of the platform, as set forth.



14. In combination with the bed or body, the sliding platform forming the bottom therefor, the gearing for working the platform to and fro, the ratchet mechanism to engage the gearing to determine the direction of rotation of the same, and the consequent direction of movement of the platform, and the adjusting means to regulate the throw of the ratchet mechanism and the consequent speed of the platform, and the tripping devices to engage the ratchet mechanism when the platform reaches a certain point, as set forth.

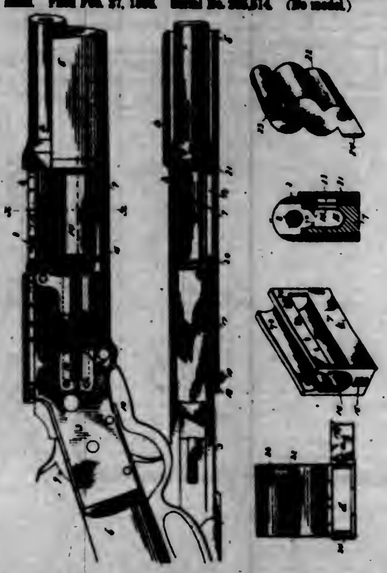
15. In a manure-spreader, the body, the sliding flexible platform forming the bottom therefor, the drum P, for operating the platform, the ratchet mechanism for working the drum, and the tripping device carried by the platform to engage the ratchet mechanism, whereby, when the platform has reached a certain point, the tripping device strikes the ratchet mechanism, when the continued movement of the machine causes the drum P to draw the platform back to its initial position.

16. In a manure-spreader, the bed or body, the sliding platform forming the bottom therefor, the drum P, the cords A' B', wound in reverse directions on the drum and connected to the platform, the ratchet mechanism for the drum, and the tappet-arm G^2, carried by the platform to operate the ratchet mechanism and change the direction of the rotation of the drum, and the consequent direction of movement of the platform, as set forth.

17. The combination, with the body having the depending frame, of the drum P, the sliding bottom adapted to pass beneath the body and be supported on the frame, ratchet-wheel X', having the teeth Y' Z' extending in opposite directions, the oscillating lever A^2, the pawl pivoted to the said lever and having the oppositely-extending arms to engage the teeth Y' Z' alternately, and the spring-detent D^2, secured to the lever A, as set forth.

383,640. STORAGE-BATTERY PLATE. CHARLES D. P. GIBBS, New York, N. Y. Filed Mar. 3, 1888. Serial No. 265,970. (No model.)

Claim.—1. A storage-battery plate consisting of two sheets of metal, each formed with openings, as described, the metal around said openings being forced outward on each side of the plate, so as to form projections, and placed together with the projections on one plate touching the projections on the other plate.



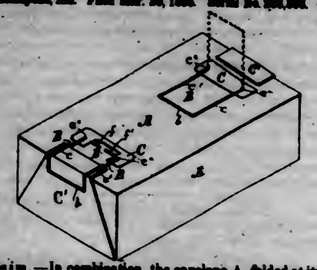
2. A storage-battery plate consisting of two sheets of metal, each having inclined perforations or openings for receiving the active material, the metal at the base of each opening in each plate being in metallic contact with the metal of the other plate.

3. A storage-battery plate consisting of two sheets of metal, each having perforations throughout its surface, projections of metal being thrown out from both sides of the plate, the projections upon the contiguous surfaces of the respective plates being in contact, and active material in said openings and in the space between the plates.

4. A storage-battery plate consisting of the two sheets B' and B^2, each having openings or perforations b, and projections thrown out in opposite directions from the general surface of the sheets, said sheets being covered together, substantially as described.

5. A storage-battery plate consisting of the two sheets B' B^2, each having openings or perforations b, and projections thrown out in opposite directions from the general surface of the sheets, said sheets being covered together, and active material contained within the openings.

383,641. MAGAZINE-GUN. SOLOMON E. HOVELEY, Springfield, Mass. Filed Feb. 27, 1888. Serial No. 265,514. (No model.)



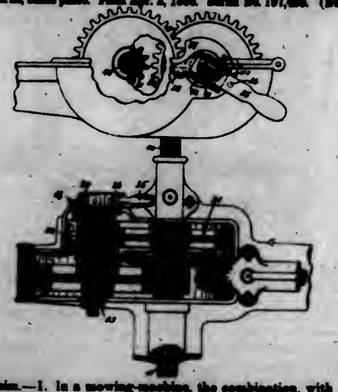
Claim.—1. In a breech-loading fire-arm, the combination, with a carrier-block having an aperture in its side of such size as to be capable of receiving a cartridge, and having a longitudinal bar over said aperture through which cartridges are introduced into the block, of the frame of the arm having through one side thereof an aperture corresponding to and registering with that in said carrier-block, said block being capable of a reciprocating movement between the sides of said frame and in the rear of and transversely to the end of the barrel, substantially as set forth.

2. The frame of a breech-loading fire-arm having an aperture through one side thereof for the introduction of cartridges, two rabbeted strips secured on the side of said frame at opposite ends of said aperture, a carrier-block capable of a reciprocating motion between the sides of said frame, in the rear of the barrel, and having an aperture in one side thereof corresponding to and registering with that in the side of said frame, there being a longitudinal bar attached to the block above said aperture, combined with a cartridge-magazine capable of attachment to the side of said frame, and of delivering cartridges therefrom through said two apertures into the carrier-block, substantially as set forth.

3. The frame of a breech-loading fire-arm having an aperture through one side thereof for the introduction of cartridges, two rabbeted strips secured on the side of said frame at opposite ends of said aperture, a carrier-block capable of a reciprocating motion between the sides of said frame in the rear of the barrel, and having an aperture in one side thereof corresponding to and registering with that in the side of said frame, said carrier-block having a lower chamber for live cartridges and an upper recess separated therefrom by longitudinal bars, combined with a cartridge-magazine capable of attachment to the side of said frame and of delivering cartridges therefrom through said two apertures into the carrier-block, and a sliding cover on said frame having one end engaging with said magazine, substantially as set forth.

383,642. FASTENING FOR ENVELOPES. WILLIAM H. HUBBARD, Indianapolis, Ind. Filed Mar. 20, 1888. Serial No. 268,082. (No model.)

Claim.—In combination, the envelope A, folded at its open end, as shown, the wire fastening B, consisting of the end bar, b, side bars, c c, and holding-bars f f', and the flexible strip C, having the openings c^3 therein, through which the ends of the wire are extended, which strip pivotally secures the fastening to the body of the envelope, as described, and the said fastening being bent so as to bear upon the front and rear faces of the envelope near the outer edges to hold the folds in close contact with the body of the envelope, all substantially as shown and set forth.

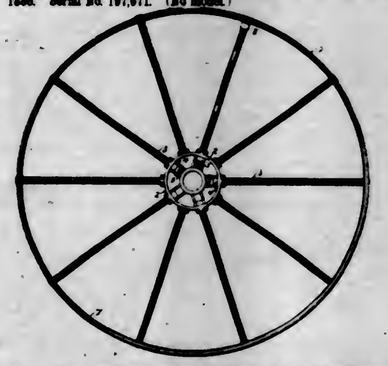


383,643. DOOR-CHECK. ALEXANDER JOHNSON, Canajoharie, N. Y., assignor of one-half to Jerome H. Keator, same place. Filed Apr. 6, 1888. Serial No. 269,709. (No model.)

Claim.—1. The improved door-check composed of the two-armed lever a a', pivoted at the junction of its arms, the cushion b, connected to the arm a', the spring c, arranged to turn the lever upward, and the cam d, formed with flat bearings at different distances from the pivot of the cam, and adapted to engage successively the top of the arm a, substantially as described and shown.

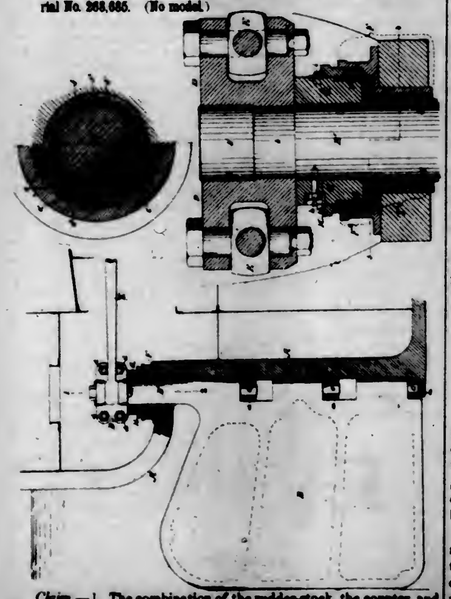
2. The combination of the plate P, formed with the recess r in its back and provided with the stud e, the two-armed lever a a', pivoted at the junction of its arms to the front of said plate, the cushion b, connected to the arm a', the pin or screw f, connected to the arm a and protruding into the recess r of the plate, the spring c, secured at one end in the said cavity and having its opposite end pressing upward on the pin or screw f, the cam d, pivoted to the plate P and formed with flat bearings i i at different distances from the pivot of the cam, the arm h, extended from the cam, and the rod l, connected to said arm, substantially as described and shown.

383,644. MOWING-MACHINE. SAMUEL V. KENNEDY and DANIEL SMITH, Minneapolis, Minn., assignors to the Minneapolis Harvester Works, same place. Filed Apr. 2, 1888. Serial No. 267,493. (No model.)



Claim.—1. In a mowing-machine, the combination, with a main shaft having a gear-wheel mounted thereon, of an eccentrically-

mounted shaft carrying a gear-wheel adapted to engage with the gear-wheel on the main shaft, a keeper on one end of the eccentric-shaft, a handle sliding freely therein, a projection on the main frame, and a projection on the sliding handle adapted to engage therewith, substantially as described.



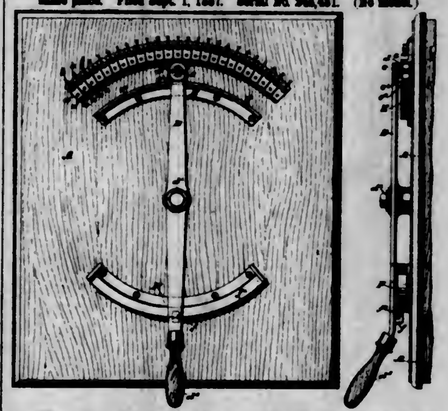
2. In a mowing-machine, the combination, with a main shaft having a gear-wheel mounted thereon, of an eccentrically-mounted shaft carrying a gear-wheel adapted to engage with the gear-wheel on the main shaft, a keeper on one end of the eccentric-shaft, a handle sliding in said keeper, a projection or pin, 36, on the sliding handle, a projection, 37, on the main frame, and a spring engaging said handle and adapted to snap the projection 36 thereon in front of the projection on the main frame to lock the machine into gear.

383,645. WHEEL. SAMUEL V. KENNEDY, Minneapolis, Minn., assignor to the Minneapolis Harvester Works, same place. Filed Apr. 3, 1886. Serial No. 197,671. (No model.)

Claim.—The combination, in a wheel, of the hub 1, provided with the flanges 2 2, having the spoke-holes therein, the series of projections 5, arranged within said flanges and adapted to receive the ends of the spokes between them, the spokes 3, and the nuts 4, arranged upon said spokes between said projections 5 and the inner walls of the flanges 2, substantially as described.

383,646. COMBINED BEARING AND STUFFING-BOX FOR RUDDERS. J. H. KOUNTZ, Philadelphia, Pa. Filed Mar. 27, 1886. Serial No. 268,685. (No model.)

Claim.—1. The combination of the rudder-stock, the counter, and a shell therein comprising two portions, one forming a bearing for the rudder-stock and the other forming the stuffing-box, substantially as set forth.



2. The combination of the rudder-stock, the counter, a shell having two portions, one forming both a steady-bearing and a supporting-bearing for the rudder-stock and the other forming a stuffing-box to prevent ingress of water to the hold of the vessel, substantially as set forth.

3. A rudder-bearing for vessels, consisting of a shell having a horizontal bearing for a collar on the rudder-stock and a stuffing-box above said horizontal bearing.

4. A rudder-bearing for vessels, consisting of a shell having a horizontal bearing for a collar on the rudder-stock, a vertical bearing for the stock below said horizontal bearing, and a stuffing-box above the same, all substantially as specified.

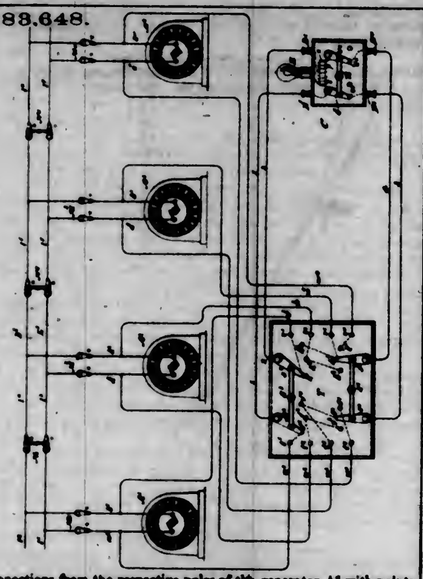
5. The combination of the counter, the shell having a lower bearing portion and upper stuffing-box portion, the rudder-stock, the cross-head secured thereto, and the bearing-collar interposed between said cross-head and the horizontal portion of the bearing in the shell, all substantially as specified.

383,647. SWITCH FOR ADJUSTABLE RESISTANCES. PHILIP LADEL, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Sept. 1, 1887. Serial No. 248,481. (No model.)

Claim.—1. In a switch for resistances, the combination of the base-board, the plates *a a*, having the lugs *c c* projecting perpendicularly from the base-board, the lever D, and a contact-surface, *d*, carried thereby and pressing against the faces of said lugs in a direction parallel with the plane of the base-board.

2. In a switch for resistances, the combination, with a series of plates, *a a*, having the outwardly-projecting lugs *c*, of the lever D, having its axis parallel with said lugs, the plate *c*, having the lug c^2, and contact-springs *d* and *d'*, compressed between the lugs *c* and c^2.

3. In a switch for resistances, the combination of the plates *a a*, having the outwardly-projecting lugs *c*, the lever D, a contact-surface, *d*, pressing against said lugs, and a guide-plate, F, having the flange *f'*, and the catch *f*, carried upon said lever and projecting beneath said flange.



4. In a circuit-controlling switch, the combination, with the contact-plates and lever, of a contact-spring carried by the lever and pressing against said plates, consisting of a looped band of resilient metal having its ends projecting toward each other and fastened to the lever, substantially as described.

383,648. APPARATUS FOR CONNECTING ALTERNATE-CURRENT DYNAMOS. PHILIP LADEL, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Oct. 1, 1887. Serial No. 251,189. (No model.)

Claim.—1. The combination, with three or more alternate-current electric generators, of a switch-board for synchronizing the same, consisting of two double-point switches, contact-points for the respective arms of one switch connected with the respective poles of said generators, contact-points for the respective arms of the second switch connected with said poles, and an indicating device included in circuit between the respective switches.

2. The combination, with the alternate-current generators A', A^2, and A^3, of the switches S' and S^2, their contact-points f' f^2 K K^2 g' g^2 K^3 K^4, the indicating device C, connected between the switches, electrical connections from the respective poles of the generator A' with the points f' K, respectively, connections from the respective poles of the generator A^2 with the points g' and K^4, respectively, and electrical

383,648.

connections from the respective poles of the generator A^3 with points f^3 g^3 and K^3 K^4.

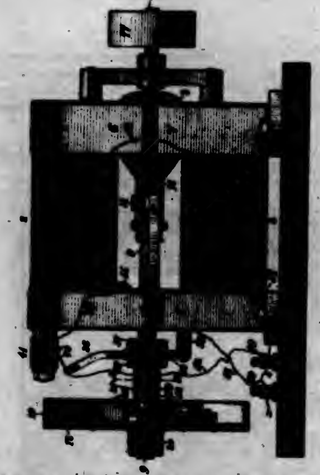
3. A switch-board for connecting different alternate-current generators through an indicating device consisting of two switches, each having two contact-arms and each arm having contact-points, conductors leading from one pole of each generator except one to the respective contact-points of one arm of one switch, conductors leading from the other poles of the same generators to the respective contact-points of the other arm of the same switch, and similar electric connections from the respective poles of all the generators except one of the first-named with the contact-points of the respective arms of the remaining switch.

4. A switch-board for connecting different alternate-current generators through an indicating device consisting of two switches, each having two contact-arms and each arm having contact-points, conductors leading from one pole of each generator to the contact-points of one arm of each switch, conductors leading from the remaining poles to the contact-points of the remaining arms, and an indicating device included in circuit between said switches.

383,649. VOLTMETER. PHILIP LADEL, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Oct. 20, 1887. Serial No. 253,721. (No model.)

Claim.—1. The combination, with a voltmeter consisting of two coils or solenoids, their respective cores, a common support for said cores, an indicator moved by said support, and metallic and carbon resistances in circuit with said coils, of a box containing the same, consisting of two parts hinged together, one part carrying the carbon resistance and the other the coils and metallic resistance, substantially as described.

2. The combination of a case, A, having a cover or lid, A', the incandescent electric lamps placed in the lid and shielded by the covering of wire-gauze, the indicating apparatus placed in the case A, an adjustable resistance, D, the protecting-cover for the coils and resistance, an indicator and adjustable slide for the resistance, said indicator projecting above said protecting-cover, and an indicating-arm visible through the cover, substantially as described.



3. In an indicator for electric circuits, carbon resistances consisting of incandescent electric lamps, a box containing the indicator and said lamps, and a wire-gauze or ventilating protecting-cover for said lamps.

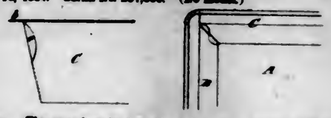
383,650. BEDSTEAD. MATHEW LAWSTER, Brunswick, Ga. Filed Oct. 1, 1887. Serial No. 251,204. (No model.)

Claim.—As an improvement in bedsteads, the combination, with the head and foot boards and the side rails, of the castings D, secured to the same, and having the perforated lugs *d*, the diamond-shaped coupling-plates F, the rods E, secured to said plates in the angles thereof and radiating therefrom and having hooks *e* at their ends, which engage the lugs *d*, the rods G', secured to the coupling-plates and extending toward each other, and provided with screw-threads at their inner ends, and the clamp G, consisting of the nuts g^2 g^3, fitted on the screw-threaded ends of the rods G', and the parallel bars g' g', connecting the nuts g^3, substantially as set forth.

383,651. GOVERNOR FOR ELECTRIC MOTORS. RICHARD H. MATHER, Windsor, Conn. Filed Dec. 9, 1886. Serial No. 221,095. (No model.)

Claim.—1. A rheostat consisting of an indefinite number of annular disks of copper or other highly-conductive material and an indefinite number of annular disks of iron or other material of comparatively low conductivity, all clamped together upon an insulated core by uniform pressure, in combination with an electric motor whose field-magnet helices are connected in parallel with said rheostat, a centrifugal governor which is mounted upon the armature-shaft of said motor, and a sleeve and brush-carrying lever, whereby said governor may manipulate said rheostat, substantially as and for the purpose specified.

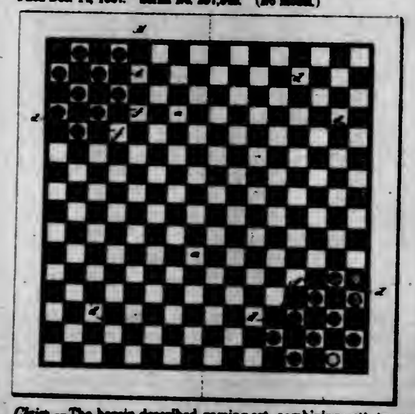
2. A rheostat consisting of a number of perforated plates of copper or other highly-conductive material, a number of like smaller plates of iron or other material of comparatively low conductivity, and an insulated core upon which all said plates are clamped together, in combination with an electric motor, an isochronous governor, which is driven by the armature-shaft of said motor, a slotted sleeve upon said shaft, and a lever which engages said sleeve and is armed with a brush which is adapted to be moved across the edges of said first-mentioned plates, substantially as and for the purpose specified.



3. A rheostat consisting of plates of copper or other highly-conductive material and a number of intermediate plates of less highly-conductive material, all fastened side by side in electrical contact with each other upon a suitable support and insulated therefrom, in combination with an electric motor whose armature-shaft is provided with a radially-projecting pin, a sleeve which surrounds said shaft and is provided with two stop-collars and with a spiral slot for the accommodation of said pin, a lever which carries an electric brush and is provided with an eye, and a loose collar which is pivoted in said eye and between said stop-collars, substantially as and for the purpose specified.

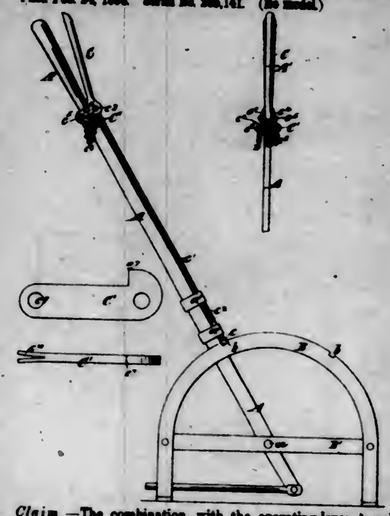
4. As a rheostat, an indefinite number of annular disks of copper or other highly-conductive material, in combination with an indefinite number of annular disks of iron or other material of comparatively low conductivity, all clamped together upon an insulated core by uniform pressure, substantially as and for the purpose specified.

5. As a rheostat, a number of perforated plates of copper or of other highly-conductive material, a number of like smaller plates of iron or of other material of comparatively low conductivity, and an insulated core, upon which all said plates are clamped together, in combination with a brush which is adapted to be moved across the edges of said first-mentioned plates, substantially as and for the purpose specified.



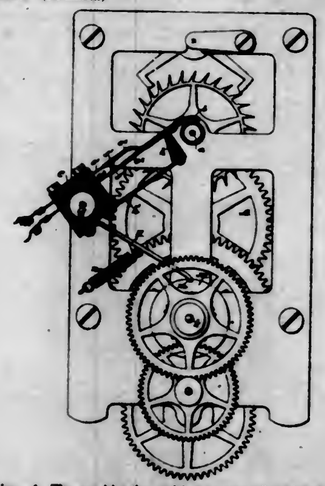
6. As a rheostat, a number of plates of copper or other highly-conductive material and a number of smaller intermediate plates of less highly-conductive material, all fastened side by side in electrical contact with each other upon a suitable support and insulated therefrom, in combination with an electric brush, and with mechanism which is adapted to move said brush across the edges of said first-mentioned plates, substantially as and for the purpose specified.

383,652. PAN. EDGAR W. HEMMERDAN, Brooklyn, N. Y. Filed May 11, 1887. Serial No. 287,809. (No model.)



Claim.—The pan herein described, having a laterally-projecting flange at its upper edge formed by portions overlapping at the corners, and having at the unsoldered corners of its walls a lip or projection on each wall bent over the adjacent and meeting wall, substantially as herein set forth.

383,653. GAME OF SKILL. GEORGE H. ROSES, Boston, Mass. Filed Dec. 14, 1887. Serial No. 257,563. (No model.)



Claim.—The herein-described gaming set, combining with two or more sets of several men each, each set of different colors, a player's board having its surface divided into squares and having a group of several of said squares in two or more opposite corners of said board, having an indicated separation from the other squares thereon, substantially as set forth.

383,654. SWITCH-LOCK. ALEXANDER PELLOW, Hyrax, N. Y. Filed Feb. 24, 1888. Serial No. 265,141. (No model.)

Claim.—The combination, with the operating-lever A and its notched locking-segment B, of the catch-bolt *c*, the catch-lever C, having cheeks which embrace the operating-lever and through which the catch-lever is pivoted to the operating-lever, and a locking key or bolt, as C', inserted through said cheeks and engaging the operating-lever, whereby the swinging of the catch-lever on its pivot to withdraw the catch-bolt is prevented, substantially as herein described.

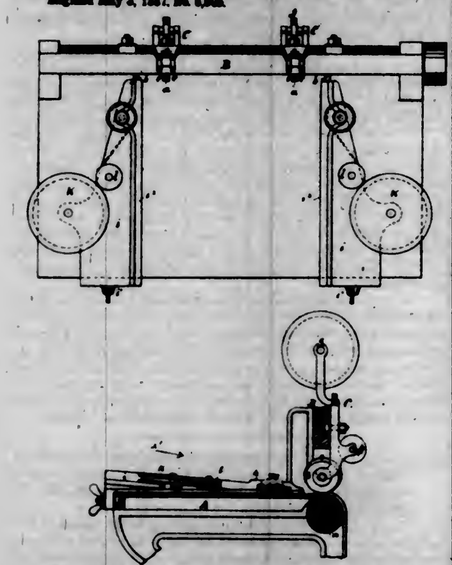
383,655. CIRCUIT-CLOSING DEVICE FOR ELECTRIC CLOCKS. CHESTER H. PAGE, Brooklyn, N. Y. Filed Dec. 21, 1887. Serial No. 258,570. (No model.)

Claim.—1. The combination, with a motor, of a circuit-controlling cam or block actuated thereby and two contact-arms projecting into the path thereof, so arranged that one will be released by the cam before the other, contact-points carried by the respective arms and brought into contact with each other during the time intervening between the release of the two arms, a support for the arms, and means for moving the support, thereby carrying the arms out of the path of the cam, substantially as described.

2. The combination of a circuit-closing cam, a circuit-controller operated thereby, a movable support for the same, a revolving disk, a mechanical connection between said support and said disk, whereby the circuit-controller is normally held out of operative position, and means whereby the revolution of the disk periodically brings the circuit-controller into operation.

3. The combination, with a clock-movement, of the cam, the circuit-closing arms *d d'*, the pivoted support C, carrying the same, the lever K, and the disk M, against which said lever rests, said disk having one or more notches, *m*.

4. In a circuit-closing device, the combination, with the pivoted support C, of the arms *d* and *d'* and the resting-block or support A, secured to said block C, substantially as described.



5. A circuit-controlling attachment for clock-movements, consisting of two movable arms adapted to be released one at a time, contact-points carried thereby and brought into contact with each other by the release of one arm before the other, a resting-block upon which the arms rest out of contact with each other, and a tilting support for the arms, whereby they may be thrown out of operation.

6. A circuit-controlling device designed to be operated by a motor, consisting of a contact device applied to the arbor of the motor, a tilting support for the same, whereby it may be thrown out of operation, and a second arbor for turning the device upon its support, thereby throwing it temporarily out of operation.

7. The combination, with two revolving arbors, of two contact-arms projecting toward one of the arbors and actuated thereby to control the connections of an electric circuit, and mechanism operated by the second arbor to throw the arms out of range of the first-named arbor.

8. The combination, with the circuit-closing cam and the two contact-arms periodically engaged thereby, of the pivoted support for said arms, a revolving disk, and the lever or arm resting against said disk for normally holding said contact-arms out of the path of said cam, and having one or more notches or releasing-points for allowing said arms to be moved toward the cam.

383,656. APPARATUS FOR APPLYING STRIPS TO BOXES. THEODOR REINZ, Dresden, Saxony, Germany, assignor of one-half to Jean Gebertel, same place. Filed May 30, 1887. Serial No. 239,502. (No model.) Patented in Germany Apr. 14, 1887, No. 41,397; in Belgium May 3, 1887, No. 77,305; in France May 3, 1887, No. 189,266, and in England May 3, 1887, No. 6,958.

Claim.—1. In a machine for pasting on strips, the combination, with a frame, of horizontal circumferentially-grooved rollers and presser-rollers for pressing the strips upon the surface of the sheet, substantially as shown and described.

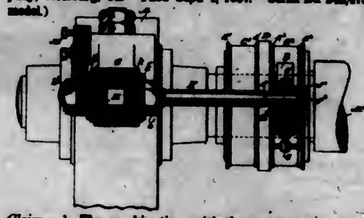
2. The combination, with a table, of laterally-adjustable slides on the same, circumferentially-grooved rollers mounted horizontally on the slides, and pressure-rollers mounted to revolve in planes at right angles to that of the slides, substantially as shown and described.

3. The combination, with a table, of the roller *w*, the vertical presser-rollers *a* and *b b*, and the horizontal rollers *h*, substantially as shown and described.

4. The combination, with the table A and the roller *w*, of the circumferentially-grooved presser-rollers *a* and the rollers *m*, substantially as shown and described.

5. The combination, with the table A and the roller *w*, of the rollers *a c*, the disks *c c*, washers resting against the sides of said disks, the springs *d d*, the presser-rollers *b b*, and the rollers *h h*, substantially as shown and described.

383,657. BOBBIN FOR THE FIELD-MAGNETS OF DYNAMOS. ALBERT SCHERR, Allegheny, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Sept. 1, 1887. Serial No. 248,678. (No model.)



Claim.—1. The combination, with the field-magnet of an electric machine, of bobbin-spools fitting over the cores or polar projections of the field-magnet and lugs at the inner ends of the spools for securing them in position.

2. In an electric machine, a bobbin-spool having lugs at the inner end fitting over the field-magnet core, whereby it may be secured in position.

3. In an electric machine, a spool for receiving a bobbin of the field-magnet, consisting of a central cylindrical portion of soft iron, an outer flange of non-magnetic material secured to one end, and one or more lugs secured to the opposite end for securing the spool to the field-magnet.

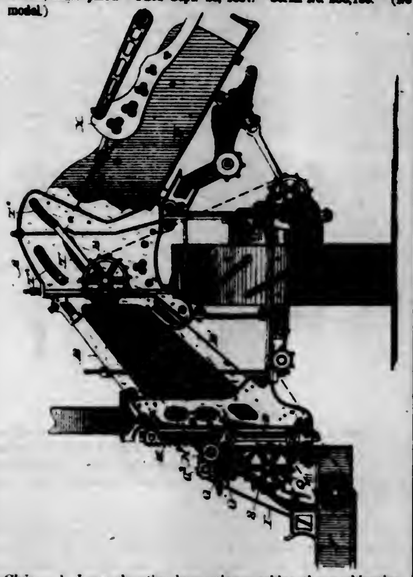
383,658. BRUSH-HOLDER FOR ELECTRIC GENERATORS. ALBERT SCHERR, Allegheny, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Sept. 1, 1887. Serial No. 248,679. (No model.)

Claim.—1. The combination, with the commutator or collecting rings of an electric generator, of a contact-brush, a clamp for the same, a rod for supporting the clamp, means for adjusting the brush-clamp longitudinally upon said rod, and means for adjusting the rod longitudinally, substantially as described.

2. The combination, with an electric generator and its commutator or collecting ring, of a commutator-brush of less width than the commutator-ring to which it is applied, a clamp for the same, a rod for receiving the clamp, a square block upon said rod preventing it from turning, a support for receiving said rod, and means for adjusting the rod in said support.

383,659. ARMATURE FOR DYNAMOS. ALBERT SCHERR, Allegheny, and ERNST M. BULLOCK, Pittsburg, assignors to the Westinghouse Electric Company, Pittsburg, Pa. Filed Sept. 9, 1887. Serial No. 248,871. (No model.)

Claim.—1. The combination, with the armature of an electric machine, of a ring of metal at the end of the same, lugs projecting from the ring to the periphery of the armature, and blocks of insulating material—such as wood—secured to said rim between said lugs.



2. In an armature for electric machines, composed of insulated plates of soft iron, end plates applied thereto, rings of brass or similar material screwed upon said end plates, and strips of insulating material fastened to said ring flush with the periphery of the armature.

3. In an electric machine, an armature consisting of plates of soft iron bound together, sections of insulating material secured at the respective ends and flush therewith, constituting corners for the armature over which the wire is wound, and metallic rings to which said insulating material is secured.

4. The combination, with the armature-core, of the ring *d'*, having the lugs *e*, the clips secured to said lugs, and the longitudinal strips *p'*, also secured to said lugs.

5. In an armature for electric machines, a core, inductive wire wound upon the face thereof, a layer of insulating material covering said wire, plates secured to the respective ends of the armature, and flanges upon said plates projecting over the wire and its insulation.

383,660. PLATFORM ADJUSTMENT FOR HARVESTERS. CASPER F. SEARCH, Winona, Minn., assignor to the Winona Harvester Works, same place. Filed Sept. 20, 1887. Serial No. 250,189. (No model.)

Claim.—1. In an elevating harvesting-machine, the combination, with the combined main wheel and elevator-frame, of an elevator, a grain-platform adjustable to be raised or lowered independently of the combined main wheel and elevator-frame, the lower rollers of the elevator being mounted on the grain-platform and movable with the latter, and the upper rollers being mounted in elongated bearings in the combined main wheel and elevator-frame and movable with the grain-platform, and a pivotal grain-receiving board to receive the grain as it is discharged from the elevator, connected with the elevator, to be raised and lowered with the latter to different angles, substantially as described.

2. In an elevating harvesting-machine, the combination, with the combined main wheel and elevator-frame, of an elevator, a grain-platform adjustable to be raised or lowered independently of the combined main wheel and elevator-frame, the lower rollers of the elevator being mounted on the grain-platform and movable with the latter, and the upper rollers being mounted in elongated bearings in the combined main wheel and elevator-frame and movable with the grain-platform, a pivotal grain-receiving board to receive the grain as it is discharged from the elevator, and a pivotal grain-shield overlying the grain-receiving board, both being connected to the upper rollers of the elevator and movable up or down as the latter are moved, substantially as described.

3. In an elevating harvesting-machine, the combination, with the elevator-frame, of an apron-roller having outwardly-tapering laterally-recessed openings in its opposite ends, and journals extending into the said openings and provided with lugs to engage with the recesses therein, and having bearing in the elevator-frame, substantially as described.

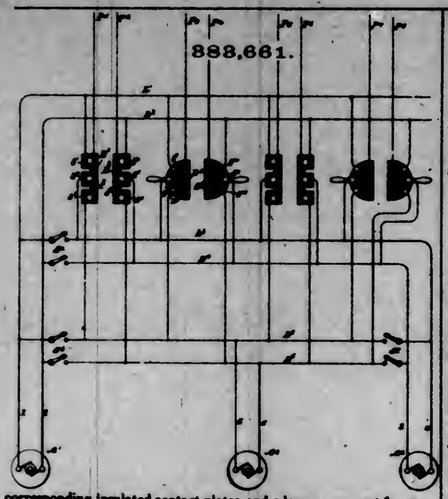
4. In an elevating harvesting-machine, the combination, with the elevator-frame, of an apron-roller journaled in removable metal journal-bearings in said frame and having removable journals extending into the ends of the roller, substantially as described.

5. In an elevating harvesting-machine, the combination, with the combined main wheel and elevator-frame, and elevator aprons and rollers, of an apron-roller having a laterally-recessed tapering opening, *h*, in each end, caps P, having laterally-recessed tapering openings *h'*, and secured upon the ends of the roller, canvas-guide bars having hollow heads *k*, and plates *k'*, provided with laterally-recessed openings k^2, shafts Q, having pins *i* near their inner ends and inserted through openings in the side of the elevator-frame into opposite ends of the roller, and flanged boxes Q', surrounding the shafts and secured to the sides of the frame of the elevator, substantially as described.

6. In an elevating harvesting-machine, the combination of a combined main wheel and elevator-frame, A, having slots T and T' in the upper end of its sides, a grain-platform connected with the combined main wheel and elevator-frame, and adjustable thereon, to be raised or lowered, and an elevator having apron-rollers N O bearing on the platform, apron-rollers N' O', supported in the slots T T', and canvas-guide bars R and R' on the inner sides of the frame of the elevator connected at opposite ends, respectively, with the rollers N N' and O O', and an upper and lower apron traveling over said rollers, substantially as described.

7. In an elevating harvesting-machine, the combination of a combined main wheel and elevator-frame, A, having curved slots T, T', and T^2 in the upper ends of its sides, a grain-platform connected with the said frame, and adjustable thereon, to be raised or lowered, an elevator having its lower and upper apron rollers connected by apron-guide bars and supported respectively on the grain-platform and in the slots T and T', a pivotal grain-receiving board, U', pivoted on its opposite sides near its lower edge to the sides of the elevator-frame near one end and axially connected with the upper heads of the lower apron-guide bars at its upper edge, and a pivotal grain-shield, W, hinged at its outer end, having lateral bearings near its middle extending into the slots T^2, and pivotally connected near its opposite sides and near its middle portion with the upper-apron roller, O', of the lower apron, by links *a'*, substantially as described.

8. In an elevating harvesting-machine, the combination, with the elevator aprons and rollers, adjustable to be raised or lowered independently of the combined main wheel and elevator-frame, and with said elevator-frame, of a pivotal grain-receiving board, U', to receive the grain discharged from the elevator, substantially as described.



9. In an elevating harvesting-machine, the combination, with the elevator rollers, aprons, and canvas-guide bars, adjustable to be raised or lowered in the elevator-frame independently of the combined main wheel and elevator-frame, and with said elevator-frame, of a pivotal grain-receiving board, U', comprising side plates, U^3, journaled near their lower ends at the sides of the main wheel and elevator-frame, and near their upper ends at the sides into the upper heads of the lower-apron canvas-guide bars, and a board, *e*, secured to the side plates, U^3, and having hinged to its lower end a bar, *g*, substantially as described.

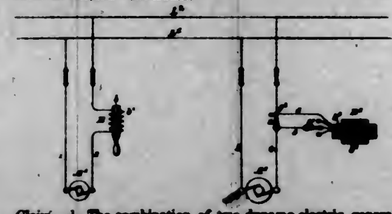
10. In an elevating harvesting-machine, the combination, with the elevator, the rollers, aprons, and guide-bars thereof, being adjustable to be raised or lowered independently of the main frame, of a pivotal grain-receiving board, U', to receive the discharged grain from the elevator-aprons, and a pivotal grain-shield, W, to direct the discharged grain to the receiving-board, both connected with the elevator, to be moved in parallel planes by the raising or lowering movements of the elevator rollers, aprons, and guide-bars, substantially as described.

383,661. CIRCUIT-CONTROLLING APPARATUS FOR ELECTRIC-LIGHTING CIRCUITS. OLIVER B. SHALLENBERGER, Rochester, assignor to George Westinghouse, Jr., Pittsburg, Pa. Filed Mar. 30, 1887. Serial No. 232,667. (No model.)

Claim.—1. A switch or circuit-controlling device consisting of a movable lever, two independent circuit-closing plates upon said lever, two independent series of contact-plates, in contact with which the circuit-closing plates may be respectively placed, individual contact-plates adjacent to the last-named contact-plates, and switch-plugs or circuit-closing devices adapted to place the individual contact-plates in connection with their respective contact-plates at will.

2. A circuit-controlling switch consisting of two independent circuit-closing plates, two independent series of contact-plates, in contact with which the respective circuit-closing plates may be placed, corresponding series of independent contact-plates, one or both of which series are normally electrically insulated from the first-named contact-plates, switch-plugs or circuit-closing devices for completing the connections between any two of the first-named contact-plates and their

corresponding insulated contact-plates, and a lever or support for moving the circuit-closing plates into contact therewith.



3. In a system of electrical distribution, the combination of an outgoing and return wire, two circuit-closing plates with which said wires are respectively connected, two series of contact-plates arranged in pairs, means for moving said circuit-closing plates into contact with different contact-plates of said series simultaneously, pairs of supply-conductors, and coupling devices for completing the connections of any pair of contact-plates with a corresponding pair of supply-conductors at will, substantially as described.

4. The combination of the switch B, the plates *d* and d^2, carried thereby, the two series of contact-plates b' b^2, &c., and b^3 b^4, &c., and their corresponding plates, b' b^3, &c., and b^2 b^4, &c., and conductors leading from the latter, substantially as described.

5. The combination of the pivoted lever B, the contact-plates *d* and d^2, carried thereby, the contact-plates b' b^2, &c., and b^3 b^4, &c., arranged in curved series, and the corresponding insulated plates with which said plates are respectively adapted to be connected, substantially as described.

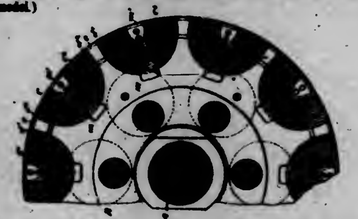
6. The combination, with two or more generators, of multiple circuit-closing plates, respectively constituting the terminals of the generators, a series of contact-plates for each of said circuit-closing plates, into contact with which the latter may be moved, a second series of contact-plates, one plate being provided for each of the first-named contact-plates, coupling devices for connecting the second contact-plates with the respective first-named plates, main lines connected with the respective second contact-plates, and independent switches for connecting the generators in multiple-arc circuit.

383,662. COUPLING OF ALTERNATE-ELECTRIC-CURRENT GENERATORS. OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Sept. 1, 1887. Serial No. 248,494. (No model.)

Claim.—1. The combination of two dynamo-electric generators whose armatures have different amounts of self-induction, a circuit to which they are connected in multiple arc, and a device connected in series with one of the machines having a self-induction approximately equal to the difference of the self-inductions of the armatures.

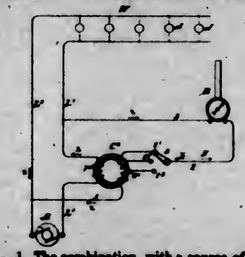
2. The combination, with two alternate-current electric generators of different capacities for self-induction, of a main line with which they are connected in multiple arc, and an adjustable self-induction device connected in series with one of the machines, substantially as described.

383,668. ARMATURE FOR DYNAMOS. OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Sept. 1, 1887. Serial No. 248,493. (No model.)



Claim.—1. In the armature of an electric machine, an end clip for receiving the wires, consisting of a metallic frame, and a lining-block of wood or other insulating material fastened into said frame.

2. In an electric machine, an end clip for receiving the armature-wire, consisting of a metallic frame, a lining-block of wood or other insulating material, said block having a lug upon its inner surface, and screws binding the frame and block to the end of the armature.



3. In an electric machine, the combination, with the armature-core, of a ring, *d'*, having lugs *e*, an end clip, F, consisting of the frame *f'*, the block *f*, of non-conducting material, having the lug *f'*, and means for fastening the block to a lug, *e*, of said ring, substantially as described.

383,664. ARMATURE FOR ELECTRIC MACHINES. OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Sept. 1, 1887. Serial No. 248,495. (No model.)

Claim.—In an armature for electric machines, a core of magnetic material, inductive wire wound in separate sets of convolutions arranged flat upon the face of the armature-core, non-magnetic lugs about which the convolutions are wound, and strips of insulating material separating the outer wires of adjacent sets of convolutions from each other.

383,665. INDICATOR FOR ELECTRIC CIRCUITS. OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Sept. 1, 1887. Serial No. 248,492. (No model.)

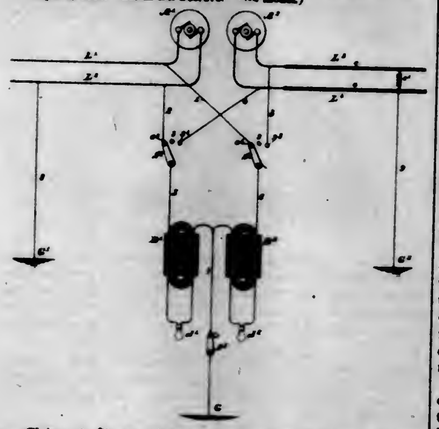
Claim.—1. The combination, with a source of electricity and a work-circuit supplied therefrom, of an electric converter having its primary coil connected in series with the work-circuit and its secondary coil connected in multiple arc therewith, and an electric indicator connected in the circuit of the secondary coil, substantially as described.

2. In an indicator for electric circuits, the combination of a converter having its primary coil adapted to be connected in series with the work-circuit and its secondary coil connected to the terminals of the source of electricity, and an indicator operated by resultant currents traversing the secondary coil of the converter.

3. The combination, with a source of electricity and a work-circuit, of the lines L'-L^2, supplying current thereto, the converter C, having its primary coil *p'* connected in the line L', a circuit including the secondary coil *s'*, means for causing a current to traverse the coils *s'*, which current is dependent upon the difference of potential at the

terminals of the source of electricity and upon the opposing action of the converter, and the indicator B, connected in the circuit of the coils *c'*.

4. In an indicator for electric circuits, a converter having one coil connected in series and the other coil connected in multiple arc with the work-circuit, and an indicator operated by currents traversing the last-named coil, substantially as described.



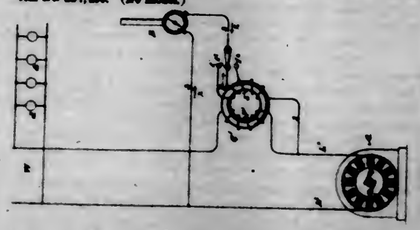
5. In an indicator for electric circuits, the combination of a converter having one coil connected in series and the other in multiple arc with the work-circuit, an indicator operated by currents traversing the latter coil, and means for varying the relative values of the two coils.

6. In an indicator for electric circuits, a converter having a primary coil receiving currents proportionate to the consumption in the work-circuit, and its secondary coil traversed by resultant currents due to the currents induced therein and to currents proportionate to the difference of potential at the terminals of the source, an electric indicating device connected in the secondary circuit, and means for varying the active length of the secondary coil.

7. In an indicator for electric circuits, a converter having a primary coil receiving currents proportionate to the consumption in the work-circuit, and its secondary coil traversed by resultant currents due to the currents induced therein and to currents proportionate to the difference of potential at the terminals of the source, and an electric indicating device connected in the secondary circuit.

383,666. APPARATUS FOR DETECTING GROUND-CONNECTIONS IN ELECTRIC CIRCUITS.

OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Sept. 1, 1887. Serial No. 248,670. (No model.)

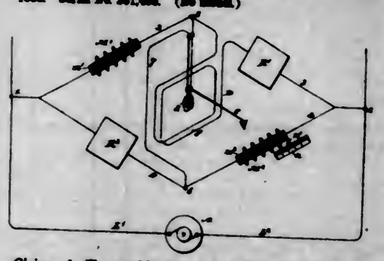


Claim.—1. The combination, with a source of alternating electric currents and lines leading therefrom, of two electric converters, conductors derived from said lines respectively and including such converters and leading to the earth, and an indicating device connected in the secondary circuit of each of said converters.

2. The combination, with a source of alternating electric currents and underground metal-covered lines leading from the respective poles thereof, of two electric converters, means for placing the same in circuit between the respective lines and the earth, and indicating devices connected in the secondary circuits of the respective converters.

383,667. METHOD OF INDICATING ELECTRIC CURRENTS.

OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Original application filed Sept. 1, 1887, Serial No. 248,669. Divided and this application filed Dec. 9, 1887. Serial No. 257,409. (No model.)



Claim.—1. The hereinbefore-described method of indicating the difference of potential upon an electric circuit, which consists in introducing in the circuit of an indicator deriving currents from the said circuit an opposing electro-motive force which is approximately proportional to the current in the work-circuit.

2. The hereinbefore-described method of indicating the difference of potential existing upon an electric circuit, which consists in introducing into an indicating-circuit traversed by electric currents an opposing electro-motive force, the amount of which is proportional to the current delivered to the work-circuit and approximately proportional to the fall of potential due to the transmission to the work-circuit.

3. The hereinbefore-described method of indicating the difference of potential at the work-circuit of a system of electric distribution, which consists in deriving a current proportional to the difference of potential at the source of currents and in opposing thereto an electro-motive force proportional to the current delivered to the work-circuit, substantially as described.

383,668. ELECTRICAL INDICATOR FOR ALTERNATING ELECTRIC CURRENTS.

OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Jan. 21, 1888. Serial No. 261,402. (No model.)

Claim.—1. The combination of an indicator acted upon by variations in alternating, intermittent, or pulsatory electric currents to indicate such currents, two self-induction devices and two resistances respectively in branch circuits spanning one of said self-induction devices and said indicator and the other of said induction devices and the indicator.

2. The combination of two branch conductors, a self-induction device and a resistance in one branch, the former being adjacent to the branching-point, a self-induction device and a second resistance in the other branch, the latter being adjacent to said branching-point, a conductor uniting points in the respective branches between the corresponding self-induction devices and resistance, and an electric indicator operated by alternating, intermittent, or pulsatory currents connected in the last-named conductor.

3. An indicator for alternating, intermittent, or pulsatory electric currents, consisting of the combination, with the lines L' and L², of the conductors 3 and 4, leading from the points 1 and 2 in the respective lines, the self-induction device M' and the resistance R' in one of said conductors, the induction device M² and the resistance R² in the other of said conductors, a conductor, 7, connecting the conductors 3 and 4 at points 5 and 6, the coil *d* in the conductor 7, and the coil *f*, included in a portion of the circuit receiving currents constant in their relative direction with reference to the circuit L' L².

4. An indicator for alternating, intermittent, or pulsatory electric currents, consisting of a movable and a fixed coil in inductive relation to each other, a Wheatstone bridge, in the bridge-conductor of which one of said coils is situated, a self-induction device and a resistance in one arm of the Wheatstone bridge, and upon opposite sides of the point at which the bridge-conductor is united therewith, a resistance in a portion of the other arm which spans the coil thus situated and said self-induction device, and a second self-induction device in a portion of the second arm spanning said coil and the first-named resistance.

5. The combination, with the main-line conductors of a system of electric distribution, of an electric indicator for alternating, intermittent, or pulsatory electric currents, consisting of a movable and a fixed coil in inductive relation to each other, two self-induction devices, a conductor in which they are connected, devices for opposing the flow of current, respectively connected, one in a branch circuit spanning one of said indicating-coils and one of said self-induction devices and the other in a branch circuit spanning the last-named indicating-coil and one of said self-induction devices, and a conductor including the other indicating-coil leading to points in the respective main-line conductors, substantially as described.

6. The combination, with an electric circuit, of an electric indicator operated by alternating, intermittent, or pulsatory currents traversing its coils, a conductor connecting points of different potential in said circuit, a self-induction device and a resistance located in said conductor, a second conductor connecting said points, a resistance and a self-induction device connected in the last-named conductor, the resistance being adjacent to the point to which the first-named self-induction device is adjacent, one of said self-induction devices being adjustable with reference to its self-inductive capacity, and a bridge-conductor uniting points of normally-equal potential in said conductors, in which said indicator is included.

7. The combination of a source of intermittent, alternating, or pulsatory electric currents, an electric circuit arranged as a Wheatstone bridge, an indicating-coil connected across said bridge, and a second coil in proximity to the first, connected independently thereof to the source of current.

8. The combination of a source of alternating, intermittent, or pulsatory electrical currents, an electrical circuit arranged as the arms of a Wheatstone bridge, and an indicator therefor, consisting of two coils, one connected across the points of equal potential thereof, and the other connected independently to the source of current.

9. An indicator for alternating, intermittent, or pulsatory electrical currents, consisting of two resistance-circuits having points of equal normal difference of potential, an indicating-coil connected between said points, and a second coil establishing a field of force connected in circuit between points at which the direction of flow of current is independent of the direction of flow of the current in the resistance-circuits.

10. The combination of a circuit traversed by alternating, intermittent, or pulsatory currents, two branch circuits connected therewith and adapted to vary their relative distribution of difference of potential under variations in the difference of potential of the main circuits, a coil of wire connected across two intermediate points on said branch circuits, a second coil connected in shunt to the main circuit, and an indicating device affected by the combined currents in the two coils.

383,669. ELECTRICAL INDICATOR.

OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Jan. 21, 1888. Serial No. 261,467. (No model.)

Claim.—1. The combination of an electrical indicator for alternating, intermittent, or pulsatory electric currents and a conductor of high self-inductive qualities whose coefficient of self-induction decreases with an increase of applied potential in circuit with such indicator, whereby the sensitiveness of the instrument is increased.

2. The combination of an electric indicator for alternating, intermittent, or pulsatory electric currents and an adjustable self-inductive device whose coefficient of self-induction decreases with an increase of applied potential in circuit with said indicator, whereby the sensitiveness of the instrument is increased.

3. An electric indicator for alternating, intermittent, or pulsatory electric currents, consisting of an indicating device acted upon by electric currents, a self-inductive device, and an adjustable resistance in circuit therewith.

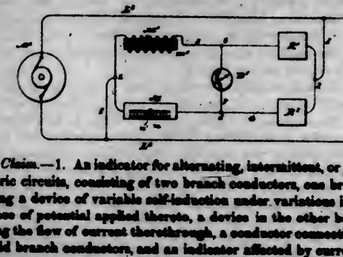
4. An electric indicator for alternating, intermittent, or pulsatory electric currents, consisting of an indicating device affected by such currents, and two or more self-inductive devices having different coefficients of self-induction in circuit therewith.

383,670. ELECTRICAL INDICATOR.

OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Jan. 21, 1888. Serial No. 261,468. (No model.)

Claim.—1. The combination of an electric conductor, branch circuits for the same, a self-induction device in one branch, a resistance included in the other branch, opposing solenoids included in the respective branches, and an indicator acted upon by alternating, intermittent, or pulsatory electric currents traversing said solenoids.

2. An electric indicator consisting of two branch circuits, a self-induction device in one branch, means for balancing the normal apparent resistance of the self-induction device in the other branch, two opposing solenoids in the respective branches, and an indicator for alternating, intermittent, or pulsatory electric currents, to which said solenoids are applied.



3. An electric indicator for alternating, intermittent, or pulsatory electric currents, consisting of two branch circuits, a self-induction device in one branch, means for balancing the normal apparent resistance of the self-induction device in the other branch, two opposing solenoids in the respective branches, an indicator to which said solenoids are applied, and an adjustable resistance connected in the conductor leading to said branch circuits.

4. The combination of a source of alternating, intermittent, or pulsatory electric currents, conductors L' and L², leading therefrom, a conductor, 4, leading from the conductor L' to the conductor L², and having a portion of its length divided in branches *l* and *l'*, a self-induction device included in one branch, and a resistance, R', included in the other branch, substantially as described.

5. An electrical indicator for alternating, intermittent, or pulsatory electric currents, consisting of an indicating device having differential coils, and two reactive coils of unlike self-induction connected in circuit with the respective coils of the indicator.

383,671. ELECTRICAL INDICATOR.

OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Jan. 21, 1888. Serial No. 261,470. (No model.)

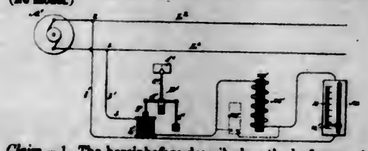
Claim.—1. An indicator for alternating, intermittent, or pulsatory electric circuits, consisting of two branch conductors, one branch containing a device of variable self-induction under variations in the difference of potential applied thereto, a device in the other branch opposing the flow of current therethrough, a conductor connecting points in said branch conductors, and an indicator affected by currents traversing said connecting conductor, substantially as described.

2. An indicator for alternating, intermittent, or pulsatory electric circuits, consisting of a conductor having two branches, self-induction devices included in the respective branches, an indicating device included in a conductor uniting the two branches, and resistance devices included in the respective branches in shunt-circuit upon the respective self-induction devices and the indicating device.

3. An indicator for alternating, intermittent, or pulsatory electric circuits, consisting of an electric conductor having two branches, a self-induction device and an artificial resistance included in one branch, two resistance devices included in the other branch, an electric conductor uniting intermediate points in the two branches, and an indicating device in the last-named conductor.

4. An indicator for alternating, intermittent, or pulsatory electric circuits, consisting of an electric conductor having two branches, a self-induction device and an artificial resistance included in one branch, a second resistance and an adjustable resistance device included in the other branch, an electric conductor uniting intermediate points in the two branches, an indicating-coil in the last-named conductor, and a second indicating-coil included in the first-named conductor and applied to the other indicating-coil, substantially as described.

5. In an indicator for alternating, intermittent, or pulsatory electric currents, the combination of the conductor *l*, having branches 3 and 4, the conductor 7, uniting said branches, the indicator D', included in the conductor 7, a self-induction device, M', included in the branch 3, a device in the corresponding conductor, 4, whose rate of change of apparent resistance is different from that of the device M', and means for causing a current to pass through the conductor 7 in one direction or the other, accordingly as the counter electro-motive force of the device M' rises above or falls below that of the corresponding device in the conductor 4.



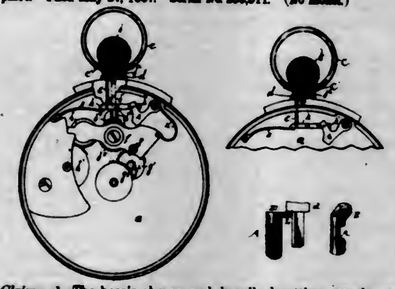
6. An indicator for periodically-variable currents, consisting of two circuits of approximately constant specific resistance having points of equal normal difference of potential, a coil of self-induction included in one of said circuits, and an indicator connected between the points of equal potential.

7. The combination of the circuit traversed by variable electrical currents, two circuits connected in shunt thereto, of approximately constant specific resistance, a coil of self-induction included in one of said circuits adapted to vary the distribution of differences of potential in its circuit under variations of difference of potential in the main circuit, and an indicator connected to a point in each of said shunt-circuits.

8. An indicator for alternating, intermittent, or pulsatory electric circuits, consisting of two circuits in multiple arc, one of which contains a coil of self-induction adapted to vary the distribution of differences of potential on said circuits under variations of difference of potential applied thereto, and an indicating device connected across said circuits to indicate such variations of potential.

9. The combination of a source of alternating, intermittent, or pulsatory electric currents, an electrical circuit arranged as the arms of a Wheatstone bridge, one of said arms including a portion having a variable self-induction under variations of current traversing it, and an indicator connecting two intermediate points in said circuits.

383,672. METHOD OF INDICATING ELECTRIC CURRENTS. OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Jan. 21, 1888. Serial No. 261,471. (No model.)



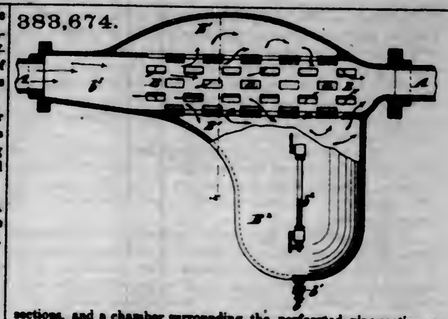
Claim.—1. The hereinbefore-described method of measuring the difference of potential existing between two points in an electric circuit for alternating, intermittent, or pulsatory electric currents, which consists in determining the amount of resistance required in a circuit of high self-induction through which said points are connected to establish a definite current therein.

2. The hereinbefore-described method of determining the variations in the difference of potential between two points in an electric circuit for alternating, intermittent, or pulsatory electric currents, which consists in establishing in the circuit connecting said points a high self-induction and indicating the variations of current passing through such circuit of high self-induction, substantially as described.

3. The hereinbefore-described method of indicating the difference of potential between two points in an electric circuit for alternating, intermittent, or pulsatory electric currents, which consists in establishing a definite current through a circuit of high self-induction, connecting the points by varying an adjustable resistance connected in the circuit, and noting the amount of such variations.

4. The hereinbefore-described method of indicating the difference of potential between two points in an electric circuit for alternating, intermittent, or pulsatory electric currents, which consists in establishing a difference of potential at the terminals of a coil of high self-induction which derives current from that circuit and in adding the difference of potential at the terminals of an adjustable resistance connected in the same circuit.

383,673. STEM WINDING AND SETTING WATCH. WILLIAM H. STEVENS, Buffalo, N. Y., assignor of one-half to Henry K. Stevens, same place. Filed May 27, 1887. Serial No. 239,511. (No model.)



Claim.—1. The herein shown and described setting attachment for watch-movements, consisting of the combination, with tilting lever or yoke *f*, of the plunger *e*, spring *s*, and levers *k* and *r*, all substantially as shown, and for the purposes set forth.

2. In a pendant setting attachment for watch-movements provided with a tilting lever or yoke, *f*, and revolving crown *b*, having notched arbor *b'*, the herein shown and described plunger *e*, actuated by the revolving crown *b*, and adapted to force a tilting lever, thereby throwing the setting mechanism into gear, as and for the purposes set forth.

383,674. SEPARATOR. GERLAIR STUART, Plainfield, N. J. Filed Dec. 20, 1887. Serial No. 258,468. (No model.)

Claim.—1. The separator herein described, consisting of a steam-pipe section or passage which is perforated or formed with lateral openings, and with the ends of which are connected the steam-pipe

383,674.

sections, and a chamber surrounding the perforated pipe-section or passage, and which is constructed to form a well for receiving water and oil, substantially as herein set forth.

2. The combination, with the pipe-sections A, of the separator, comprising the pipe-section or passage B, larger in diameter than the sections A, and having lateral perforations or openings, the chamber B', surrounding the pipe-section or passage B, and the well B'', for receiving the water and oil, and provided with an outlet-pipe therefor, substantially as herein set forth.

383,675. MANUFACTURE OF INCANDESCENT ELECTRIC LAMPS. EDWARD P. THOMPSON, Elizabeth, N. J. Filed Jan. 28, 1887. Serial No. 225,117. (No model.)

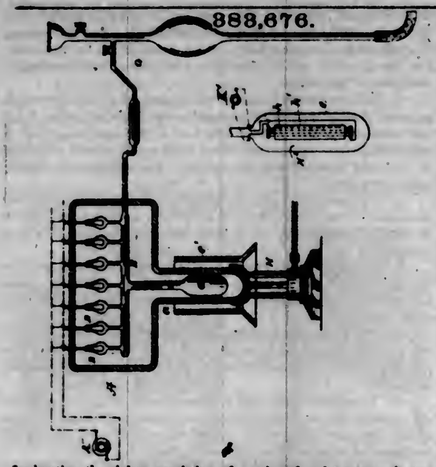
Claim.—1. The hereinbefore-described method of manufacturing incandescent electric lamps, which consists in attenuating the atmosphere within the globe and heating the leading-in wires independently of the filament to a higher temperature during the process of evacuating than they are heated after the lamp is sealed.

2. The hereinbefore-described method of manufacturing incandescent electric lamps, which consists in exhausting the globe and in heating the leading-in wires and their joints independently of the filament during the process of evacuating to a temperature greater than that which they acquire while the lamp is normally operated.

3. The hereinbefore-described process of manufacturing incandescent electric lamps, which consists in passing a current through each leading-in wire independently of the other and independently of the filament, thereby heating the same to an abnormal temperature during the process of evacuating and thereby expelling the gases therefrom.

4. In an incandescent electric lamp, a filament and two leading-in wires extending from each terminal thereof through the walls of the globe, forming four independent exterior terminals.

5. In an incandescent electric lamp, the combination, with the filament, of a double leading-in wire for each terminal of the filament, the respective arms of which are in electrical connection only at the joint.



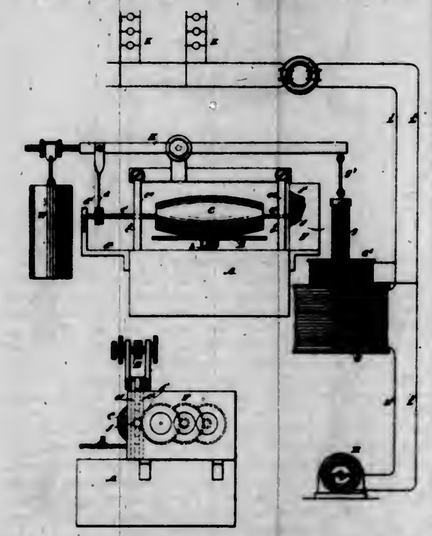
6. In an incandescent electric lamp, the combination, with the filament, of a double leading-in wire for each terminal, and a loop at each end of each leading-in wire formed by passing the ends of the wire back through the wall of the globe.

7. The hereinbefore-described process of expelling the atmosphere from the leading-in wires of a filament, which consists in heating to incandescence the portions of the wires within the globe independently of the filament and independently of the wire passing through the wall of the globe.

383,676. EVACUATING ELECTRIC LAMPS. EDWARD P. THOMPSON, Elizabeth, N. J. Filed Apr. 15, 1887. Serial No. 234,902. (No model.)

Claim.—The combination, with a vacuum apparatus and a series of incandescent-electric-lamp globes connected therewith, of a device

383,676.



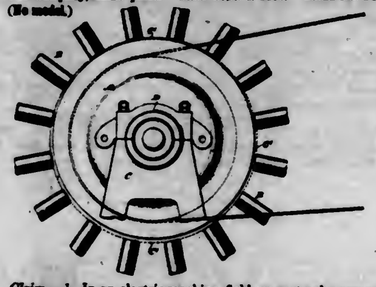
for heating the globes, consisting of a series of resistance-conductors, an evacuated chamber connected with the globes containing the conductors, and means for placing the conductors in an electric circuit.

383,677. GALVANIC-BATTERY FLUID. HANS J. VON HEIDRAPP, New York, N. Y. Filed Sept. 27, 1887. Serial No. 250,857. (No specimens.)

Claim.—A solution for galvanic batteries, composed of four hundred cubic centimeters of sulphuric acid, two hundred of water, two hundred of nitric acid reduced to forty per cent., and one hundred grams of bichromate of potash, as set forth.

383,678. ELECTRIC METER. GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa. Filed June 16, 1887. Serial No. 241,492. (No model.)

Claim.—1. The combination, with a revolving plane, of a spheroidical roller in frictional contact with the face thereof, registering mechanism receiving its motion through said contact, and means for adjusting the angular position of the axis of said roller with reference to the plane of the disk in accordance with variations in the force to be measured.

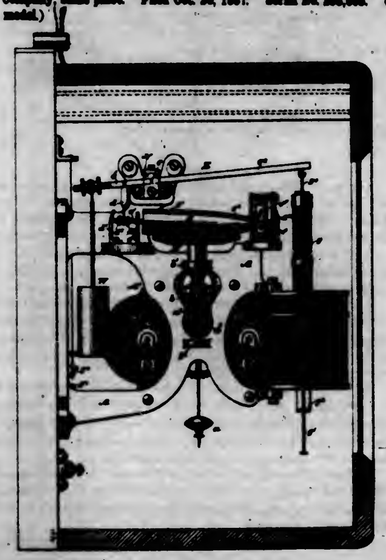


2. In a meter, the combination, with a revolving plane, of a spheroidical roller in frictional contact with the face thereof, and means for varying the angular position of the axis of said roller with reference to the plane of the disk, thereby causing the point of contact to be moved toward and from the center of revolution of said plane.

3. In a meter, the combination, with the revolving disk B, of the spheroidical roller C, in frictional contact with the face of said disk, the stirrup *d*, supporting one end of the axis of said roller, and means for raising and lowering said end through said stirrup by variations in the force to be measured.

4. The combination of a revolving plane, a spheroidical roller in frictional contact with the face thereof, a magnetizing solenoid and core movable with relation to each other under the influence of an electric current, and means for communicating movements thus produced to the roller, thereby changing its point of contact with the revolving plane.

5. The combination of a revolving plane, spheroidical roller in frictional contact with the face thereof, guides for retaining the axis of the roller in a plane perpendicular to the axis of revolution of said plane, and mechanism actuated by electricity for moving said axis in said perpendicular plane.

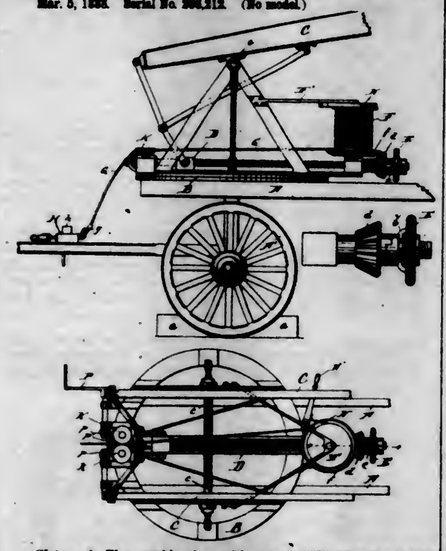


383,679. MOUNTING ARMATURES OF DYNAMOS. GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Sept. 1, 1887. Serial No. 248,488. (No model.)

Claim.—1. In an electric machine, field-magnet poles arranged in a circular series and an armature mounted upon its bearings with its axis of revolution eccentric with reference to the circle of the field-magnet poles, whereby the pressure of the armature upon its bearings is opposed by the excess of the magnetic attraction exerted by the nearer poles of the field-magnets.

2. In an electric machine, the combination, with the field-magnet poles arranged in a circular series, of an armature having its axis of revolution eccentric with reference to the circle of said poles, being located in a plane constituting a continuation of the plane of resultant pull of the force of gravity and the tension of the driving-belt of the machine beyond the center of the series of field-magnet poles.

383,680. ELECTRIC METER. GEORGE WESTINGHOUSE, Jr., and PHILIP LARNE, Pittsburg, Pa., assignors to the Westinghouse Electric Company, same place. Filed Oct. 20, 1887. Serial No. 252,602. (No model.)



Claim.—1. In an electric motor, the combination of a friction-roller, a revolving disk against the face of which the roller rests, registering mechanism receiving motion through said roller, and means for automatically modifying the angle of the axis of said roller with reference to the surface of the disk in accordance with variations in the force to be measured, said roller being of gradually-diminishing cross-section through the portion adjacent to the center of the revolving surface and one end and approximately straight through its remaining portion.

2. In an electric motor, the combination, with a flat revolving surface, of the roller in frictional contact therewith, said roller being of gradually-diminishing cross-section from the center to one end, a lever operated by variations in the current, a stirrup connecting one arm of said lever with the axis of said roller, the point of attachment with the axis being adjustable, a registering device, and a pinion carried by said axis and communicating motion to the registering device.

3. In an electric motor, the combination of the clock-movement, the revolving disk B, the roller C, resting thereon, and the curved plates d' d^2 at the respective ends of the axis of said roller for preventing it from undue longitudinal movement, substantially as described.

4. In an electric motor, the combination, with the rocking roller C and the revolving disk B, upon which the roller rests, of the axis for said roller, the guide-plates at the respective ends of the axis, a pinion upon said axis between the rollers and one of said guide-plates, and a registering mechanism geared with said pinion.

383,681. TURN-TABLE EXTENSION-LADDER TRUCK. REDMOND ARCOCK, Chicago, Ill., assignor to Everett R. Preston, same place. Filed Mar. 5, 1888. Serial No. 266,212. (No model.)

Claim.—1. The combination, with a turn-table extension-ladder truck and its pivoted main ladder and raising mechanism, of a winding-drum connected therewith and a draft line or cable whereby horse-power may be applied for raising the ladder, substantially as specified.

2. The combination, with a turn-table extension-ladder truck, its pivoted main ladder, and screw raising mechanism, of a winding-drum geared to said screw and a draft-cable, substantially as specified.

3. The combination, with a turn-table extension-ladder truck and its pivoted main ladder and raising mechanism, of a winding-drum connected therewith, and a draft line or cable whereby horse-power may be applied for raising the ladder, and shoes for blocking the wheels of the truck, substantially as specified.

4. The combination, with a turn-table extension-ladder truck and its pivoted main ladder and raising mechanism, of a winding-drum connected therewith, and a draft line or cable whereby horse-power may be applied for raising the ladder, and a brake for controlling the motion of the ladder, substantially as specified.

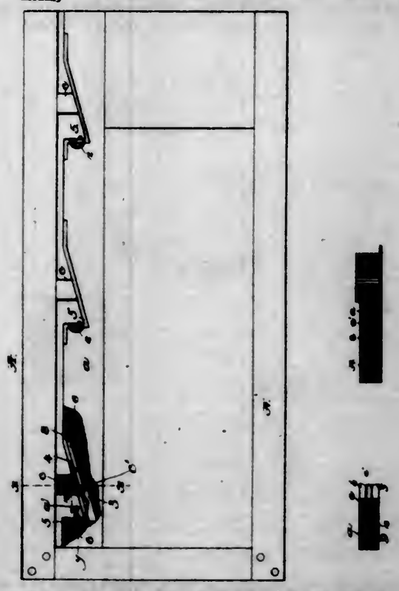
5. The combination, with a turn-table extension-ladder truck, its pivoted main ladder, and screw raising mechanism, of a winding-drum geared to said screw, a draft-cable, and guide-pulleys for said cable, substantially as specified.

6. The combination, with a turn-table extension-ladder truck and its pivoted main ladder and raising mechanism, of a winding-drum connected therewith, and a draft line or cable whereby horse-power may be applied for raising the ladder, and a clutch device for connecting and disconnecting said winding-drum with said raising mechanism, substantially as specified.

7. The combination, with a wheeled truck, of a pivoted structure mounted thereon, a screw raising mechanism mounted on said truck and connected to said pivoted structure, a winding-drum geared to said raising-screw, and a draft line or cable wound around said drum for revolving the same, and thus operating the raising-screw, substantially as specified.

8. The combination, with a wheeled truck, of a pivoted structure mounted thereon, a screw for raising the same, a winding-drum geared to said screw, a clutch, and a draft line or cable, substantially as specified.

9. The combination, with a wheeled truck, of a pivoted structure mounted thereon, screw raising mechanism, a winding-drum geared to said screw, and a draft-line and guide-pulleys, substantially as specified.



10. The combination, with a wheeled truck, of a pivoted structure mounted thereon, screw raising mechanism, a winding-drum connected with said screw, a draft line or cable, and a brake, substantially as specified.

11. The combination, with a wheeled truck, of a pivoted structure mounted thereon, screw raising mechanism, a winding-drum connected with said raising-screw, a draft line or cable, and devices for blocking the wheels of the truck, substantially as specified.

12. The combination, with a wheeled truck, of a turn-table, a pivoted ladder, screw raising mechanism, a winding-drum, a draft-cable, gears connecting said winding-drum and screw, a brake-shoe, and brake-lever, substantially as specified.

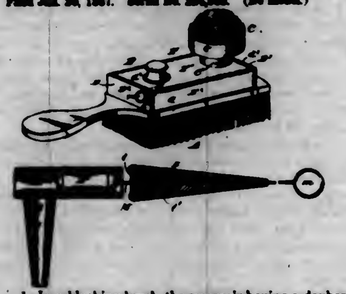
13. The combination, with truck A, of turn-table B, ladder C, screw D, having splined sliding gear d, spring d^2, and cam-wheel E, winding-drum F, having gear f, draft-cable G, and brace-arm F', substantially as specified.

383,682. SIDE-STICK FOR PRINTERS' GALLEYS. EDWARD P. ALLEN, Boston, Mass. Filed June 30, 1887. Serial No. 243,726. (No model.)

Claim.—1. A removable side-stick for a printer's galley, it having one or more openings or recesses having an inclined side provided with a groove, and a wedge-block, as a, connected with the side-stick, and so adapted to be locked in the recess that its contact-face will be flush with the side-stick, and moving upon the inclined side as a guideway, the flat face of the wedge-block being adapted to bear upon the side of the galley directly, substantially as described.

2. A side-stick for a printer's galley, it having one or more openings or recesses having an inclined grooved side, and a wedge-block, as a, connected permanently with the side-stick, and moving upon the inclined side as a guideway, the inclined face of the block a engaging the said groove, a stop or cheek, b, and a spring-latch c, substantially as and for the purpose specified.

3. A side-stick for a printer's galley, it having one or more openings or recesses having an inclined side, and a wedge-block, as a, connected with the side-stick, and moving upon the inclined side as a guideway, and a catch, b, to engage and hold said wedge-block when the latter is in the deeper part of the recess, and a releasing device, 12, therefor, substantially as and for the purpose specified.



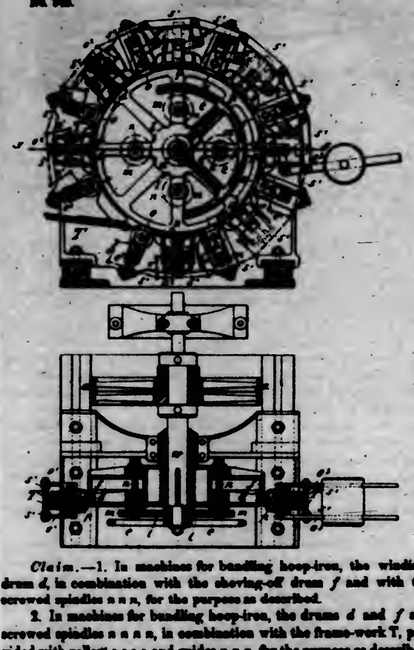
383,683. WASHING-MACHINE. JOHN H. ALLEN, Keyser, W. Va. Filed Dec. 5, 1887. Serial No. 257,057. (No model.)

Claim.—1. As an improvement in washing-machines of the class herein described, the revolving cylinder or receptacle having a removable section and deflectors, the ends or heads of said cylinder or receptacle and the sides of the deflectors being provided with circular detents or recesses and the cubes, substantially as shown and described.

2. The combination, with the box or tub, of the cylinder or receptacle, the operating-shaft, the agitating-paddles, the deflectors, and the grooved cubes, the said paddles and deflectors and the ends or heads of the cylinder or receptacle being provided with circular detents or recesses, substantially as shown, and for the purpose stated.

383,684. BLACKING-BRUSH. WILLIAM H. BAKER, Dennison, Ohio. Filed Jan. 30, 1887. Serial No. 225,993. (No model.)

Claim.—1. In a blacking-brush, the reservoir having a dauber attached thereto, the tube K, the tube I, connected with the tube K and extending into the dauber, and the valve M', combined with funnel-shaped tube L, having cap l and packing l', and the valve-rod M, passing through said tube, the packing l' being adapted to prevent the blacking from escaping through the opening d^4 for the said rod, substantially as described, for the purpose set forth.



2. In a blacking-brush, the reservoir having a dauber attached thereto, the tube K, the tube I, to carry the blacking from the interior tube, K, to the dauber, the valve M' in the tube K, combined with the tube L, the larger end of which is placed a short distance from one end of the tube K, and the small end of which is passed through an opening, d^4, in the end of the reservoir, the rod M, connected with the valve M', and passing through the tube L and inclosed in the packing l' therein, and the cap or head l, to hold said packing in the tube, all substantially as described, for the purpose set forth.

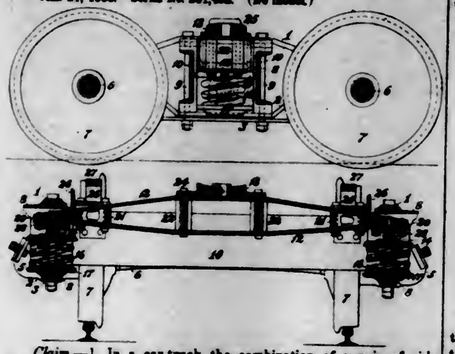
383,685. NUT-LOCK. JAMES P. BALL, Philadelphia, Pa. Filed Sept. 26, 1887. Serial No. 250,257. (No model.)

Claim.—A nut-fastener consisting of a spring-piece having an eye coinciding with the periphery of the bolt near its center and on one side thereof, and having one of its ends projecting upward and the other end projecting downward, the sides of said ends being opposite the eye and so located in relation to the bolt as to prevent the disengagement of the said piece laterally from the bolt, substantially as described.

383,686. MACHINE FOR BUNDLING HOOP-IRON. WILHELM RASSEN, Kettwerbe, Prussia, Germany. Filed Mar. 16, 1886. Serial No. 295,407. (No model.) Patented in Germany June 10, 1887, No. 42,695; in England July 4, 1887, No. 9,467; in Belgium July 4, 1887, No. 76,696; in France July 4, 1887, No. 184,907, and in Luxemburg Jan. 13, 1888, No. 562.

Claim.—1. In machines for bundling hoop-iron, the winding-drum d, in combination with the shoving-off drum f and with the screwed spindles n n n, for the purpose as described.

2. In machines for bundling hoop-iron, the drums d and f and screwed spindles n n n n, in combination with the frame-work T, provided with rollers o o o o and guides p p p, for the purpose as described.



3. In machines for bundling hoop-iron, the winding-drum d, in combination with the shoving-off drum f, the screwed spindles n n n, and the frame-work T, provided with rollers o o and guides p p, arranged elastically to the frame, with the levers d' d' d', connected by links d, for the purpose as described.

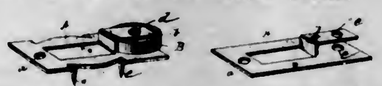
383,687. CORSET. FREDERICK A. RABATTE, Philadelphia, Pa. Filed Mar. 12, 1887. Serial No. 230,623. (No model.)

Claim.—An anatomical corset consisting of a body having secured thereto and within the same, at a place corresponding to the place of defect in the body of the wearer thereof, a strap of fixed length secured at both ends by a row of stitching, (the position and length of said strap being determined by the character of the defect in the body of the wearer,) the said corset-body having opposite to the strap and on the inner wall thereof horizontal stays, said parts being combined substantially as and for the purpose set forth.

383,688. CAR-TRUCK. JOHN C. BARBER, St. Paul, Minn. Filed Jan. 21, 1888. Serial No. 261,662. (No model.)

Claim.—1. In a car-truck, the combination of a pair of side frames, an end casting secured centrally between the journal-boxes of each of said frames, and transoms secured to said end castings independently of and without bearing against the side frames, substantially as set forth.

2. In a car-truck, the combination of a pair of side frames, an end casting secured centrally between the journal-boxes of each of said frames and provided with lateral flanges, and transoms fitting against and secured to the end castings between the flanges thereof, substantially as set forth.



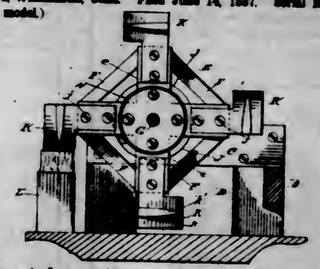
3. In a car-truck, the combination of a pair of side frames, an end casting secured centrally between the journal-boxes of each of said frames, springs supported within said end castings, a swing beam or bolster supported by said springs, and transoms secured to the end castings independently of and without bearing against the side frames, substantially as set forth.

4. In a car-truck, the combination of a pair of side frames, a frame or box-shaped end casting interposed centrally between the journal-boxes of and secured to each of said frames, a spring or group of springs supported within each of said end castings, a spring-cap resting upon the top of each spring or series of springs, a roller-bearing fitting a seat in each of said spring-caps, and a bolster resting at its ends upon said roller-bearings, substantially as set forth.

5. In a car-truck, the combination of a pair of side frames, a frame or box-shaped end casting secured centrally between the journal-boxes of each of said frames, a spring or group of springs supported within each of said end castings, a bolster supported with the capacity of free lateral movement upon bearings on said springs or groups of springs, and side-motion stops secured to the bolster in position to abut against the end castings at the limits of the lateral movements of the bolster, substantially as set forth.

6. In a car-truck, the combination of a bolster formed of a pair of arched or bent plates connected at their ends, thimbles provided with lateral chafing-plates interposed between and secured to the bolster-plates, and side bearing and lateral motion stop-castings secured to the chafing-plate thimbles and bolster-plates, substantially as set forth.

383,689. ANTI-FRICTION ROLLER FOR DRAWERS. JOHN BARR, Rochester, N. Y., assignor of one-half to Lewis C. Tower, same place. Filed Dec. 20, 1887. Serial No. 258,497. (No model.)



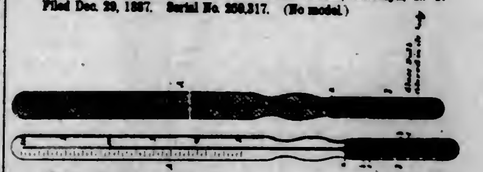
Claim.—1. The combination, with a base-plate having portions thereof bent out at substantially right angles thereto to form holding projections or points and a portion bent over parallel with said base-plate, of a roller between said bent-over portion and base-plate, and a pivot for said roller carried by the bent-over portion and base-plate, respectively, substantially as described.

2. In an anti-friction roller for drawers, the combination, with the extended base-plate having a portion thereof bent over substantially parallel therewith at one end, of a roller located between said bent-over portion and base-plate, the pivot therefor being held by said bent-over portion and base-plate, respectively, substantially as described.

3. In an anti-friction roller for drawers, the combination, with the extended base-plate having a tongue cut out of the center of the same and bent over parallel therewith at one end, of a roller located between said bent-over portion and base-plate, the pivot therefor being held by said bent-over portion and base-plate, respectively, substantially as described.

383,690. MACHINE FOR SPLITTING WOOD. CHARLES H. BARROWS, Willimantic, Conn. Filed June 14, 1887. Serial No. 241,258. (No model.)

Claim.—1. In a machine for splitting fire-wood, a vertically-rotating wheel supported on a suitable shaft and a series of cutters fixed to the wheel at suitable intervals from each other and projecting beyond the periphery thereof, each cutter consisting of two blades, which are arranged substantially at right angles to each other, and all the cutters facing in the same direction around the wheel, as and for the purpose described.



2. In a machine for splitting fire-wood, the combination of a vertically-rotating wheel supported on a horizontal shaft, a series of two-part cutters projecting radially from the wheel at suitable distances from each other, and a stationary block disposed in advance of said wheel and at one side of the path of the cutters, as and for the purpose described.

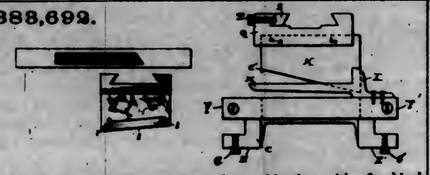
3. In a machine for splitting fire-wood, a vertically-rotating wheel carrying a series of spaced two-part cutters, one of the blades of each cutter being arranged at right angles to and projecting centrally from one of the lateral faces of the other blade of said cutter, as and for the purpose described.

4. In a machine for splitting fire-wood, a vertically-rotating wheel carrying a series of fixed two-part cutters which project beyond the periphery of the wheel at suitable intervals, one of the blades, *k*, of each cutter having one of its lateral faces inclined to the other face thereof, and the other blade, *k'*, of said cutter fitting snugly against the inclined lateral face of the other blade and projecting centrally therefrom, the cutting-edges of both blades lying in the same plane, as and for the purpose described.

5. In a machine for splitting fire-wood, a vertically-rotating wheel hung upon a suitable shaft and having a series of radial arms, each provided with a longitudinal socket which opens through the outer extremity and one of the lateral faces of the arm, in combination with a series of two-part cutters which are arranged at points beyond the periphery of the wheel, and each cutter having an extended shank which fits snugly in the socket of the arms, and means for detachably securing the cutters to the arms of the wheel, as and for the purpose described.

383,691. THERMOMETER. ADOLPH BAYER, Brooklyn, N. Y. Filed Dec. 29, 1887. Serial No. 259,317. (No model.)

Claim.—1. A thermometer having a transparent glass tube and a bulb of glass colored in its body, substantially as shown and described.



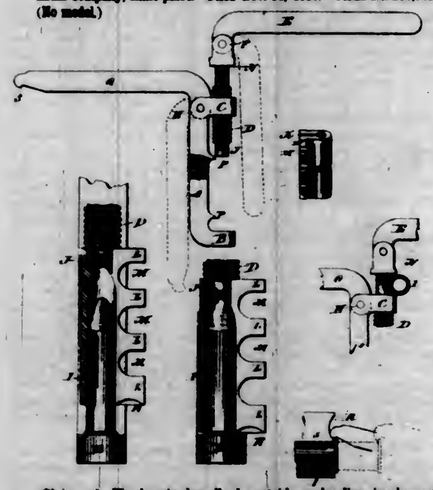
2. A thermometer having a transparent glass tube and a bulb of glass having transparent portions *b* and portions *c*, colored in their body, substantially as shown and described.

383,692. PAPER-CUTTING MACHINE. CHARLES BOSE, Philadelphia, Pa. Filed June 11, 1887. Serial No. 241,062. (Model.)

Claim.—1. In a paper-cutting machine, the combination of a die and a knife having a hooked cutting-edge at its side, as and for the purpose set forth.

2. In a paper-cutting machine, the combination of a knife, a die provided with a slot for the knife, and a forked guide above the slot, the arms of the fork extending parallel to the plane of the slot, and a grooved upward extension to the fork, said extension engaging the knife throughout its entire path of movement, as set forth.

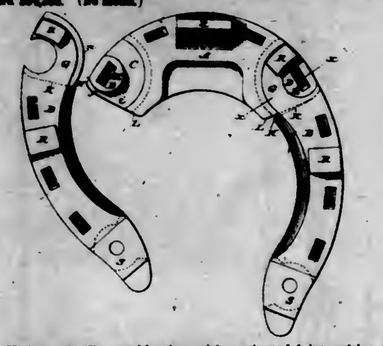
383,692.



3. In a paper-cutting machine, the combination, with a fixed bed provided with parallel transverse ways and a die provided with a slot to receive the corner-cutting knife and mounted upon said ways, of a reciprocating frame provided with a guide-rail and the herein-described knife for cutting off corners, mounted upon said guide-rail and provided with two cutting-edges and a clearing-edge, the cutting-face being beveled away from said edges, whereby the portion of the material cut off by the knife is forced through the die, substantially as described.

4. In a paper-cutting machine, the combination, with a reciprocating knife, of a die provided with a slot or opening for the knife and a forked knife-guide carried by the die, the arms of the fork extending parallel to the plane of the slot and adapted to engage the opposite side faces of the knife, substantially as described.

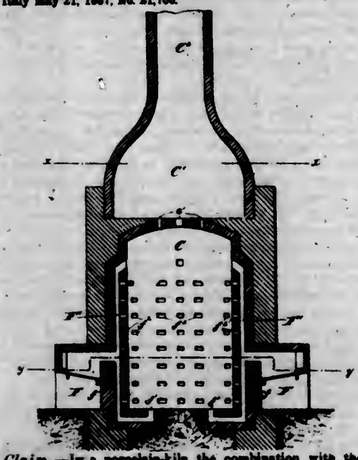
5. In a paper-cutting machine, a knife formed of a single piece of metal, having two cutting-edges and a clearing-edge, the cutting-face being beveled away from said cutting-edges, substantially as herein shown and described.



383,693. CARTRIDGE-RELOADING IMPLEMENT. THOMAS G. BENNETT, New Haven, Conn., assignor to the Winchester Repeating Arms Company, same place. Filed Nov. 30, 1887. Serial No. 256,888. (No model.)

Claim.—1. The herein-described cartridge-reloading implement, consisting in the combination of the stock A, constructed with a laterally-projecting seat, B, and with a corresponding laterally-projecting head, C, a screw through said head in line with the said seat, a handle hinged to the screw, and so as to swing in a plane substantially parallel with the screw, a second handle hinged to the stock, and so as to also swing in a plane substantially parallel with the axis of the screw, and a block constructed with a recess longitudinally therein corresponding substantially to the size of the loaded cartridge, the said block adapted to be set between the said seat and the end of the screw, substantially as described.

2. The combination of the tubular block I, the interior in shape corresponding to the cartridge to be loaded, the said block slit longitudinally upon one side, the said slit opening into the chamber in the block, and the block constructed with lateral projections from each side said recess, the said projections forming one or more transverse recesses across the said slit, a stock, A, constructed with a laterally-projecting seat, B, and with a like laterally-projecting head, C, a screw through said head, the said seat adapted to receive one end of said block and the screw arranged to bear upon the other end of said block, the said screw constructed with a shoulder, N, which, with the said head, forms a pair of jaws, substantially as and for the purpose described.

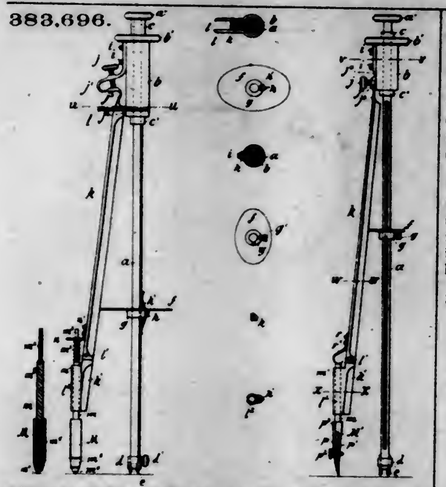


383,694. HORSESHOE. JOHN E. BRENNAN, Walla Walla, Wash., and EDWARD W. BRENNAN, Portland, Oreg. Filed Nov. 5, 1887. Serial No. 254,302. (No model.)

Claim.—1. The combination, with a pivoted joint uniting the separable sections of a sectional horseshoe, of a cylindrical stud having a nail-hole pierced through it, and serving as the pivot for the joint, substantially in the manner and for the purpose herein set forth.

2. A cylindrical perforated stud formed near the outer angle of each end of the toe-section of a sectional horseshoe upon its ground side by means of a segmental recess in said face encircling said stud, in combination with a counterpart segmental tongue projecting from the corresponding end of the appropriate heel-section to enter and fill said recess when the two sections are properly adjusted to fit the foot, substantially in the manner and for the purpose herein set forth.

383,695. PORCELAIN-KILN. LOUIS BOURGEOIS, St. Vallier, France. Filed Aug. 27, 1887. Serial No. 248,061. (No model.) Patented in France Nov. 5, 1886, No. 179,457; in Belgium May 9, 1887, No. 77,875; in Spain May 13, 1887, No. 11,111; in England May 13, 1887, No. 7,093, and in Italy May 21, 1887, No. 21,706.



Claim.—In a porcelain-kiln, the combination, with the outer wall and the furnace or furnaces, of an inner wall extending from the floor to near the roof of the kiln, and forming, with the outer wall and completely enveloping the firing-chamber, a heat-distributing chamber, said inner wall having heat-distributing openings in front of the furnace or furnaces only, said heating-chamber being open at top, and flues under the floor of the kiln communicating with the heat-distributing chamber and the firing-chamber, substantially as and for the purposes specified.

383,696. ELLIPTOGRAPH. HERMANN BOSSHART, Philadelphia, Pa., assignor of one-half to J. Walter Douglass, same place. Filed July 26, 1887. Serial No. 245,481. (No model.)

Claim.—1. An improved elliptograph having a feathered rod with an adjustable collar on its lower extremity, to which are fitted two or more shouldered needle-points, a plate with a hub mounted on said rod, a spring secured to said hub and extending through said plate for holding the same in any position vertically on said rod, a sleeve mounted

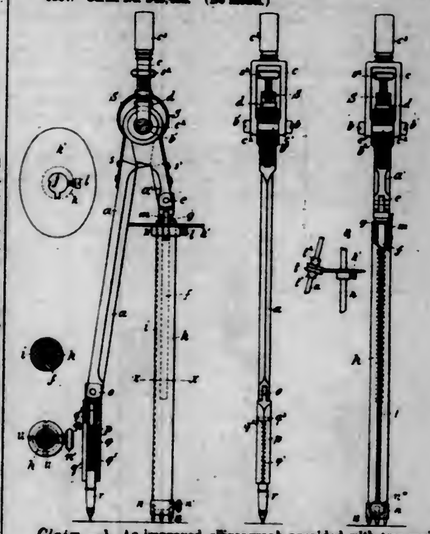
383,696.

on the upper portion of said rod, a spring-leg suitably secured to said sleeve, a leg hinged to said spring-leg, and a drawing attachment supported by said hinged leg and guided by said spring-leg, substantially as and for the purposes set forth.

2. An improved ellipsograph having a feathered rod with a thumb-nut on its upper extremity and two or more shouldered needle-points fitted to a collar adjustably attached to the lower extremity of said rod, a disk having a hub formed integral therewith and mounted on said feathered rod, a spring for holding the same in a vertical position thereon, a sleeve provided with upper and lower hubs suitably mounted on the upper portion of said rod, whereby a rotary movement thereof is obtained, a spring-leg secured to said sleeve, a short leg hinged to said spring-leg, and a pen or pencil attachment held in position by said short leg and supported by said spring-leg, substantially as and for the purposes set forth.

3. An ellipsograph having a feathered rod with a sleeve mounted upon the upper portion thereof, one or more shouldered needle-points suitably attached to the lower extremity of said rod, a plate fitted to said feathered rod, and means for retaining it in position thereon, in combination with a spring-leg attached to said sleeve provided with an adjusting-screw, a short leg which has integral therewith a tube hinged to said spring-leg, and a pen or pencil attachment supported in position by said legs, substantially as and for the purposes set forth.

4. An improved ellipsograph having a feathered rod with a nut on its upper extremity formed integral with said rod, and two or more shouldered needle-points secured to a collar adjustably attached to the lower extremity of said feathered rod, a disk with a narrow groove formed in the interior surface thereof, a spring for retaining said device in a vertical position on said rod, a sleeve mounted on the upper portion of said rod, a spring-leg attached to said sleeve and hinged to a second leg, a drawing attachment supported and guided by said legs, and means for adjusting said legs to any angle of inclination to said feathered rod, substantially as and for the purposes set forth.



5. An improved ellipsograph provided with a feathered rod, a plate or disk adjustably mounted on said rod, whereby the size of the figure to be drawn may be readily increased or diminished, and a sleeve journaled to said rod, in combination with a spring-leg with its adjusting-screw, a short leg hinged to said spring-leg, a drawing attachment supported by said legs, and a double guideway rigidly secured to said sleeve, whereby the lateral movement of the legs while the instrument is being manipulated is prevented, substantially as described.

6. An ellipsograph having a rod with a thumb-nut on its upper extremity and recesses formed in its lower extremity for the reception of shouldered needle-points held therein by a collar with a clamping-screw, an elliptical plate or disk combined with a hub fitting onto said rod, and a spring for holding it in position thereon, in combination with a sleeve suitably supported upon said rod, a spring-leg attached to said sleeve, with a screw for adjusting said spring-leg to the desired angle of inclination to said rod, a short leg hinged to said spring-leg and having formed therewith a tube with a slit running through the surface thereof, a pen or pencil attachment, the stem of which carries a pin, a helical spring coiled around said stem, and a bracket secured to said spring-leg, all arranged substantially as and for the purposes set forth.

7. An improved device for forming geometrical figures, having a feathered rod, a plate or disk with a hub mounted on said rod, a spring for holding said plate or disk and hub in position thereon, a sleeve mounted on the upper portion of said feathered rod, a spring-leg attached thereto and to a short leg having a tube with a vertical slit in the surface thereof, a drawing attachment with a stem having a pin secured thereto, and means, as described, for supporting said attachment in proper position while the instrument is being manipulated, substantially as described.

8. An improved device for forming geometrical figures, having a feathered rod and a sleeve supported in position thereon, a fulcrum attached to said sleeve, a guideway secured to said sleeve, a spring-leg secured to said sleeve and provided with an adjusting-screw, a tube formed integral with a short leg hinged to said spring-leg, and a drawing attachment supported in said short leg and guided by said spring-leg, substantially in the manner and for the purposes described.

383,697. ELLIPSOGRAPH. HERMANN DOMMANN, Philadelphia, Pa., assignor of one-half to J. Walter Douglass, same place. Filed July 30, 1887. Serial No. 245,622. (No model.)

Claim.—1. An improved ellipsograph provided with two main legs suitably hinged together, a shank carried by one of said legs, a sleeve mounted thereon carrying on its lower extremity one or more needle-points, a plate fitted to said sleeve, a short leg with a socket therein hinged to the opposite main leg, and a drawing attachment supported in said socket, substantially as and for the purposes set forth.

2. An improved ellipsograph provided with two legs of unequal length hinged together, a shank attached to the shorter leg and provided with a stationary collar upon its upper extremity, a sleeve secured to said shank, a latch for holding said sleeve to said shank, a plate or disk fitted to said sleeve, a collar carrying two or more points, and means for holding said collar to said sleeve, a short leg hinged to the longer leg with a bored-out interior and a pencil attachment suitably held in said leg, substantially as and for the purposes set forth.

3. An improved ellipsograph having two legs suitably hinged together, a bail with a handle located centrally thereon, in combination with a shank hinged to one of said legs, a sleeve mounted thereon, means for holding the same thereto, one or more shouldered points secured to the lower extremity of said sleeve, a plate or disk with a hub integral therewith mounted on said sleeve, and means for holding the same thereto, a socketed leg hinged to one of the main legs, and a drawing attachment suitably supported in said socket, substantially as and for the purposes set forth.

4. The combination, with a device provided with two legs hinged to each other, of a spring encircling the upper extremity of and secured to the sides of said legs, an adjusting-screw passing through said spring, and a cap-plate mounted on one of said legs, substantially as and for the purposes described.

5. The combination, with a device having two main legs suitably attached to each other and carrying a bail with a handle, of a shank secured to one of said legs and having a sleeve mounted thereon, a narrow groove extending through the surface thereof, a plate or disk

provided with a feather fitting into said groove, and means for holding said plate or disk in position thereon, a collar provided with one or more points attached to said sleeve, a leg provided with a socket hinged to the other main leg, and a pencil attachment suitably supported thereby, substantially as and for the purposes set forth.

6. An improved device consisting of two legs hinged to each other, a shank attached to one of said legs, a sleeve mounted thereon with one or more needle-points fitted to the lower extremity thereof, a plate or disk with a beveled-edge periphery, and a hub formed integral with said sleeve, a grooved wheel loosely mounted on the opposite leg, and a drawing attachment suitably supported by said leg, substantially as and for the purposes set forth.

7. An improved device for forming geometrical figures, consisting of two main legs suitably hinged together and carrying a bail having a handle, a shank jointed to one of said main legs with a fixed collar thereon, a sleeve mounted upon said shank, and a latch for holding said sleeve to said shank and permitting of the removal of the plate or disk held thereon, a narrow longitudinal groove in said sleeve, an elliptical plate or disk secured to a hub having a feather upon the interior surface thereof and fitting into said groove, a collar having one or more shouldered points, and means for securing said collar to said sleeve, and a drawing attachment supported by the opposite leg, substantially as and for the purposes set forth.

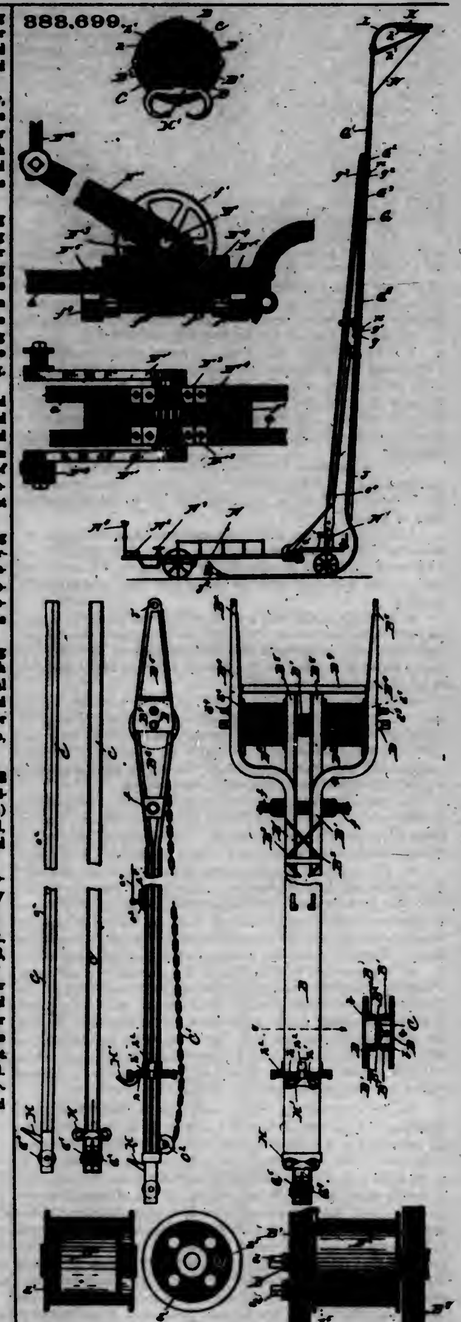
8. An improved device provided with two legs, a shank connected with one of said legs by means of a knuckle-joint, a sleeve mounted thereon carrying a plate having a beveled-off periphery, a grooved wheel with double hubs secured thereto and loosely mounted upon the opposite leg, a spring secured to the upper extremity of both of said legs, having an adjusting-screw, and a cap-plate, *d*, formed integral with one of said legs, substantially as and for the purposes set forth.

9. An improved device provided with two main legs, a short leg hinged to one of said legs and having the interior bored out, a narrow vertical slit in the surface of said short leg uniting with a transverse slit therein, a drawing attachment having a stem with a pin projecting therefrom, and a helical spring coiled around said stem, whereby said attachment may be elevated and supported by means of the pin in said transverse slit out of its operative position.

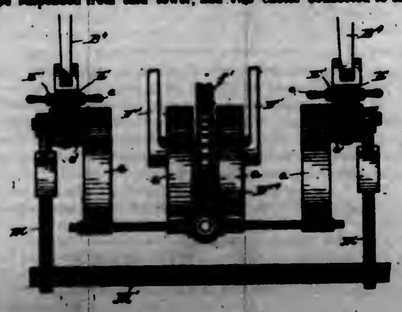
10. An improved device, substantially such as described, having a sleeve held by means of a latch to a fixed collar formed integral with a shank hinged to one of the legs thereof, and a narrow longitudinal groove formed in said sleeve, in combination with a plate or disk and a hub formed integral therewith, and with a feather upon the interior surface thereof, and means for adjusting said plate or disk to said sleeve, substantially as and for the purposes set forth.

388,698. COMPOSITION OF MATTER TO BE USED IN THE MANUFACTURE OF GRINDSTONES, &c. CHARLES F. BRADSHAW, Baltimore, Md. Filed Nov. 23, 1887. Serial No. 255,594. (No specimens.)

Claim.—1. A new composition of matter for the purpose described, which has for its base sulphur and powdered pumice-stone, combined substantially as specified.



2. A new composition of matter which consists of sulphur, pumice-stone, powered antimony, and bone-black, all combined substantially in the proportions set forth.



388,699. WATER-TOWER TRUCK. ABRAHAM BERGER, Jr., Chicago, Ill., assignor to H. Bruce Preston, same place. Filed Mar. 26, 1887. Serial No. 232,094. (No model.)

Claim.—1. The combination, with a trunk-frame, of a tower or derrick having vertically-adjustable pivots connecting the same to said trunk-frame, and mechanism for raising and lowering said tower or derrick, having a pivoted connection with said trunk-frame to enable such raising and lowering mechanism to automatically adjust or adapt itself to the position of the tower or derrick, substantially as specified.

2. The combination, with a trunk and water-tower, of a water-pipe suspended from said tower, and two cables connected to said water-pipe, one near its lower end and one above, for suspending and directing the water-pipe, said water-pipe being suspended wholly by said cables, and two guides for said pipe, either one or both of which may be used in directing the pipe, substantially as specified.

388,699.

3. The combination of a truck, a pivoted tower, an extensible mast having two pulleys near its upper end, a suspended water-pipe, and two cables connected to said pipe at different points for suspending and directing the same, two winding-drums for operating said cables, and two guides for said pipe, either one or both of which may be used in directing the pipe, substantially as specified.

4. The combination of a truck, a pivoted tower, an extensible mast having two pulleys near its upper end, a suspended water-pipe, and two cables connected to said pipe at different points for suspending and directing the same, two winding-drums for operating said cables, said cables having a swivel-connection with said pipe, and two guides for said pipe, either one or both of which may be used in directing the pipe, substantially as specified.

5. The combination of a truck, a pivoted tower, an extensible mast having two pulleys near its upper end, a suspended water-pipe, and two cables connected to said pipe at different points for suspending and directing the same, two winding-drums for operating said cables, said cables having a swivel-connection with said pipe, and a guide-yoke, H, near the top of said mast, and a second guide-yoke, H', near the top of said tower, substantially as specified.

6. The combination of a truck, a pivoted tower, an extensible mast having two pulleys near its upper end, a water-pipe and two cables connected to said pipe at different points, and two winding-drums for operating said cables, said cables having a swivel-connection with said pipe, a guide-yoke, H, near the top of said mast, and a swiveling guide-yoke, H', near the top of said tower, substantially as specified.

7. The combination, with tower and mast, of a water-pipe, a cable for suspending said water-pipe from the top of said mast, and a swiveling guide-yoke mounted on said tower near the top thereof, substantially as specified.

8. The combination, with tower and mast, of a water-pipe, two cables for suspending said water-pipe from the top of said mast, and a swiveling guide-yoke mounted on said tower near the top thereof, and a second guide-yoke near the top of said mast, substantially as specified.

9. The combination, with a truck, of a pivoted tower, an extensible mast, a cable-suspended water-pipe, and two guide-yokes for said water-pipe, one near the top of said mast and one near the top of said tower, nozzle K, flexible hose L, guide-rod *h*, pivotal arm *h'*, and cord or line N, substantially as specified.

10. The combination, with a truck, of a hollow straight pivoted tower consisting of plates B B, angle-plates B' B' B' B', and plates B^2 B^2, raising and lowering mechanism connecting said pivoted tower, and truck for raising and lowering the tower and holding it in different positions, and a telescopic mast fitting in the interior channel or guideway of said hollow tower, substantially as specified.

11. The combination, with a truck, of a pivoted tower consisting of flat plates and angle-plates riveted together to form an interior channel or guideway, and a telescopic mast consisting of a pair of channel-bars riveted together, back to back, substantially as specified.

12. The combination, with a truck, of a pivoted tower consisting of flat plates and angle-plates riveted together to form an interior channel or guideway, and a telescopic mast consisting of a pair of channel-bars riveted together, back to back, and a chain or cable for elevating said mast secured thereto and fitting or moving in the hollow space or channel in one of said channel-bars, substantially as specified.

13. The combination, with a truck, of a pivoted tower consisting of angle-bars and plates riveted together, said angle-bars being parallel to each other at the upper portion of the tower, and the angle-bars at the opposite edges of the tower being curved apart and forming two divergent arms at the lower end of the tower for pivoting the same to the truck, each of said divergent arms being formed of two curved angle-bars which are spread apart from each other in a plane transverse to the plane of the tower, substantially as specified.

14. The combination, with a truck, of a pivoted forked tower consisting of angle-bars B' B' B' B' and plates B^2 B^2 riveted together, the angle-bars at the opposite edges of the tower being curved apart in the plane of the tower, forming two divergent curved arms, B^4 B^4, at the lower end of the tower for pivoting the same to the truck, each of said divergent arms B^4 B^4 being formed of two of said curved angle-bars spread apart from each other in a plane transverse to the plane of the tower, pivot-pieces B^5 B^5, embraced between and secured to said transversely-spread curved angle-bars at the ends thereof, angle-plates B^6 and journal-plates B^7, secured to said transversely-spread curved angle-bars, division-bars B^3 B^3, extending between and parallel to said divergent arms B^4 B^4, transverse brace-bar B^8, to which the ends of said division-bars are secured, crank-shaft D, and winding-drums D^2 D^2, mounted upon and between said divergent arms and division-bars, substantially as specified.

15. The combination, with a truck, of a pivoted forked tower consisting of angle-bars B' B' B' B' and plates B^2 B^2 riveted together, the angle-bars at the opposite edges of the tower being curved apart in the plane of the tower, forming two divergent curved arms, B^4 B^4, at the lower end of the tower for pivoting the same to the truck, each of said divergent arms B^4 B^4 being formed of two of said curved angle-bars spread apart from each other in a plane transverse to the plane of the tower, pivot-pieces B^5 B^5, embraced between and secured to said transversely-spread curved angle-bars at the ends thereof, angle-plates B^6 and journal-plates B^7, secured to said transversely-spread curved angle-bars, division-bars B^3 B^3, extending between and parallel to said divergent arms B^4 B^4, transverse brace-bar B^8, to which the ends of said division-bars are secured, crank-shaft D, and winding-drums D^2 D^2, mounted upon and between said divergent arms and division-bars, substantially as specified.

16. The combination of a truck and a pivoted tower, a telescopic mast and a water-pipe, a chain for raising the mast, a pair of cables for suspending the pipe, a crank-shaft journaled upon said tower near its lower end, having sprocket-wheel D' secured rigidly thereto, and winding-drums D^2 D^2, journaled loosely thereon, and crank-shafts d^3 d^4, for operating said drums, substantially as specified.

17. The combination, with a water-tower and a cable-suspended water-pipe, of a swiveling guide-yoke for said pipe, substantially as specified.

18. The combination, with a water-tower and a cable-suspended water-pipe, of a guide-yoke for said pipe, upper ring, A, and a circular ring or guideway, *h'*, for said guide-yoke to swivel upon, mounted upon said tower, substantially as specified.

19. The combination, with a truck, of a tower or structure mounted thereon, a pivot or shaft pivotally connecting said tower or structure with the truck, horizontal rotary shaft F, mounted on said truck and extending transversely across the same back of and parallel to the pivot of said tower or structure, crank-arm F', secured rigidly to said shaft F, and connecting-link F^3, pivoted at one end to said crank-arm and at its other end to said pivoted tower or structure, said arm F' and link F^3 together constituting a toggle connecting the said fixed shaft F with the ladder, substantially as specified.

20. The combination, with a truck, of a pivotal tower or structure mounted thereon, a pivot or shaft pivotally connecting said tower or structure with said truck, horizontal shaft F, mounted on said truck and extending transversely across the same back of and parallel to the pivot of said tower or structure, crank-arm F', secured rigidly to said shaft F, and connecting-link F^3, pivoted at one end to said crank-arm and at its other end to said pivoted tower or structure, worm-shaft f^3, having worm f^3, said shaft F having a gear, f', meshing with said worm f^3, said arm F' and link F^3 together constituting a toggle connecting the said fixed shaft F with the ladder, substantially as specified.

21. The combination, with a truck, of a pivoted tower or structure mounted thereon, a shaft, F, crank-arm F', and pivoted link F^3 for raising the same, said shaft having a gear, f', and a worm, f^3, said shaft F being journaled on a laterally swinging or swiveling housing, F^4, substantially as specified.

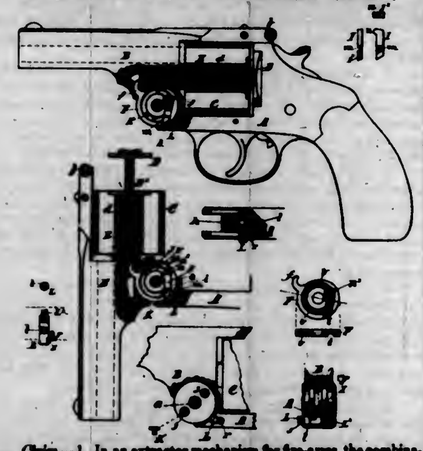
22. The combination, with truck A, of a pivoted tower or structure, B, mounted thereon, the pivots of said tower being vertically adjustable on said truck, shaft F, having crank-arm F' secured thereto, pivoted link F^3, connecting said crank-arm and tower, worm-gear f', secured to said shaft F, shaft f^3, having worm f^3, meshing with said gear f', and block or housing F^4, pivotally connected to said shaft f^3, said shaft F being journaled on said block F^4, substantially as specified.

23. The combination, with truck A, of a pivoted tower or structure, B, mounted thereon, the pivots of said tower being vertically adjustable on said truck, shaft F, having crank-arm F' secured thereto, pivoted link F^3, connecting said crank-arm and tower, worm-gear f', secured to said shaft F, shaft f^3, having worm f^3 meshing with said gear f', and a block or housing, F^4, pivotally connected to said shaft f^3, said shaft F being journaled on said block F^4, and shafts f^5 f^6, connected by bevel-gears with said shaft f^3, substantially as specified.

383,700. ANIMAL-TRAP. JAMES BEMER, Oakland, Cal. Filed Feb. 16, 1888. Serial No. 264,321. (No model.)

Claim.—1. An animal-trap consisting of a collapsible inclosure of wire-netting secured to corner-posts, and having openings in all of its sides, the frames *b*, surrounding said openings, solid glass doors suspended within the openings, and mirrors inside of the inclosure and back of each door, substantially as described.

2. An improved animal-trap consisting of an inclosure made of wire-netting adapted to be rolled up when not in use, said inclosure



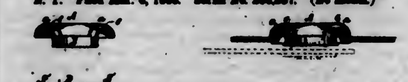
383,700.

having openings on all sides, solid glass doors suspended in said openings and adapted to swing inward, and mirrors fixed in the ground inside of the inclosure and in line with the doors, as herein described.

383,701. REVOLVING FIRE-ARM. HIRAM H. CALDWELL, Worcester, Mass., assignor to the Harrington & Richardson Arms Company, same place. Filed Mar. 7, 1888. Serial No. 266,651. (No model.)

Claim.—1. In an extractor-mechanism for fire-arms, the combination, with the barrel-hinge stir, the finger-disk mounted to swing on the hinge-pivot between said ears, and the finger-disk stop-bolt supported in said finger-disk to be retracted or projected beyond the periphery thereof, of two studs supported in the side of said barrel-hinge ear with their ends extending into the recessed side of said finger-disk at positions to respectively engage and operate said stop-bolt, one when the barrel is tilted forward and the other when the barrel is swung back to normal position, substantially as set forth.

2. In an extractor mechanism for fire-arms, the finger-disk having the groove *i*, with a recess, *n'*, in the side thereof, in combination with the longitudinally-movable stop-bolt I, fitted to slide free within said finger-disk groove, and having a lug, *n*, projecting from its side into said recess *n'*, together with studs borne by the hinge-ear and entering the groove to operate said stop-bolt, substantially as and for the purpose set forth.

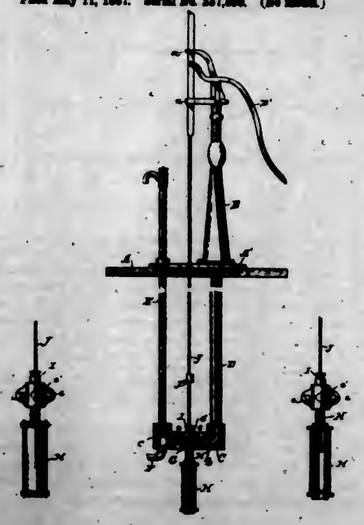


3. The combination, with the frame and barrel-hinge, shell-extractor, and extractor-spring, in a fire-arm, of the grooved finger-disk, the stop-bolt having a notch or shoulder, *n*, fitted within said finger-disk with one of its ends projectable from the periphery thereof, two studs carried by the barrel-hinge, which engage and move said stop-bolt, and an intercepting-stud supported in the frame adjacent to the periphery of the disk, against which said stop-bolt is arrested for effecting lifting action of the extractor, substantially as set forth.

4. The combination, substantially as described, with the frame and barrel-hinge, shell-extractor stem, and extractor-spring, in a fire-arm, of the finger-disk F, the stop-bolt I, fitted in said finger-disk and having a shoulder, *n*, and laterally-beveled outer end, two studs, J and K, fixed in the barrel-hinge, and the spring-actuated intercepting-stud L, having the notch *l* and supported in the frame A adjacent to the periphery of said finger-disk for engaging the end of the stop-bolt, for the purposes set forth.

5. In a fire-arm of the class described, the fire-end of the frame provided with the recess or groove A, in combination with the barrel-hinge, extractor-finger disk carrying a stop-bolt the end of which works in said groove, and the laterally-movable spring-pressed intercepting-stud arranged across said groove, substantially as set forth, whereby the stop-bolt is protected by inclosure within the frame.

6. In an extractor-operating mechanism for fire-arms, the combination, with the finger-disk F and stop-bolt I, beveled on its outer end, of the spring-pressed intercepting-stud L, supported in the frame for engaging said stop-bolt, and having the notch *l*, the spring L' at the end of said stud, and the stud-retaining screw *r*, for the purposes set forth.



383,702. GLOVE-FASTENER. DANIEL A. CARPENTER, New York, N. Y. Filed Mar. 6, 1888. Serial No. 266,367. (No model.)

Claim.—1. In the spring member of a fastening device, the combination of the portion A, having the concavo-convex ring *a*, and slits *c c*, extending in opposite directions from the opening *b*, whereby is formed a pair of yielding jaws inclosed by an annular spring, and the eyelet B, the sides of the opening *b* being drawn downward to the tubular part of the eyelet and adapted to alternately engage and release a stud, substantially as and for the purpose described.

2. In the spring member of a fastening device, the spring portion A, having the concavo-convex ring *a*, an eyelet, B, with a concavo-convex flange conforming to the ring *a*, said spring portion having an opening, *b*, with yielding sides, which are drawn downward to the tubular part of the eyelet and adapted to alternately engage and release a stud, and a washer, D, drawn up, substantially as shown, to fit the recess on the under side of the flange of the eyelet, said parts being severally constructed and combined in the manner and for the purpose set forth.

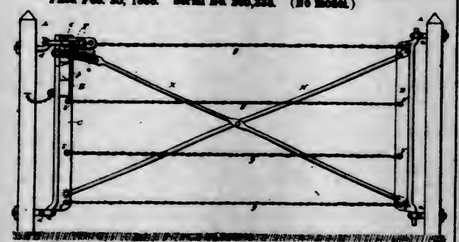
383,703. FORCE-PUMP. GEORGE A. CARTER, Des Moines, Iowa. Filed May 11, 1887. Serial No. 237,889. (No model.)

Claim.—1. In a force-pump, the combination, with a hollow distributing-base, of a hollow bracket removably secured to the same, and the main cylinder screwed into and suspended entirely below said bracket and easily removable from the same and the distributing-base, substantially as and for the purposes set forth.

2. In a force-pump, the combination of the hollow distributing-base C, the hollow bracket G, removably attached to said distributing-base, the pump-cylinder H, screwed into said bracket, and the pump-rod J, passing through said bracket, substantially as set forth.

3. In a force-pump, the combination, with a hollow bracket, G, supporting the removable pump-cylinder H and provided at its upper end with a stuffing-box, I, through which the jointed pump-rod J passes, of the distributing-base C, air-chamber D, and discharge-pipe E, substantially as described.

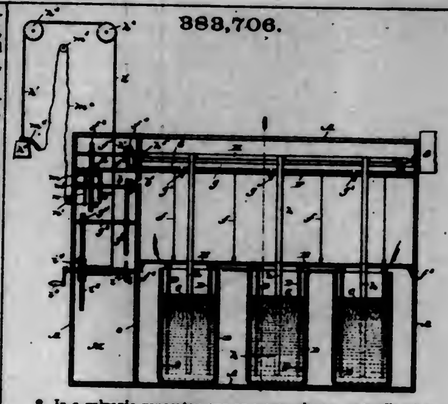
383,704. APPARATUS FOR DISTILLING WATER. PASCAL B. CHARBONNEAU, Bay City, assignor of one-half to Thomas H. Smith, East Saginaw, Mich. Filed Apr. 28, 1888. Renewed Aug. 1, 1887. Serial No. 245,255. (No model.)



Claim.—1. In a water-distilling apparatus, the combination, with an evaporating-chamber, *a*, a condensing-chamber, *b*, above the said chamber *a*, and a cold-water reservoir, *d*, located above the said chamber *b*, of a spout, *r*, projecting from and opening into the said chamber *a*, and a feed-pipe, *s*, connected with the cold-water reservoir *d* and leading to the said spout *r*, and provided with a valve, *p*, substantially as and for the purpose specified.

2. In a water-distilling apparatus, the evaporating-chamber *a*, a receiving-chamber, *i*, over the said chamber *a*, a condensing-chamber, *b*, above the said chamber *i*, and a pipe, *n*, passing through the said chamber *i* and connecting the said chamber *b* with the chamber *a*, in combination with the conical deflecting-plate *e*, placed directly over the said pipe *n*, and the deflecting-plate *f*, forming the top of the said chamber *i*, and provided with the central opening *g*, and the outside openings, *h*, substantially as and for the purpose set forth.

3. In a water-purifying apparatus, the combination of an evaporating-chamber, *a*, and a condensing-chamber, *b*, located directly over



383,705. WIRE GATE. ARMENIS J. COUNTS, Green Bay, Wis. Filed Feb. 25, 1888. Serial No. 265,236. (No model.)

Claim.—A wire gate consisting of a hinge-bar, B, and fastening-bar C, connected by wires and having braces H K crossed and fastened at their intersection and to said hinge-bar, the fastening or stretcher bar being pivotally connected near its lower end to the brace H and adjustably connected at its upper end to the brace K by the pin *s* and slot *n*, with suitable means, substantially as described, for securing said hinge-bar and fastening or stretcher bar to the gate-posts.

383,706. GALVANIC BATTERY. HARRY R. COX, Chatteris, Ohio, assignor to George Clarke Cox, same place. Filed Dec. 17, 1887. Serial No. 258,333. (No model.)

Claim.—1. The herein-described means for preventing polarization in galvanic generators, which consists in one or more agitators extending into the electrolyte, a train of gears connected with said agitators, and a source of power, whereby said agitators are actuated through the medium of said gears, substantially as described.

383,706.

2. In a galvanic generator, one or more agitators extending into the solution or electrolyte, a rocking shaft, a train of gears, and a suitable source of power connected with said gears, whereby the agitator or agitators are actuated by the power through the medium of the gears and rocking shaft, substantially as described.

3. In a galvanic generator, a suitable frame, one or more cells containing a suitable electrolyte, a rocking shaft journaled in said frame, and one or more agitators secured to the said shaft and extending into said electrolyte, in combination with a train of gearing connected with the rocking shaft, and a weight to actuate said gearing, substantially as described.

4. In a galvanic generator, the combination of one or more cells containing suitable electrolyte, electrodes removably located in the electrolyte, a winding-shaft connected with the electrodes, a train of gearing, a source of power to actuate the gearing, and a laterally-movable gear-wheel, whereby the gearing is connected and disconnected with the winding-shaft, substantially as described.

5. In a galvanic generator, the combination of one or more bifurcated agitators extending into the electrolyte, a shaft carrying the bifurcated agitators, a train of gearing connected with the shaft, and a source of power to actuate said gearing and agitators, substantially as described.

6. In a galvanic generator, the combination of the electrolyte, plates or electrodes extending into the same, a winding-shaft, agitators extending into said electrolyte, a train of gearing normally connected with said agitators, a source of power, and a laterally-moving gear-wheel, whereby the power is connected with the raising-shaft to lift the electrodes from the electrolyte, substantially as described.

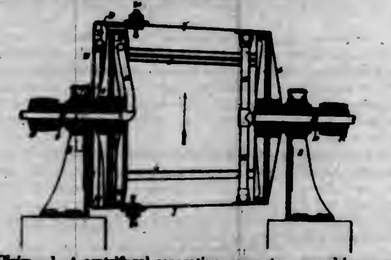
7. In a galvanic generator, the electrolyte, plates or electrodes, a raising device, and agitators extending into said electrolyte, in combination with a train of gearing normally connected with the agitators, a source of power to operate said gearing, and a laterally-moving gear-wheel, whereby said gearing is disconnected with the agitators and connected to raise the electrodes from the electrolyte, substantially as described.

8. In a galvanic generator, the combination of the electrolyte, the electrodes, a raising or winding shaft, agitators extending into the electrolyte, a weight, a train of gearing actuated by the weight, said gearing normally actuating the agitators, and a movable shaft connected with the weight, whereby, when said weight reaches a certain point, the gearing is disconnected with the agitators and thrown into gear with the winding-shaft, for the purpose described.

9. In a galvanic generator, the combination of the electrolyte, the electrodes secured to a suitable frame, a winding or raising shaft, one or more agitators secured to the same and extending into the electrolyte, a train of gearing normally actuating the agitators, a weight to actuate the gearing, and a longitudinally-movable shaft connected with the weight, whereby the agitators are thrown out of gear with the driving-power, and the electrodes are raised from the electrolyte when it is desired that the generation be discontinued, substantially as described.

10. The combination, with a rocking shaft and a winding-shaft, of a drum, a rope, cord, or wire wound thereon, and provided with a driving-weight at its opposite end, a longitudinally-movable shaft, gearing connecting the shaft and the drum, gearing connecting the movable shaft and rocking shaft, a spring to hold the movable shaft in gear with the rocking shaft, and a lever secured to the movable shaft and connected with the driving-weight, whereby the movable shaft is thrown out of gear with the rocking shaft and in gear with the winding-shaft, substantially as described.

11. In a galvanic generator, the combination of the electrolyte, a rocking shaft, one or more agitators secured to the rocking shaft and extending into the electrolyte, a crank upon one end of the rocking shaft, a crank-shaft connected with the crank upon the end of the rocking shaft, a train of gearing to drive said crank-shaft, and a weight to drive the train of gearing, substantially as described.



12. The combination, with the winding-shaft and rocking shaft, of cranks to drive the rocking shaft, a longitudinally-movable shaft normally driving the crank-shaft and provided with gearing to drive the winding-shaft, gearing and a weight to drive the movable shaft, a lever to throw the movable shaft out of gear with the crank-shaft and in gear with the winding-shaft, and a cord and spring, whereby said lever is connected with the weight, substantially as described.

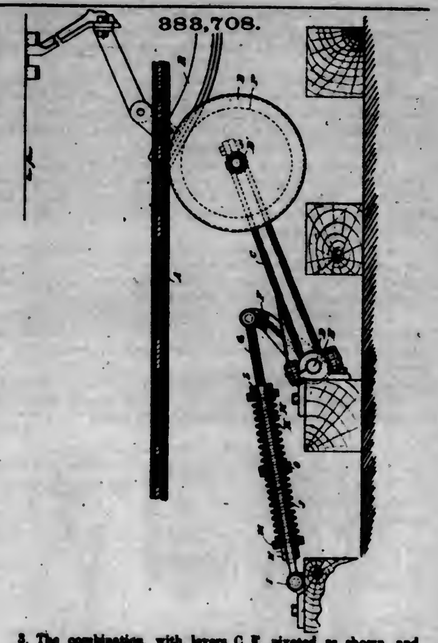
13. In a galvanic generator, the combination, with the electrolyte, of one or more agitators extending into the same, and a suitable source of power connected with the agitators, whereby the same are given a to-and-fro motion within the electrolyte, for the purpose described.

14. In a galvanic generator, the combination, with the electrolyte and electrodes removably located in the same, of gearing, a suitable source of power to actuate said gearing, and a laterally-movable gear-wheel, whereby said gearing is connected to raise the electrodes from the electrolyte, substantially as described.

15. In a galvanic generator, the combination, with the electrolyte, the electrodes removably located in the same, and agitators extending into the electrolyte, of gearing normally actuating the agitators, a source of power to drive the gearing, and a laterally-moving gear-wheel, whereby said gearing is disconnected with the agitators and connected with the electrodes to raise the same from the electrolyte, substantially as described.

383,707. CENTRIFUGAL APPARATUS FOR SEPARATING OILS. ARCHIBALD F. CRAIG, Paisley, ALEXANDER RUSSELL, Inbermuir, County of Renfrew, and JAMES GOODALL, Pumpherston, County of Mid-Lothian, Scotland. Filed July 21, 1887. Serial No. 244,893. (No model.) Patented in England Mar. 10, 1887, No. 3,817.

Claim.—1. A centrifugal separating apparatus comprising a rotary vessel with its axis horizontal and having a body with disks at both ends, the disks having bosses or shafts, an axial feed-pipe with rotating radial branches inside of the vessel, a channel or guard, and a stationary pipe with its entrance within such channel or guard for delivering the lighter oil or other liquid, and a second channel and stationary pipe projecting into it for delivering the heavier oil or other liquid, all substantially as described.



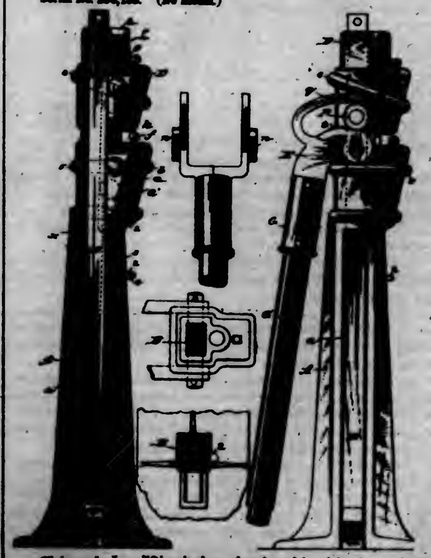
2. A centrifugal separating apparatus comprising a rotary vessel with its axis horizontal and having end disks, a feed-pipe, an annular plate, 21, outside one of the end disks to form a channel, 20, this end disk having openings near its periphery, a pipe projecting into the channel 20 to deliver the heavier liquids, and a pipe on the other side of the end disk to deliver the lighter liquid.

3. A centrifugal separating apparatus comprising a rotary vessel with its axis horizontal and having end disks, one of which, 6, has a channel, 18, on its inner side and is perforated near its periphery, an annular plate, 21, outside of the disk to form a channel, 20, a feed-pipe, an axial delivery-pipe projecting into the channel 18, and a delivery-pipe projecting into the channel 20, all substantially as set forth.

383,708. CABLE-SUPPORTING SHEAVE FOR CABLE RAILWAYS. GEORGE C. GRANT, New York, N. Y. Filed Feb. 25, 1888. Serial No. 265,302. (No model.)

Claim.—1. In a cable-supporting device, the combination of a sheave to receive the cable, a lever carrying said sheave, and a spring connected to said lever for upholding said sheave, so that the lever and the spring-connection have a differential movement, substantially as and for the purposes set forth.

2. The combination of the guard-rail B, carried by a car, the cable, the lever pivoted on the roadway, having both arms projecting on one side of its pivot, a cable-carrying roller carried by the arm, and a spring connected to the other arm, substantially as and for the purposes set forth.



383,708.

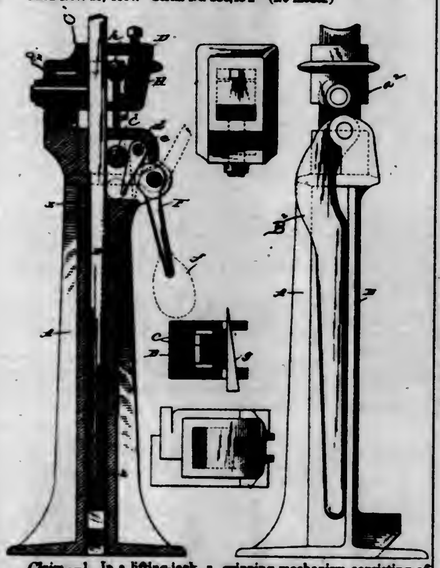
3. The combination, with levers C F, pivoted as shown, and adapted to operate substantially as described, of frame H, pivoted to the roadway, rod G, connected to arm F and sliding in said frame, a spring guided in said frame, and a follower on said rod for compressing said spring.

4. The combination, with lever C F, pivoted as shown, rod G, connected thereto, of a follower adjustable on said rod, and a spring held between said follower and an abutment fixed to the roadway, substantially as set forth.

383,709. LIFTING-JACK. LEWIS J. GREENLEAF, St. Louis, Mo., assignor of one-half to Andrew Warren, same place. Filed Nov. 26, 1887. Serial No. 256,128. (No model.)

Claim.—1. In a lifting-jack, a chambered head having a channel

for the lifting-bar, said chamber being formed with a rear inclined wall and opening directly into the channel, a roller in said chamber, and a spring-pin in a recess in the head bearing upon the roller, substantially as described.



2. In a lifting-jack having a standard provided with a holding-grip and a head provided also with a grip, a lifting-bar and a lifting-lever pivoted on the standard and provided with a cam-surface fitted to bear against a projection on the head and thus to lift the head as the lever rises, substantially as described.

3. In combination, the standard and its grip, the lifting-bar, a head also having a grip, and a lever pivoted on the standard and provided with a cam-surface fitted to bear against a projection on the head to lift the head as the lever rises, and a loop over the projection, substantially as described.

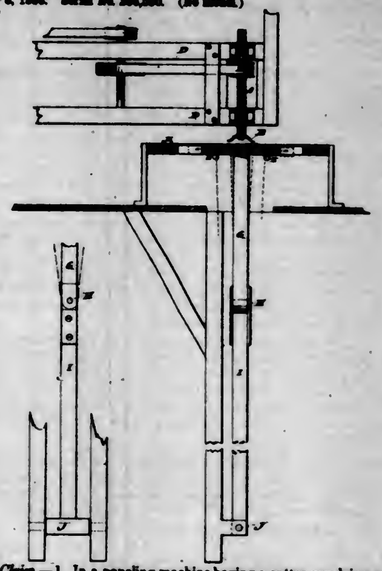
4. In a lifting-jack and in combination, a channeled standard having a chamber formed with an inclined rear fixed wall, a gripping-roller and a lifting-bar tapering from the upper end downwardly, and a suitable lifting-head and lever, all substantially as described.

5. In a lifting-jack having a standard provided with a holding-grip and a head provided with a grip, a grooved and tapered lifting-bar and suitable operating means for lifting said bar, substantially as described.

388,710. LIFTING AND LOWERING JACK. LOUIS J. CRESSLINE, St. Louis, Mo., assignor of one-half to Andrew Warren, same place. Filed Nov. 25, 1887. Serial No. 256,134. (No model.)

Claim.—1. In a lifting-jack, a gripping mechanism consisting of a movable plate in the gripping-chamber, arranged opposite the face of the lifting-bar, a roller interposed between said plate and the bar, and a holder in rear of said movable plate, whereby the plate may be caused to move and the bar and its weight be lowered, substantially as described.

2. In combination, in a lifting-jack, the lifting-bar, the hinged plate, the interposed roller, and a holder for said plate, all substantially as described.

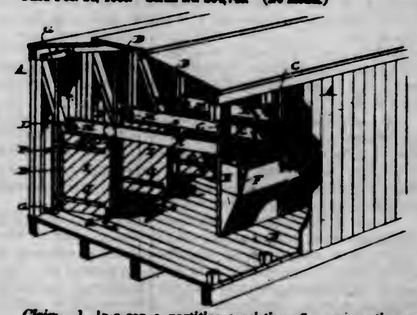


3. In combination, in a lifting-jack, the lifting-bar, the movable plate, the interposed roller, and holder consisting of the cam-lever bearing on the rear of the movable plate, forming a holder therefor, all substantially as described.

4. In combination, in a lifting-jack, the lifting-bar, the movable plate, the interposed roller, and the cam-lever forming a holder for the movable plate, the parts being arranged, as described, with the bearing-point of the cam on the rear face of plate in line with the center of the roller and that of the pivot of the cam-lever.

5. In combination, in a lifting-jack, a grip and a lifting-bar having a taper from upper to lower part, substantially as described.

6. The combination, in a lifting-jack, of a lifting-bar, B, having a tapered channel, the movable plate *d*, the interposed roller C, the holding-lever for the movable plate, and a lifting-head provided with a stationary plate, H, having an inclined front face, with a roller interposed between it and the lifting-bar, substantially as described.



388,711. PANELING-MACHINE. JOHN A. DAHL, New Haven, Conn., assignor to the Dahl Bros. & Company, same place. Filed Mar. 4, 1882. Serial No. 268,892. (No model.)

Claim.—1. In a paneling-machine having a cutter revolving upon a vertical axis, the combination therewith of a holder beneath the cutter adapted to receive the work, the said holder hung below upon two different axes, the said axes at an angle to each other, substantially as described, and whereby said holder may swing beneath the cutter transversely upon one axis and longitudinally upon the other, substantially as described.

2. In a paneling-machine having a cutter revolving upon a vertical axis, the combination therewith of a holder beneath the cutter adapted to receive the work, the said holder hung below upon two different axes, the said axes at an angle to each other, with a former surrounding said holder, the said holder adapted to work against the edges of the former, substantially as described.

388,712. RAILWAY-CAR. CHARLES A. DAVIS, Washington, D. C. Filed Feb. 21, 1882. Serial No. 264,740. (No model.)

Claim.—1. In a car, a partition consisting of a rear section extending from the rear wall of the stall-space partially across said space and adapted to fold against said rear wall, and an independently-removable continuous section above and in line with said rear section, adapted to be raised vertically to the upper part of the car.

2. In a car, the combination of a partition and a laterally-yielding support for the end of said partition, whereby it is adapted to yield laterally.

3. In a car, a partition consisting of a hinged rear section extending partially across the stall-space, and an upper section extending entirely across said space, the two sections being provided with connecting devices, substantially as described and shown, whereby they may be connected and caused to act in unison in resisting side pressure or independently stowed away.

4. In combination with hinged partition-section I and partition board or section K, a pin extending from one into a socket in the other and serving to connect the two while in use, but to permit their ready separation.

5. In a car, the combination of a rear partition-section hinged to swing horizontally against a wall of the car, a partition board or section immediately above and in line with the rear section, extending entirely across the space to be partitioned and free to be raised and lowered at both ends, a fixed support to which one end of the partition-board or upper section is attached, and posts or supports between which the opposite end of said board is passed.

6. In a car, the combination of a vertical rod at one side and posts or supports at the opposite side of the space to be partitioned, a rear partition-section hinged to said rod and arranged to swing laterally, and a partition board or section above and in line with the rear section, provided at one end with an eye to encircle the rod and having its other end extended between and sustained by two of the posts or supports.

7. In a car, the combination of a vertical rod at one side of the space to be partitioned, posts or supports at the opposite side thereof, and a partition-board provided at one end with a swivel-eye encircling the rod, whereby the board is rendered capable of being raised and lowered and turned about its longitudinal axis from a vertical to a horizontal plane, substantially as and for the purpose set forth.

8. In combination with rod B and posts C C, partition-board K, provided with a swivel-eye to encircle the rod, and a hanger or support in the upper part of the car to receive and support the partition-board.

9. In a car, the combination of a partition and an upright rod or support therefor capable of movement transversely to the length of the stall.

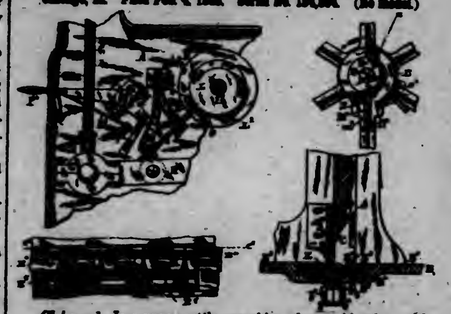
10. In a car, the combination of a partition, an upright or support therefor capable of movement transversely to the length of the partition, a guide or guides to limit said movement, and springs bearing against the movable support and serving to restore it to its normal position.

11. In a car, the combination of vertical rod B, posts C C, partition-section I, hinged to swing about said rod, and partition-board K, having an eye or loop to encircle the rod and extending between the posts C C.

12. In combination with rod B and with a partition supported thereby, a guide, P, to hold the rod in position and limit its lateral movement.

13. In combination with a vertical rod, B, and a partition hinged thereto, slotted support G, for said rod, provided with springs H, substantially as described and shown.

388,713. MEAT-CUTTER. PETER DEMBLER and WILLIAM DEMBLER, Philadelphia, Pa. Filed Apr. 26, 1887. Serial No. 236,143. (No model.)



Claim.—1. A meat-cutter consisting of a casing, a rotary blade, and a stationary slotted discharge-plate, the casing having on the inner face of its back a spiral throat and a stationary bed for the rotary blade, said throat and bed being integral portions of said back, and having a circumferential rim which is provided with lugs for holding the discharge-plate in position, said parts being combined and operating substantially as described.

2. A meat-cutter having a discharge-plate with slots E, one wall thereof being oblique, as at *d'*, and the opposite wall, *d²*, at right angles to the side of the plate, and the inner face of said wall *d²* having a pocket, *a*, and a rotary cutter, with mechanism, substantially as described, connected therewith for rotating the same, substantially as described.

3. A meat-cutter having a slotted discharge-plate and a rotary cutter with a cutting-blade, H, having the advance oblique face, *b*, and rear oblique face, *d*, with the cutting-edge *c* at junction of said faces *b* and *d*, said discharge-plate and rotary cutter being so secured within the casing of said meat-cutter as to be in contact, substantially as described.

4. In a meat-cutter, the combination of a casing, a rotary cutter with a blade having the oblique faces *b* and *d* and cutting-edge *c*, with a discharge-plate having tangential slots, one wall of each of the said slots being oblique, as at *d'*, and the opposite at a right angle to the side of the plate, as at *d²*, and, depressed, forming the pocket *a*, substantially as and for the purpose set forth.

388,714. PAPER-CUTTING MACHINE. EDWARD P. BORDEN, Chicago, Ill. Filed Feb. 4, 1886. Serial No. 191,094. (No model.)

Claim.—1. In a paper-cutting machine, the combination, with a movable cutter, of a bed or table, a laterally-movable bar, F', located in front of the cutter and supported and constructed to slide upon the said table, and a spring applied to throw the said movable section of the table toward the cutter, substantially as and for the purpose set forth.

2. In a paper-cutting machine, the combination, with a movable knife or cutter, and a table provided with an opposing stationary part or edge, of a laterally-movable bar, F', a spring applied to throw the said bar F' toward the stationary part of the table, and stops adapted to hold the said movable part or bar from contact with the stationary part of the table, substantially as described.

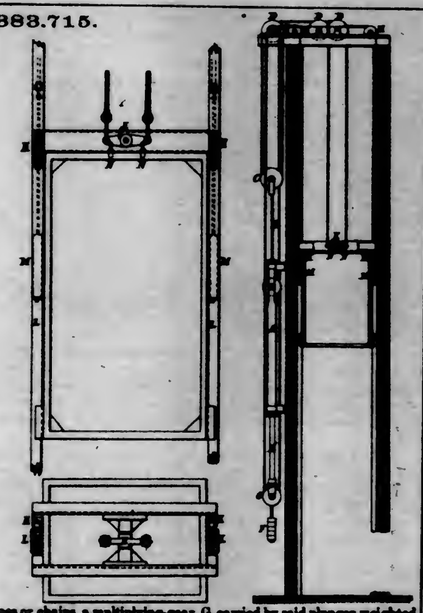
3. In a paper-cutting machine, the combination, with a movable knife or cutter, of a table comprising a laterally-yielding part or bar, F', made in separately-movable parts or sections, substantially as described.

4. In a paper-cutting machine, the combination, with a movable cutter, of a table made in two stationary parts, F² and F³, separated to form a slot, *b*, at the line of junction between the parts of the table, and provided with lugs *b'* *b²*, bolted together, for uniting the parts, substantially as described.

5. The combination, with the cutting lever H, for actuating the knife, and a clutch device connecting the driving-pulley with the driving-shaft of the machine, and comprising a dog, N, and a latch, M, of a cam-plate, O, adapted to operate said dog and latch, a sliding rod, P', supporting said cam-plate, a hand-lever, P', pivoted upon the machine-frame and connected with the said rod, an arm, P⁵, pivoted upon the said lever, with its free end in the path of the oscillating lever H, a latch, P⁴, pivoted upon the lever P' adjacent to its handle, and a rod, P⁶, connecting said arm P⁵ and latch P⁴, substantially as described.

6. The combination, with the driving-shaft F and the pulley P, and a clutch device for connecting said pulley and shaft, embracing a collar or sleeve, L, upon the shaft, provided with a notch or recess, L', and a movable dog, N, upon the pulley, constructed to engage said recess L', and a cam-plate, O, for actuating said dog, of a hand-wheel, Q, upon the driving-shaft, whereby the latter may be turned into position to prevent the engagement of the dog with the recess when said dog is released by the action of the cam-plate, substantially as described.

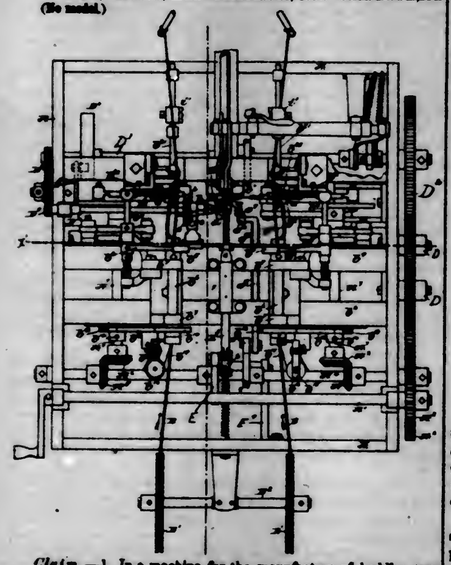
388,715. ELEVATOR. EDWARD R. ELLERSON, Westminster, England. Filed Nov. 2, 1887. Serial No. 254,163. (No model.) Patented in England Jan. 27, 1887, No. 1,180; in France Nov. 2, 1887, No. 183,721; in Belgium Nov. 4, 1887, No. 79,413; in Victoria Nov. 21, 1887, No. 5,488, and in New South Wales Nov. 28, 1887, No. 284.



Claim.—1. In combination with the guides L L, wedges K K, and the rocking cross-head E, attached to an elevator-cage, an elongated hydraulic cylinder, A, the plunger B B', carrying the multiplying drums or pulleys C C, and weights F, the guide-pulleys D H, and ropes or pulleys passing in duplicate over said multiplying-drums and guide-pulleys to the wedges and rocking cross-head, substantially as described.

2. The combination, with an elevator-cage having a rocking cross-head, E, for attachment of suspension ropes or chains, of the indicators N N, attached to said cross-head and depending into the cage, substantially as described.

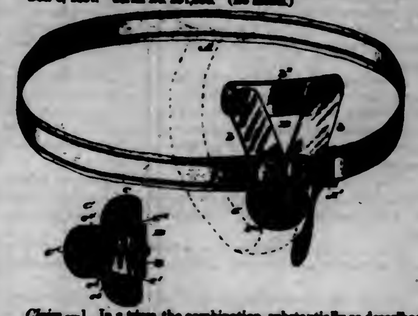
3. In combination with an elevator-cage having a rocking cross-head, E, the long vertical hydraulic cylinder A, the plunger B B', carrying a multiplying-gear, C, and weights F, the guide-pulleys D D, and ropes or chains passed in duplicate over said guide-pulleys from the multiplying-gear to the rocking cross-head, substantially as described.



4. In combination with an elevator-cage, its suspension ropes or chains, and an elongated vertical hydraulic cylinder having a plunger, B B', carrying a multiplying-gear for attachment of said suspension

388,715.

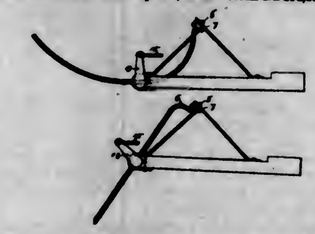
ropes or chains, a multiplying-gear, G, carried by said plunger, weighted brake-wedges K K, arranged on the cage, guide-pulleys H H, and an independent set of ropes or chains passed from the gear G over the pulleys H to said brake-wedges and moved uniformly with the suspension ropes or chains, substantially as described.



388,716. MACHINE FOR MAKING LOOM-HARNESS. THOMAS A. BENSON, Lawrence, Mass. Filed June 29, 1887. Serial No. 243,202. (No model.)

Claim.—1. In a machine for the manufacture of heddles, two parallel needles, C C, to contain the thread from which the heddles are to be made, the said needles being located in different horizontal and also in different vertical planes, and the two eye-formers, one of which is offset, as described, combined with two thread-twisters of different lengths, means, substantially as described, to operate the eye-formers and thread-twisters, whereby the threads are wrapped about the eye-formers and the latter are moved into position at the ends of the said needles, and eye-discharging devices co-operating with the said eye-formers, substantially as and for the purposes set forth.

2. In a machine for the manufacture of heddles, two parallel needles to contain the threads from which the heddles are to be made and to receive upon them the eyes of the heddles, the said needles being located in different horizontal and vertical planes, two thread-twisters one of which is longer than the other, two eye-formers one of which is offset with relation to the other, two sets of loop-dischargers located in different vertical and horizontal planes, and means, substantially as described, to operate the said needles, loop-twisters, eye-formers, and loop-dischargers, substantially as set forth.



388,717. TRUSS. ROBERT H. FARMER, Brooklyn, N. Y. Filed Dec. 6, 1887. Serial No. 257,259. (No model.)

Claim.—1. In a truss, the combination, substantially as described, of a pad-frame comprising an upper horizontally-arranged extended abdominal rest provided with a cushion or lining on its inner surface, and having a downwardly-depending pad-support constructed independent of and secured at an angle to said abdominal rest, and carrying a pad at the lower end thereof, having a spring-actuated pressure-block therein, and a waist belt or girth permanently secured to said support at one end and the other end thereof adapted to be removably attached thereto, the securement and attachment of said belt being at a point between the spring-pad and abdominal rest, but nearer the pad, whereby a positive securement of the pad-support and pad is obtained and the greatest pressure exerted upon the spring-pad.

2. The combination, with a truss, of the pad-supporting frame, consisting of angularly-arranged strips b and an upper strip, b', having a cushion or lining on its inner surface and adapted to rest against the abdomen, and a pad carried at the lower end of said frame and provided with a spring-actuated pressure-block or plunger, substantially as described.

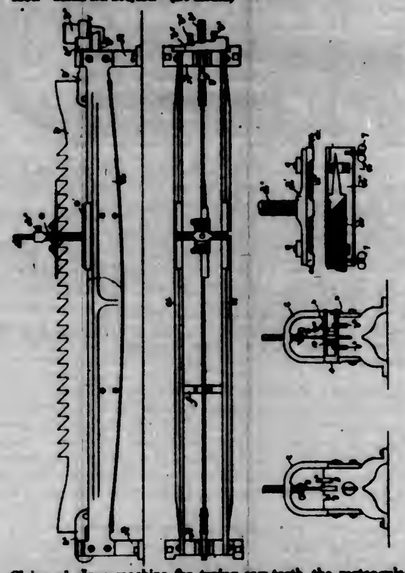
388,718. BUNDLE-CARRIER FOR HARVESTERS. GRANT J. PIER, Minneapolis, Minn. Filed Apr. 12, 1888. Serial No. 270,082. (Model.)

Claim.—1. In a bundle-carrier, a series of carrying-arms mounted in a suitable support by pivoted ends whose axial lines are oblique to the plane of the arms, in combination with a shaft having a series of transverse wedge-shaped slots, through which said arms pass, and means for turning said shaft on its axis, and thereby turning said arms on their pivots, substantially as described.

2. In a bundle-carrier for harvesters, the combination, with a series of carrying or holding arms mounted in a suitable support by pivoted ends whose axial lines are oblique to the plane of the arms and capable of a partial rotation on their axes to dump their load, of the supporting and operating rock-shaft located between the pivotal supports of the arms and their free ends, and provided with a series of transverse wedge-shaped slots, through which said arms pass, substantially as described, and for the purposes set forth.

3. In a bundle-carrier for harvesters, a series of carrying or holding arms mounted in a suitable support by pivoted ends whose axial lines are oblique to the plane of the arms, and provided near their upper ends with offset portions that move upward against the bundles as the arms are turned on their axes, in combination with operating mechanism for turning the said arms, substantially as described.

388,719. LACE PIN OR BROOCH. EDWARD B. GAUNT, Glasgow, Ky. Filed Sept. 9, 1887. Serial No. 249,353. (No model.)



Claim.—1. The combination, with a body-plate having at one end a sleeve and at the other end a cast, of a pin having an enlarged or flattened portion near its point.

2. The combination, with a body-plate having at one end a sleeve and at the other end a cone-shaped cast, and a spring secured to the end of the body-plate carrying the sleeve, said spring having a tooth or catch located thereon, of a pin having a collar near its outer end.

3. The combination of a body-plate having at one end a cone-shaped cast, a bolt or stud projecting from the small end of said cast, a sleeve secured at the other end of said plate, and a spring secured to the said plate near the sleeve, said spring provided at its free end with a curved projection and with an inwardly-inclined tooth or catch, with a headed pin having a flattened or enlarged portion near its point and a collar near its head, said collar having its inner face beveled.

388,720. MACHINE FOR TRUING THE TEETH OF SAWS. ROBERT GARDNER, Jr., Portland, New Brunswick, Canada. Filed Jan. 21, 1888. Serial No. 261,602. (No model.)

Claim.—1. In a machine for truing saw-teeth, the rectangular open frame adapted to support the saw-blade, straining devices for adjusting the blade to a suitable tension, combined with a file-carrier adapted to move longitudinally upon the side bars of the frame to true the teeth of the saw, substantially as described.

2. In a machine for truing saw-teeth, the frame-work adapted to receive and support the saw, and means for holding the same under tension, combined with a universally-adjustable file-carrier moving upon the frame, substantially as described.

3. In a machine for truing saw-teeth, the frame adapted to hold the saw, combined with the yoke, and a vertically-adjustable file-carrier movable longitudinally upon the frame, substantially as described.

4. In a machine for truing saw-teeth, the frame to hold and suspend the saw, combined with a file-carrier made vertically and transversely adjustable, and the yoke to which the file-carrier is attached, movable upon the frame longitudinally, substantially as described.

5. In a machine for truing saw-teeth, the frame recessed at each end to receive the saw, combined with means, as the key b^4, and wedge-block interposed between the key b^4 and frame to subject the saw to longitudinal tension, substantially as described.

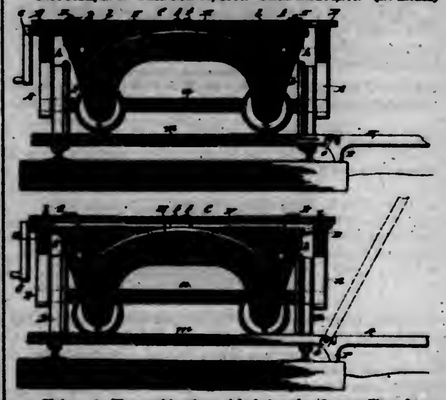
6. In a machine for truing saw-teeth, the frame recessed at each end to receive the saw, combined with means, as the key b^4, stepped wedge-block b^5, and the supports b^6, to regulate the tension of the suspended saw, substantially as described.

7. In a machine for truing saw-teeth, the frame provided at each end with notches or recesses of different depths to receive saws of different widths, substantially as and for the purposes described.

8. In a machine for truing saw-teeth, the frame, and straining devices adapted to hold and suspend the saw under a given tension, combined with a transversely-adjustable slotted file-carrier, substantially as described.

9. A file-carrier for truing saw-teeth, consisting of a clamp, d^2, adjustably attached to a plate fixed to a spindle, and fasteners, as set screws 7, to hold the file in position transversely in the said clamp, substantially as described.

388,721. MATCH-FRAME. GEORGE W. GATES, Oshkosh, Wis. Filed Feb. 17, 1887. Serial No. 227,852. (No model.)



Claim.—In a match-splint-holding press or frame, the combination of a number of slats concave on the one side and convex on the other, held permanently together with curved spaces between them, into which the splints are thrust and held, substantially as described.

388,722. MATCH PRESS OR FRAME. GEORGE W. GATES, Oshkosh, Wis. Original application filed Feb. 17, 1887, Serial No. 227,852. Divided and this application filed Sept. 1, 1887. Serial No. 248,591. (No model.)

Claim.—In a match-splint-holding press or frame, the combination of a number of slats having curved grooves or channels in their sides into which the match-splints are thrust and held at three or more points, substantially as described.

388,723. DEVICE FOR HANDLING CARS. GEORGE H. GRAY, Port Plain, N. Y. Filed Feb. 14, 1888. Serial No. 264,203. (No model.)

Claim.—1. The combination, with the truck, of an auxiliary frame mounted below the same and provided with wheels at right angles to the wheels of the truck, and means for raising and lowering said auxiliary frame, as set forth.

2. The combination, with a truck, of an auxiliary frame provided

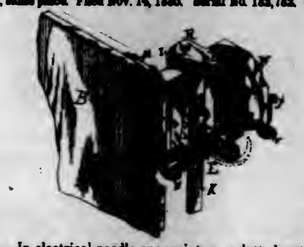
with wheels, means for raising and lowering said auxiliary frame, and supplemental rail-sections, substantially as set forth.

3. The combination, with a truck, of an auxiliary frame provided with wheels, springs suspending said frame in an elevated position, and means for lowering said frame, substantially as set forth.

4. The combination, with a truck, of an auxiliary frame provided with wheels, wedge-blocks, a differentially-threaded shaft moving said blocks, and an operating-crank, substantially as set forth.

5. The combination, with the truck and the auxiliary frame provided with wheels, of wedge-shaped blocks, differential screw-shaft moving said blocks, and springs connected to the truck and engaging the auxiliary frame, substantially as set forth.

6. The combination, with the truck and the auxiliary frame, of bolts connected to the latter and playing through openings in the truck-platform, and means for raising and lowering said auxiliary frame, substantially as set forth.

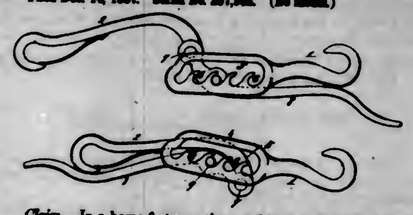


7. The combination, with the permanent track, of the rails N, provided with tongues and feet at their inner ends, and rails *n*, pivoted to said tongues, substantially as set forth.

383,724. DOOR-SECURER. GEORGE G. GREY, Adams, Mass. Filed Feb. 17, 1888. Serial No. 264,226. (No model.)

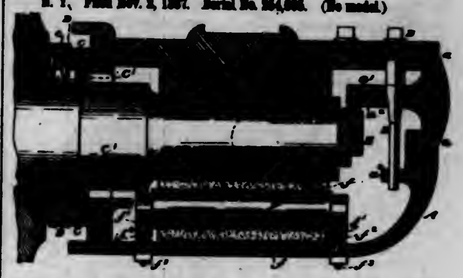
Claim.—The combination of an attaching-plate provided with a spur at an angle to the plate for engaging the door-casing, a brace-plate provided with a flange adapted to rest against the casing of the door, a fastener-plate provided with a flange adapted to engage the door, and a lift-plate between the brace-plate and the attaching-plate, said plates being hinged together at one end, the lift-plate being provided with a hole, and the attaching-plate being provided with a projection for engaging the hole of the lift-plate for holding the latter in position, substantially as described.

383,725. ELECTRICAL NEEDLE ANNUNCIATOR. WILLIAM R. GILL and RUDOLPH SCHNEIDAU, Chicago, Ill., assignors to John F. Wolbrank, same place. Filed Nov. 14, 1885. Serial No. 182,782. (No model.)



Claim.—In electrical needle annunciators, a slotted restoring-bar, in combination with weighted levers, the weighted ends of the weighted levers being in the slots, and being restored thereby to their normal position, substantially as described.

383,726. DETACHABLE CAR-SEAT ARM. JAMES A. GOBIN, Huntington, W. Va. Filed Nov. 7, 1887. Serial No. 254,537. (No model.)

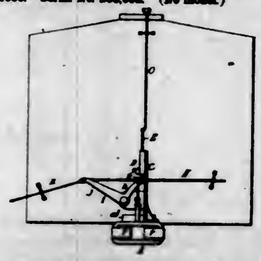


Claim.—The combination of the end pieces, B, of a car-seat and the keepers E, secured thereon, each consisting of a base portion, *e*, lug F, integral with said base, having reduced sides, and a head, *f*, with the back D, the arms C, secured thereto and having shanks *c*, perforated at their free ends by openings G, and having axial slots *g*, communicating with said openings and extending from the openings to the extremities of the arms, the opening G corresponding in diameter to the greatest width of lug F, and the slot *g* to the lesser diameter of said lug, all constructed and arranged substantially as and for the purpose described.

383,727. HAME-FASTENER. JOHN C. HACKNEY, St. Louis, Mo. Filed Dec. 14, 1887. Serial No. 257,982. (No model.)

Claim.—In a hame-fastener, the combination of hook 1, having slot 3, forming ears 4, ratchet-teeth 6 in the ears 4, hook 2, lever 8, pivoted to the hook 2, and arbors or journals 9 on the lever engaging the ratchet-teeth in the ears on hook 1, substantially as and for the purpose set forth.

383,728. CAR-AXLE BOX. JAMES M. HALLOWES, New York, N. Y. Filed Nov. 2, 1887. Serial No. 254,005. (No model.)



Claim.—1. The axle-box A, having the perforated lug a^4, combined with the door *a*, having the lug *a'*, provided with the tapered hole a^5, and the screw-bolt B, substantially as set forth.

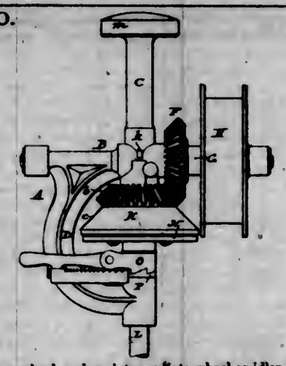
2. The axle and the packing-ring C, having the slot *c'*, combined with the circular plate C and screw *c*, substantially as set forth.

3. The axle and the packing-ring C, having the slot *c'*, combined with the plate C, screw *c*, and spring D, substantially as specified.

4. The axle-box A, combined with the interior end stop, E, and bolts *e*, substantially as set forth.

383,729. CAR-COUPLING. LORENZO H. HARRIS, Auburn, Ill. Filed Mar. 27, 1888. Serial No. 268,602. (No model.)

Claim.—1. In combination, an upright support or standard, the slide E, applied to work thereon, a coupling-pin attached to said slide, the weighted bell-crank lever projecting into said slide, and the rods M N O, all substantially as shown and described.



2. In combination, the slide E, with its support and coupling-pin, the bell-crank lever, its operating-rods, and the draw-head having the springs *r r* within its mouth, as set forth.

383,730. MACHINE FOR BORING, DRILLING, &c. HEZEKIAH C. HEISLEY, Richmond, Ind. Filed Feb. 6, 1888. Serial No. 263,762. (No model.)

Claim.—1. In a machine for boring, drilling, &c., the combination of the frame A, provided with a band-wheel, H, and a gear-wheel, F, adapted to rotate in unison, a tool-stock or spindle mounted in the frame and provided with a friction-wheel, N, and an idler encircling the spindle and adapted to engage with the wheels F and N.

2. In a machine for boring, drilling, &c., the combination, with a frame, of a band-wheel and a gear-wheel carried thereby and adapted to rotate in unison, a spindle or tool-stock mounted in the frame and

383,730.

provided with a wheel, and an intermediate wheel or idler journaled upon the spindle, substantially as shown, and adapted to impart motion from the gear-wheel to the wheel upon the tool-stock.

3. In combination with a frame, a band-wheel and a gear-wheel mounted thereon and adapted to rotate in unison, a tool-stock or spindle journaled in the frame, a gear or wheel carried by said tool-stock, and an idler loosely encircling the stock.

4. In combination with a frame, a band-wheel, H, and a gear-wheel, F, both mounted therein and adapted to rotate in unison, a tool-stock or spindle, a double-faced gear or wheel mounted loosely upon the spindle and adapted to remain in engagement with the gear-wheel F, a gear or wheel rigidly secured to the spindle, and a spring adapted to hold the spindle-wheel normally out of contact with the wheel F.

5. In combination with a frame, a band-wheel, H, and a gear, F, both mounted therein, a tool-stock or spindle, L, journaled in the frame and provided with a friction-wheel, N, a combined gear and friction wheel, K, loosely encircling the spindle, and a spring, M, serving to keep the wheels K N normally separated.

6. In combination with a frame, a band-wheel, H, and a gear, F, both mounted thereon, a tool-stock or spindle, L, journaled in the frame and provided with a friction-wheel, N, a combined gear and friction wheel, K, encircling the spindle, a spring, M, tending to keep the wheels K and N separated, and the collars O P, adapted and arranged to hold these wheels in engagement.

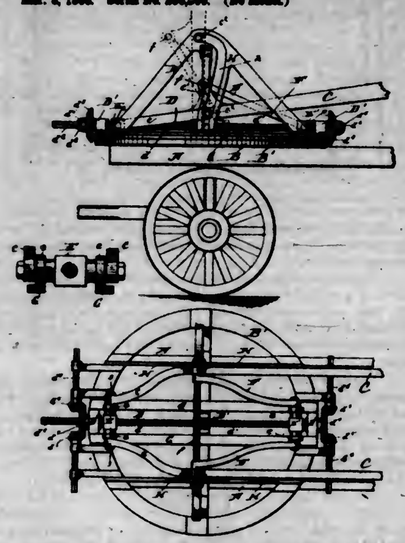
7. In combination with a frame, A, band-wheel H, and gear-wheel F, carried thereby, a tool-stock or spindle mounted in the frame and adapted to rotate and also to move longitudinally therein, a wheel secured rigidly to said spindle, and an idler loosely encircling the spindle and adapted to engage the wheel thereon as said spindle is moved relatively to the frame.

8. In combination with a frame, a band-wheel, H, and gear-wheel F, carried thereby, a tool-stock or spindle mounted in said frame, a wheel secured rigidly to the spindle, an idler encircling the spindle and adapted to engage the wheel thereon as the said spindle is moved longitudinally, a spring tending to keep the wheels upon the spindle separated, and a cam adapted and arranged, substantially as shown, to overcome the force of the spring and to hold the wheels in engagement.

9. In a machine constructed substantially as shown and described, the combination, with the frame, of a spindle, L, mounted therein and provided with a wheel, a sleeve, I, encircling the spindle and provided at its lower end with a collar, *a*, a nut, J, screwing upon the spindle, and a wheel mounted upon the sleeve and clamped between the nut and the collar.

10. In combination with frame A, provided with arms B and D, a spindle, L, mounted in said frame, a sleeve, I, encircling the spindle and provided with a collar, *a*, a wheel mounted upon the sleeve, a nut screwing upon the sleeve and provided with a series of notches, *j*, a pin, *k*, mounted in frame A and adapted to engage the notches, and a spring, *l*, bearing upon said pin, all substantially as shown.

11. In combination with frame A, a spindle, L, mounted therein, an idler encircling said spindle, and a wheel, N, secured rigidly upon the spindle and comprising hub *e*, plates *f g*, paper body A, and bolts *i*.



12. In combination with frame A, provided with a gear-wheel, F, a spindle mounted in the frame and provided with a conical friction-wheel, N, and a wheel, K, encircling the spindle and provided on its upper face with teeth *b* and with a conical shell, *c*, as and for the purpose set forth.

13. In combination with a frame, a spindle mounted and adapted to slide longitudinally therein, a conical friction-wheel, N, secured to said spindle and provided with a countersunk hub, and a conical friction-wheel, K, loosely encircling the spindle and provided with a hub to fit within the hub of the wheel N.

14. In a machine of the class described, the combination, with the frame A, having the upright arm C and tool-operating mechanism, of a fixed nut secured to the arm C, and a threaded stem passing through said nut and provided with a hand-wheel.

15. In combination with a shaft, I, threaded externally and provided at its lower end with a collar or flange, *a*, a wheel, K, mounted loosely upon the spindle and recessed at its upper end, and a nut encircling the spindle and serving to hold the wheel in place thereon.

383,731. TURN-TABLE EXTENSION-LADDER TRUCK. CHARLES HIMM, Chicago, Ill., assignor to Everett B. Preston, same place. Filed Mar. 5, 1888. Serial No. 266,500. (No model.)

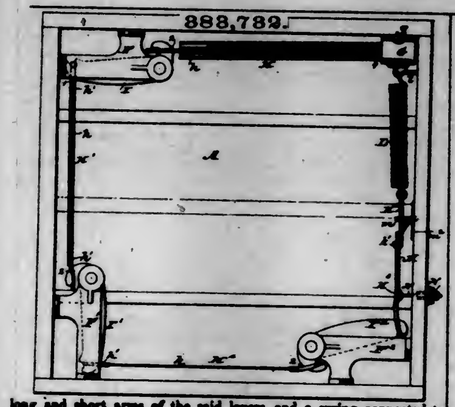
Claim.—1. The combination, with a turn-table truck, of guide-bars G G, right-and-left screw D, nuts E E', ladder C, pivoted to one of said nuts, and link F, pivoted to the other of said nuts and to the ladder, substantially as specified.

2. The combination, with a turn-table truck, of guide-bars G G, right-and-left screw D, nuts E E', ladder C, pivoted to one of said nuts, and link F, pivoted to the other of said nuts and to the ladder, said link F being longer than the distance between the two pivots on the ladder, substantially as specified.

3. The combination, with a turn-table truck, of guide-bars G G, right-and-left screw D, nuts E E', ladder C, pivoted to one of said nuts, and link F, pivoted to the other of said nuts and to the ladder, and guide-braces H H, secured to the turn-table on each side of the ladder, substantially as specified.

4. The combination, with a turn-table truck, of guide-bars G G, right-and-left screw D, nuts E E', ladder C, pivoted to one of said nuts, and link F, pivoted to the other of said nuts and to the ladder, said nuts E E' being furnished with friction-rollers to roll on said guide-bars G G, substantially as specified.

5. The combination, with a truck, of a right-and-left screw, a pair of nuts, a structure pivoted to one of said nuts, and a link pivoted at one end to said structure and at the other to the other of said nuts, substantially as specified.



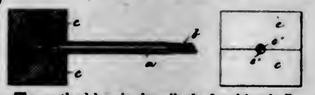
6. The combination, with a turn-table truck, of guide-bars G G, right-and-left screw D, nuts E E', ladder C, pivoted to one of said nuts, and link F, pivoted to the other of said nuts and to the ladder, and guide-braces H H, secured to the turn-table on each side of the ladder, said guide-braces H H having slots A A to receive a pivot projection or roller, *c'*, on the ladder, substantially as specified.

383,732. TEMPERATURE-REGULATOR FOR INCUBATORS. JOHN W. HILL, Valley Falls, Kans. Filed July 30, 1887. Serial No. 245,705. (No model.)

Claim.—1. A thermostat for incubators, consisting of a series of pivoted levers, and a series of thermostatic links connected directly to the long and short arms of the said levers, substantially as described, whereby provision is made for permitting the links to exert a pull when contracting, as set forth.

2. In a thermostat for incubators, the combination of a series of pivoted levers, a series of thermostatic links connected directly to the

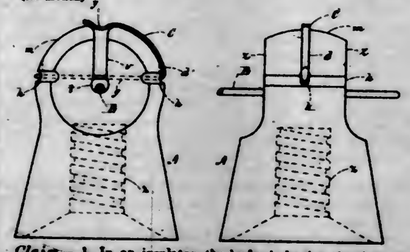
388,732.



long and short arms of the said levers, and a spring connected to the last link of the series and serving to actuate the links and levers when permitted by the expansion of the links, substantially as herein shown and described.

3. The combination, with the incubating-chamber provided with a valve, of a series of pivoted bell-crank levers, a series of thermostatic links connected to the long and short arms of the said levers, and intermediate mechanism between the said last link and the valve for operating the said valve, substantially as herein shown and described.

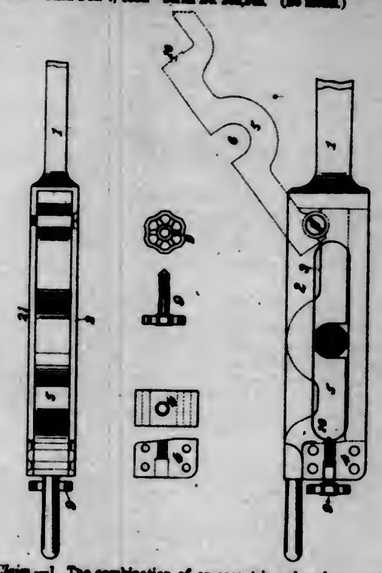
4. The combination, with the incubating-chamber provided with a hinged valve and egg-drawer in said chamber, of a series of bell-crank levers pivoted in the drawer, a series of thermostatic links connected to the long and short arms of the said levers, a spring, a link connecting the spring to the last link of the series, and intermediate mechanism for operating the valve by the expansion and contraction of the said links, substantially as herein shown and described.



5. The combination, with the incubator-drawer A, of the links H H' H² H³, the bell-crank levers I I' I², the spring L, the bell-crank lever M, the cord N, and a rod for operating the ventilator-valve or the index of a register supported upon the outside of the incubator, substantially as described.

388,733. METHOD OF MAKING HEDDLES. SALMON F. JENKINS, East Braintree, Mass. Filed Nov. 30, 1887. Serial No. 256,556. (No model.)

Claim.—The method herein described of making hollow needles, which consists in first constructing a hollow cylinder, then inserting an open end thereof between a series of reciprocating and rotating dies having tapering recesses, and laterally hammering and compressing the walls of the open end of the cylinder into a uniformly-tapered closed point, substantially as set forth.

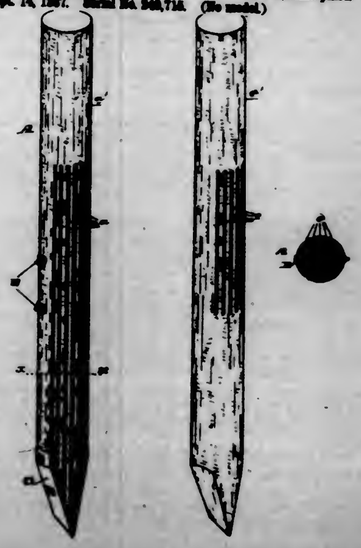


388,734. INSULATOR FOR ELECTRICAL WIRES. FRANK H. KETCH, Peterborough, N. H. Filed Feb. 3, 1888. Serial No. 262,898. (No model.)

Claim.—1. In an insulator, the body A, having the slot *v* and hole *h*, in combination with the fastener C, inserted in said hole and provided with the arm *r*, substantially as described.

2. In an insulator, the fastener C, having the arm *r* and bend *p*, in combination with the body A, having the slot *v* and hole *h*, substantially as set forth.

388,735. ROTARY-HOE. PETER KERSVAAG, Youngstown, Ohio. Filed Feb. 7, 1888. Serial No. 263,262. (No model.)



Claim.—1. The combination of an eccentric-rod and a movable latch for connecting said rod to valve-operating mechanism, substantially as set forth.

2. The combination of a slotted eccentric-rod, a valve-operating pin, and a movable latch or block provided with a hook for engaging said pin, substantially as set forth.

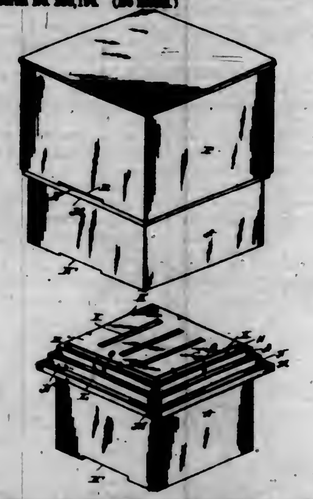
3. The combination of an eccentric-rod provided with slotted side bars, a valve-operating pin in the side bars, and a latch provided with a hook for locking the pin to the eccentric-rod, substantially as set forth.

4. The combination of an eccentric-rod provided with slotted side bars, a valve-operating pin fitting in the slots in the side bars, a latch provided with a hook for locking the pin to the eccentric-rod, and a look for holding the latch in position, substantially as set forth.

388,736. PROTECTING AND PRESERVING PILES. CHARLES C. LAKE, San Francisco, Cal., assignor to John H. Scott, same place. Filed Sept. 14, 1887. Serial No. 249,718. (No model.)

Claim.—1. The method of protecting and preserving piles, which consists in splitting the pile in that portion of it which is exposed to attack, and in then treating the split portion with a protective or antiseptic compound, whereby the slits are filled with it and the substance of the wood permeated, substantially as herein described.

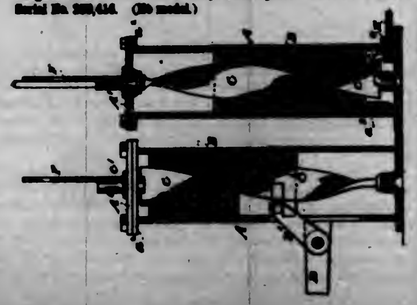
2. The method of preserving piles, which consists in splitting, in substantially the direction of its length, that portion of the pile which is exposed to attack, leaving the upper or top portion of the pile unsplit, and in treating the split portion with a protective or antiseptic compound, whereby its slits are filled and its substance permeated, substantially as herein described.



3. The method of preserving piles, which consists in splitting, in substantially the direction of its length, that portion of the pile which is exposed to attack, leaving the top portion unsplit, in then treating the split portion with a protective or antiseptic compound, whereby its slits are filled and its substance permeated, and in then spiking or pinning the split portion together, substantially as herein described.

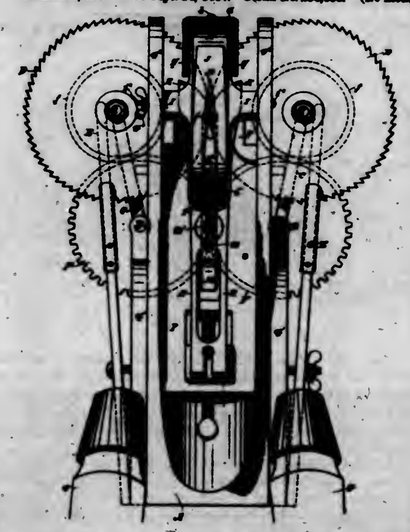
4. The pile provided in the direction of its length with a number of slits extending throughout that portion which is exposed to attack, said pile having its top or upper portion unsplit, substantially as herein described.

5. A pile having a solid or unsplit upper portion, and its lower portion, which is exposed to attack, slitted or split, and its split portion spiked or pinned transversely, the slits of said portion being filled with a protective or antiseptic compound, substantially as herein described.



6. A pile having its lower portion split, its upper portion unsplit, and a metal cap for covering its point, substantially as herein described.

388,737. BEE-HIVE. JOHN LAMB, Bremen, Ind. Filed Dec. 27, 1887. Serial No. 259,194. (No model.)



Claim.—The combination, with a bee-hive, of the supporting-collar formed with the exterior shoulder and having the supporting-hooks, and the cover or casing lined with a non-conducting material and formed at its bottom with a small opening or entrance, as set forth.

388,738. SWITCH-GEARD. GEORGE H. LEONARD, St. Paul, Minn., assignor of one-half to C. W. Hedegyre, same place. Filed Dec. 30, 1887. Serial No. 259,444. (No model.)

388,739. FRUIT-STONING MACHINE. BENJAMIN A. LILLIE, San Francisco, Cal. Filed Sept. 24, 1887. Serial No. 250,082. (No model.)

Claim.—1. In a fruit-stoning machine, and in combination with rotary cutters, the opposing curved spring guide-plates on each side of the cutters and the spring-arms secured below, and on which said plates are mounted, whereby the fruit in being drawn between the plates by the cutters is closed upon by the plates, substantially as described.

2. In a fruit-stoning machine, and in combination with the rotary cutters, the opposing curved guide-plates, the spring-arms on which they are mounted, whereby they close upon the fruit as it is drawn between them by the cutters, and an adjustable connection between the plates and the supporting spring-arms, substantially as described.

3. In a fruit-stoning machine, and in combination with the rotary cutters, the opposing guide-plates, the spring-arms on which they are mounted, and the adjustable connection of said spring-arms with their supports, substantially as described.

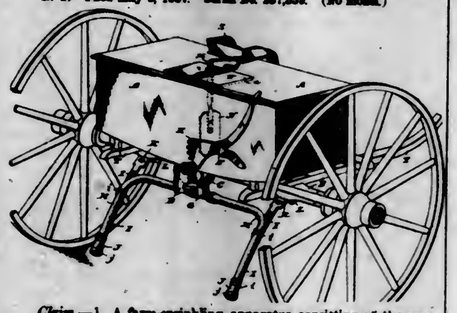
4. In a fruit-stoning machine, and in combination with the rotary cutters, the opposing guide-plates, the spring-arms on which they are mounted, the adjustable connection between the plates and the arms, and the adjustable connection between the arms and their supports, substantially as described.

5. In a fruit-stoning machine, and in combination with the rotary

cutters, the opposing guide-plates, the spring-arms on which they are mounted, and the oscillating brackets on which the arms are mounted, whereby the plates may be adjusted to or from each other, substantially as described.

6. In a fruit-stoning machine, and in combination with the rotary cutters, the opposing guide-plates, the spring-arms on which they are mounted, and the adjustable tension-springs on the back of the spring-arms, substantially as described.

7. In a fruit-stoning machine, and in combination with the rotary cutters, the adjustable opposing guide-plates, the adjustable spring-arms on which they are mounted, and the adjustable brackets supporting the spring-arms, substantially as described.

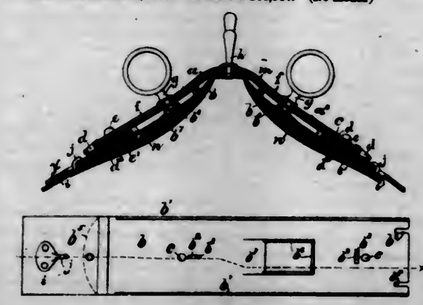


8. In a fruit-stoning machine, and in combination with the rotary cutters, the bifurcated scraper-knives below, and the intervening quartering knives or guides secured thereto, substantially as described.

9. In a fruit-stoning machine, the rotary cutters, in combination with the bifurcated scraping-knives below, the intervening quartering knives or guides, and the adjustable connection between said knives or guides and the scraping-knives, substantially as described.

10. In a fruit-stoning machine, the rotary cutters, in combination with the adjustable segmental plates *n*, secured thereto and covering a portion of the teeth of the cutters, said plates having prongs projecting from the peripheries of the cutters, and the adjustable covering-plates O, secured to the cutters, whereby but a portion of the teeth of the cutters may be exposed in advance of the prongs, substantially as described.

11. In a fruit-stoning machine, the rotary cutters, in combination with the adjustable segmental plates *n* and O on the side of the cutters and covering all their teeth but a portion which is left exposed, said plates being movable to and from each other to vary the length of the exposed portion, and the prongs N on the plates *n*, extending beyond the peripheries of the cutters, substantially as described.



383,740. SPRINKLING-MACHINE. RUSSEL P. LOVEJOY, Craig, N. Y. Filed May 6, 1887. Serial No. 237,339. (No model.)

Claim.—1. A farm-sprinkling apparatus consisting of the reservoir A', with its rounding bottom, and vibrating agitator M N, to the bottom of which tank is attached the discharge tube and cock C, and T-tube G, carrying the hose-sections H, with the roses J J, supported by the adjustable arms I I, the whole mounted upon the axle B and thills T.

2. The combination, with the tank, axle, and wheels, of the yielding arms I I, each provided with a portion substantially parallel with the bottom of the tank and a rearwardly-drooping portion to engage the hose-sections, and provisions, as described, for endwise adjustment of said arms, as set forth.

383,741. HARNESS-SADDLE. STEPHEN A. MARKER, Newark, N. J. Filed Mar. 5, 1888. Serial No. 266,557. (No model.)

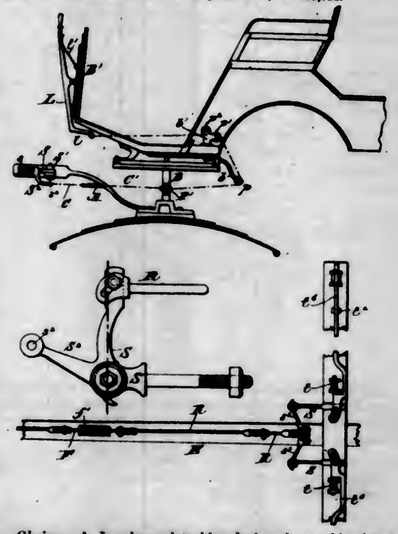
383,741.

Claim.—1. The combination, with the pad-plate *a* and shell *b*, provided with flanges *b'*, secured thereto to form a channel open at its outer end, of the skirt *k*, having its inner end attached to the plate within the said channel, the whole constructed and arranged as shown and described.

2. The combination, with the plate *a* and shell *b*, having flanges *b'*, of the shouldered lug b^3, and the hole or notch a^2, to fit the end of such lug, and means, substantially as described, for securing the plate and shell together, as and for the purpose set forth.

3. The combination, with the plate *a* and shell *b*, having the flanges *b'* secured together to form a channel between the same, of longitudinal and transverse ribs b^4 and incline b^7, as and for the purpose set forth.

4. The combination, with the plate *a*, provided with a hole, a^4, and the foundation-piece *f*, secured thereon, of the pad and loop, *d*, having shank *d'*, inserted between the inner end portions of the plate and foundation-piece, and the stud d^3, as and for the purpose set forth.



5. The combination, with the plate *a* and shell *b*, provided with flanges *b'*, and extension b^5, of a flexible end piece secured to the said extension beyond the ends of the ribs b^7, the whole constructed and arranged as and for the purpose set forth.

6. The combination, with the plate *a* and shell *b*, provided with flanges *b'*, and extension b^5, of a flexible end piece skived down at its inner end, as and for the purpose set forth.

7. The combination, with the plate *a* and shell *b*, of the extension b^5, offset from the body of the shell, and the flexible end piece, *i*, secured thereon, as and for the purpose set forth.

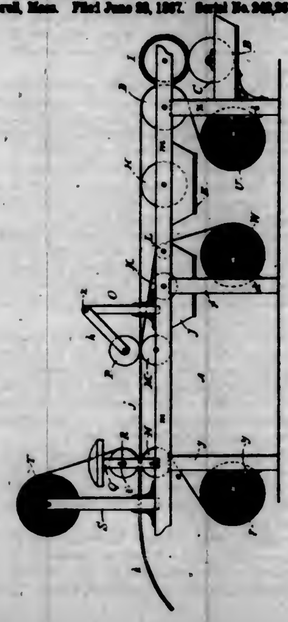
8. The combination, with the plate *a*, shell *b*, constructed as described, and the skirt *k*, of the flexible end piece, *i*, having the hook or lug *j* secured to its upper side, as and for the purpose set forth.

383,742. HORSE-DETACHER. THEODORE MAHEU and ELIE ROUSSEAU, Tourcoing, France. Filed Feb. 23, 1888. Serial No. 264,942. (No model.) Patented in France Aug. 17, 1887, No. 185,256.

Claim.—1. In a horse-detaching device, the combination, with the thill or whiffletree and a hitching-pin provided with a forked head having a segmental slot formed therein, of a rocking lever connected to the fork of the pin by a bolt passing loosely through the segmental slots in the ears of the fork, and means for rocking the lever, to move the pin out of its bearings, substantially as and for the purpose specified.

2. In a horse-detaching device, the combination, with the thill or whiffletree and a hitching-pin having its bearings on or in said thill or whiffletree, said pin being provided with a forked head having a segmental slot formed therein, of a spring-actuated rock-lever connected to the fork of the pin by a bolt passing loosely through the segmental slots in the ears of said fork, the stress of the spring being exerted to hold the pin in its bearings, and means for rocking the lever against the stress of its spring to move the pin out of its bearings, substantially as and for the purposes specified.

3. In a horse-detaching device, the combination, with the double or whiffle tree and the pole of the vehicle provided with a detachable breast-strap ferrule, of a pin or bolt to lock said ferrule to the pole, hitching-pins arranged in pairs on opposite sides of the pole and working in bearings secured to the whiffletree, said pins being provided with a forked head having a segmental slot formed in the ears thereof, levers connected to the fork of the pins by means of a bolt passing loosely through said segmental slots, a rocking segment and links and connecting-rods connecting the levers of the hitching-pins and the retaining-bolt for the breast-strap ferrule with said rocking segment, and a draft rod or chain for rocking the segment to simultaneously withdraw the retaining-bolt and hitching-pins from their bearings, substantially as and for the purposes specified.

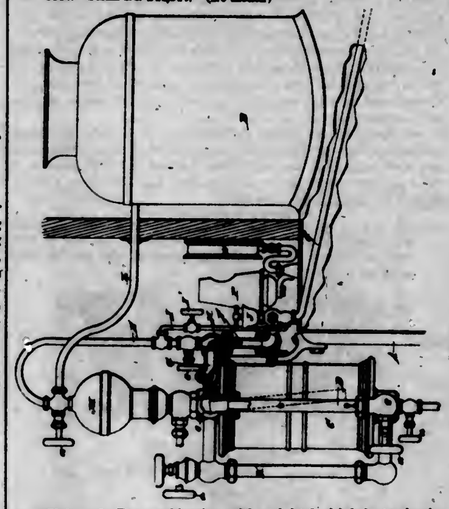


4. The combination, with the pole of a vehicle, of a detachable breast-strap ferrule, a bolt for locking the ferrule to the pole, said bolt having a forked head, in which is formed a segmental slot, a rock-lever connected with the fork of the bolt by a bolt passing loosely through the segmental slots in the ears of the fork, and a cord or rod for rocking the lever from the driver's seat, substantially as and for the purposes specified.

383,743. COTTON-CULTIVATOR. CHARLES S. MCCALL and JAMES L. HAYNIE, Bennettsville, S. C. Filed Mar. 16, 1888. Serial No. 267,249. (No model.)

Claim.—The combination, in a cotton-cultivator, of a cross-bar and a series of blades secured thereto, each of said blades being straight upon its lower edge for two-thirds of its length, and having its rear one-third or wing portion broader than the front two-thirds, and having its broader portion curved around into a concave until its lower edge is in the same horizontal plane with the lower edge of the front two-thirds of the blade, and said blade having its upper edge straight horizontally, but curved to one side, whereby the rear or wing portion of the blade is given a compound curve.

383,744. PAPER-BOARD MACHINE. JAMES H. MCCLELLAND, Pepperell, Mass. Filed June 22, 1887. Serial No. 242,361. (No model.)



Claim.—1. A paper-board machine comprising the frame A, paste-troughs B E J, paste-rolls C H K, guide-rolls D L, brush I, bed-rolls M N, presser-roll P, pivoted arms A, presser-roll R, standards Q, and the mandrels U W F T, constructed, combined, and arranged to operate substantially as described.

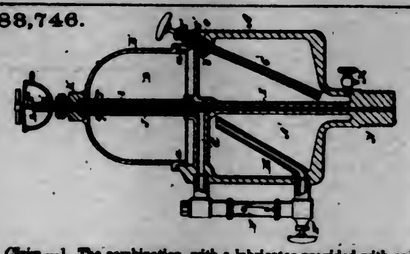
2. A paper-board machine comprising a frame, brackets, mandrels, paste-troughs, and guide-rolls mounted on said frame, a paste-roll on each side of the guide-roll for the first sheet, supplying a coating of paste to both faces of each sheet, a paste-roll in rear of the guide-roll for the second sheet, supplying a coating of paste to the face thereof, which is remote from the first sheet, and presser-rolls for uniting said first and second sheets and for pressing the third and fourth sheets upon the outer faces thereof, substantially as described.

3. A paper-board machine comprising a frame, brackets, mandrels, paste-troughs, and guide-rolls mounted on said frame, a paste-roll on each side of the guide-roll for the first sheet, supplying a coating of paste to both faces of each sheet, a paste-roll in rear of the guide-roll for the second sheet, supplying a coating of paste to the face thereof which is remote from the first sheet, a pair of presser-rolls for uniting said first and second sheets, and a second pair of presser-rolls for pressing the third and fourth sheets upon the outer faces of the first and second sheets, substantially as described.

383,745. LUBRICATOR. ELIJAH MCCOY, Detroit, Mich., assignor to Henry C. Hodges and Charles C. Hodges, same place. Filed July 16, 1887. Serial No. 244,517. (No model.)

Claim.—1. The combination, with a sight-feed lubricator having an equalizing-conduit which taps the oil-exit passage between the sight-feed glass and the part to be lubricated, of a supplemental sight-feed tube located on the oil-exit pipe between the part to be lubricated and the said equalizing-conduit, substantially as and for the purposes described.

2. The combination, with a flexible locomotive-lubricator having sight-feed tubes and equalizing-conduits corresponding with each cylinder, and which each taps its corresponding oil-exit passage between the sight-feed glass and the part to be lubricated, of supplemental sight-feed tubes located on each oil-exit passage between the point tapped by the equalizing-conduits and the said cylinders, substantially as described.



3. A sight-feed lubricator having an equalizing-conduit and a supplemental sight-feed tube, said equalizing-conduit opening into the oil-exit pipe adjacent to the entrance end of the said supplemental tube, substantially as described.

4. The combination, with a sight-feed lubricator having a supplemental sight-feed tube and an equalizing-conduit tapping the oil-exit passage between the reservoir and said supplemental sight-feed tube, of a sunk cup and cut-off valve located at the discharge end of said last-named tube, substantially as described.

5. The combination, with a sight-feed lubricator having an equalizing-conduit, of a supplemental sight-feed tube, through which oil led to its top is caused to drop, substantially as described.

383,746. LUBRICATOR. ELIJAH MCCOY, Detroit, Mich., assignor to Henry C. Hodges and Charles C. Hodges, same place. Filed Apr. 26, 1887. Renewed Mar. 13, 1888. Serial No. 266,969. (No model.)

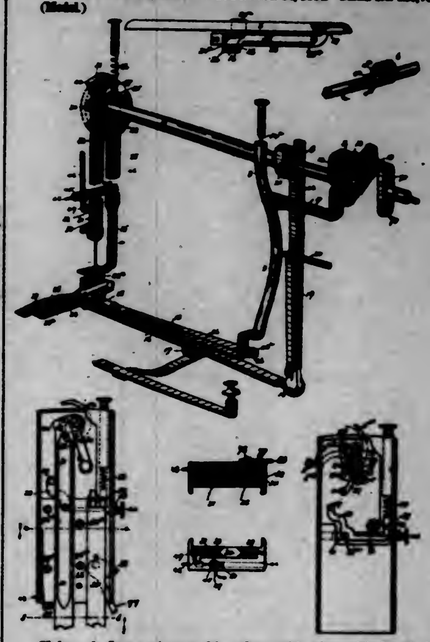
388,746.

Claim.—1. The combination, with a lubricator provided with an oil-chamber, and a condensing-chamber communicating therewith, of a steam and oil conduit, a sight-feed glass communicating with the oil-chamber and with said conduit, a stuck-cap constructed with a hollow stem arranged to seat in conjunction with said conduit, said stem traversing a fixed steam-pipe, J, whereby steam is admitted to the condensing-chamber, substantially as described.

2. The combination, with a lubricator provided with an oil-chamber, a condensing-chamber communicating therewith, and a visible-feed glass, of a steam and oil conduit extending upward in the oil-chamber, a laterally-extended pipe communicating with the sight-feed glass and with said conduit, a perforated pipe, J, traversing the condensing-chamber, and a stuck-cap provided with a hollow stem traversing said pipe, the construction being such that said stem may be seated in conjunction with said conduit, thereby to cut off the feed from the visible-feed glass and afford a continuous passage from said stuck-cap through said stem and conduit to the parts to be lubricated, substantially as described.

3. The combination, with the oil-chamber, of a condensing-chamber engaged directly therewith, a plug, *c*, through which communication is afforded from the condensing-chamber to the oil-chamber, a valve engaged in said plug to regulate said communication, and the pipes C E, substantially as described.

388,747. CENTRIFUGAL GRAIN-DRYING MACHINE. FERDINAND HILLENBRAND, St. Charles, Mo. (Original application filed July 18, 1887, Serial No. 244,698. Divided and this application filed Dec. 19, 1887. Serial No. 258,326. (No model.)



Claim.—1. The combination, substantially as hereinbefore set forth, of the main frame, the rotary carriage, and the strainer mounted in the carriage, with the hopper extending into the strainer, the convex plate below the mouth of the hopper, and the radial ribs or wings arranged on the inside of the strainer and extending from the convex plate to the other end of the strainer.

2. The combination, substantially as hereinbefore set forth, of the main frame, the rotary carriage mounted therein, and the funnel-shaped strainer mounted in the carriage, with the hopper extending into the mouth of the strainer, the convex plate on the bottom of the strainer under the mouth of the hopper, and the radial ribs or wings extending from the convex plate to the top of the strainer.

3. The combination, substantially as hereinbefore set forth, of the main frame, the carriage, the strainer mounted in the carriage, and the jacket surrounding the carriage and having a discharge-opening at the bottom, with the annular deflector arranged around the top of the carriage and over the jacket, the outer casing, the partition between the outer casing and the jacket, and the annular trough arranged under the outer casing.

4. The combination, substantially as hereinbefore set forth, of the main frame, the rotary carriage having a water-discharge opening near the bottom, the funnel-shaped strainer contained in the carriage, and the jacket surrounding the carriage to receive the water therefrom, with the inclined annular deflector arranged around the top of the carriage and over the jacket and provided with an annular water-opening into the jacket around the carriage, the inclined outer casing, the partition between the outer casing and the jacket, and the top plate over the partition and the outer casing.

388,748. SEWING-MACHINE. THOMAS I. HILLIS, Cliftonville, Ohio. Filed Oct. 22, 1881. Renewed Feb. 14, 1888. Serial No. 263,703. (Model.)

Claim.—1. In a sewing-machine, the combination, with the stitch-forming mechanism thereof, of a hollow standard and arm, a horizontal crank-shaft contained in the latter, a vertical rock-shaft contained in the former, and a pitman jointed at its respective ends to a crank on the driving-shaft and an arm on the rock-shaft, as and for the purpose set forth.

2. The combination of the driving-shaft 4, the vertical rock-shaft 8 actuated thereby through the medium of the pitman 9, and carrying the shuttle-driving arm 13, the screws 14 14ª, and the frame in which said screws have bearings for setting said vertical rock-shaft up or down for timing the movements of the various parts of the machine, as explained.

3. The combination of the feed-bar 23, carrying the roughened feed-plate 29ª, the stirrup-bar 24 25, pivoted to the feed-bar at 29ª, the lever 16, inserted in the stirrup 25 and actuating the feed-bar through the medium of the connecting-bar 28, and means for imparting to the feed-bar the necessary vertical movement, as explained.

4. The combination, with the stirrup-bar 24 25, supporting-bracket 24ª, feed-bar 23, and means for imparting to said feed-bar the necessary horizontal reciprocating motion, of the lever 16 and wedge-shaped bar 26, operating the feed in the manner described.

5. The combination of the skeleton needle-bar 31, having V-shaped grooves in its sides and longitudinal grooves in the spaces of said V-shaped grooves, with adjustable gibs 34, having V-shaped ridges corresponding with said V-grooves, and so arranged as to permit the taking up of wear of the needle-bar longitudinally of the line of shuttle movement, substantially as set forth.

6. The combination, with the needle-bar 31 and the take-up 54, of the pendent arm 56, fixed to the rock-shaft of the take-up, and the link 57, connecting said arm to the needle-bar, and arranged to impart to said arm a vibratory motion on both sides of a vertical line, said arm 56 and link 57 constituting a toggle-joint folding on itself and imparting a differential and compound movement to the take-up arm from the continuously-moving needle-bar, as explained.

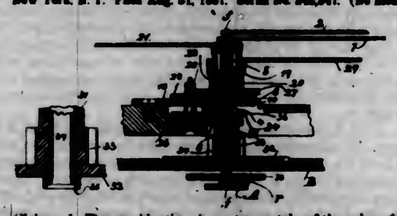
7. The combination, with the presser-foot bar and a spring for holding it down, of the needle-bar, having a shoulder, 40, and a lever engaged at one end by said shoulder and engaging at the other with said spring for relieving its pressure upon the presser-foot bar when the needle is down, as set forth.

8. In combination with the head having a recess in its front, as shown, for the reception of the thread, the thread-check within said recess having fixed jaw 44 and movable jaw 45, controlled by a spring, and the needle-bar 31, having inclined portion, as shown, and acting to relieve the thread-check and release the thread, substantially as and for the purpose set forth.

9. In a thread-check in a sewing-machine, substantially as herein described, the combination of a pair of rods placed end to end and nipping the thread between their ends, means for adjusting one of said rods in position, and a spring for pressing the other against it, as set forth.

10. In a sewing-machine, substantially as herein described, the combination of the nippers 44 45 with a lug or handle for opening them for the insertion of the thread, and a dowel or pin, 47, for retaining the thread between them, as explained.

11. The combination, with the face-plate, the tension device secured thereto, and the presser-foot bar, of the lifting-lever having a screw-threaded pivot engaging a correspondingly screw-threaded aperture, and a lever engaged at one end by said pivot-screw, and engaging at the other with said tension device, for the purpose set forth.



12. The main driving-shaft carrying at its forward end a crank or crank-wheel operating the needle-bar, and at its rear end a crank to operate the shuttle-carrier, in combination with a vertical shaft carrying the shuttle-driving arm, means for adjusting said shaft in a vertical direction, and a pitman connecting the rear crank of the driving-shaft with the arm of the vertical rock-shaft, whereby the vertical adjustment of said rock-shaft is made to time the movements of the various parts.

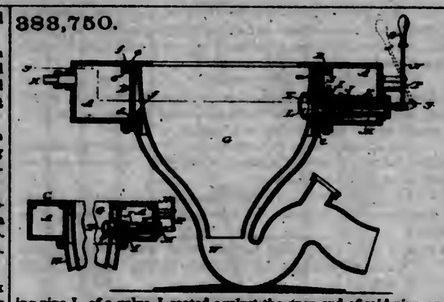
13. The combination, with the presser-foot mechanism, the needle-bar, and the lever engaging at one end with said presser-foot mechanism and engaged at the other by said needle-bar when depressed, of the sliding bar 41, to which said lever is fulcrumed, the split socket 43 on the end of said bar, the conical set-screw 42, and the head of the machine having a perforation through which said socket projects, as set forth.

14. The combination, with the presser-foot bar 36, its spring 36, and the rod 37, interposed between the said spring and presser-foot bar, of the needle-bar 31, having the lateral projection or shoulder 40, and the L-shaped lever 38, engaged at one end by said shoulder and engaging at the other with said rod 37, relieving the pressure of the spring 36 upon the presser-foot bar when the needle is down, as explained.

15. The combination, with the apertured face-plate, of a tension-pulley, a stem projecting through the aperture in the face-plate and having an enlarged head or flange bearing against said pulley, a spring for forcing said head or flange against said pulley, a lever engaging the inner end of said stem, and the lifting-lever engaging the other end of the aforesaid lever, as set forth.

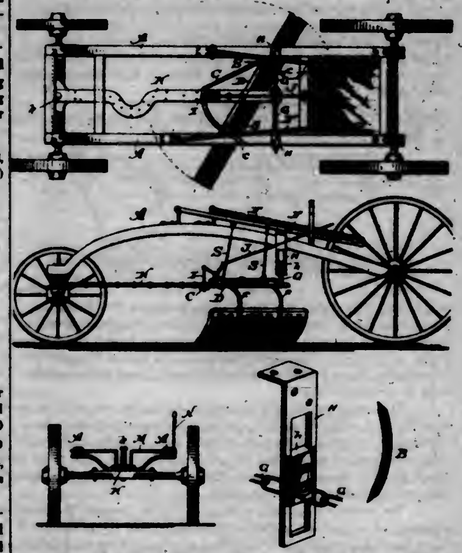
388,749. SPLIT-SECONDS STOP-WATCH. CHARLES H. METCALF, New York, N. Y. Filed Aug. 31, 1887. Serial No. 248,947. (No model.)

Claim.—1. The combination, in a stop-watch, of the arbor *f* for the independent seconds-hand, the tubular arbor 5 for the additional independent seconds-hand, the bridge 16, tubular arbor 19, cannon 20 for the minute-hand, wheel 27, and cannon 28 for the hour-hand, the gear-wheel 23 and pinion 24 for driving the hour and minute hands, and the gearing connecting the arbor of the wheel 24 with the train of gearing in the watch-movement, substantially as specified.



2. The combination, with the tubular center arbor, 31, in a watch-movement, of the tubular arbor 34, passing through the arbor 31 and held therein by friction, the wheel 24 on each arbor 34, the hour and minute hands and their tubular arbors, and the gearing between the wheel 24 and each hour and minute hands, and an arbor passing through the arbor 34 and carrying an independent seconds-hand, substantially as set forth.

3. The combination, with the tubular central arbor, 31, in a watch-movement, of the tubular arbor 34, passing through the central arbor, 31, and held therein by friction, the gear-wheel 24 on each arbor, the hour and minute hands and their gearing, and an independent seconds-hand, 2, and central arbor, *f*, therefor within a bearing inside the tubular arbor 34, a bridge, A, for one end of said arbor *f*, and the connections for moving the said arbor *f* and hand, substantially as set forth.



388,750. WATER-CLOSET. GILBERT HUBBARD, New York, N. Y. Filed Oct. 27, 1887. Serial No. 253,055. (No model.)

Claim.—1. The combination, with the flushing-tank A and flushing-pipe L, of a valve, I, seated against the open end of said pipe, and having a tubular stem, J, a guide-cylinder, K, projecting through the wall of the tank, closed at one end and embraced at its inner end by the tubular valve-stem, a valve-rod, M, extending outwardly through the tubular valve-stem and its guide-cylinder, and a lever, N, actuating said rod, substantially in the manner and for the purpose herein set forth.

2. The combination, with the discharge-pipe L, valve I, tubular valve-stem J, guide-cylinder K, upon which said valve-stem plays, and guide-rod M, extending through said valve-stem and guide-cylinder and passing outwardly through the closed end of the cylinder, of a secondary valve, R, controlling an opening in the valve I, and opening outwardly to permit of a discharge from within the tubular valve-stem and its guide-cylinder when the valve I is closed, substantially in the manner and for the purpose herein set forth.

388,751. ROAD-SCRAPER. GEORGE H. MILLER, Aurora, and CHAS. B. MOAIN, Chicago, assignors to Frederick C. Austin, Chicago, Ill. Filed Feb. 4, 1888. Serial No. 263,062. (No model.)

Claim.—1. In a road-scraper, the combination of a supporting-carriage, a draw-bar vertically adjustable at its forward end to permit the wheels to run under it while turning the machine, and means for effecting such adjustment while the machine is in operation, substantially as described.

2. In a road-scraper, the combination of a supporting-carriage, a draw-bar laterally and vertically adjustable at its rear end, a vertically-adjustable flexible attachment for the rear end of the draw-bar, vertically-sliding clamps in which the ends of the flexible attachment are secured, and a scraper-blade vertically and laterally adjustable with the rear end of the draw-bar, substantially as described.

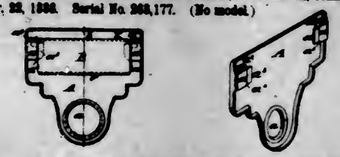
3. In a road-scraper, the combination of a supporting-carriage, a draw-bar vertically adjustable at its forward end, and a cranked rod and lever for effecting such vertical adjustment, substantially as described.

4. In a road-scraper, the combination of a supporting-carriage, a draw-bar, a scraper-blade, and an angular scraper-blade supporting-rack, the circular portion of which is provided with holes to permit its adjustment, substantially as described.

5. In a road-scraper, the combination of a supporting-carriage, a draw-bar, a scraper-blade, a scraper-blade supporting-rack, an auxiliary supporting-rack, and a traveler on which the auxiliary supporting-rack travels while turning, substantially as described.

6. In a road-scraper, the combination of a supporting-carriage, a draw-bar, and a scraper-blade provided with sharpened sides and ends, substantially as described.

7. In a road-scraper, the combination of a supporting-carriage, a laterally-curved draw-bar, and a scraper-blade, substantially as described.



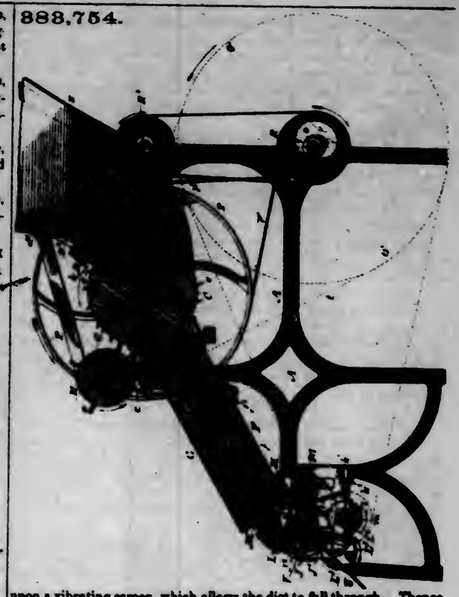
383,752. PORTABLE BULLET-PROOF WATCH-BOX. PATRICK F. MILLMAN, Washington, D. C. Filed July 27, 1887. Serial No. 245,430. (No model.)

Claim.—1. A watch-box formed with port-holes for the batteries and openings for the eyes, in combination with sliding bullet-proof cushions adapted to normally close the said port-holes, and springs for holding the cushions in position, all arranged substantially as shown and described.

2. In a battery of the character herein described, the base-piece formed with a series of recesses, in combination with revolvers the barrels of which are adapted to rest in the said recesses, rods for securing them therein, and a bar resting against the forward face of the triggers of the revolvers and adapted to discharge them simultaneously when pulled.

383,753. BUCKLE. JAMES F. MOLLOY, West Haven, Conn. Filed Mar. 22, 1888. Serial No. 268,177. (No model.)

Claim.—1. In the lever-buckle herein described, the combination, with the lever having at its ends pivots or trunnions, of a frame having ears turned inward and provided with downwardly-presented and inwardly-turned hooks to receive beneath them and behind the ears the pivots or trunnions of the lever, said ears also having flanges which underlie the pivots or trunnions to hold them in said hooks, substantially as herein described.



2. The combination, with a lever, B, having pivots or trunnions b', at the ends, of a frame, as A, having the inwardly-turned ears a', surmounted by downwardly and inwardly turned hooks a^2 and provided with the inwardly-offset flanges a^3, against the outer faces of which the lever closes, thereby producing a buckle with a flat plain back, substantially as herein described.

3. The combination, with a lever, B, having integral pivots or trunnions at its ends, of a frame, as A, having the inwardly-turned ears a', provided with hooks a^2, and flanges, as a^3, to form the bearings for the lever, the said lever having inwardly-turned tongues b^2, which engage with the said ears when the lever is closed and relieve the pivots or trunnions of strain, substantially as herein described.

4. The combination, with a lever-buckle frame, of a lever pivoted therein and having its upper edge provided with spurs for engaging the strap, and also having its lower edge turned in and formed with spurs for engaging the strap, substantially as herein described.

383,754. MACHINE FOR OPENING, CLEANING, AND GINNING SEED-COTTON. JOHN R. MONTAGUE, Auburn, N. Y., assignor to the Montague Roller Cotton-Gin Company, Toledo, Ohio. Filed Oct. 5, 1887. Serial No. 251,942. (No model.)

Brief.—The cotton is taken from the hopper by a toothed roller, over which and concentrically with which vibrates a cleaning-card to open and straighten the fiber. A wiper-roll knocks the cotton down

upon a vibrating screen, which allows the dirt to fall through. Thence the cotton passes under a feed-roll to the gin-rolls, being acted upon adjacent to the gin-rolls by a reciprocating rake. The ribs upon the feed-roll are protruded and withdrawn by a cam.

Claim.—1. The combination, substantially as hereinbefore set forth, of the hopper, the traversing drawing-teeth, means for actuating them, the cleaning-card, its supports pivoted concentrically with the axis of movement of the drawing-teeth, and means for reciprocating the cleaning-card, whereby it is caused to travel in a path parallel with the actuating-surface of the drawing-teeth to open the bolls and draw out the fibers.

2. The combination, substantially as hereinbefore set forth, of the hopper, the traversing drawing-teeth, means for actuating the drawing-teeth, the reciprocating card, means for reciprocating the card over the drawing-teeth in an arc coinciding with the line of movement of the drawing-teeth, the beater or cleaning roller arranged in rear of the drawing-teeth, and means for driving the beater or cleaning roller faster than the drawing-teeth to clear the latter, as well as beat out the dust, &c.

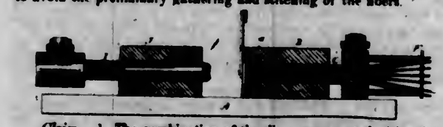
3. The combination, substantially as hereinbefore set forth, of the hopper, the traversing drawing-teeth, means for actuating the drawing-teeth, the cleaning-card arranged over the drawing-teeth, means for actuating the card, the beater or cleaning roller, means for actuating it, the laterally-reciprocating grating upon which the seed-cotton falls after being acted on by the beater, and means for reciprocating the grating.

4. The combination, substantially as hereinbefore set forth, of the feed-roll having radially-reciprocating ribs to grasp and retard the seed-cotton and insure its regular delivery to the ginning-rolls, means for actuating the ribs, the ginning-rolls arranged in close proximity to the feeding-roll to receive the seed-cotton therefrom, and means for actuating the ginning-rolls.

5. The combination, substantially as hereinbefore set forth, of the feed-roll having radially-reciprocating ribs to grasp and retard the seed-cotton and insure its regular delivery to the ginning-rolls, means for actuating the ribs, the ginning-rolls arranged in close proximity to the feeding-roll to receive the seed-cotton therefrom, means for actuating the ginning-rolls, the seed-separating teeth or rake reciprocating longitudinally between the ginning-rolls, and means for actuating the rake.

6. The combination, substantially as hereinbefore set forth, of the ginning-rolls, the feed-roll having radially-reciprocating ribs, means for actuating the ginning-rolls, feed-roll, and the ribs, the laterally-reciprocating seed-separating teeth, means for actuating the teeth, and the concave or guide plate concentrically surrounding the lower front portion of the feed-roll to facilitate the grasp of its reciprocating ribs on the seed-cotton.

7. The combination, substantially as hereinbefore set forth, of the ginning-rolls, means for actuating the rolls, the feed-roll, its radially-



reciprocating ribs or blades, means for actuating the roll and its ribs or blades, the concave partially encircling the feed-roll, the seed-separating teeth reciprocating between the concave and the ginning-rolls, means for actuating the teeth, the grating over which the seed-cotton passes to the concave and feed roll, and means for reciprocating the grating.

8. The combination, substantially as hereinbefore set forth, of the ginning-rolls, the feed-roll, means for actuating the ginning-rolls and feed-roll, the concave under the feed-roll, the laterally-reciprocating separating-teeth, means for actuating them, the laterally-vibrating grating, the traversing, drawing-teeth, the beater-roll, and means for actuating the grating, drawing-teeth, and beater-roll.

9. The combination, substantially as hereinbefore set forth, of the ginning-rolls, the feed-roll, means for actuating the ginning-rolls and feed-roll, the concave arranged under the feed-roll, the separating-teeth, the grating, the beater-roll, the traversing drawing-teeth, reciprocating card, means for actuating the separating-teeth, grating, beater-roll, and drawing-teeth, and the hopper.

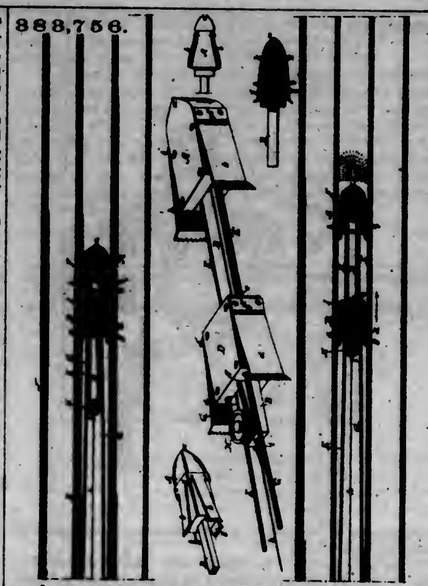
383,755. MACHINE FOR MAKING UPHOLSTERERS' TUFTS. JAMES L. MOORE, Stratford, assignor, by mesne assignments, to E. H. Hubbard, Bridgeport, and John K. Beach, New Haven, Conn. Filed May 10, 1886. Serial No. 201,674. (No model.)

Brief.—The object of the invention is to produce an improved machine for the manufacture of upholsterers' tufts of that class in which the tuft is made from a mass of fibers and one end of the fibers inclosed in a back, the other ends being free to spread, and particularly to avoid the preliminary gathering and stitching of the fibers.

Claim.—1. The combination of the die *a*, constructed with a flaring mouth, and a reciprocating slide, C, concentric with and in rear of said die, the said slide adapted to receive a mass of yarns or fiber, with a cutter arranged to work across the face of the said die, a reciprocating follower constructed to receive and carry a metallic cup-shaped back, the said follower being in axial line with said die, and mechanism, substantially such as described, for actuating the said slide, cutter, and follower, all substantially as and for the purpose described.

2. The combination of the die *a*, constructed with a flaring mouth, the tubular reciprocating slide C, in axial line and concentric with said die, and perforated guide-plate F, substantially concentric with said slide, with a cutter adapted to work across the face of said die, and a reciprocating follower constructed to carry a cup-shaped metal back, with mechanism, substantially such as described, for actuating the said slide, cutter, and follower, substantially as and for the purpose described.

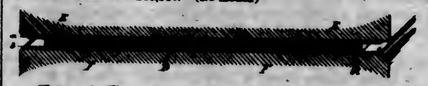
3. The combination of the die *a*, constructed with a flaring mouth, a reciprocating slide, C, concentric with and in rear of said die, the said slide adapted to receive a mass of yarn or fiber, a reciprocating follower constructed to receive and carry a metallic cup-shaped back, the said follower being in axial line with said die, and the two cutters *f g*, arranged in guides parallel with the plane of the die, one each side the opening through the die and adapted to work across the face of the die, with mechanism, substantially such as described, to impart reciprocating movement to said cutters, slide, and follower, all substantially as described.



4. The combination of the die *a*, constructed with a flaring mouth, auxiliary stop *r*, reciprocating tubular slide C, provided with a corresponding shoulder, *s*, a cutter adapted to work across the face of said die, and a follower, I, constructed to receive and carry a cup-shaped metal back and in axial line with said die, with mechanism, substantially such as described, for actuating the said slide, cutter, and follower, substantially as described.

5. The combination of the die *a*, reciprocating slide C, stop M, auxiliary stop *r*, a cutter adapted to work across the face of said die, and a reciprocating follower in axial line with said die and constructed to receive and carry a cup-shaped metal back, with mechanism, substantially such as described, for actuating the said slide, cutter, and follower, substantially as described.

383,756. CRAWLER FOR ELECTRIC OR OTHER CONDUITS. HENRY G. MORRIS, Philadelphia, Pa. Filed Dec. 17, 1887. Serial No. 258,179. (No model.)



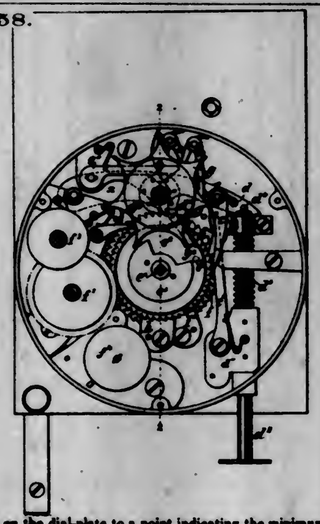
Claim.—1. The wholly-described crawler for conduits, said crawler consisting of two blocks, each provided with grippers for preventing back movement, and two ropes or cords, one imparting a positive forward movement to one block and the other imparting a positive forward movement to the other block, substantially as and for the purpose described.

2. The combination of the two blocks, each provided with grippers for preventing back movement, and two ropes or cords, each connected to one block and passing around a bearing on the other block, all substantially as specified.

3. The combination of the blocks A and D, each provided with grippers to prevent back movement, an arm, B, passing from the block A through the block D, a rope, E, secured to the front of the block D, passing around a rope-bearing in the block A, and thence back past the block D, and a rope, G, secured to the rear of the block D and passing around a rope-bearing on the arm E, thence around a rope-bearing on the block D, and thence back through said block, all substantially as described.

383,757. METHOD OF FILLING SECONDARY-BATTERY PLATES. HENRY G. MORRIS and PEDRO G. SALOM, Philadelphia, Pa. Filed Jan. 12, 1888. Serial No. 260,867. (No model.)

Claim.—1. The mode herein described of forming secondary-battery plates, said mode consisting in filling the cells or interstices of the grid with powdered active material, placing a uniform layer of said active material on one or both sides of the grid, and then compressing the surplus material into the cells of the grid, all substantially as specified.



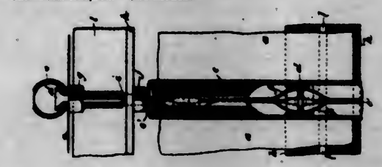
2. The mode described of filling a secondary-battery plate, said mode consisting in mounting the grid on a supporting-plate, applying a retaining-frame to the top of the grid, placing the active material in the cells of the grid and piling it above the same, removing the surplus material until it is level with the top of the retaining-frame, and then removing the latter and compressing the surplus material into the cells of the grid, all substantially as specified.

3. The mode described of filling a secondary-battery plate, said mode consisting in mounting the grid on a supporting-plate, applying a retaining-frame to the top of the grid, filling the cells of the latter with the active material and piling the latter above the same, removing the surplus material until it is level with the top of the retaining-frame, then reversing the grid and repeating the operation on the other side of the same, and finally compressing the two layers of surplus material into the cells of the grid, all substantially as specified.

383,758. FARE-INDICATING DEVICE FOR VEHICLES. WILHELM F. HEBLER, Hamburg, Germany. Filed Jan. 5, 1886. Serial No. 258,382. (No model.) Patented in Belgium Feb. 21, 1887, No. 78,497.

Claim.—1. The combination, in a fare-indicating apparatus for cabs and other vehicles, of the dial-plate, the ratchet-wheel *b*, the two pawl-levers *d* and *x*, the disk x^6, the sector *l*, the indicating-hand, and the angle-levers *m n* and *o p*, for the purpose of stopping automatically the movement of said hand after its first leap over a certain part of

383,758.



the divisions on the dial-plate to a point indicating the minimum fare, substantially as set forth.

2. In a fare-indicator for cabs or other vehicles, the two pawl-levers *d* and *x*, the disk x^2, the sector *l*, the indicating-hand, the angle-levers *m n* and *o p*, and the ratchet-wheels, in combination with the ratchet-wheel *e*, its spring, the spring-held disengaging-bolt having contact with said pawl-lever *d*, and the pawls *c c'*, substantially as shown and described whereby a disengagement is effected after a certain distance or time equivalent to the minimum fare has been exceeded, as set forth.

3. In a fare-indicating apparatus, the combination, with the ratchet-wheels, the main shafts, and the pawl-levers *d x*, of the disk d^2, having the projection d^3, the notched disk d^4, the star-wheel *g*, and the pinion *g'*, having the pins, substantially as shown and described.

4. In a fare-indicating apparatus the combination, with the ratchet-wheel *b* and the pawl-lever *d*, of the auxiliary pawl-lever *x*, the disk x^2, having a notched and toothed edge, the sector *l*, having the groove, the pawl *k*, the angle-levers *m n* and *o p*, the latter engaging a stop-pin, *i*, of the lever *d*, and the spring x^4, engaging a pin, x^5, substantially as shown and described.

383,759. SHEET-METAL STRUCTURE. WILLIAM ORR and PETER S. BROWN, Glasgow, County of Lanark, Scotland. Filed Aug. 22, 1887. Serial No. 247,573. (No model.)

Claim.—1. In a sheet-metal structure, the combination of the tube *c*, having slot *c'*, into which are passed the edges of two adjacent sheets of metal, and wedges or clips by which the edges of said sheets are spread at points within the tube, substantially as set forth.

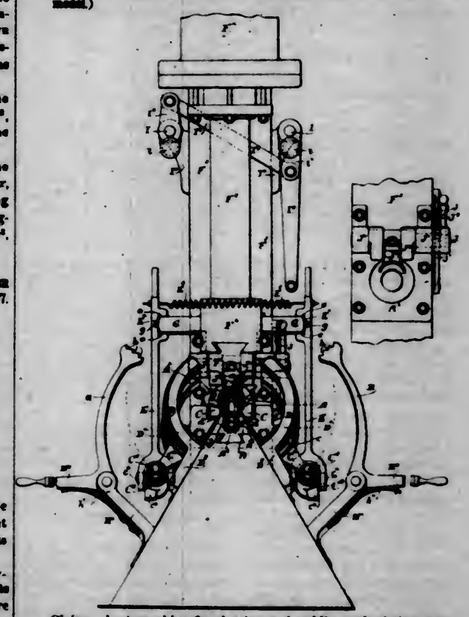
2. In a sheet-metal structure, the combination of the tube *c*, having slot *c'*, into which are introduced the edges of two adjacent sheets of metal, and a wedge or clip having the head *d*, and two or more faces for the reception of a tool for rotating said clip, as set forth.

3. In a sheet-metal structure, the combination of the tube *c*, having slot *c'*, into which are passed the edges *b* of two adjacent sheets, *a*, and a wedge or clip by which the edges *b* are spread within the tube, the said tube being secured to purlin bars or supports *h*, substantially as set forth.

4. In a sheet-metal structure, the combination of the tube *c*, the sheets *a*, with edges secured as set forth, and the wedge or clip having a projection for securing the structures to purlin bars or supports, substantially as described.

5. The combination of a tube having a slot and sheets inserted therein, as described, of clips for securing the sheets in the tube, having ends projecting outward and secured to the purlin-bar by a nut, as set forth.

6. In the construction of sheet-metal structures, a metal sheet having a series of corrugations or indentations across its surface, and its longitudinal edges bent at an angle to the plane of the sheet, the said bent edges being inserted in slotted tubes, and the corrugations at the ends of one sheet superposed on those of the next, substantially as and for the purpose set forth.



383,760. ARTIFICIAL TOOTH. JOHN B. PARKER, Grand Rapids, Mich. Filed Dec. 6, 1887. Serial No. 257,267. (No model.)

Claim.—1. A porcelain shell and crown made integral with each other, the under surface of which crown is a plane surface practically parallel with its grinding-surface and at right angles to the perpendicular inner side of the shell, substantially as described.

2. A porcelain shell having attached a porcelain crown made integral therewith, the under surface of which crown is a plane surface substantially parallel to its grinding-surface and at right angles to the perpendicular inner side of the shell, and provided with projecting pins, substantially as described.

3. In combination with a bridge having a flattened upper surface, a tooth consisting of an outer shell or facing having attached a crown extending inward from the upper part of said shell, the under surface of which crown is substantially parallel with the grinding-surface and at right angles to the perpendicular inner side of the shell of the same and resting upon the upper surface of the said bridge, and pins projecting from the under surface of said crown and bent against the inner surface of the platinum lining at the rear of the shell, substantially as described.

383,761. MACHINE FOR MAKING AXLE-SKEINS. SIMEON B. PARSONS, Chicago, Ill. Filed Nov. 21, 1887. Serial No. 255,720. (No model.)

Claim.—1. A machine for shaping and welding axle-skeins, comprising a mandrel, movable folding-dies, and a hammer, substantially as described.

2. A machine for the purpose stated, comprising a mandrel, a stationary anvil-block having a narrow longitudinally-arranged working-surface adjacent to the mandrel, and folding-dies mounted to rotate about longitudinal axes adjacent to the surface of the mandrel and at opposite sides of the working-surface of the anvil-block, substantially as described.

3. A machine for the purpose stated, comprising a mandrel, a stationary anvil-block having a narrow longitudinally-arranged working-surface adjacent to the mandrel, and pivotally-supported folding-dies located at opposite sides of said anvil-block and having pivotal support at their inner edges upon the said anvil-block, substantially as described.

4. The combination, with a mandrel and supports for the same, of a stationary anvil-block located longitudinally beneath the mandrel, folding-dies located at both sides of the mandrel, and a welding-hammer acting upon the top surface of the mandrel, substantially as described.

5. The combination, with a mandrel and movable folding-dies, of supports for the dies comprising curved guides and supporting arms or castings attached to the dies and engaging said guides, substantially as described.

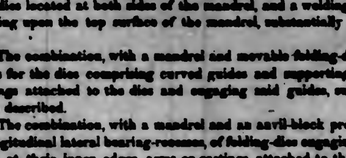
6. The combination, with a mandrel and an anvil-block provided with longitudinal lateral bearing-recesses, of folding-dies engaging said recesses at their inner edges, arms or castings attached to the dies, and stationary curved guides engaging said arms or castings, substantially as described.

7. The combination, with a mandrel and movable folding-dies, of a reciprocating hammer applied to act against the mandrel, and means detachably connecting the hammer with the folding-dies, whereby the latter may be actuated by a movement of the hammer, substantially as described.

8. The combination, with a mandrel and movable folding-dies mounted to rotate about longitudinal axes, of a reciprocating hammer applied to act against the mandrel, and means detachably connecting the free or outer parts of the dies with the hammer, whereby the dies may be closed about the mandrel by the movement of the hammer, substantially as described.

9. The combination, with a mandrel, of pivoted folding-dies, arms attached to the dies for actuating the same, and detents engaging the said arms for holding the dies in their closed position, substantially as described.

10. The combination, with a mandrel and pivotally-supported folding-dies, of a vertically-reciprocating hammer acting against the mandrel, and bars E E, connected with the folding-dies and adapted for detachable engagement with the hammer, substantially as described.



11. The combination, with a mandrel and pivotally-supported folding-dies, of a reciprocating hammer acting against the mandrel, bars E E, pivotally connected with the folding-dies and constructed for detachable connection with the hammer, springs applied to throw said bars into position to engage the hammer, and means upon the machine-frame for throwing and holding said bars out of engagement with the hammer, substantially as described.

12. The combination, with a mandrel and folding-dies, of bars E E, pivotally connected with the folding-dies, arms G G upon the hammer, engaging notches in the said bars E E, springs applied to hold the said bars E E in engagement with the arms G G, and connected rock-shafts I I, provided with cranks *i i*, engaging said bars E E, substantially as described.

13. The combination, with a mandrel and folding-dies, of a rigid support for one end of the mandrel, and a movable support or bearing for the opposite end thereof, detachably engaged with the mandrel, substantially as described.

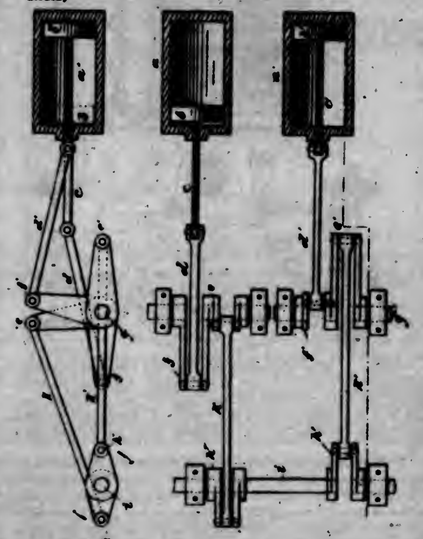
14. The combination, with a mandrel, folding-dies, and hammer, of means for removing the finished skein from the mandrel, embracing a push-bar, J^4, and a rock-shaft provided with a crank engaging said push-bar, substantially as described.

383,762. HOOK OR GLOVE FASTENER. ALFRED P. PERKINS, Providence, R. I., assignor, by direct and mesne assignments, to Allen H. Reeder, Cincinnati, Ohio. Filed Aug. 26, 1887. Serial No. 247,988. (No model.)

Claim.—1. In the herein-described fastener for shoes, &c., a curved plate or frame having a rectangular opening secured by one end permanently to the meeting edge of one flap of the material to be fastened and extending thence across the meeting edge of the second flap, a lever-tongue formed to correspond with the frame-opening pivoted by one of its ends at the outer end of said opening and extending beneath and in the longitudinal direction of the opening and terminating in a depressed hook, and an eye or yoke secured to the edge of the second flap adapted to engage the hook of the lever-tongue, all combined and arranged so that upon engaging the hook in the eye and pressing the frame downward the engaging end of the lever-tongue slips into the opening of the frame, forming a flush surface with the frame-plate and covering and concealing the hook and eye, being held in such position, with the meeting edges forced together, by the retractile strain of the material acting at an angle with the frame-plate and tongue, substantially as set forth.

2. A fastener for shoes, gloves, &c., embodying an open frame secured at one end to one meeting edge of the shoe or glove and carrying pivoted at the other end a lever terminating in a cup-shaped bifurcation adapted to engage beneath a button secured to the opposite meeting edge of the article, and by throwing the lever over its center draw the edges of the material together and carry the button through the open frame into a position in which the parts of the fastening are disposed substantially in the line of strain of the material held, substantially as set forth.

383,763. PIPE-PLATE. GILES PERKINS, Avoca, Pa. Filed Feb. 1, 1888. Serial No. 262,633. (No model.)

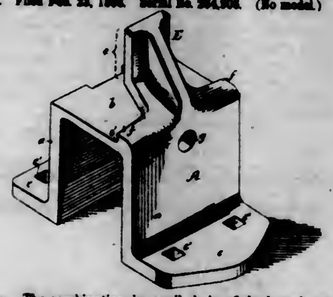


Claim.—1. In a joint, the combination, with the rail and fish-plate having a slot with a bolt therethrough, of a cotter inserted in an independent slot, and a head or strip bearing against said cotter and passing partially around the rail, substantially as and for the purposes set forth.

2. In a joint, the combination, with the rail and fish-plate having a slot therethrough, of a cotter inserted in an independent hole, a head or strip on one end of said cotter adapted to pass partially around the rail, and having a slot therein for the reception of the other end of said cotter, as set forth.

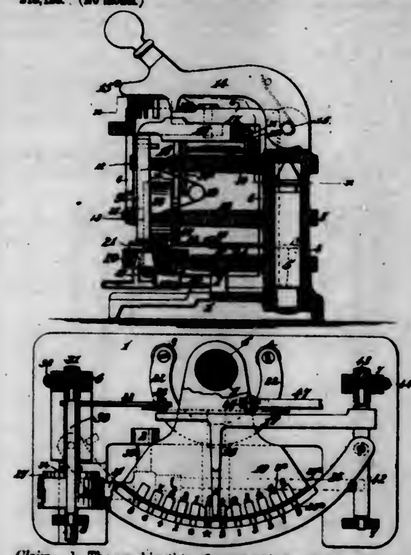
3. In a joint, the combination, with the rail and a fish-plate having cam-surfaces with slots and holes therein and bolts therethrough, of a cotter inserted transversely through said rail and plate, and a strip or head passing partially around the rail and bearing at both ends on said cotter.

383,764. STEAM-ENGINE FOR EQUALIZING POWER. WILLIAM A. PITT, Glastonbury, Conn. Filed Dec. 15, 1887. Serial No. 258,017. (No model.)



Claim.—1. In a steam-engine, the combination, with two cylinders and their piston-rods, of two sets of cranks mounted on independent shafts arranged in the same horizontal plane, two sets of cranks on a common shaft set in line with two of said cranks and connected therewith, and with the two other cranks at right angles thereto, as set forth.

2. The combination, with the cylinders *a a'* and piston-rods *e f*, of the cranks *f f'* and *e f*, set on independent shafts arranged in the same

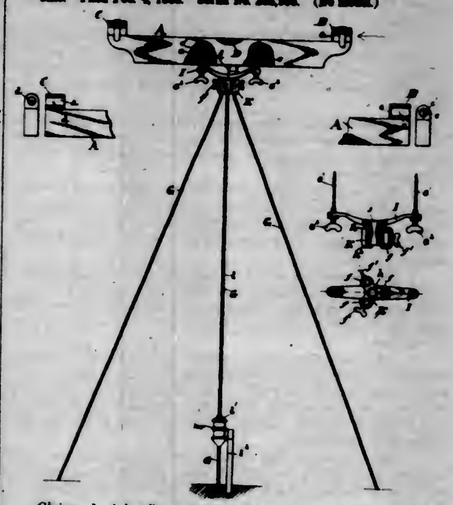


horizontal plane, connecting-rods *d d'*, cranks *h h'*, set on a common shaft, and rods *k k'*, all arranged as set forth.

383,765. RAIL-CHAIR. JAMES GIBBS, Jr., Philadelphia, Pa., assignor to William Wharton, Jr., and Company, Incorporated, same place. Filed Feb. 23, 1888. Serial No. 264,908. (No model.)

Claim.—The combination, in a rail-chair, of the base *b*, an extension, E, of the chair, having a face, *c*, ledges *f f*, extending on each side of the extension E, with a rail, B, and securing-bolt D, passing through the chair, and adapted to not only press the rail to the base *b*, but also to force it against the face *c* and into the recess formed by the extension and against the ledges *f f*, substantially as set forth.

383,766. MACHINE FOR CUTTING OR PUNCHING CHECKS, &c. CHARLES A. RANDALL, New York, assignor, by mesne assignments, to William D. Biger, Brooklyn, N. Y. Filed Sept. 9, 1886. Serial No. 213,123. (No model.)



Claim.—1. The combination of a movable frame, the cutters or punches and dies carried by the same, a single selecting and actuating lever mounted upon and moving with the movable frame, and a single lever interposed between the punches or cutters and the single selecting and actuating lever, substantially as and for the purpose set forth.

2. The combination of a movable frame carrying the punches and dies, a punch selecting and actuating lever mounted on and moving with the frame, paper-feed devices, and a swinging lever for operating the feed devices, interposed between the punches and the punch-selecting lever and depressed by the latter to operate the punches, substantially as described.

3. The combination of a movable frame carrying the punches and dies, a punch selecting and depressing lever mounted on and carried by the swinging frame, a movable lever having an arm projecting forward beneath the punch-selecting lever, the rock-shaft carrying the pawl and connected with the armed lever, the feed-wheel, the ratchet-wheel, and the yielding friction-roller, substantially as described.

383,767. DITCHING-LEVEL. EDWARD EISENBRAUN, Orrville, Ohio. Filed Feb. 4, 1888. Serial No. 263,202. (No model.)

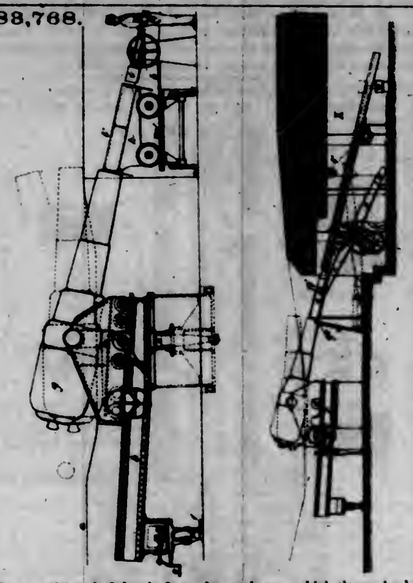
Claim.—1. A leveling-instrument having in combination a body provided with a spirit-level, sights, and two holes, *c*, entering at the lower side and extending upward, a tripod-head, and a bar, I, having at each end a vertical thumb-screw, c^2, the upper ends of said screws loosely occupying the said holes in the body.

2. A leveling-instrument having in combination a body provided with a spirit-level, sights, and two holes, *c*, entering at the lower side and extending upward, a tripod-head, a bar, I, swiveled to the tripod-head, and two vertical thumb-screws, c^2, one at each end of the swiveled bar, the upper ends of said screws loosely occupying the said holes in the body.

3. A leveling-instrument having in combination a body provided with a spirit-level, sights, and two holes, *c*, entering at the lower side and extending upward, a tripod-head, and a bar, I, having at each end a vertical thumb-screw, c^2, the upper ends of said screws loosely occupying the said holes in the body, a tubular spindle, K, connecting the tripod-head and said bar, and a plumb-bob hung by a cord, *l*, which is attached to the said body and passes down through the tubular spindle.

4. A leveling-instrument having in combination a body provided with a spirit-level and sights, a tripod-head, a tubular spindle, K, turning in the tripod-head, and a plumb-bob hung by a cord, *l*, which is attached to the said body and passes down through the tubular spindle.

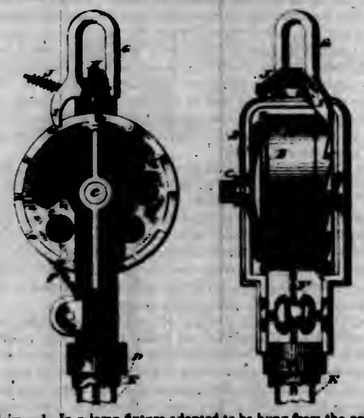
5. A leveling-instrument having in combination a body provided with a spirit-level and sights, a tripod-head, a tubular spindle, K, turning in the tripod-head, and a plumb-bob having circumferential ribs *m* and hung by a cord, *l*, which is attached to the said body and passes down through the tubular spindle.



6. A leveling-instrument having in combination a body provided with a spirit-level and sights, a tripod-head having leg-sockets *f*, the bores of which are parallel, and legs G, the upper ends, *p*, of which enter the sockets, and each leg having a curve, *q*, just below the end part which occupies the sockets, whereby the legs may be spread to form a pyramid-stand, or may be turned in the sockets and brought close together and in parallel position.

383,768. MOUNTING AND LOADING APPARATUS FOR GUNS. GEORGE W. RENDEL, Newcastle-upon-Tyne, England. Filed June 7, 1887. Serial No. 240,543. (No model.) Patented in England June 7, 1873. No. 2,222.

Claim.—1. The gun-mounting apparatus hereinbefore described, consisting of the combination of the platform, the vertical supporting-pivot near its front, the wheels supporting the rear end of the platform, the track for the supporting-wheels concentric with the platform-pivot, the gun-carriage adapted to recoil along the platform, the parapet extending both in front of and laterally beyond the gun-carriage, and the ramming apparatus, working parallel with the lateral extension of the parapet, protected by it and in line with the bore of the gun and close to its muzzle when run forward on its carriage, turned parallel with the parapet, and its muzzle depressed to receive the charge from the ramming apparatus, as set forth.



2. The combination of the platform supported at or near its front end by a vertical pivot just in rear of a parapet, the supporting-wheels

383,768.

at the opposite end of the platform, the trunk upon which these wheels run as the platform turns about its pivotal support, the gun and its carriage adapted to recoil along the platform, the ramming apparatus protected by the parapet, and at a short distance from the muzzle of the gun when the gun has been brought into its loading position by the turning of its platform, the railway for a trolley for conveying ammunition, and a railway transverse to the trolley-railway for a carriage for conveying the trolley and its load into a position between the muzzle of the gun and the rammer, substantially as and for the purpose set forth.

383,769. EXTENSION-LAMP FIXTURE. FRANK REED, Meriden, Conn., assignor of one-half to Edward Miller & Company, same place. Filed Nov. 30, 1887. Serial No. 256,511. (No model.)

Claim.—1. In a lamp-fixture adapted to be hung from the ceiling and consisting of two parts, one the suspending portion and the other part carrying the lamp or lamps, the said other part adjustable to different elevations with relation to the suspending portion, the combination therewith of a frame, a spring-drum arranged upon an axis in said frame, the said frame and drum arranged in one of said parts, a cord or chain upon said drum and extending therefrom into connection with the other of said parts, the said drum constructed with one or more notches in a line concentric with the axis of the drum, and a dog adapted to engage the notches in the drum when the parts are in the normal position, the said frame and dog, the one constructed for limited rotation in a horizontal plane, and the other stationary with relation to the same plane, substantially as described.

2. In a lamp-fixture adapted to be hung from the ceiling and consisting of two parts, one of said parts adapted to be suspended from the ceiling and remain stationary, the other part adapted to carry the lamp or lamps and adjustable to different elevations, the combination therewith of a spring-drum hung in a frame formed as a part of the stationary portion, a cord or chain therefrom in connection with the adjustable part, a hanger above the said frame and to which the said frame is pivoted, so that the said frame may rotate on the said pivot, the said drum constructed with one or more notches, and the hanger constructed with a corresponding dog adapted to engage said notch or notches of the drum in the normal condition of the fixture, substantially as described, and whereby said engagement of said hanger and drum may be released by a rotative movement of the fixture, substantially as described.

3. In an extension-lamp fixture, the combination of a frame carrying the stationary part of the fixture, a drum arranged upon an axis in said frame, a cord or chain therefrom and connected to the adjustable part of the fixture, a hanger to which the said frame is connected by a pivot, so as to permit a partial rotation of the said frame and drum, the said drum constructed with one or more notches in a line concentric with the axis of the drum, the hanger constructed with a dog extending downward and so as to stand in the path of said notch or notches on the drum in the normal condition of the drum, and a spring between said hanger and frame, the tendency of which is to draw the said hanger and drum into engagement but yield under the rotative movement of the frame and so as to take the drum out of engagement with the hanger, substantially as described.

4. In an extension-lamp fixture, the combination of a frame, A, carrying the stationary part of the fixture, a drum, B, hung in the said frame upon a horizontal axis and so as to revolve in a vertical plane, a cord or chain extending from said drum into connection with the adjustable part of the fixture, the said drum constructed with a series of notches or teeth, *a*, concentric with its axis, a hanger, G, with a vertical pivot-connection between said hanger and frame, whereby a horizontal rotation is permitted to the frame and all it carries independent of the hanger, a dog, I, projecting downward from said hanger into the path of the said concentric series of notches on the drum, and a spring, J, connected by one end to the frame and by the other end to said hanger, the tendency of the spring being to yieldingly hold the frame in the position of engagement between the dog and drum, but so as to permit disengagement under a rotative movement of the said frame, substantially as described.

383,770. UNDERGROUND CONDUIT AND GRIP FOR ELECTRIC RAILWAYS. ELIAS R. RICE and ALBERT H. HEDDERSON, Baltimore, Md. Filed Sept. 17, 1885. Serial No. 177,579. (No model.)

Claim.—1. In an electric railway, a longitudinally-slotted conduit formed entirely of non-conducting concrete or cement, and having longitudinal grooves or channels formed therein to receive and hold the conducting-rail, substantially as set forth.

2. In an electric railway, a longitudinally-slotted conduit extending along the line of way, the walls of which are formed entirely of non-conducting water-proof concrete or cement, and one or more naked electric conductors embedded in the walls of said conduit and having a part of their surface exposed, substantially as set forth.

3. In an electric railway, the combination of a longitudinally-slotted conduit extending along the line of way and formed entirely of non-conducting water-proof material, said conduit having one or more partially-exposed naked conductors embedded therein and traversing its interior in a direction parallel with said slot, and depending contact or current-collecting devices on a moving car or motor adapted to enter said slot and make connection with each conductor or conductors.

4. In an electric railway, the combination of an underground conduit formed of insulating or non-conducting material extending along the line of said railway and having an interior longitudinal elevation formed integral therewith and provided with a groove or channel formed therein, and an electric conductor adapted to enter said groove and be removably but securely held therein by virtue of gravity without danger of accidental displacement.

5. In an electric railway, an underground conduit having a centrally-supported conducting-rail, and provided at intervals with nor-

mally-sealed openings extending through the interior of the central support or supports, through which openings electrical connection can be made between the conducting-rail and exterior translating devices, substantially as and for the purpose set forth.

6. In an electric railway, an underground conduit for the conductors thereof formed of non-conducting water-proof concrete or cement, and provided with an interior longitudinal elevation formed integral therewith and having a groove for receiving an electric conductor, said elevation extending along the bottom of the conduit and dividing the lower portion thereof into drainage-channels, substantially as set forth.

7. In an electric railway, the combination, with an underground conduit having a central longitudinal surface opening or slot extending along its entire length and provided with an interior ridge or elevation extending along the bottom of the conduit, of an insulated A-shaped electric conductor supported by said elevation directly under the surface-opening, and a channel at each side of said conductor designed to receive the surface-drainage, and provided at intervals with a common outlet, substantially as set forth.

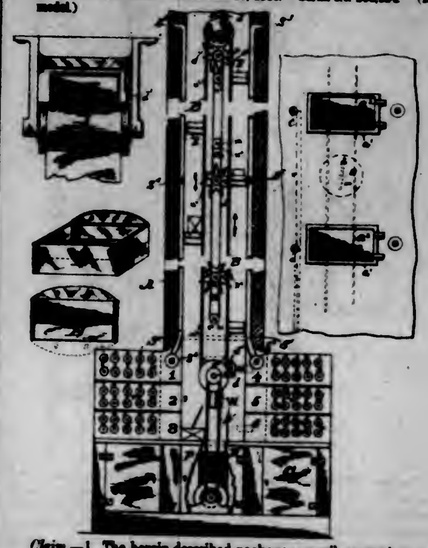
8. In an electric railway, the combination of an insulated conducting-rail extending along the line of way, and having its exposed contact or rubbing surface A-shaped in cross-section, and one or more contact wheels or pulleys provided with a V-shaped groove, and designed and adapted to move along said rail in contact with both sides of its exposed surface, the sides of said conducting-rail being pitched or inclined at an angle different from and less acute than that of the V-shaped groove in the contact wheel or wheels.

9. In an electric railway, the combination of a longitudinally-slotted underground conduit extending along the line of said railway, and a vertically-adjustable bar on a motor or car having grooved pulleys or contact-wheels pivoted to its lower end and designed and adapted to enter said slotted conduit and make electrical contact with one or more A-shaped insulated conductors supported therein, said contact-wheels being grooved at an angle more acute than that formed by the sides of the conductor or conductors, substantially as set forth.

10. An underground conduit for the conducting rail or rails of an electric railway, having a longitudinal opening or slot along its upper surface, and formed entirely of prepared sections of suitable length made from non-conducting or insulating concrete or cement, said sections being placed end to end and secured to each other by a joint of similar material in a plastic state in such a manner that both the interior and the exterior upper surface of the conduit remain perfectly smooth, substantially as and for the purpose set forth.

11. In an electric railway, a vertically-adjustable grip or contact bar capable of vertical motion between guides secured to and depending from a moving car or motor, said bar having at its lower end a centrally-pivoted yoke or rocking lever provided with contact wheels or pulleys, substantially as set forth, said contact-wheels, by reason of their pivoted connecting-yoke, being capable of adjusting themselves to inequalities in the conducting rail or rails and to irregularities of motion due to an uneven roadway, and thereby lessen or obviate the damage caused by interruptions in contact and consequent sparking.

12. In an electric railway, the combination, with a motor or car adapted to travel on said railway, of a longitudinally-slotted conduit extending along the line of said railway and having one or more electric conductors therein, and a depending vertically-adjustable bar extending through the slot from said motor or car and having at its lower end a pivoted yoke or rocking lever provided at its respective extremities with contact-wheels or current-collecting devices designed and adapted to make electrical contact with the conductor or conductors in the said conduit, substantially as and for the purpose set forth.



13. In an electric railway, the combination of a conduit having a longitudinal slot, an insulated vertically-guided bar entering said slot and adapted to make connection with an electric conductor carried in the conduit, and depending guides or supporting-brackets also entering said slot and provided with ways or channels between which the conducting-bar is free to slide, substantially as set forth.

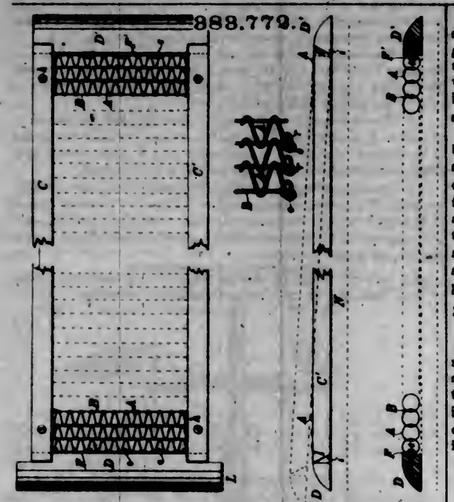
14. In an electric railway, the combination of a longitudinally-slotted conduit extending along the line of said railway and having one or more electric conductors therein, depending guide-brackets on a moving car or motor and adapted to enter said longitudinal slot, a vertically-adjustable conducting-bar also carried by said car or motor and adapted to enter the slot between said guide-brackets, and insulating material between the said bar and the guide-brackets, substantially as and for the purpose set forth.

15. In an electric railway, the combination of a conduit having a narrow longitudinal slot, a motor or car having depending brackets or guides of such thickness as to nearly fill the width of the slot, and an insulated conducting-bar capable of vertical motion between such guides, but somewhat thinner in cross-section, and adapted to enter the conduit between the sides of the slot and without coming in contact therewith, substantially as set forth.

16. In an electric railway, the combination, with the conducting rail or rails, of the conducting-bar H, the yoke or rocking lever J, with its contact-wheels K K, and the slot *j* and pin *j'*, to limit the rocking motion of the yoke or lever, substantially as set forth.

388,771. MAIL-CONVEYING APPARATUS. ALFRED D. SAMSON, Brooklyn, N. Y. Filed Jan. 16, 1888. Serial No. 260,894. (No model.)

Claim.—1. The herein-described package or mail conveying apparatus, comprising a vertical closed well-hole extending through the several floors of a building, and provided with apertures or openings through its wall within easy reach from each floor, doors or the like normally closing said openings, an endless conveyer vertically operating in said well-hole, receptacles carried by said conveyer and adapted to pass within reach from each of said openings, each receptacle being provided with a pocket in its top and bottom, a motor in the bottom of said well-hole adapted to drive the conveyer, and connections between the motor and each floor, as set forth.

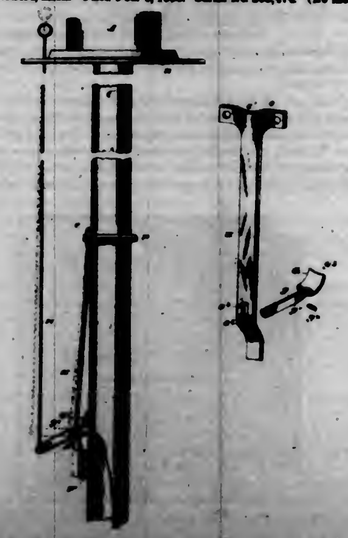


2. A conveying apparatus comprising a vertical well-hole extending through the several floors of a building, and provided with one or more openings through its wall at each floor, pulleys mounted at the top and bottom of said well-hole, an endless vertically-operating conveyer passing over said pulleys and adapted to be driven by the lower pulley, which is provided with an auxiliary pulley connected with an electric motor, and wires running through the well-hole from each floor, by which the operation of the motor can be started or stopped from any floor, as set forth.

3. The apparatus comprising a vertical well-hole extending through the several floors of a building, an endless conveyer operating in the same and provided with pockets or receptacles, and an indicating device whereby the number of floors traversed by the conveyer is shown and consisting of a graduated face or dial, and an indicating-finger operating over the face of the dial and located on and operated by a shaft or stud extending transversely into the vertical well-hole, said shaft or stud and the finger carried by the same being operated by the operation of the conveyer, substantially as described.

4. The apparatus comprising a vertical well-hole extending through the several floors of a building, an endless belt conveyer operating in the same and provided with pockets, and an indicating device whereby the number of stories traversed by the conveyer is shown upon every floor and consisting of a graduated face or dial upon each floor, an indicating-finger for each dial, horizontal shafts or studs extending transversely into the vertical well-hole and carrying said fingers and rotated by the belt conveyer as it operates, and belting whereby the shafts are connected and made to operate simultaneously when one shaft is turned, as set forth.

388,772. WIRE MAT. HENRY H. SUPLEE, Rochester, N. Y., assignor of one-half to William W. Gates, same place. Filed Dec. 22, 1887. Serial No. 258,603. (No model.)

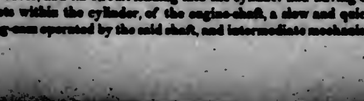


Claim.—1. In a flexible wire mat or floor-covering, the combination, with a series of parallel wire spirals, the coils of adjacent spirals overlapping each other, of straight wires passing through such overlapped portions to hold the spirals together, the ends of the straight wires being bent back on themselves over the ends of the coils to prevent the expansion of the latter, and the ends of coils being bent, substantially as described, to prevent rotation of the coils and their consequent displacement, as set forth.

2. The combination, with the side bars, C C, extending along the sides of the mat and fastened to the supporting-surface N, of the herein-described removable flexible wire mat, consisting of a series of parallel spiral coils, A A, connected together by the wires B B, passing through the adjacent coils and provided with the end bars, D D', projecting laterally beyond the edges of the mat and adapted to engage with the ends of the side bars to secure the mat in place between the side bars, substantially as and for the purpose set forth.

3. The combination, with the side bars, C C, extending along the sides of the mat and fastened to the supporting-surface N, of the herein-described removable flexible wire mat, consisting of a series of parallel spiral coils, A A, connected together by the wires B B, passing through the adjacent coils and provided at each end with the end bars, D D', attached to the mat by the wires F F and eyes *e e*, and lugs or projections *i i*, engaging the side bars, substantially as described.

388,773. VENT-STOPPER FOR PUMPS. ABNER SEGRAL, Hickory Corners, Mich. Filed Feb. 9, 1888. Serial No. 263,474. (No model.)



Claim.—1. In a vent-stopper for pumps, the combination, substantially as before set forth, of the well-tube having a vent, an elongated spring-arm secured thereto at one end and outwardly inclined therefrom, and having a cushion on its lower end to engage with the vent, a pawl carried in the lower end of said spring-arm having an inner T-head movably bearing against the well-tube, and a pull-rod secured to the outer end of said pawl.

2. In a vent-stopper for pumps, the combination, substantially as before set forth, of the well-tube having a vent therein, an elongated spring-arm secured to said tube by a clip having a slot in its lower end, a vent-closing cushion below said slot and outwardly inclined from the tube, the pawl mounted in the lower slotted end of the spring-arm having a T-head movably bearing against the tube and against the spring-arm to prevent disengagement therefrom, a transversely-arranged pin passing through said pawl on the outside of the spring-arm to limit the outward movement of the said spring-arm, and a pull-rod secured to the outer end of said pawl.

388,774. LOOM-SHUTTLE. JAMES C. SMEDLEY, Philadelphia, Pa. Filed Aug. 13, 1887. Serial No. 247,231. (No model.)

Brief.—The spindle-holding head has pivoted on it the bobbin-retaining catch, which is normally forced to engage the bobbin by a spring. The head is further provided with a cavity in which plays the journal of a spring-actuated knuckle, which holds the spindle in its inner and outer positions. This knuckle is formed with a lip, which engages the end of the bobbin-retaining catch when the spindle is in its outer position and so frees the bobbin from the catch.

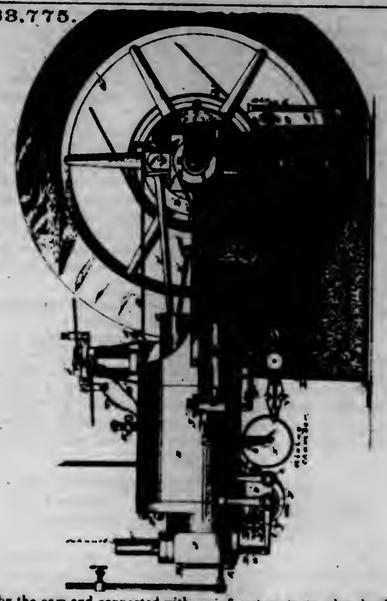
Claim.—1. A shuttle having a spindle with a spring-actuated catch pivoted to the head thereof, and provided with a spring-pressed knuckle having a projecting lip adapted to bear against the spring-pressed arm of said catch when said spindle is elevated, substantially as and for the purpose set forth.

2. A shuttle having a spindle with a head pivoted to the body of the said shuttle, a catch pivoted in an opening in said head and having the spring H, adapted to keep said catch in contact with a bobbin on said spindle, and the knuckle J, pivoted to said head and provided with the projecting lip *b*, said parts being combined substantially as and for the purpose set forth.

3. A shuttle having a spindle with its head pivoted to the body of the shuttle, a spring-actuated catch pivoted to the head, and a spring-pressed knuckle having a lip adapted to bear on the spring-pressed arm of the catch when said spindle is elevated, said head of the spindle having a projection or shoulder on its lower side adapted to bear against the body of the shuttle, said parts being combined substantially as and for the purpose set forth.

4. A shuttle having the spindle B, with head C and spring-actuated catch F, said head being provided with the recess D, open at its ends and having therein the pivot E of said catch, the latter being secured to said head, and the spring-pressed knuckle J, having its journal *a* in the opening *d* of said head, and the projecting lip *b*, adapted to bear against the heel of said catch F when said spindle is elevated, said parts being combined substantially as and for the purpose set forth.

388,775. GAS-ENGINE. CLARK SIZER, Springfield, Ohio. Filed Nov. 30, 1887. Serial No. 256,493. (No model.)



Claim.—1. In a gas-engine, the combination, with the cylinder and a differential piston, of a mixing-chamber in communication with the cylinder, an inlet-passage to the cylinder, also communicating with said chamber, a pump communicating with said chamber and with the atmosphere through a carbureting-chamber and carbureting material, a suitable exhaust-port, an igniting device, and the engine-shaft and its adjuncts operatively connected with the piston and pump.

2. In a gas-engine, the combination, with the cylinder, a differential piston, a mixing-chamber, two valves, one opening toward the cylinder and the other from it, and a cylinder-inlet passage communicating with said chamber and having a valve opening toward the cylinder, of a carbureting-tank, a pump communicating with the atmosphere through said tank and communicating with said chamber, and governor mechanism controlling the communication between said tank and pump, and the engine adjuncts which actuate said piston, pump, and governor.

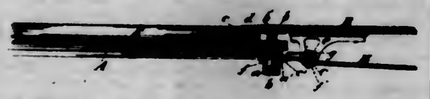
3. In a gas-engine, the combination, with an electrical generator, and a circuit leading into the cylinder and having contact-points within the same, of slow and quick actuating mechanism connected with one of said contact-points, for the purpose described.

4. In a gas-engine, the combination, with a cylinder, an electrical generator, and its circuit leading into the cylinder and having contact-points within the cylinder, of the engine-shaft, a slow and quick actuating-cam operated by the said shaft, and intermediate mechanism actu-

383,775.

ated by the cam and connected with one of said contacts, whereby the circuit is broken with different degrees of rapidity.

5. In a gas-engine, the combination, with the cylinder, a dynamo, its circuit composed in part of a fixed insulated rod projected into the cylinder, and a reciprocating rod also projected into the cylinder and having a holding-down spring and contacts between said rods, of a pivoted bell-crank lever engaging the reciprocating rod, a rocking arm connected to the bell-crank lever, the engine-shaft, and a cam thereon, which actuates the rocking arm and having two head-inclines, one of which is more abrupt than the other.



6. In a gas-engine, a cam for actuating an exhaust-valve, provided with head and tail inclines and a long and short surface between said inclines.

7. In a gas-engine, a cam for actuating a circuit-breaker, having two head-inclines, one of which is more abrupt than the other.

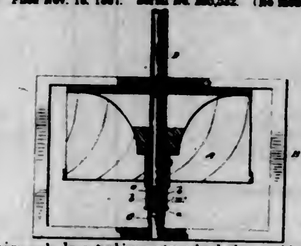
8. In a gas-engine, the combination, with the main shaft and two cams, one of which has two head-inclines, one more abrupt than the other, and the other of which cams has a long and a short cam-surface, of two pivoted rocking arms slidingly mounted, and an adjusting-lever therefor, whereby said arms are adjustable opposite the respective head-inclines and cam-surfaces.

9. In a gas-engine, the combination, with a mixing-chamber, of two pipes connected therewith, one of which extends near the opposite wall of the chamber from which it enters a terminus in proximity to the other pipe.

383,776. HAND-REST FOR BOOK-KEEPERS. WILLIAM D. SLOAN, Brooklyn, N. Y. Filed Sept. 10, 1887. Serial No. 249,408. (No model.)

Claim.—1. A book-keeper's hand-rest composed of overlapping bottom plate, A, and hand-supporting plate B, arranged in parallel planes, a sliding guide-connection for maintaining such relation of the parts, and devices for adjusting said plates at their lapping parts to grip the same to the book to hold the plate B in position to support the hand in the operation of writing, substantially as herein set forth.

2. The combination of the plate A, having a terminal angle-rest, *c*, and the plate B, having a terminal angle-rest, *d*, arranged to abut and lap each other end for end, and devices connecting said plates at their lapping edges, whereby the said plates may be clamped and maintained in parallel relation to each other upon the edge of a book, substantially as described.



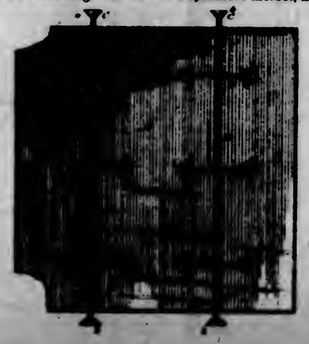
3. The combination of the plate A, the plate B, guides permitting a movement of the plates in a direction transverse to their plane, and a spring arranged to press toward each other the lapping edges of the said plates, substantially as and for the purpose herein set forth.

4. The combination of the plate A, provided with the sleeves *a*, the plate B, provided with the stems *b*, and a spring arranged to press the lapping edges of said plates toward each other, substantially as and for the purpose herein set forth.

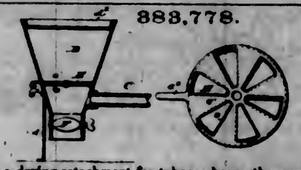
5. The combination of the plate A, provided with the sleeves *a*, the plate B, provided with the stems *b*, springs *f f*, and the levers E E, arranged to press the lapping edges of said plates toward each other, substantially as and for the purpose herein set forth.

6. The combination of the plate A, provided with the sleeves *a*, the plate B, provided with the stems *b*, springs *f f*, and the levers E E, formed integral with each other and arranged to press the lapping edges of said plates toward each other, substantially as and for the purpose herein set forth.

383,777. TURBINE WATER-WHEEL. S. MORGAN SMITH, York, Pa. Filed Nov. 18, 1887. Serial No. 255,522. (No model.)



Claim.—1. In a turbine water-wheel, the combination, with a step having its upper bearing-surface formed convex, of a vertical shaft, a bearing-plate, E, concave on its lower face, so as to fit the upper convex surface of the step, the said bearing-plate being of greater diameter than the step, and a series of vertical radially-disposed pillars, *b*, formed integral with the bearing-plate and adapted to support the vertical shaft, these pillars being formed on the bearing-plate at its perimeter and outside of the radius of the step, whereby the water may circulate freely between the lower end of the shaft and bearing-plate and over all parts of the bearing-plate and keep it at a uniform temperature throughout, substantially as described.



2. In a turbine water-wheel, the combination, with the step having a convex upper bearing-surface, of a bearing-plate, E, of uniform thickness throughout and slightly larger in diameter than the step on which it bears, the said bearing-plate having its lower bearing-surface concave, so as to fit the convex bearing-surface of the step, and its upper surface correspondingly convex to shed or throw off sediment and trash, the radially-disposed pillars formed integral with the bearing-plate outside of the radius of the said step, and the vertical shaft supported by the said pillars, whereby a water-circulating chamber is formed between the lower end of the shaft and the upper surface of the bearing-plate, substantially as described.

383,778. DRYING ATTACHMENT FOR TOBACCO-BARNS. JOHN M. BUSHOW, Big Stony Creek, Va., assignor of one-third to John Wesley Brown, Mercer County, W. Va. Filed Nov. 12, 1887. Serial No. 255,088. (No model.)

Claim.—1. In a drying attachment for tobacco-barns, the combination of a furnace provided with two dampers below the combustion-chamber and a cold-air pipe connected to the furnace between the two dampers, substantially as described, whereby provision is made for admitting the cold air to the furnace to be heated or delivering it directly into the building to lower the temperature thereof, as set forth.

383,778.

2. In a drying attachment for tobacco-barns, the combination of a furnace having open lower part, and provided with two dampers below the combustion-chamber, and cold-air pipes arranged in and projecting through the sides or ends of the barn and provided with dampers, and with laterally-projecting pipes connected to the furnace between the dampers of the furnace, substantially as described.

383,779. CAR AND ENGINE REPLACING FROG. ISAAC R. TIPTON, Youngstown, Ohio. Filed Dec. 24, 1887. Serial No. 258,881. (No model.) Patented in England Aug. 3, 1887, No. 10,998.

Claim.—1. A car-replacer composed of a shell having walls of different relative heights, and a curved or segmental top uniting the upper edges of the walls, the said top being curved transversely, substantially as described.

2. A car-replacer composed of walls substantially parallel and inclining from a vertical line, the walls being of different relative heights, the curved top uniting the upper edges of the walls and sloping from the higher to the lower wall, and the braces uniting the walls and resting against the inner side of the said top, substantially as and for the purpose described.

3. The combination, with the segmental shell, of the braces, some of the braces oblique and others vertical, substantially as and for the purpose described.

4. The combination, with the segmental shell, of the cross-rod centrally disposed to form a brace and a handle, substantially as described.

5. The combination, with the segmental shell, of the braces extending from one wall to the other and touching the top, and the cross-rod arranged midway between the ends of the segment, substantially as and for the purpose described.

6. The combination, with the segmental car-replacer, of the wear-plate located about midway between the ends of the car-replacer and arranged transversely thereof, substantially as specified.

7. The combination, with the segmental car-replacer having a recess in its crest, of the wear-plate fitted in the said recess, substantially as described.

8. The combination, with the segmental car-replacer having a recess in its crest provided with converging edges, of the wear-plate dovetailed in said recess, substantially as described.

9. The herein-described segmental shell, having the lower edges of the side walls thickened, substantially as described.

10. The herein-described segmental shell, having the side walls provided with a longitudinal groove in their edges, substantially as and for the purpose described.

11. The herein-described segmental shell, having the middle portion of its side walls thickened and extended downward, and having the lower edge of the said middle portion longitudinally grooved, substantially as and for the purpose described.

12. The combination, with the segmental car-replacer, of the projection 1, square on its under side and rounding on its upper end, substantially as and for the purpose described.

13. The combination, with the car-replacer, of thin and wide locking-spurs located along each edge of the car-replacer, and having one side of the spurs in a vertical plane and the other side beveled to form an edge, substantially as and for the purpose described.

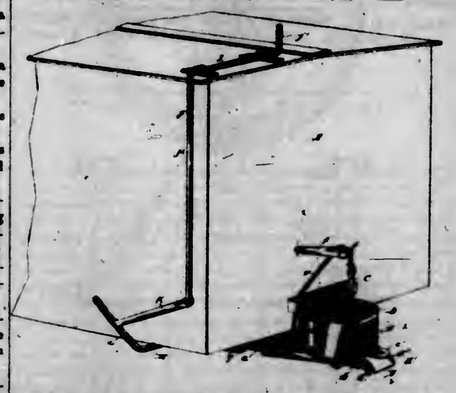
14. The combination, with the car-replacer, of end and side locking-spurs, being thin and wide, the end locking-spurs being arranged with their greatest length at right angles to the greatest length of the side locking-spurs, and having the inner side of each locking-spur in a vertical plane and its outer side beveled inward to a straight edge, substantially as set forth.

383,780. PUMP. MARLON H. THORNLACK, Lafayette, Ind. Filed July 19, 1887. Serial No. 244,747. (No model.)

Claim.—1. As an article of manufacture, a lining for a pump-cylinder, composed of a hollow casting formed with a taper to enable it to take up swelling in the pump-cylinder and a sheet-metal tube secured to said casting, substantially as and for the purposes set forth.

2. As an article of manufacture, a lining for a pump-cylinder, composed of a hollow casting provided with spurs on its exterior and

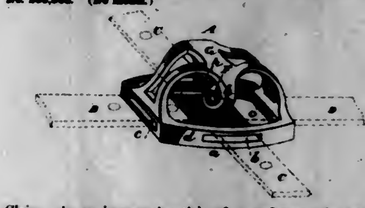
383,780.



formed with a taper to enable it to take up swelling in the pump-cylinder, and a sheet-metal tube secured to said casting, the inner faces of the tube and casting at the joint being substantially flush with each other, substantially as and for the purposes set forth.

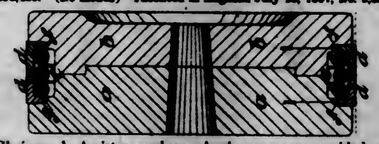
3. The combination, with the hollow tapering casting provided with spurs on its exterior, of the sheet-metal tube secured to the casting, the inner faces of the casting and tube at the joint between the two being substantially flush with each other, substantially as and for the purposes set forth.

4. The combination, with the tapering casting formed with the spurs and having the sheet-metal tube secured thereto, of the pump-stock fitting around said tube and casting and secured to the latter by its taper and spurs, and the wall-tubing fitting inside the casting, substantially as described.



383,781. CAR-COUPLING. GEORGE W. TOLES, Neodesha, Kans. Filed Feb. 11, 1888. Serial No. 263,673. (No model.)

Claim.—1. In a car-coupler, the combination, with the draw-head, the pin, and the pivoted guide-bar D, having the guide-face *d'*, provided with the retaining-flanges *d*[3], of the double crank-shaft journaled under the car, the pulley situated over the draw-head, the chain or cord running thereover and connecting the one crank of the shaft and pin, the pitman journaled on the other crank, the slotted link connecting the pitman and guide-bar, and the coiled spring extending normally the pitman and the link, substantially as specified.

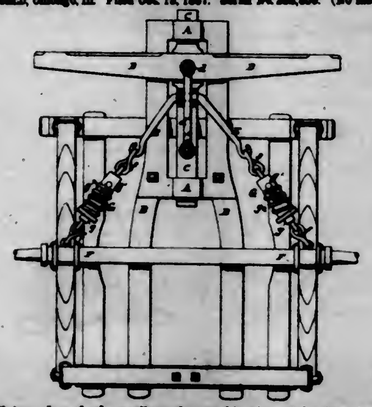


2. In a car-coupler, the combination, with the draw-head, the pin, the crank-shaft journaled under the car, the pulley, and the chain or cord connecting the crank-shaft and pin over the pulley, of the double-angled lever journaled in bearings on the roof of the car, and the link connecting the depending arm of said lever and the upstanding handle of the crank-shaft, substantially as specified.

383,782. COMBINED BACK-BAND BUCKLE AND TRACE-CARRIER. SAMUEL H. TOLER, Ramsdale, Mo. Filed Apr. 2, 1888. Serial No. 269,262. (No model.)

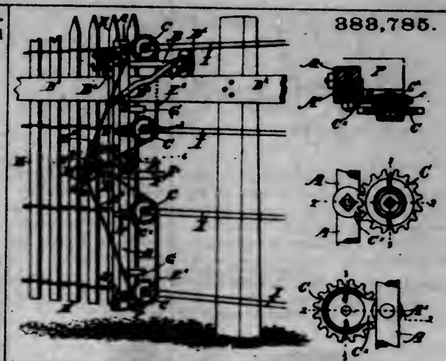
Claim.—As an improved article of manufacture, the combined buckle and trace-carrier described, consisting of the base portion *a*, having apertures *b b* and *c c*, the transverse strip B, having its lower face flush with the lower face of the base portion, and its upper face cut away to form the recess *d*, flush with the apertures *b*, and the arched piece G, arranged at right angles to the strip B, and formed with the hooks *h*, covered by said arched piece, substantially as shown and set forth.

383,783. PISTON AND PLUNGER. RICHARD TOZER, Alderley Edge, County of Chester, England. Filed Dec. 20, 1887. Serial No. 258,469. (No model.) Patented in England July 12, 1887, No. 9,922.



Claim.—1. A piston or plunger having a groove provided with ledges *f* at the sides, in combination with packing-rings *d* within the groove, and having edges to bear upon the said ledges to support the piston or plunger, all substantially as described.

2. A piston or plunger having packing-rings, and an internal spiral spring whose axis is coincident with the axis of the piston, the spring being a coiled rod of circular, semicircular, triangular, or semi-tubular section, as and for the purpose set forth.



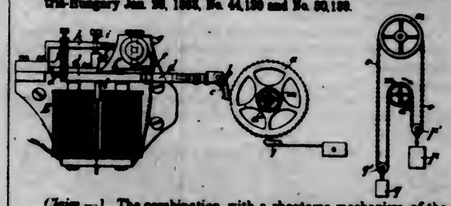
3. A piston or plunger composed of the body *a* and cover *b*, and formed with a groove, *c*, and ledges *f f*, in combination with the rings *d d* within the groove, and having edges to bear upon the ledges to support the piston and a spring behind the ring, substantially as described.

383,784. DRAFT ATTACHMENT FOR WAGONS. J. GEO. UNSELD, Chicago, Ill. Filed Oct. 19, 1887. Serial No. 252,850. (No model.)

Claim.—In a draft-equalizer, the combination of the draw-bar C, sliding in the guide-bracket A, and carrying the evener D, the rearwardly-extending V-shaped draw-link E, pivoted to the draw-bar C centrally, and duplicate links *f*, and spring devices *G g f g*, connected to the rear ends of the link E and axle F, the parts being arranged in the manner and for the purpose set forth.

383,785. FENCE-MACHINE. THEODORE F. VANDERVORT, Rush, and ALPHEUS L. HAFER, Shelbyville, Ind. Filed Dec. 21, 1887. Serial No. 258,216. (No model.)

Claim.—1. The combination, in a fence-machine, of several twisting-wheels, two driving-wheels, and independent driving-chains running from said driving-wheels to said twisting-wheels or groups of twisting-wheels, one of said driving-wheels being provided with means of engagement with the other, whereby either a part or all of the twisting-wheels may be driven.



2. The combination, in a fence-machine, of a series of twisting-wheels adjustable toward or from each other, a driving wheel or wheels located to one side of the twisting-wheels and adjustable toward or from said twisting-wheels, and drive-chains connecting said twisting-wheels and said drive-wheels, whereby said twisting-wheels can be adjusted to different positions without varying the length of said driving-chains, substantially as set forth.

3. A fence-machine having a series of twisting-wheels, mechanism for operating said series of twisting-wheels, and means for throwing a portion of said twisting-wheels out of connection with the operating mechanism, substantially as set forth.

4. In a fence-machine, the combination of the twisting-wheels and drive-chains, two independent driving-wheels mounted upon the same shaft and provided with clutch-faces, one being mounted loosely on said shaft, and means for holding said wheels together and for forcing them apart, and means for operating said shaft, whereby the twisting-wheels or groups of twisting-wheels driven therefrom may be operated independently, substantially as set forth.

5. The combination, in a fence-machine, of the standard or post, serrated plates secured thereto, and brackets for the twisting-wheels having similar serrated faces, said twisting-wheels, driving-chains, driving-wheels, and an adjustable bracket supporting said driving-wheels, whereby the positions of said brackets on said plates, and consequently the positions of the twisting-wheels, may be varied as desired, substantially as set forth.

383,786. ELECTRIC APPARATUS FOR WINDING CLOCKS. MARIANO VIAS, Bilbao, Spain. Filed Oct. 13, 1887. Serial No. 252,753. (No model.) Patented in England Sept. 27, 1887, No. 13,091; in Belgium Sept. 28, 1887, No. 79,626; in France Sept. 30, 1887, No. 186,142; in Italy Oct. 5, 1887, No. 22,469; in Spain Nov. 30, 1887, No. 11,788, and in Austria-Hungary Jan. 20, 1888, No. 44,150 and No. 30,150.

Claim.—1. The combination, with a rheotome mechanism, of the herein-described weight-elevator, one wheel or pulley of the same communicating motion to the mechanism to be driven and its other wheel or pulley adapted to be driven by the armature of the rheotome mechanism, substantially as set forth.

2. The combination, with a weight-elevator, of a shaft carrying a ratchet-wheel and a wheel or pulley to operate the weight-elevator, and an automatic rheotome mechanism, the armature of the rheotome mechanism being adapted to operate the ratchet-wheel, and hence the elevator, substantially as described.

3. The combination, with an automatic rheotome mechanism, of a shaft adapted to be driven by the armature of the same, a wheel or pulley on said shaft, a weight adapted to be raised by the rotation of said pulley or wheel, and an additional wheel or pulley communicating motion to the mechanism to be driven and connected with and operated by the downward pull of said weight, substantially as described.

4. The combination, with an automatic rheotome mechanism, of a wheel or pulley intermittently rotated by the armature of the rheotome mechanism, a wheel or pulley imparting motion to the mechanism to be driven, and an endless chain or the like carrying weights, whereby the wheel immediately connected with the rheotome mechanism is adapted to operate the chain and weights independently of the other pulley, which is operated by the weights independently of the pulley which raises the weight, substantially as described.

5. The combination, with an automatic rheotome mechanism, of the herein-described weight-elevator, one wheel or pulley of the same communicating motion to the mechanism to be driven, and its other wheel or pulley adapted to be driven by the armature of the rheotome mechanism, and an automatic circuit breaker and closer connected with the wheels or pulleys of the elevator, whereby the operation of the rheotome mechanism is stopped and started automatically, as set forth.

6. The combination, with an automatic rheotome mechanism, of a weight-elevator communicating motion to the mechanism to be driven and intermittently operated by the armature of the rheotome mechanism, an automatic circuit breaker and closer, gearing connecting said breaker and closer with the weight-elevator, whereby the operation of the rheotome mechanism is stopped when the driving-weight has passed upwardly a certain distance, and gearing connecting said circuit breaker and closer with the mechanism operated by the weight, whereby the operation of the rheotome mechanism is started when the weight has passed downward a certain distance, as set forth.

7. The combination, with a rheotome mechanism and a weight-elevator, of a shaft rotated by the armature of the rheotome mechanism and adapted to operate the weight-elevator, an automatic circuit breaker and closer for the rheotome mechanism, gearing connected with said circuit breaker and closer, a lug or projection upon the shaft, adapted to operate said gearing when the shaft rotates, additional gearing connected with the circuit breaker and closer, and a wheel actuated by the downward pull of the weight and provided with a lug or projection to engage and operate said last-mentioned gearing, for the purpose set forth.

383,787. PIPE-THREADING DIE. FREDERICK VIEHLE, Yonkers, N. Y. Filed Feb. 15, 1888. Serial No. 264,072. (No model.)

Claim.—1. The combination, with the block of a cutter-die, of radially-guided cutters having teeth or racks at one side, pivoted locking-jaws having toothed faces, a slide-ring provided with pins for engaging said jaws, and means for shifting the slide-ring, substantially as set forth.

2. The combination of a block having radially-aligned recesses at the inner and outer ends, radial cutters guided in said recesses and provided with teeth or racks at one side, pivoted locking-jaws having toothed faces meshing with said racks, an interior slide-ring guided in a groove of the cap and provided with pins for engaging the jaws, means for shifting said slide-ring, and means for locking it into position when shifted, substantially as set forth.

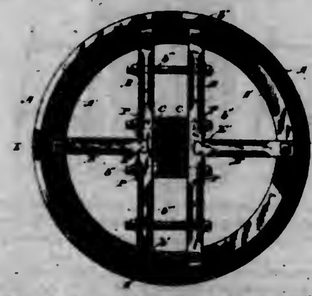
3. The combination of the main part and caps of the block, screw-bolts for connecting the same, radially-guided cutters having teeth or racks at one side, toothed locking-jaws pivoted to said bolts, and a slide-ring guided in a groove of the cap and provided with pins for engaging the jaws, so as to set the cutters in locked position or expand the same, substantially as set forth.

4. The combination of the block of a cutter-die, radially-guided cutters having teeth or racks, pivoted locking-jaws having toothed faces meshing with said racks, a recessed slide-ring guided in the block and encircling the jaws, and tapering fingers pivoted to said slide-ring and adapted to engage the locking-jaws, so as to adjust the same and the cutters, substantially as set forth.

5. The combination of the block of a cutter-die, radially-guided cutters having teeth or racks at one side, pivoted locking-jaws having toothed faces, a slide-ring having pins for engaging said jaws and setting the same, and an encircling slide-ring having pivoted and tapering fingers for adjusting the jaws and cutters after they are set, substantially as set forth.

6. The combination of the block of a cutter-die, radially-guided cutters having teeth or racks, pivoted locking-jaws having toothed faces intermeshing with said racks, recesses at the inner ends said hooks at the outer ends, a slide-ring having pins for engaging the hooks of the jaws, a second slide-ring extending around the jaws, and tapering fingers pivoted to the jaws and guided along inclined recesses of the circumference of the block, substantially as set forth.

7. The combination of the block of a cutter-die, radially-guided cutters having teeth or racks at one side, pivoted locking-jaws having toothed faces intermeshing with the toothed cutters, a slide-ring extending around the jaws, tapering fingers pivoted to the slide-ring and guided along inclined recesses of the outer flange of the block, and radial lugs attached to the slide-ring and extended to the outside of the block for setting the slide-ring, substantially as set forth.



8. The combination of the block of a cutter-die, radial cutters guided by the same, said cutters having toothed middle portions and smooth ends, pivoted locking-jaws having toothed faces for locking said cutters, and filling-pieces set into the guide-recesses at the outer flange of the block, substantially as set forth.

383,788. INSECT-TRAP. JOHN WILLIAMS, Fort Colborne, Ontario, Canada. Filed Dec. 7, 1887. Serial No. 257,944. (No model.)

Claim.—In insect-traps, the combination of an open vessel, A, contracted at the top and containing a liquid, B, and with the handle *c* and hook *d*, from which an ordinary lantern can be suspended so that the light is on or near a level with the top of the vessel A, substantially as set forth.

383,789. SPLIT PULLEY. WILLIAM A. WILLINGHAM, Chattanooga, Tenn. Filed Sept. 8, 1887. Serial No. 248,836. (No model.)

Claim.—1. In a split pulley, the combination, with two rim-sections having a combined angular extent slightly less than an entire circumference, of two hub-sections attached by intermediate devices to said rim-sections, respectively, and means, substantially as described, for fastening said hub-sections together and for drawing the meeting ends of said rim-sections together, each of said hub-sections having in its inner face a cylindrical groove whose axis is coincident with the axis of the rim-section, and the meeting ends of said rim-sections being free to approach each other after the axes of said cylindrical grooves become coincident, substantially as and for the purpose set forth.

2. In a split pulley, the combination, with two rim-sections having an angular extent slightly less than an entire circumference, of spoke-arms attached to said sections, respectively, hub-sections attached to said spoke-arms, respectively, and means for fastening together the spoke-arms of the two sections, each of said hub-sections having in its inner face a cylindrical groove whose axis is coincident with the axis of the corresponding rim-section, whereby when the axes of said cylindrical grooves become coincident the contiguous ends of said rim-sections shall still be slightly separate, said said contiguous ends being free to approach each other after said axes become coincident, substantially as and for the purpose set forth.

3. The combination, with the rim-sections A A, of the spoke-arms B B, attached to said rim-sections, respectively, the hub-sections C C, attached to the arms B B, respectively, and grooved to form a bushing, and the bolts *b'*, connecting said arms B B and hub-sections C C, the groove in each of said sections C C being a cylindrical segment whose axis is coincident with that of the corresponding rim-section,

the combined angular extent of said rim-sections being slightly less than an entire circumference, and the contiguous ends of the rim-sections being free to approach each other after their axes become coincident, substantially as and for the purpose set forth.

4. The combination, with the two rim-sections A A, each having an internal flange, A', of the spoke-arms B B, each made up of two parts, *b b*, lying on opposite sides of the flange A', the plates P, extending across the outer faces of the spoke-arms, and bolts *b''*, passing through the plates P and the spoke-arms, substantially as and for the purpose set forth.

383,790. LOCOMOTIVE. LEANDER S. WOODBURY, Calumet, Mich.

Filed Feb. 20, 1888. Serial No. 264,583. (No model.)

Claim.—1. The combination of the locomotive and a tender coupled thereto, with an arm projecting beneath the tender from the locomotive and laterally confined to said tender, all substantially as specified.

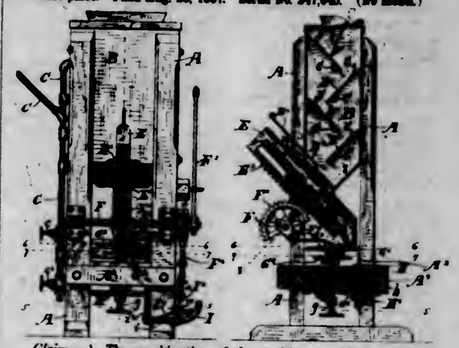
2. The combination of the locomotive and tender, with an arm, F, having extensions adapted to opposite bearings on the locomotive and having a bearing on the tender, a rod connected to said arm between the opposite bearings, and a spring interposed between the head of said rod and a bearing carried by the locomotive, all substantially as specified.

3. The combination of the locomotive and tender, a transverse bar, E, having bearing portions *e e*, slotted bearings for the latter on the locomotive, an arm attached to the bar and having a bearing on the tender, a rod connected to the arm, and a spring interposed between the head of the rod and a bearing on the locomotive, all substantially as specified.

4. The combination of the locomotive and tender, an arm adapted to a bearing on the tender, and having extensions, with opposite bearings on the locomotive, a rod connected to the arm, a spring interposed between the head of said rod and a link hung to an arm on the locomotive, a bearing for said arm, and means for moving said bearing into and out of position, all substantially as specified.

383,791. WIRE-CLOTH. HENRY ATKINS, Newark, Ohio. Filed Mar. 30, 1888. Serial No. 267,861. (No specimens.)

Claim.—1. A wire-cloth consisting of interwoven copper wire and brass wire, substantially as specified.



2. A wire-cloth consisting of the warp of copper wire and the weft of brass wire, substantially as specified.

3. A wire-cloth consisting of interwoven copper and brass wires, the copper wire being of larger gage than the brass wire, substantially as specified.

383,791.

383,792. COMBINED COOKING AND CAN-FILLING APPARATUS. JOHN J. BENNER, Greenwood, Ind., assignor of one-third to Harry Wood, same place. Filed Aug. 23, 1887. Serial No. 247,645. (No model.)

Claim.—1. The combination of the cooking-box B, containing a series of shelves extending alternately from the opposite sides of said box toward its center, and steam-supply pipes C, the branches of which extend inside said box and are perforated, and upon which the inner ends of said inclined shelves rest, substantially as shown and described.

2. The combination of the cooking-box, a series of shelves therein extending on an incline from each side of said box alternately toward its center, and a series of perforated steam-pipes extending inside said box between said shelves.

3. The combination of the cooking-box B, terminating in an opening at the lower end, the hopper D, with which said opening communicates, and a plunger in said hopper.

4. The combination of the cooking-box B, terminating in an opening in its lower end, a hopper, D, with which said opening communicates, and a gate by which said opening may be closed, substantially as set forth.

5. The combination of the cooking-box, the hopper with which it communicates, the plunger in said hopper, and a rack and pinion by which said plunger is operated.

6. The combination of the hopper for receiving the cooked article, the cooking apparatus arranged to discharge into said hopper, a revolving disk containing openings arranged beneath the mouth of said hopper, and a movable platform below said revolving disk, upon which cans may be placed and brought to and beneath the mouth of the hopper and the opening in the revolving disk, the opening in said disk thus serving, while the can is being filled, as an opening in the top of said can, substantially as set forth.

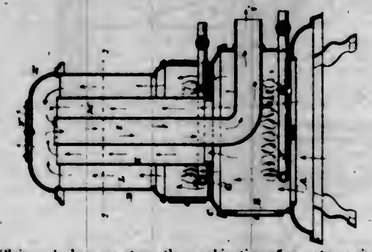
7. The combination, in a combined cooking and can-filling apparatus, of the cooking-box, a hopper arranged to receive the substance from said cooking-box, a plunger mounted to fit closely and slide in said hopper, a rock-shaft geared to said plunger for operating it, a revolving disk for receiving the cans and carrying them forward, and a connection between said rock-shaft and said disk, whereby the plunger and the disk may be operated simultaneously, substantially as set forth.

8. The combination of a hopper, a revolving disk arranged below the mouth of said hopper and containing holes, a second disk arranged on the same shaft therewith and containing notches for receiving cans, a discharging device in said hopper, the mechanism for simultaneously operating said disks, and a vertically-movable platform arranged below the mouth of said hopper for receiving cans successively as they reach that point, and the mechanism for giving to said movable platform a vertical movement, whereby the cans are brought into close contact with the disk containing the holes, and thus tightly closed, except as to the opening in said disk immediately above it, substantially as set forth.

9. The combination of the revolving disk G', having holes therein and faced on the under side with a yielding or elastic material, a vertically-movable platform, H, and the mechanism by which said movable platform is operated, and the can at the time resting on said movable platform brought into close contact with the under side of said disk G'.

10. The combination of a hopper for receiving cooked articles, the apparatus for cooking the same arranged to discharge into said hopper, a discharging device therein, a revolving device for moving the cans to and beneath the discharging-point of said hopper, a vertically-movable platform for bringing said cans up closely into position to be filled, a rock-shaft, and connections between said rock-shaft and the discharging device in the hopper, substantially as set forth.

11. The combination of the rock-shaft F, having an arm, F^3, and a pawl pivoted to said arm, a vertical shaft, G, having the disks G' and G^2, one of which is provided with pins or projections with which said pawl will engage, whereby as said shaft F is rocked said shaft G and the disks thereon are revolved, substantially as set forth.



12. The combination of the rock-shaft F, the arm F^3 thereon, a vertically-movable platform, H, having a spindle, *h*, which extends down and rests on a hinge or spring-bar, a cam or crank-shaft by which said hinge or spring-bar may be moved, and a connecting-rod between a crank-arm on said shaft and the arm F^3 on the shaft F.

13. The combination, in a cooking and can-filling machine, of a water-supply pipe, I, containing a flexible section, and a lever running to said flexible section from the can-manipulating mechanism, whereby the liquid in said pipe is periodically forced out into the cans simultaneously with the movement of said can-manipulating mechanism, substantially as set forth.

14. The combination, in a cooking and can-filling machine, of a water-supply pipe, I, a flexible section, *i*, therein, the shaft F, having an arm, and a bell-crank lever, I', pivoted to the frame-work, one end resting upon said flexible section of pipe and the other against the arm on the shaft, whereby when said shaft is rocked the flexible section will be compressed, substantially as set forth.

15. A combined cooking and can-filling apparatus consisting of a cooking apparatus arranged with a can-filling apparatus to discharge into the hopper thereof, substantially as set forth.

383,793. GAS-STOVE. LEWIS BRIDGE, Philadelphia, Pa., assignor to the Pennsylvania Globe Gas Light Company, of Pennsylvania. Filed Dec. 27, 1886. Serial No. 222,577. (No model.)

Claim.—1. In a gas-stove, the combination of an outer casing or cylinder forming a combustion-chamber, a burner at or near its bottom, a central radiating-cylinder entirely inclosed by the said outer casing and opening into it near its top, but without direct connection with the external air, and further being exposed on its outside to the products of combustion ascending in the combustion-chamber, and also adapted to receive part at least of said products of combustion through its upper end, which opens into the combustion-chamber, an elbow-outlet extending through said combustion-chamber, opening from the bottom of said radiating-cylinder and located immediately above the burner, and a register or valve in the top of the stove-case above the central cylinder to allow part of the products of combustion to escape into the room and part to enter the central elbow-outlet, the interior passages of the stove, where combustion takes place, being substantially closed to the air exterior to the stove, and draft-passages to the burner at the base of the stove.

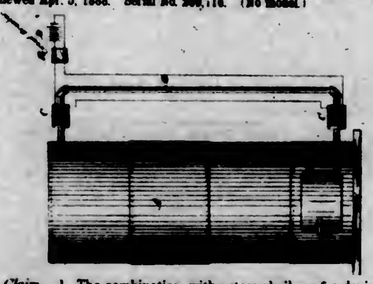
2. In a gas-stove, the combination of three concentric passage-ways, all open at the top and communicating with each other, a gas-burner at or near the bottom of each of the two outer passage-ways, and a smoke-outlet connecting with the bottom of the inner passage-way, substantially as and for the purpose specified.

3. In a gas-stove, the combination of three concentric passage-ways, all open at the top and communicating with each other, a gas-burner at or near the bottom of each of the two outer passage-ways, a chamber into which the bottoms of the two outer concentric passage-ways open, and a smoke-outlet connecting with the bottom of the inner passage-way, substantially as and for the purpose specified.

4. In a gas-stove, the combination of three concentric passage-ways, all open at the top and communicating with each other, a chamber at the bottom communicating with the bottoms of the two outer passage-ways, a valve between the chamber and one of said outer passage-ways, a gas-burner above the valve, a second gas-burner in the chamber below the two outer concentric passage-ways, and a smoke-outlet connecting with the bottom of the central or inner passage-way, substantially as and for the purpose specified.

5. The combination, in a stove, of the outer case or shell, the central outlet-tube, I, open at the top and made angular at the bottom, passing through the case of the stove to form an escape-flue at *i*, the gas-burner J, located within the stove-case and below the cylinder I, the second cylinder, H, forming the concentric passage-ways L and M, both open at the top, and a gas-burner, K, in the bottom of passage-way L and exterior to the cylinder H, substantially as and for the purpose specified.

6. The combination, in a stove, of the outer case or shell, the central outlet-tube, I, open at the top and made angular at the bottom, passing through the case of the stove to form an escape-flue at *i*, the gas-burner J, located within the stove-case and below the cylinder I, the second cylinder, H, forming the concentric passage-ways L and M, both open at the top, and a gas-burner, K, in the bottom of passage-way L and exterior to the cylinder H, and a valve, G, to connect or disconnect the passages L M at their bottoms, substantially as and for the purpose specified.

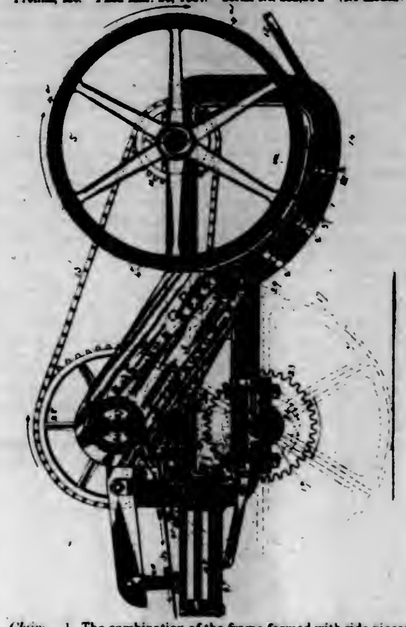


7. The combination, in a stove, of the outer case or shell, the central outlet-tube, I, open at the top and made angular at the bottom, passing through the case of the stove to form an escape-flue at *i*, the gas-burner J, located within the stove-case and below the cylinder I, the second cylinder, H, forming the concentric passage-ways L and M, both open at the top, a gas-burner, K, in the bottom of passage-way L and exterior to the cylinder H, and a register, F, arranged above the top of the passage-way L M and cylinder I, substantially as and for the purpose specified.

383,794. ELECTRIC SHELLING-BOTTLE. CHARLES T. BROWN, Chicago, Ill., assignor to Flora L. Brown, same place. Filed Dec. 23, 1887. Serial No. 258,836. (No model.)

Claim.—The combination, with a containing-vessel, of a battery comprising a sheet of zinc bent into a tube, a carbon stick contained in the tube, and an asbestus diaphragm saturated with an excitant between the zinc and carbon, and a sponge saturated with an electrolyzable compound in circuit with the elements of the battery.

383,795. DEVICE FOR PREVENTING INCRUSTATION IN STEAM-BOILERS. WILLIAM B. BULL, Quincy, Ill. Filed Jan. 19, 1888. Renewed Apr. 5, 1888. Serial No. 269,716. (No model.)

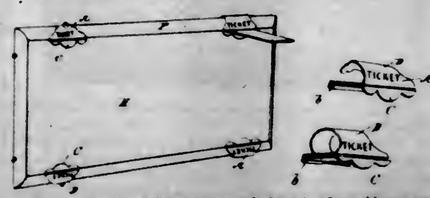


Claim.—1. The combination, with a steam-boiler, of a device for preventing incrustation therein, consisting of an electric generator, an electro-magnet in circuit therewith, having its poles in contact with said boiler, and a device in said circuit for varying the current from the generator, substantially as described.

2. The combination, with a steam-boiler, of a device for preventing incrustation therein, consisting of an electric generator, an electro-magnet in circuit therewith and having its poles in contact with the

boiler at points widely separated, so as to include the mass of the boiler between them, and a device for varying the current in said circuit, substantially as described.

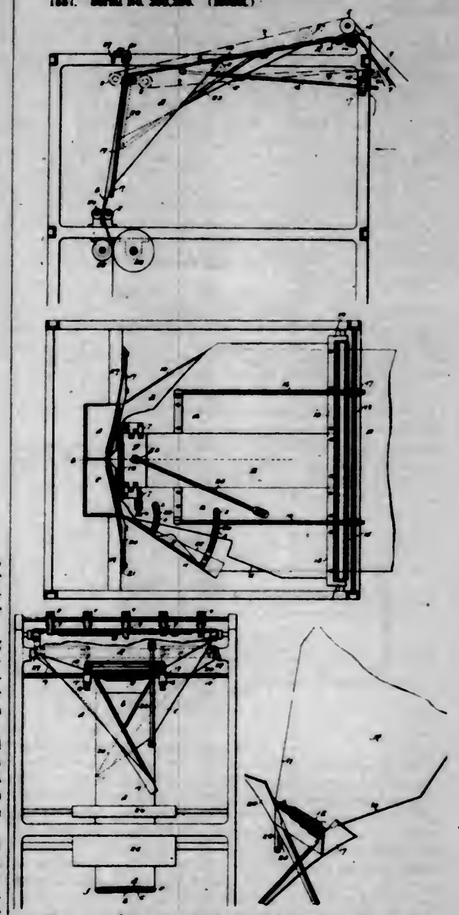
383,796. CLOVER-SEED HARVESTER. HERMANN DOEPKENS, Frohna, Mo. Filed Mar. 26, 1887. Serial No. 232,504. (No model.)



Claim.—1. The combination of the frame formed with side pieces, having curved parts 1 1, curved floor 3, secured thereto, the cylinder 5, having combs 4, formed with stripping-teeth 4ª, the roller 14 in advance of the floor, and the upwardly and forwardly extending fender 15, substantially as described.

2. The combination of the frame formed with side pieces, having curved parts 1 1, curved floor 3, secured thereto, the cylinder 5, having combs 4, formed with stripping-teeth 4ª, the upwardly and rearwardly inclined floor 30, formed with a trough, 29, beneath the upper edge, 6, of the main floor, and the endless conveyer 32, having brushes 33, working through the trough, substantially as described.

3. The combination of the frame having curved floor 3, secured thereto, the cylinder 5, having combs 4, formed with stripping-teeth 4ª, the upwardly and rearwardly inclined floor 30, formed with a trough, 29, beneath the upper edge, 6, of the main floor, the endless conveyer 32, having brushes 33, and the riddle 39 at the end of the conveyer-floor, substantially as described.



4. The combination of the frame having curved floor 3, secured thereto, the cylinder 5, having combs 4, formed with stripping-teeth 4ª, the upwardly and rearwardly inclined floor 30, formed with a trough, 29, beneath the upper edge of the main floor, the endless conveyer 32, having brushes 33, the riddle 39, into which the conveyer discharges, and the chute 47 beneath the riddle, having brushes 48, substantially as described.

383,797. TICKET-HOLDER. DAVID F. CROPUT, Bridgeport, Conn., assignor to Burns, Silver & Co., same place. Filed Dec. 21, 1887. Serial No. 258,553. (No model.)

Claim.—A ticket-holder constructed of a strip of metal bent upon itself with one end bent upward and backward to conform to the shape of the frame of the car-seat, and the other end bent downward and backward to rest against the cushion of the back of said car-seat, and with a ridge formed at the back of said ticket-holder where it is bent upon itself, in combination with said seat, which is provided with a recess in the frame thereof adapted to receive the ridge and flat bent portions of the ticket-holder.

383,798. FOLDING-MACHINE. LUTHER C. CROWELL, Brooklyn, assignor to Robert Hoe, Peter S. Hoe, Stephen D. Tucker, Theodore H. Hood, and Charles W. Carpenter, all of New York, N. Y. Filed Oct. 13, 1887. Serial No. 252,226. (Model.)

Claim.—1. In a longitudinal folder, the combination, with an internal guide arranged across one part of the web obliquely to the travel thereof, of an internal guide arranged across the other part of the web at right angles to the travel thereof, and an external corner extending from a point adjacent to the junction of the internal guides, and arranged to deflect the part of the web passing over the oblique guide and lay it over onto the part passing over the other guide, substantially as described.

2. In a longitudinal folder, the combination, with internal guides arranged across the side portions of the web obliquely to the travel thereof, of an internal guide arranged across the central portion of the web at right angles to the travel thereof, and external corners extending from points adjacent to the junctions of the internal guides, and arranged to deflect the portions of the web passing over the oblique guides and lay them over onto the portion passing over the other guide, substantially as described.

3. In a longitudinal folder, the combination, with internal guides arranged across the side portions of the web obliquely to the travel thereof, of an internal guide arranged across the central portion of the web at right angles to the travel thereof, and external corners extending from points adjacent to the junctions of the internal guides, and arranged to deflect the portions of the web passing over the oblique guides and lay them over onto the portion passing over the other guide, substantially as described.

4. In a longitudinal folder, the combination, with internal guides arranged across the side portions of the web obliquely to the travel thereof, one of said guides being adjustable to and from the other and to different angles with relation to the web, of an internal guide arranged across the central portion of the web at right angles to the travel thereof, said guide being adjustable in length, and external corners extending from points adjacent to the junctions of the internal guides, and arranged to deflect the portions of the web passing over the oblique guides and lay them over onto the portion passing over the other guide, one of said corners being adjustable to conform to the adjustment of the internal guides, substantially as described.

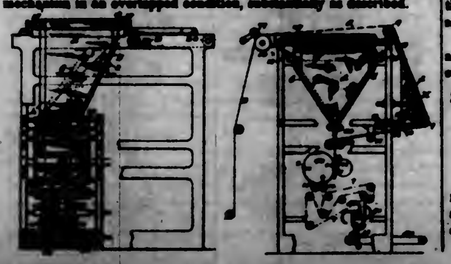
5. In a longitudinal folder, the combination, with internal guides, 10 11 12, and the auxiliary internal guide, 22, arranged to co-operate with one of said guides, of the external corners, 19 20, substantially as described.

6. In a longitudinal folder, the combination, with internal guides 10 11 12, and the auxiliary internal guide, 22, of the external corners, 19 20, extending from points adjacent to the junctions of said internal guides, and arranged to deflect the side portions of the web and lay them over one upon the other onto the central portion, substantially as described.

7. In a longitudinal folder, the combination, with internal guides arranged across the side portions of the web obliquely to the travel thereof, one of said guides being adjustable to and from the other and to different angles with relation to the web, of an internal guide arranged across the central portion of the web at right angles to the travel thereof, said guide being adjustable in length, the auxiliary internal guide, 22, and external corners extending from points adjacent to the junctions of the internal guides, and arranged to deflect the portions of the web passing over the oblique guides and lay them over onto the portion passing over the other guide, one of said corners being adjustable to conform to the adjustment of the internal guides, substantially as described.

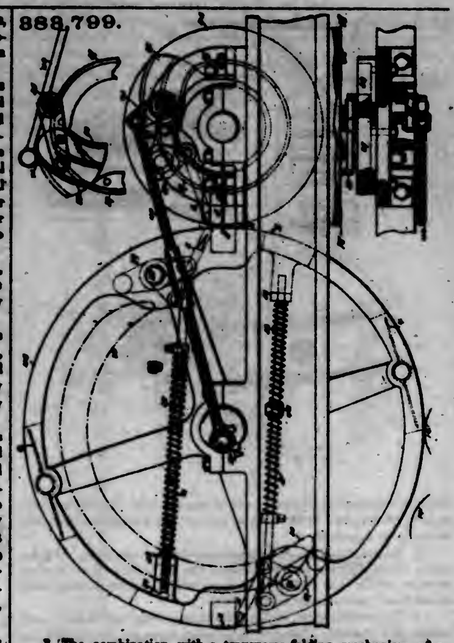
8. In a longitudinal folder, the combination, with the plate A, made in two parts and forming the internal guides, 10 12, of the removable supplemental section *g*, substantially as described.

9. In a longitudinal folder, the combination, with the internal guides, 10 12, of the internal guide, 11, made adjustable to different angles with relation to the guides 10 12, substantially as described.



10. In a longitudinal folder, the combination, with an internal guide arranged across one part of the web obliquely to the travel thereof, of an internal guide arranged across the other part of the web at right angles to the travel thereof, and an external corner extending from a point adjacent to the junction of the internal guides, and arranged to deflect the part of the web passing over the oblique guide and lay it over onto the part passing over the other guide, and tapes for conducting the web to and onto the folder, substantially as described.

11. In a longitudinal folder, the combination, with the internal guides, 10 or 11 and 12, recessed or cut away at their point of union, of an external corner, 19 or 20, extending from a point opposite said recess, and arranged to deflect the part of the web passing over one of said internal guides, substantially as described.



383,799. DELIVERY MECHANISM FOR PRINTING-MACHINES. LUTHER C. CROWELL, Brooklyn, assignor to Robert Hoe, Peter S. Hoe, Stephen D. Tucker, Theodore H. Hood, and Charles W. Carpenter, all of New York, N. Y. Filed Nov. 2, 1887. Serial No. 254,603. (No model.)

Claim.—1. The combination, in a delivery mechanism, of a plurality of longitudinal folders set side by side and one slightly in advance of another, so as to deliver their folded products overlapped, substantially as described.

2. The combination, with a transverse cutting mechanism, of a plurality of longitudinal folders set side by side and one slightly in advance of another, so as to deliver their folded webs to said cutting mechanism in an overlapped condition, substantially as described.

383,799.

3. The combination, with a transverse folding mechanism, of a plurality of longitudinal folders set side by side and one slightly in advance of another, so as to deliver their folded products to said transverse folding mechanism in an overlapped condition, substantially as described.

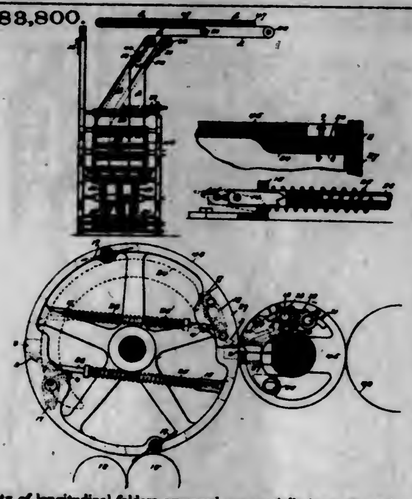
4. The combination, with a transverse cutting and folding mechanism, of a plurality of longitudinal folders set side by side and one slightly in advance of another, so as to deliver their folded webs to said cutting and folding mechanism in an overlapped condition, substantially as described.

5. The combination, with a transverse cutting mechanism, of a plurality of longitudinal folders set side by side and one slightly in advance of another, so as to deliver their folded webs to said cutting mechanism in an overlapped condition, and a web-associating mechanism arranged to associate and deliver the webs to one of said longitudinal folders, substantially as described.

6. The combination, in a delivery mechanism, of a plurality of reversibly-arranged longitudinal folders set side by side and one slightly in advance of another, and so as to deliver their folded products overlapped, with their folded edges in opposite directions, substantially as described.

7. The combination, with a longitudinal folder, G, and a web-turner, of a second longitudinal folder, H, so arranged as to deliver its folded product overlapped upon the product of the first folder, said second folder consisting of an internal guide arranged at right angles to the web across its path of travel, an internal guide arranged obliquely across the path of one part of the web, and an external turner arranged to turn the web over the oblique internal guide, substantially as described.

8. The combination, with the rock-shaft 35, carrying the pins 6 and having the rock-arm 36, of the cam 38, for rocking the shaft, and the rod 40 and crank 39, for operating the cam, substantially as described.



9. The combination, with the rock-shaft 35, carrying the pins 6 and having the arm 36, of the eccentric guide 37, cam 38, rod 40, and crank 39, substantially as described.

383,800. DELIVERY MECHANISM FOR PRINTING-MACHINES. LUTHER C. CROWELL, Brooklyn, assignor to Robert Hoe, Peter S. Hoe, Stephen D. Tucker, Theodore H. Hood, and Charles W. Carpenter, all of New York, N. Y. Filed Nov. 10, 1887. Serial No. 254,703. (No model.)

Claim.—1. The combination, in a delivery mechanism, of a plurality of longitudinal folders set one in advance of and partially above another, so as to deliver their folded products inset, substantially as described.

2. The combination, with a transverse cutting mechanism, of a pla-

383,800.

rality of longitudinal folders arranged one partially beneath another, so as to deliver their folded webs to said cutting mechanism inset, substantially as described.

3. The combination, with a transverse folding mechanism, of a plurality of longitudinal folders arranged one partially beneath another so as to deliver their folded products to said transverse folding mechanism inset, substantially as described.

4. The combination, with a transverse cutting and folding mechanism, of a plurality of longitudinal folders arranged one partially beneath another, so as to deliver the folded webs to said cutting and folding mechanism inset, substantially as described.

5. The combination, with a transverse cutting mechanism, of a plurality of longitudinal folders arranged one partially beneath another, so as to deliver their folded webs to said cutting mechanism inset, and a web-associating mechanism arranged to associate and deliver the webs to one of said folders, substantially as described.

6. The combination, with the pins 3 and rock-shaft 16, of the rod 26 and spring 25, for protruding the pins, the guide 15, and the latch 14, for holding the pins in their retracted position, substantially as described.

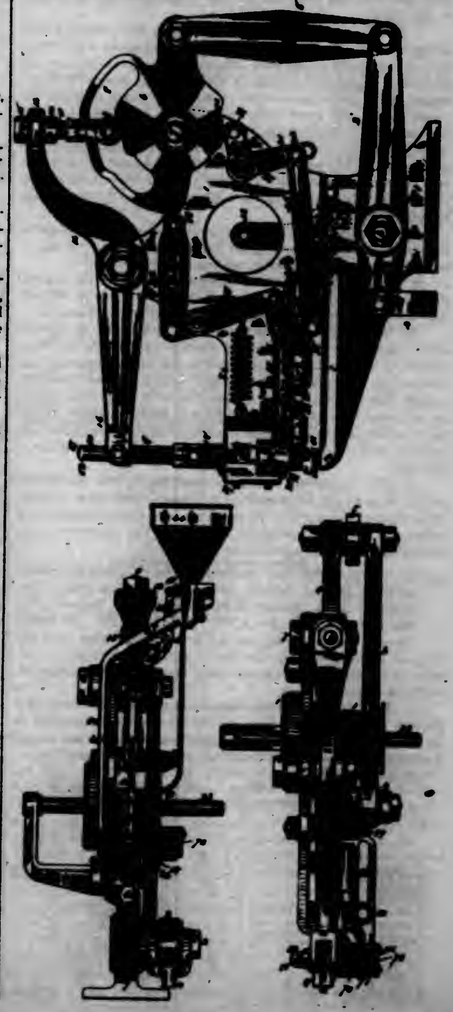
7. The combination, with the pins 6, rock-shaft 12, and segment 33, of the shaft 31, segment 32, and spring 30, for protruding the pins, substantially as described.

8. The combination, with the pins 6 and shaft 12, of the cam-lever 27 and the sliding bolt 34, for holding the pins in their retracted position, substantially as described.

9. The combination, with the pins 6 and shaft 12, of the cam-lever 27, having the recess 11 and opening 10, and the sliding bolt 34, for limiting the movement of the pins and for holding them in their retracted position, substantially as described.

383,801. DUST ARRESTER AND COLLECTOR. ROBERT I. DOWTEN, St. Louis, Mo. Filed Oct. 4, 1887. Serial No. 251,662. (No model.)

Claim.—1. In a dust arrester and collector, the combination of the outer imperforate cylinder, an inner perforated cylinder smaller than the outer cylinder, and a flue having a tangential opening, through which the air and dust are deposited into the chamber between the cylinders, substantially as and for the purpose set forth.



2. In a dust arrester and collector, the combination of the outer imperforate cylinder, inner perforated cylinder, and delivery-flue having a tangential opening, said cylinders being in the form of a frustum of a cone, and the inner cylinder being smaller and conforming in shape with the outer cylinder, substantially as and for the purpose set forth.

3. In a dust arrester and collector, the combination of the outer imperforate cone-shaped cylinder open at its lower end, inner perforated cylinder smaller than and conforming in shape with the outer cylinder, and a tangential delivery-flue opening into said outer cylinder at the top of the machine, the inner cylinder being open at top and bottom, substantially as and for the purpose set forth.

4. In a dust collector and arrester, the combination of the outer imperforate cylinder, an inner cylinder smaller than the outer cylinder, and a flue through which the air and dust are deposited into the chamber between the cylinders, said inner cylinder having perforations varying in size, substantially as set forth.

383,802. BUTTON-MACHINE. JONATHAN BERRY, St. Louis, Mo., assignor of one-half to George D. Berry, Le Roy, Kans. Filed June 4, 1887. Serial No. 240,268. (No model.)

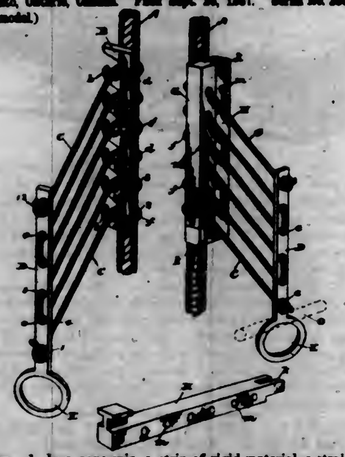
Claim.—1. The combination, in a machine for attaching buttons, of a plunger having a recess to receive the eye of a button, and a

383,802.

groove on its lower edge to receive the staple, a retractile horn for supporting the button, and a fixed slotted plate for arresting the movement of the button, substantially as described.

2. The combination, in a machine for attaching buttons, of a plunger, a retractile horn having its end formed with shoulders and curved to conform to the contour of the button, and an anvil, substantially as described.

3. The combination, with the hopper, of a reciprocating slide having a vertical recess through its end for receiving the buttons, and a tube over which said recessed end passes and into which the buttons are discharged, substantially as described.



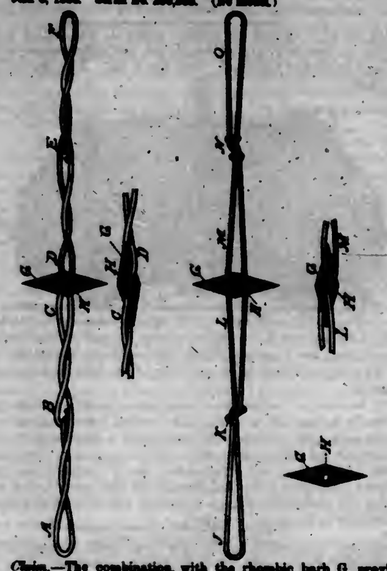
4. The combination, in a button-attaching machine, of a plunger constructed of a single piece of metal adapted to cut off a piece of wire, bend it into a staple and force it through the goods, a wire-feeding device, and a retractile horn, substantially as described.

5. The combination, with the hopper and the reciprocating feeding device for removing the buttons from the hopper, of the inclined feed-tube slotted from end to end and constructed with its upper portion substantially cylindrical in shape and its lower portion flattened to prevent the escape of the eye of the button from said slot, substantially as described.

6. The combination, in a button-attaching machine, of the body 1, the cam 6, having the groove 8 therein, the pitmen and levers connecting the same with the motive power, the lever 13, having the anti-friction wheel 9 secured thereto and working on said cam, the plunger 18, and the pitman 17, connecting the plunger with the lever 13, substantially as described.

7. In a button-attaching machine, the combination, with the cam 6 and the lever 13, of the screw-threaded arm 10, having connection with said lever and provided with a friction-wheel, 9, on its lower end, adapted to come in contact with said cam, substantially as described.

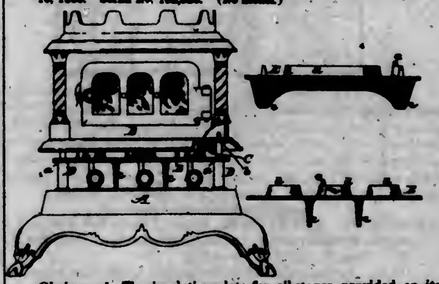
383,803. ROPE-GRIP OR SILVADOR-STROP. ARTHUR K. EVANS, Toronto, Ontario, Canada. Filed Sept. 23, 1887. Serial No. 250,710. (No model.)



Claim.—1. In a rope-grip, a strip of rigid material, a straining-piece, and a series of loops attached to one side of said strip, adapted to pass around the rope to be gripped, and through openings on the opposite side of said grip to said straining-piece, substantially as described.

2. In a rope-grip, a strip of rigid material having openings on the opposite sides, a series of loops passing through said openings, and a straining-piece, to which one end of each of said loops is connected, substantially as described.

3. The combination, with rope A, of plate B, having hooked projections *b* and holes *d*, the straining-piece D, provided with ring E and holes *e*, and the rope or marline C, secured to said plate B and straining-piece D, substantially as described, and for the purpose specified.



4. The combination, with the rope A, of the pieces G and H, having holes *m*, T-shaped projections, and notched so as to form shoulders *k*, the rope or marline C, secured to said pieces G and H, and the straining-piece D, having holes *e* and ring E, substantially as described, and for the purpose specified.

383,804. WIRE FENCE. FRANK C. FRASER, Cayuga, N. Y. Filed Jan. 3, 1888. Serial No. 259,522. (No model.)

Claim.—The combination, with the rhombic barb G, provided with a transverse elongated central slot, H, of the closed wire links engaging the slots, whereby the barbs may be turned aside, and when released may resume their transverse position by the lengthwise strain upon the frame.

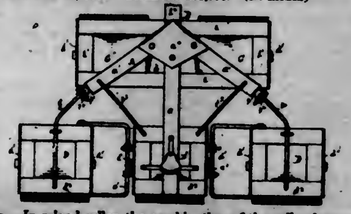
383,805. OIL-STOVE. SIMEON B. GAYLORD, Providence, R. I., assignor to the Florence Machine Company, Florence, Mass. Filed Nov. 10, 1886. Serial No. 182,262. (No model.)

Claim.—1. The insulating-plate for oil-stoves, provided on its upper side with a stud and with supporting-surfaces serving as a seat for a perforated plate, and also provided with one or more depending lugs on its under side, which serve as legs for supporting said plate, and also prevent said plate from seating a perforated plate except when said insulating-plate is right side up, substantially as described.

2. In an oil-stove, the combination, with a reservoir and a perforated plate, of an insulating-plate having bearing-surfaces on its upper side adapted to flatly seat and support said perforated plate, and provided on its under side with one or more depending lugs, substantially as described, whereby said insulating-plate when wrong side up is rendered incapable of flatly supporting or seating said perforated plate.

3. In an oil-stove, the combination, substantially as hereinbefore described, of the reservoir or base, the drum, the perforated plate, the corner-posts supporting said drum, and an insulating-plate confined against horizontal displacement by said posts, and provided with one or more depending lugs on its under side, which serve as legs for supporting said plate, and also for preventing the perforated plate from being seated on the wrong side of said insulating-plate.

4. The combination, substantially as hereinbefore described, with the drum, the reservoir, and the front supporting-posts, of an insulating-plate provided with a seat for a perforated plate on its upper side, and a depending lug on its lower side, which serves as a supporting-leg for one side of said insulating-plate, and also prevents the under side of said plate from being used as a seat for the perforated plate

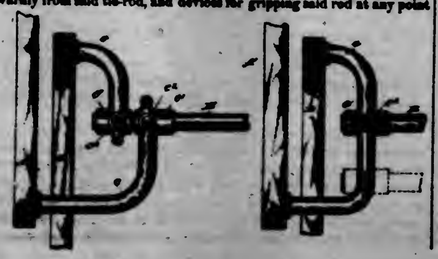


383,806. CARPET-SWEEPER. HENRY A. GOSS, HIRAM W. ROTH, and GEORGE W. KELLEY, Goshen, Ind.; said Kelley assignor to Edward W. Walker, same place. Filed July 8, 1887. Serial No. 243,741. (Model.)

Claim.—1. The combination, with a sweeper-case and its rotatable brush, of driving-wheels journaled on hangers pivoted to levers, which levers connect the hangers with the journals of the handle-bail, the said levers being pivoted to the end walls of the casing, substantially as specified.

2. In a carpet-sweeper, the combination, with the main case having slots in its top wall, as shown, of the slotted plates *c*, placed over the said slots of the case, the dust-pans pivoted at their rear portion in the said case and having rearwardly-extending arms *d*, and the sliding latches L, pivoted at their lower ends to the said arms of the pans, and their upper ends projecting through the slots and provided with notches *g* in their forward edges to engage with the slotted plates *c*, substantially as shown and described.

383,807. LAND-ROLLER. FRANKLIN GRIMM, Richland Station, Pa. Filed Feb. 27, 1888. Serial No. 265,365. (No model.)



Claim.—In a land-roller, the combination of the roller-frame, the supplemental frame connected thereto and carrying rollers, the rear series of rollers, the U-shaped arms pivotally connecting the end rollers of said series with the central one thereof, the brace-rods secured to the frames of said end rollers and removably connected to said roller-frame by nutted bolts, and the brace-rods f^3, connecting said central roller to said roller-frame, substantially as shown and described.

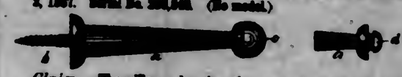
383,808. ROCKING-CHAIR. GEORGE F. HALL, New York, N. Y., assignor of one-half to Peter Lowentrust, Newark, N. J. Filed May 31, 1887. Serial No. 239,731. (No model.)

Claim.—1. The combination, with a chair of the class described and with its base, of a cross-bar or rod, and hangers with which the said rod is connected at a point between the upper and lower journal of each hanger, substantially as specified.

2. In a chair of the class described, the combination of pivoted hangers, tie-rods connecting the same, an adjusting-rod extending rearwardly from said tie-rod, and devices for gripping said rod at any point

383,808.

thereon and maintaining the hangers at a desired incline, substantially as specified.



3. In a chair of the class described, the combination of the hangers thereof, with an adjusting-rod extending therefrom, pivoted gripping-rods embracing said adjusting-rod, and a foot-lever for actuating said gripping-rods, substantially as specified.

4. The chair A, having the depending portions A', in combination with the base B, the hangers C, journaled in said base and chair and having the intermediate sockets, C', and with the tie-bar E, substantially as specified.

5. The chair A, in combination with the base B, the hangers C, journaled in said base and chair and provided with sockets C', arranged between the journals, having set-screws D^2, and with the tie-bar E, adapted to enter said sockets and be held in place by said set-screws, substantially as specified.

6. The combination, with the hangers C and rod E, of the adjusting-rod F, connected thereto, the lever G, pivoted, as at G', to the plate G^2, the rods G^4 G^5, having gripping portions G^6, and pivoted at G^3, substantially as specified.

383,809. DOOR-CHECK. FRANK J. HERBERT, New Britain, assignor of one-half to Wm. Edger Shumate, Hartford, Conn. Filed May 2, 1887. Serial No. 236,845. (No model.)

Claim.—The pillar *a*, bearing the screw *b* at its base and also bearing the wrench-grip *d*, in combination with the removable yielding cushion *c*, all substantially as described, and for the purpose set forth.

383,810. NUT-LOCK. WALTER B. HOPKINS, Streator, Ill. Filed Mar. 14, 1888. Serial No. 267,327. (No model.)

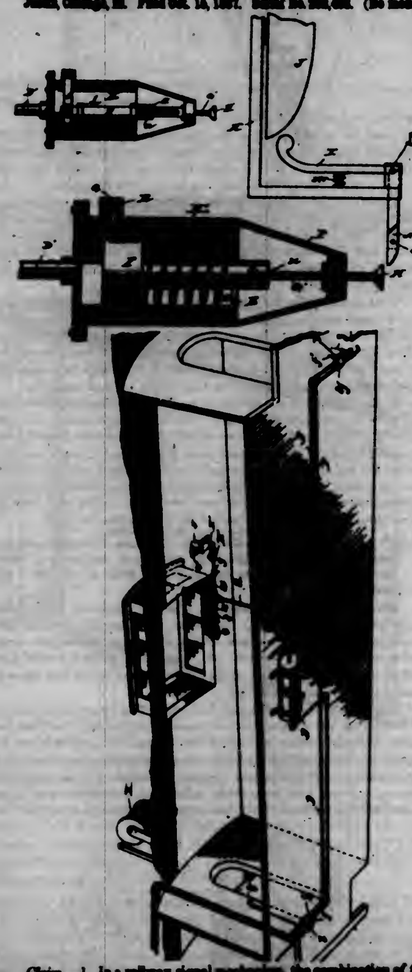
Claim.—1. In a nut-lock substantially as shown, the combination of a plate, A, provided with openings having on one edge adjacent thereto lips *e e*, said plate having a semicircular recess, a plate, B, having similar openings with lips and a raised end portion with semicircular recess and slots *g g*, a spring, C, contained within the recess, and means for securing the plates so that they may slide, substantially as shown, and for the purpose set forth.

2. The combination, in a nut-lock, of the following elements: the parts A and B, secured movably to each other and provided with semicircular recesses, said parts having projecting lips *f* and *f'*, a spring located within said recesses to bear upon said lips, one of the parts being provided with slotted rivets for holding the parts together, so that they can slide one upon the other, the parts A and B being provided with openings with projecting lips *e*, substantially as shown, and for the purpose set forth.

383,811. PUMP-VALVE. CHARLES F. HOYT, Sioux City, Iowa. Filed May 28, 1887. Serial No. 239,103. (No model.)

Claim.—1. The combination of a valve or piston formed with a groove or recess in its outer edge and with recessed outer corners, a roller formed with conical recesses in its ends, and blocks removably secured in said recessed corners and provided with screws having conical or pointed ends for said conical recesses in the ends of said roller, substantially as described.

2. The combination of a valve or piston formed with recessed

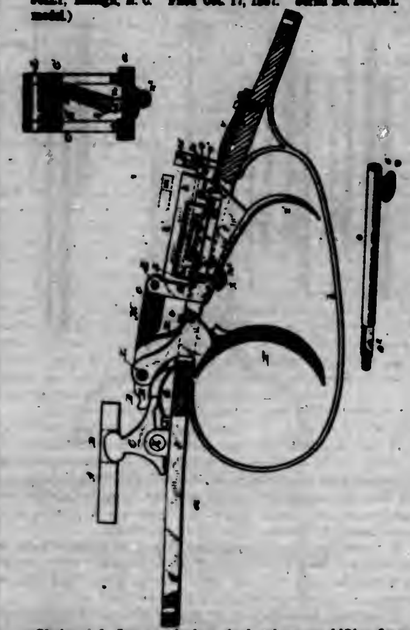


outer corners, with holes in its outer corners, and with a groove or recess in its outer edge, and provided with a lining of anti-friction material having a cylindrical groove in its outer side, an anti-friction roller supported in said groove and formed with conical recesses in its ends, and blocks fitted in said recessed outer corners of the valve or piston and formed with inwardly-projecting studs fitting in holes formed in the walls of said recessed outer corners of the valve or piston, and provided with flattening-screws entering the walls of said recesses and with conically-pointed screws for said conical recesses in the ends of said roller, substantially as described.

383,812. BOILER-SCOURER. LEWIS S. HOYT, Boston, Mass. Filed Nov. 14, 1887. Serial No. 255,624. (No model.)

Claim.—The combination, substantially as and for the purpose set forth, with the compressible body B, having a chamber, D, within the same, of the rubber cap G, provided with a central projection, L, which fits into the chamber G.

383,813. RAILWAY-FREIGHT-TRAIN SIGNAL. THOMAS M. JONES, Chicago, Ill. Filed Oct. 15, 1887. Serial No. 252,462. (No model.)



Claim.—1. In a railway signal mechanism, the combination of the two-way cock B, fitting air-tight in the vent Q, made in a side of the air-chamber E, near the end into which the pipe D' opens, the lever E, secured at one end to said cock and normally placed at right angles to the axis of said chamber and curved to conform to the curved side of said chamber, the pin U, rigidly secured in the piston G in said chamber, near the outer end of said piston, and extending at right angles to said lever in its normal position, and the slide-bar T, supported in brackets secured to the side of said chamber in a line parallel to the piston G, and having a pin through it at one end passing into a slot in the lever S near the end opposite to the cock B, and having next to its other end a slot made in the plane of the pin U and of such length that the pin U, extending through said slot, will strike the ends of it as the piston moves forth and back, so as to alternately open and close the vent Q, as and for the purposes stated.

2. In a railway signal mechanism, the cock Y, embracing in key C, pivoted at right angles by the parallel holes A A and diagonally by the hole *i*, and having the lever *l* secured to it at one end, in combination with the pipes F and D', secured beneath the cab of a locomotive and connected by hose with the pipes B and D, secured beneath the caboose of a railway freight-train, and opening, respectively, into the air-chamber A and into the pipe *d*, leading to the air-chamber F and to the whistle *c*, substantially as and for the purpose specified.

3. In a railway signal mechanism, the pipes B and D, in combination with the air-chamber A, secured beneath the caboose of a railway freight-train, and the cock Y, embracing the key C, which is operated by its lever *l*, connected at one end with the chain Z, extending up into the caboose, and at the other with the spring *f'*, secured to the under part of the caboose, said pipe D being connected by hose with the pipe D', leading into the air-chamber E, which contains the piston G, designed to throw the hammer I against the gong J in the cab of the locomotive, as stated.

4. In a railway signal-mechanism, the pipe D beneath the caboose of a freight-train, communicating with the pipe B through the cock Y beneath such caboose, and in combination with the pipe *d*, communicating through the pipe *d'* with the air-chamber F and the whistle *c* in such caboose, and communicating by means of connecting-hose with the pipe D', which opens into the air-chamber E on the locomotive, substantially as and for the purposes specified.

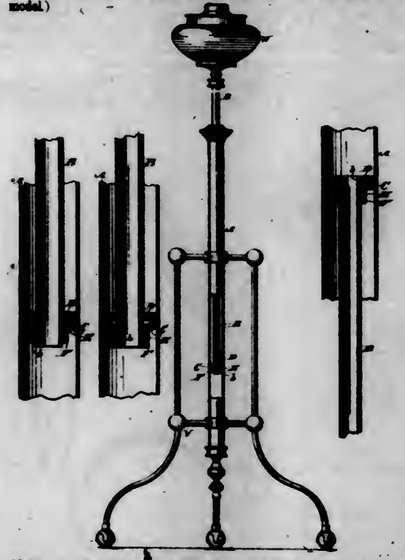
383,814. TRIGGER MECHANISM FOR GUNS. BENJAMIN R. JOLLY, Raleigh, N. C. Filed Oct. 17, 1887. Serial No. 252,621. (No model.)

Claim.—1. In a gun-lock, a single trigger, a shifting frame attached to said trigger, an abutment in the gun, and a cam carried by the shifting frame in position to engage the abutment, and thus shift the frame, whereby the frame may be made to engage the cams of a double gun alternately, substantially as described.

2. In a gun-lock, a trigger, a shifting frame mounted on said trigger so as to be shifted into position to engage either of the cams

of a double lock, and an indicator connected to said frame and extending outside the lock, so that the position of the frame may be known.

3. In a gun-lock, a trigger, a frame pivoted thereto so as to be shifted into position to engage either one of two sears, and a finger-piece connected to the frame and extending to the outside of the lock, so that the position of the frame may be changed by pressing on the finger-piece and the desired engagement be made by a subsequent pull of the trigger.



4. In a gun-lock, the combination of a trigger, a shifting frame pivoted to said trigger, a hanger in said frame, a pin carrying said hanger and adapted to swing the same, a cam on said pin, and an abutment in the lock with which said cam is brought into engagement on the pulling of the trigger.

5. The combination, in a gun-lock, of a trigger, a pivoted frame carried thereby, a hanger in the frame, a lever pivoted to the hanger and extending outside the lock, and a spring operating to press the inner end of said lever to one side of a central position, substantially as described.

6. The combination, in a gun-lock, of a trigger, a rocking frame carried thereby, a pin extending lengthwise of the frame and having a cam thereon, a hanger supported on said pin, and a lever pivoted to said hanger and to the trigger, and an abutment in the gun in position to engage said cam as the trigger is pulled.

7. In a gun-lock, the combination, with the trigger guard and strap, of a lever, F, within said guard, a bell-crank lever inside the strap with which said lever engages, and a longitudinally-moving locking-bolt with which one arm of the bell-crank lever engages, substantially as described.

388,815. LOCKING DEVICE IN EXTENSION-CHANDELIERS. WILLIAM W. KILBORN, Meriden, Conn., assignor to the Charles Parker Company, same place. Filed Nov. 30, 1887. Serial No. 256,496. (No model.)

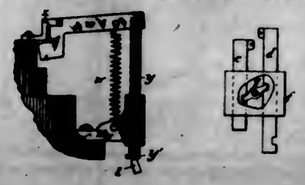
Claim.—1. In combination with the outer tube and inner tube of an extension lamp or chandelier, an adjustable washer surrounding the inner tube, and adjustable devices above and below said washer, the latter operating by friction against the outer tube to prevent accidental descent of the lamp, substantially as set forth.

2. In combination with the outer tube of an extension lamp or chandelier, and the inner tube thereof, having a larger and a smaller step or shoulder on it, a flexible washer located between said steps or shoulders and operating substantially as set forth.

3. An outer extension lamp or chandelier tube and an inner extension lamp or chandelier tube, the latter being screw-threaded at one end, in combination with nuts D and E, of different diameters, on this screw-threaded end, and a flexible washer arranged between them, substantially as set forth.

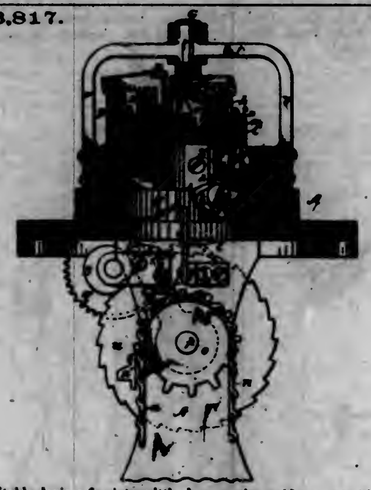
388,816. ADJUSTABLE SIDE GUIDE FOR PRINTING-PRESSES. THADDEUS L. KINGSBURY and JAMES UHRI, Chicago, Ill. Filed Nov. 19, 1887. Serial No. 255,629. (No model.)

Claim.—1. In a side guide for printing-presses, the combination, with the bottom plate formed with the longitudinal slot widened along its lower half and having the scale marked upon it, of a guide-plate formed with the central aperture, the bottom lug at its inner end, and the point at its outer end, the threaded bolt, and the thumb-nut, substantially as set forth.



2. In a side guide for printing-presses, the combination, with the bottom plate and the adjustable guide-plate formed at its inner end with the sleeve having the top set-screw, of the head formed with the bottom lug and the tubular interiorly-threaded stem, and the adjusting-screw formed with the collar and having the milled head secured upon its outer end, substantially as and for the purpose set forth.

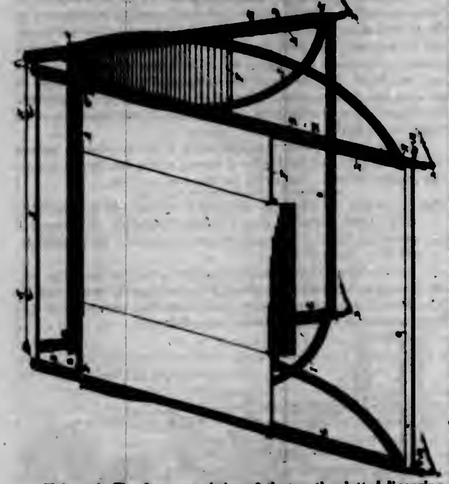
3. In a side guide for printing-presses, the combination of the bottom plate formed with the longitudinal slot widened along its lower half, and having the scale marked upon it, the guide-plate formed with the central aperture, the indicator-point, the bottom lug, and the sleeve having the top set-screw, the threaded bolt and the thumb-nut for the same, the head formed with the bottom lug and the tubular interiorly-threaded stem, and the adjusting-screw having the milled head secured on its outer end, substantially as and for the purpose set forth.



388,817. KNITTING-MACHINE. BENJAMIN R. LAMPREY and ALBERT G. BOWERS, Lake Village, N. H., assignors to the Lamprey Manufacturing Company. Filed July 5, 1887. Serial No. 243,243. (No model.)

Brief.—The machine is adapted to the production of fabrics having stripes of different colors. The yarn-guides carrying yarns of different colors are formed as rack-bars, a pinion pivoted between them acting upon the teeth of each, and thus as one guide is moved into action through the medium of a cam-wheel and lever the other is retired from action and its yarn severed.

Claim.—1. The needles and their supports, a rotary cam-cylinder and cam-dial, two yarn-guides, devices, substantially as described, between said yarn-guides, whereby when one guide is moved in one direction the other will be moved in the opposite direction, a lever fulcrumed on the cylinder, a cam adapted to turn on a pivot secured to the cam-cylinder, said lever being loosely connected at one end with one of said yarn-guides and in contact at the other end with said cam,

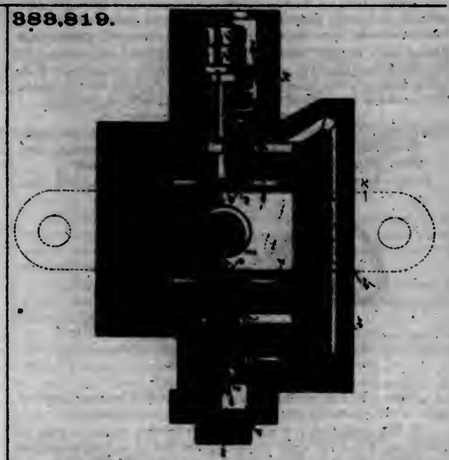


388,817.

and suitable devices for intermittingly operating said cam, combined and operating substantially as set forth.

2. The cam-cylinder, a cam-dial, a knife-arm pivoted on said cam-dial and having its knife-edge adapted to contact with said dial, a vertically-movable rod loosely connected at its upper end with said knife-arm, and devices, substantially as described, for intermittingly raising said rod, combined and operating substantially as set forth.

388,818. ADJUSTABLE MAP AND CHART SUPPORT. WILLIAM H. LAREW, Hartpeus, assignor of one-half to W. C. Reid, Hartpeus county, Ont. Filed Nov. 19, 1887. Serial No. 255,672. (No model.)



Claim.—1. The frame consisting of the top, the slotted diverging legs, and the boards extending through the slots in the legs upon each side, in combination with the diagonal connecting-rods I, substantially as and for the purpose herein described.

2. The map or chart support consisting of the boards extending through the slotted diverging legs of a frame, and having the connecting links or rods by which they are raised and depressed by the spreading or closing of the legs, and the clamps or holders for the maps or charts, substantially as herein described.

388,819. AUTOMATIC AIR-BRAKE. REUBEN J. LEWIS, Bellaire, Ohio. Filed Aug. 13, 1887. Serial No. 247,377. (No model.)

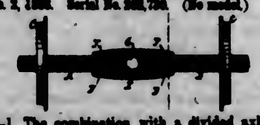
Claim.—1. In an air-brake apparatus, the combination, within a removable valve-chest, L, mounted on the seat J at the rear of the auxiliary reservoir, of the passage I from the main reservoir, the piston 1 and 12 on each side of said passage, the hollow cylindrical stem

388,819.

2, provided with the enlarged head 3, the solid cylindrical stem 13, secured to the piston 12, and the valve 15 on said stem 13, substantially as described, and for the purposes set forth.

2. In an air-brake apparatus, the combination, within a removable valve-chest, L, mounted on the seat J at the rear of the auxiliary reservoir, of the piston 1, hollow cylindrical removable stem 2, having enlarged head 3, puppet-valve 6, entirely within the head 3, piston 12, having the solid cylindrical stem 13, and valve 15 on said stem 13, substantially as set forth.

3. In an air-brake apparatus, the combination, within a removable valve-chest mounted on the seat J at the rear of the auxiliary reservoir, of the piston 1, having the hollow cylindrical stem 2, enlarged head 3, provided with the removable cap 1', puppet 6, entirely within the enlarged head 3, piston 12, stem 13, and valve 15 on said stem 13, substantially as set forth.



4. In an air-brake apparatus, the combination, within a valve-chest, L, removably mounted on the seat J at the rear of the auxiliary reservoir, of the piston 1, hollow cylindrical stem 2, enlarged head 3, having the cap 1', with perforations therein, the puppet 6, entirely within the head 3, piston 12, stem 13, and valve 15 on said stem 13, substantially as set forth.

5. In an air-brake apparatus, the combination, within a removable valve-chest, L, mounted on the seat J at the rear of the auxiliary reservoir, of the piston 1, having the cylindrical hollow stem 2, with enlarged head 3, removable perforated cap 1', puppet 6, entirely within said enlarged head 3, coiled spring 10, bearing against said cap and said puppet and tending to hold the two apart, the piston 12, stem 13, and valve 15 on said stem 13, substantially as set forth.

6. In an air-brake apparatus, the combination, within a removable valve-chest, L, mounted on a seat, J, at the rear of the auxiliary reservoir, of the piston 1, cylindrical hollow stem 2, secured thereto, and having the enlarged head 3, puppet 6, entirely within said enlarged head 3, piston 12, solid cylindrical stem 13, valve 15 on said stem 13, coiled spring 20, encircling said stem 13, flanged washer 21, against which said spring 21 bears, and the double locking-nuts 22 and 23, screwed over said stem 13, substantially as set forth.

7. In an air-brake apparatus, and in combination within a separate valve-chest, the following elements, viz: a piston, 1, hollow stem 2, puppet 6, removable perforated cap 1', the piston 12, stem 13, and valve 15, substantially as described and set forth.

388,820. CAR-AXLE. WILLIAM F. LEES, Jr., New York, N. Y. Filed Feb. 2, 1888. Serial No. 262,730. (No model.)

Claim.—1. The combination, with a divided axle consisting of the two sections A B, each having a peripheral groove, of a sleeve fitting upon and surrounding said sections and provided with holes passing transversely therethrough and registering with the peripheral grooves, keys passing through said holes and engaging with the peripheral grooves, and a sphere resting within said sleeve between the inner ends of the sections, substantially as described.

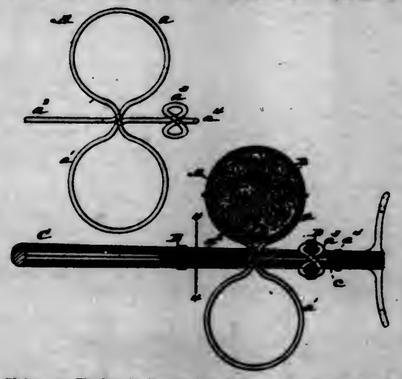
2. The combination, with a divided axle consisting of the two

sections A B, each provided with a peripheral groove and having cavities in their inner ends, of a sleeve fitting upon said sections and having holes passing transversely therethrough and registering with the peripheral grooves in said sections, keys passing through said holes and engaging in the peripheral grooves, and a sphere resting within the cavities in the ends of the sections, substantially as described.

383,821. SADDLE-PAD. JAMES MURPHY, Washington Court-House, Ohio, assignor to the Mercer Bros. Manufacturing Company, same place. Filed Jan. 11, 1888. Serial No. 260,415. (No model.)

Brief.—Improvement on Patent No. 269,650, of September 6, 1887.

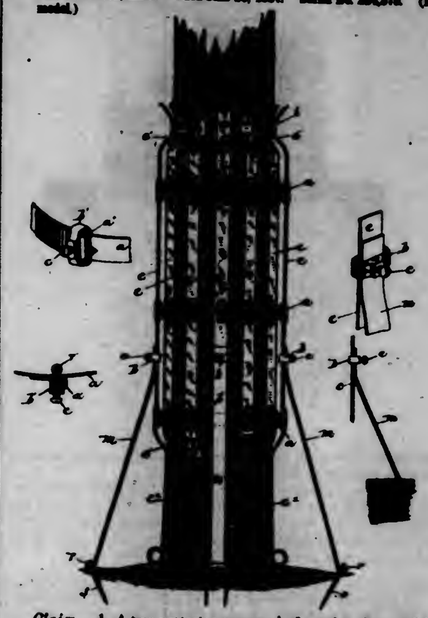
Claim.—1. The combination, with the flexible bearing plates or pads, of a downwardly-curved supporting-bar, as set forth.



2. The combination, with the flexible bearing plates or pads, of a downwardly-curved rigid supporting-bar having adjustable hinged connections with said bearing-plates, as set forth.

383,822. WICK. GEORGE MUNSON, East River, Conn. Filed Apr. 26, 1887. Serial No. 236,051. (No specimens.)

Claim.—The herein-described wick for lighting and heating purposes, consisting of a thin strip of wood the grain of which runs transversely of the wick and having one or more lines of stitches run longitudinally through it, the said wick saturated with an inflammable material and adapted for use substantially as described.

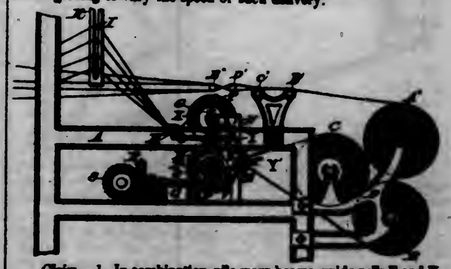


383,823. HOSE-BAG SUPPORT FOR VEHICLES. JOHN MURRAY, St. Louis, Mo. Filed Oct. 31, 1887. Serial No. 253,503. (No model.)

Claim.—1. The herein-described feed attachment for wagons, &c., consisting of the holder A, made of wire and having a circular-shaped receptacle for the feed-bucket, the respective ends of the wire being crossed and folded and extending in opposite directions, and adapted for being secured to the wagon-pole.

2. The herein-described feed attachment A, made of wire and bent to form on either side a circular holder, *a* and *a'*, the ends *a*² and *a*³ of the wire being extended in opposite directions to form means for attaching the device to a carriage, substantially as described.

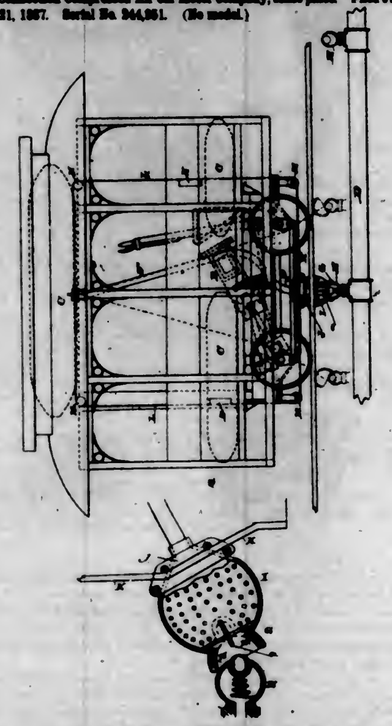
383,824. TREE-PROTECTOR. JAMES S. HOWELL and JAMES S. BROWN, Boston, Mass. Filed Jan. 30, 1887. Serial No. 225,870. (No model.)



Claim.—1. A tree-protector composed of a series of expansible hoops adapted to encircle the tree and constructed to be expanded by the growth of the tree, and a series of metal slats secured to said hoops and having their ends bent inwardly to form yielding springs adapted to bear on the trunk of a sapling and yield to the enlargement thereof until said trunk fills the hoops and straightens out the bent ends of the slats, the protector being adapted to yield, first, by the outward bending of the ends of its slats, and, secondly, by the expansion of its hoops, as set forth.

2. The tree-protector hoop composed of the metal strap having overlapping ends, and the holder *b'*, having a clamping device, and an anti-friction roller, *r'*, supporting the hoop, as set forth.

383,825. PILE-WARP DELIVERY MECHANISM FOR DOUBLE-PILE-FABRIC LOOMS. FRED PEARCE, Philadelphia, Pa., assignor of one-half to John C. Graham, same place. Filed Dec. 1, 1887. Serial No. 256,601. (No model.)



Brief.—This arrangement prevents the waste from the warps falling back upon the warps themselves, permits the ready detachment of the pile-warp-delivery mechanism, and allows the substitution of different gearing to vary the speed of such delivery.

Claim.—1. In combination, pile-warp beams, guide-rolls E and H, main rolls F and G, located one above the other, one of said rolls, at one end of its axis, being provided with a worm-wheel, and each of said rolls, at the opposite end of its axis, being provided with a gear-wheel which gears into the other, and a horizontal shaft, Q, provided with a worm which engages with said worm-wheel, substantially as and for the purposes set forth.

2. In combination, pile-warp beams, guide-rolls E and H, main rolls F and G, located one above the other, one, at one end of its axis, being provided with a worm-wheel, and each, at the opposite end of its axis, being provided with a gear-wheel which gears into the other, a horizontal shaft, Q, provided with a worm-screw which engages with said worm-wheel, and a lever pivotally fulcrumed on the loom-frame and adapted to be operated to lift the main roller provided with the worm-wheel and throw said worm-wheel out of gear with the worm on the horizontal shaft Q, as and for the purpose set forth.

383,826. AUTOMATIC AIR-SUPPLY FOR PROPELLING CARS. LEONIDAS C. PERSELY, San Francisco, Cal., assignor to the Automatic Compressed Air Car Motor Company, same place. Filed July 21, 1887. Serial No. 244,891. (No model.)

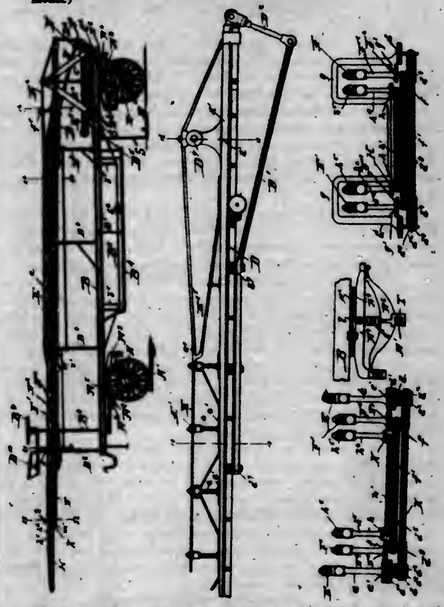
Claim.—1. The reservoir carried upon the traveling car, having the flexible tube, with one end opening into the reservoir and the other provided with a bell-mouthed nozzle, which will connect with corresponding valve-seats, and valves upon a tube fixed under ground and parallel with the line of rails, in combination with horizontal guides upon the car, and slides or rollers, whereby the nozzle at the end of the flexible tube is held in position and caused to travel from end to end of the guides while connection is made with the fixed street-tube, substantially as herein described.

2. The car provided with an air-reservoir, a flexible tube having one end connected with said reservoir and the other traveling upon horizontal guides beneath the car and provided with a bell-mouthed nozzle, by which connection is made with the corresponding valve-seats in a compressed-air pipe beneath the street, so that when such connection is made a valve will be opened to allow air to pass into the reservoir, in combination with a spring or weighted cord connected with the movable end of the air-pipe, so as to return it to the front end of the guides after connection has been broken with the street-pipe, substantially as herein described.

3. The underground tube or tunnel parallel with and between the rails and having an open slot in the top, a compressed-air pipe supported within the tube and having semi-globular projecting valve-chambers at intervals with inwardly-opening valves, in combination with a bell-mouthed nozzle fitting over the valve-seats, and a flat hollow disk extending up through the tube-slot, so as to form a connection with the lower end of a flexible tube connecting with a reservoir upon the car, substantially as herein described.

4. The bell-mouthed nozzles fitting the correspondingly-shaped valve-seats upon the air-pipe and the flexible conveying-tube with which they are connected, in combination with the traveling slides or rollers fixed to the lower end of the flexible pipe, and the guides upon which these rollers travel fixed to the car and having the ends inclined, substantially as herein described.

383,827. GARMENT-SUPPORTER. CHARLES A. PERRIN, Cambridgeport, assignor to George Frost, George H. Phelps, and George A. Frost, all of Boston, Mass. Filed Apr. 3, 1888. Serial No. 269,672. (No model.)



Claim.—1. The button, disk, or loop, and the pin, bent as described, to engage the material, combined with a jaw or guard having a recess to receive the bent or holding portion of the pin, substantially as described.

2. The button, disk, or loop, and the pin, bent as described, to engage the material, combined with the jaws *b d*, inclosing the pin, substantially as described.

3. The button, disk, or loop, and the pin, bent to engage and hold the material, combined with the jaws *b d*, bent at their outer ends to form a recess to receive the pin, substantially as described.

4. The button, disk, or loop, the pin, and a jaw connected with the pin, combined with another jaw movable with relation to the first jaw, substantially as described.

383,828. TURN-TABLE EXTENSION-LADDER TRUCK. EVERETT B. PERRIN, Chicago, Ill. Filed Mar. 5, 1888. Serial No. 266,316. (No model.)

Claim.—1. The combination, with a turn-table truck, of a pivoted main ladder, D, mounted on said turn-table, having side bars, *d*, composed of T-shaped steel bars having their middle or stem webs in vertical planes, and an extension-ladder, F, having side bars, *f*, consisting of T-shaped steel bars having their middle or stem webs in vertical planes to adapt the same to resist transverse breaking strains, and mechanism for raising said main ladder, substantially as specified.

2. The combination, with a turn-table truck, of a pivoted main ladder, D, mounted on said turn-table, having side bars, *d*, composed of T-shaped steel bars having their middle or stem webs in vertical planes, and a fly-ladder having side bars consisting of T-shaped steel bars having their middle or stem webs in vertical planes to adapt the same to resist transverse or breaking strains, and mechanism for raising and lowering said main ladder, substantially as specified.

3. The combination, with a turn-table truck, of a main ladder, D, pivoted to the turn-table and consisting of T-shaped steel side bars, *d*, supplemental bars d^2 d^3, top bar, d^4, and rungs d^5, secured to the vertical webs of said T-bars *d*, substantially as specified.

4. The combination, with a turn-table truck, of a main ladder, D,

pivoted to the turn-table and consisting of T-shaped steel side bars, *d*, supplemental bars d^3 d^3, top bar, *d'*, rungs d^2, secured to the vertical webs of said T-bars *d*, brace-bars D' D^3, and cross-bars d^7, secured to said brace-bars D' and to the side bars of the ladder D, substantially as specified.

5. The combination, with a turn-table truck, of a main ladder, D, pivoted to the turn-table and consisting of T-shaped steel side bars, *d*, supplemental bars d^3 d^3, top bar, *d'*, rungs d^2, secured to the vertical webs of said T-bars *d*, brace-bars D' D^3, and cross-bars d^7, secured to said brace-bars D' and to the side bars of the ladder D, truss-rods E, and struts *e*, substantially as specified.

6. The combination, with the main ladder having side rails composed of T-bars having their middle or stem webs in vertical planes, of an extension-ladder having side rails composed of T-bars having their middle or stem webs in vertical planes, and guides for coupling the two ladders together bearing against the top webs of said T-shaped bars, so that they may slide on each other, substantially as specified.

7. The combination, with ladders D and F, having side bars consisting of T-shaped rails with their middle webs in vertical planes, with guides secured to one of said ladders and fitting over and under the top web or flange of the T-shaped bar of the other, substantially as specified.

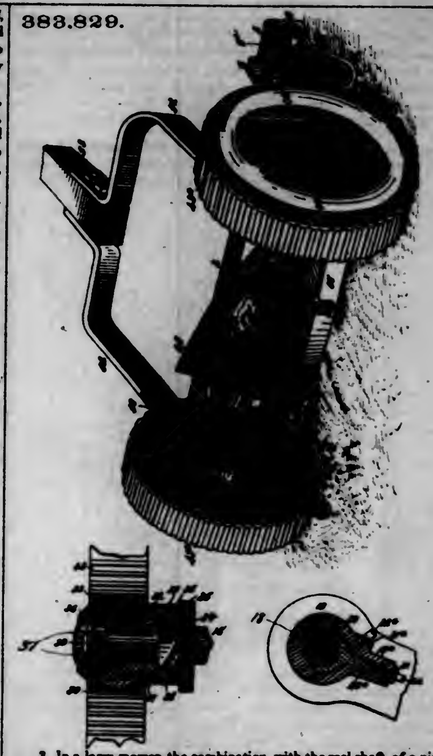
8. The combination, with ladder D, having T-shaped bars *d*, of ladder F, having T-shaped bars *f*, and guide-bars f^5, secured to said ladder F and fitting against the top flanges of said T-shaped bars *d* of the ladder D, substantially as specified.

9. The combination, with ladder D, having T-shaped bars *d*, of ladder F, having T-shaped bars *f*, and guide-bars f^5, secured to said ladder F and fitting against the top flanges of said T-shaped bars *d* of the ladder D, said guide-bars f^5 having friction-rollers f^7, substantially as specified.

10. The combination, with ladder D, having steel T-shaped side bars, *d*, of extension-ladder F, having steel T-shaped side bars, *f*, and a guide-bar, G, secured to said ladder D and fitting against the top flanges of said T-bars *f*, substantially as specified.

11. The combination, with ladder D, having steel T-shaped side bars, *d*, of extension-ladder F, having steel T-shaped side bars, *f*, a guide-bar, G, secured to said ladder D and fitting against the top flanges of said T-bars *f*, guide-bars f^5, secured to said ladder F and fitting against the top flange of said T-bars *d*, substantially as specified.

12. The combination, with main ladder D, having steel T-shaped side bars, *d*, rungs d^2, secured thereto and furnished with friction rollers or sleeves d^9, of extension-ladder F, having steel T-shaped side bars, *f*, riding on said friction-rollers d^9, substantially as specified.



13. The combination, with main ladder D, having steel T-shaped side bars, *d*, furnished with truss-rods E and struts *e*, projecting in a vertical plane, of extension-ladder F, having steel T-shaped side bars, *f*, and U-shaped guide-bars f^5, secured to said ladder F and fitting against the top flanges of said T-bars *d*, substantially as specified.

14. The combination, with main ladder D, having steel T-shaped side bars, *d*, and extension-ladder F, having steel T-shaped side bars, *f*, and truss-rods F' and struts F^6, projecting in a vertical plane, and guide-bars G, secured to said main ladder D and provided with two loops, *g g*, substantially as specified.

15. In a turn-table extension-ladder truck, the combination of the frame B, having steel side bars, *b b'*, of different widths, with clips or brackets C^2, having vertical flange *c*, furnished with groove *c'*, to embrace the narrower bar, *b'*, turn-table ring C, bolted to said brackets C^2, and turn-table C, substantially as specified.

16. In a turn-table truck, the combination of the fifth-wheel A^5, cross-bars *a*, secured thereto, having vertical flanges *a'*, and the truck-frame B, having steel side bars secured to the vertical flanges of said cross-bars *a*, substantially as specified.

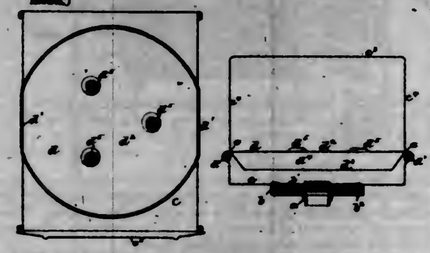
383,829. LAWN-MOWER. JAMES V. ROWLETT, Richmond, Ind. Filed May 19, 1886. Serial No. 202,596. (No model.)

Claim.—1. In a lawn-mower, the combination, with the driving-wheels and the shaft, said wheels having each a central bearing for the spindle or shaft, of a countersunk recess surrounding said bearing upon the exterior face of the wheel, a hood-washer having a circular plate seated in said recess and provided with a cap inclosing the end of the shaft and having an opening for a cotter-pin formed transversely through the cap, external flanges being formed upon each side of the opening to protect the head and end of the cotter-pin, substantially as specified.

2. In a lawn-mower, the combination, with the reel-shaft, of a ratchet-collar keyed to said shaft near its end, driving-pinions loose thereon and provided with pawl-pins arranged in bearings in the body of the pinion parallel with its axis, and a cam-collar keyed to the shaft at each end outside the pinion, and having upon its inner face cam projections which project the pawl-pins inward, substantially as specified.

3. In a lawn-mower, the combination, with the reel-shaft, of a pinion loose upon the end thereof, a ratchet-collar upon one side of said pinion, a cam-collar upon the other side, and steel pawl-pins lying in bearings in the body of the pinion and thrown by the cam-collar into engagement with the ratchet-collar, both said collars being keyed to the shaft, substantially as specified.

4. In a lawn-mower, the combination, with a ratchet-collar having opposite inclines terminating in square cam-shoulders upon one of its parallel faces, of a pinion loose on the shaft, pawl-pins arranged in the body of said pinion to move toward the ratchet-collar and from it, a cam-collar having two double inclines forming opposite apexes, said cam-collar being seated in a recess in the outer face of the pinion, and means for keying both collars to the shaft, substantially as specified.



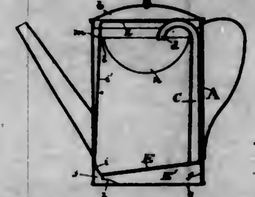
5. In a lawn-mower, the combination, with the reel-shaft, of a loose pinion, pawl-pins movable therein in lines parallel to the axis, a ratchet-pinion having radial recesses which engage with a pin through the shaft, and a cam-collar upon the opposite side of the pinion, having a cotter-pin engaging with the shaft and lying in recesses in the outer face of the collar, substantially as specified.

6. In a lawn-mower, the combination, with the disks cut away at the edge under the straps, of said straps cast or formed on the inner face of the disks, studs secured to said disks on their inner faces in a line passing through the axis of the disks and through the straps, and the arms of the handle, whereby said arms may be inserted under the straps and placed over the studs preparatory to securing the arms to the handle, substantially as specified.

7. In a lawn-mower, the combination, with the disks of the frame cut away at the edge under the straps, of inwardly-projecting straps and studs on the inner face of the disks, said studs being placed between said straps and the axial center of the disks, as set forth, and a wooden handle having metal arms secured thereto, said arms each engaging or embracing a stud by means of a suitable aperture in the arm, substantially as specified.

8. In a lawn-mower, the combination, with loose driving gears or pinions, of movable pins or pawls working in parallelism with the axes of the pinions and located between the faces and the axes of said pinions, said pins or pawls each engaging at one end with a ratchet and at the other end with a two-faced cam, whereby the pin or pawl is made to engage with a ratchet when the pinion moves in one direction, and is permitted to pass over a ratchet when moved in the opposite direction, substantially as specified.

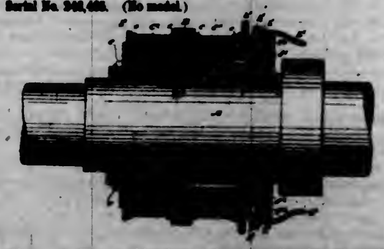
383,830. PORTABLE TIN OVEN FOR OIL OR GAS STOVES. ALBERT W. SEDGWAY, Northampton, assignor to the Florence Stamping Company, Florence, Mass. Filed Dec. 3, 1887. Serial No. 256,801. (No model.)



Claim.—1. In a portable oven, the combination, with a flanged and slitted base-plate adapted to fit the turret of a stove, of the sheet-metal oven-bottom having an opening therein, and integral ears which are passed through the slits of said base-plate and clinched thereon, substantially as described.

2. In a portable tin oven, the combination, with the slitted side walls, of a shelf which is projected through the slits in said walls, and is bent and clinched at the outer surface of said walls, substantially as described.

3. In a portable tin oven having a rectangular baking-space, the combination of a circular shelf secured to the side walls, and a base-plate through which heat passes into the oven below said shelf, substantially as described, whereby the heat is deflected laterally and evenly distributed at the four corners of the oven.

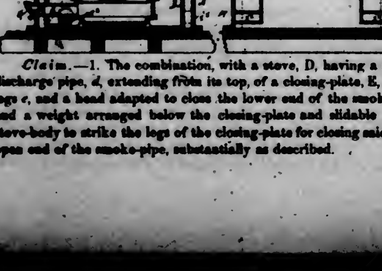


4. In a portable tin oven, the combination of slitted side walls and a hollow or air-chambered shelf projecting through slits in the walls of the oven and bent or clinched upon the outer sides of said walls, substantially as described.

383,831. EXTRACTOR FOR COFFEE-POTS. JOEL C. SLAUGHTER, St. Louis, Mo., assignor of one-half to Louis Holm, same place. Filed Dec. 8, 1887. Serial No. 257,318. (No model.)

Claim.—The herein-described extractor for coffee-pots, comprising the false bottom E, having a flat sloping top and a downflange, *f*, provided at its lowest side with an inlet, A, an upward-projecting spring, *i*, attached to the false bottom where the inlet is located, and curved outward beyond the said downflange, a stand-pipe, C, having a goose-neck nozzle, *d*, and its lower end passing through the high side of the false bottom diametrically opposite the said inlet, and a ground-coffee receptacle supported below said nozzle.

383,832. CURRENT-COLLECTOR FOR ELECTRIC MACHINES. WILLIAM STANLEY, Jr., Great Barrington, Mass. Filed Sept. 1, 1887. Serial No. 248,488. (No model.)

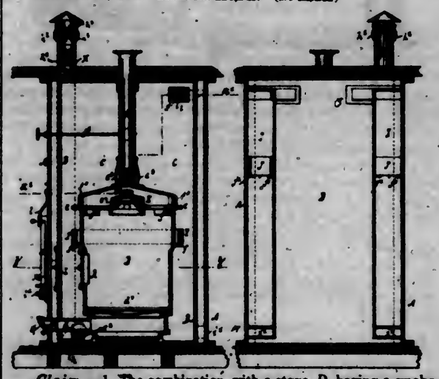


Claim.—1. The combination of the rings C and C^2, the bolts *f* and f^2, terminating in the respective rings, the blocks F and F^2, receiving the heads of the respective bolts, and the bolts *h'* and h^2, entering the heads of the bolts *f* and f^2.

2. The combination of the rings C and C^2, the bolts *f* and f^2, terminating in the respective rings, the blocks F and F^2, receiving the heads of the respective bolts, the bolts *h'* and h^2, entering the heads of the bolts *f* and f^2, and the binding-screws *k'* and k^2, for securing electrical connections with the respective rings.

3. A collector for electric machines, consisting of two rings of conducting material placed side by side and insulated from each other, two conductors for forming electrical connections with the respective rings, one of said conductors extending into one of the rings and the other extending through that ring into the second ring, but insulated from the first-named ring, and conducting-bolts screwing into the first-named conductors and extending at an angle therefrom, substantially as described.

383,833. FOLDING COOP OR CRATE. THEODORE J. STILLE and OSCAR G. STILLE, St. Louis, Mo., assignors of one-third to John A. Meuche, same place. Filed Dec. 27, 1887. Serial No. 259,014. (No model.)



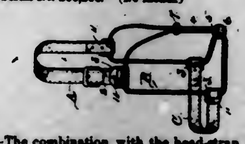
Claim.—The herein-described folding coop, the same consisting of the bottom, the top, and the sides, the two parts of which sides are severally hinged to the top and bottom of the crate and together, and provided with the side braces and the turn-buckles, as described, and the ends hinged and bolted, as set forth, all substantially as set forth.

383,834. SCREW. ERSKASU STILWELL, New York, N. Y., assignor, by direct and mesne assignments, to Bradford Willard and Hamilton C. Stilwell, same place. Filed Mar. 1, 1887. Renewed Nov. 18, 1887. Serial No. 255,562. (No model.)

Claim.—1. The herein-described screw having the wedge-shaped part B, provided at one end with a continuous thread, and at the other end with spiral serrations upon the edges of the wedging part, substantially as set forth.

2. A wood-screw having one end of the part B wedge-shaped, and provided upon its edges with spiral serrations, substantially as set forth.

383,835. CAR-HEATER. JOSEPH W. STORRS, New London, Conn. Filed Feb. 10, 1887. Serial No. 226,942. (No model.)



Claim.—1. The combination, with a stove, D, having a smoke-discharge pipe, *d*, extending from its top, of a closing-plate, E, having legs *e*, and a head adapted to close the lower end of the smoke-pipe, and a weight arranged below the closing-plate and slidable on the stove-body to strike the legs of the closing-plate for closing said lower open end of the smoke-pipe, substantially as described.

2. The combination, with a stove, D, having a smoke-pipe, *d*, provided with a retaining device, d^2, of the closing-plate, E, having legs *e* and a head, e', provided with a catch, e^2, to engage the retaining device, and a weight, F, arranged below the closing-plate and slidable on the stove-body, substantially as described.

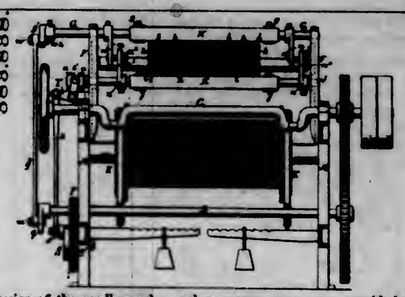
3. The combination, with a stove, D, having a smoke-pipe, *d*, extending from its top and provided at its top with slots, of a closing-plate, E, having legs *e*, extending through said slots, and a weight, F, slidable on the body of the stove to strike said arms and force the plate to close the lower open end of the smoke-pipe, substantially as described.

4. The combination, with the closing-plate located in the interior of the heater and in line with the smoke-pipe, of a weight extending about the stove, supports for said weight, legs on the plate extending outward and adapted to be engaged by the weight, and a retaining device for the plate, substantially as shown and described.

383,836. HALTER. DAVID M. SWARE, Traer, Iowa. Filed Jan. 10, 1888. Serial No. 260,206. (No model.)

Claim.—The combination, with the head-strap A and the nose-strap C, of the rope B, formed into a loop, 4, and provided with a hitching-rope, 6, the strands of said rope being carried through sleeves in the ends of the head and nose straps, and then passed, respectively, through the hitching-ring, with the ends in the sleeve of the nose-strap, and clamping-plates 3, secured in the ends of the head and nose straps and formed with arms 9, to embrace the rope on each side of the straps, substantially as described.

383,837. WEATHER-STRIP. WILLIAM STRETER, Asheville, Ind. Filed Feb. 2, 1888. Serial No. 262,750. (No model.)

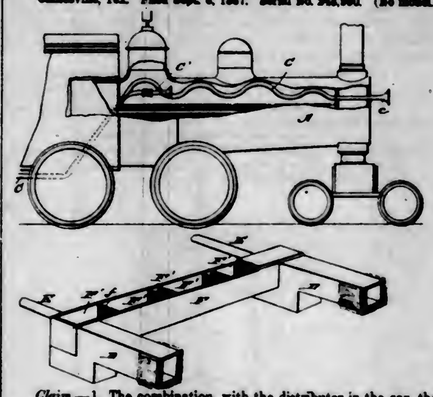


Claim.—1. In combination with the door having its bottom beveled, the strip extending the entire width of the door and held against the bevel, the plates provided with the lugs supporting and holding the strip up against the door, and the door-frame provided with the recesses to accommodate the said lugs, substantially as described.

2. In combination with the door having the beveled bottom, the strip, and the side supporting-plates having lugs in which the strip is supported and adapted to turn, and the spring secured to the door and holding the strip down to the door-sill, substantially as described.

3. The detachable and pivoted weather-strip B, provided with the upper bevel-edge, C, projecting ends c' c^2, upper and lower beveled surfaces, *d* and *e*, and a suitable felt or other covering, in combination with a door across the bottom of which said strip is placed, and hangers to connect with said strip and the edges of the door, substantially as described.

383,838. LOOM FOR WEAVING LENO FABRICS. HENRY TOPHAM and CHARLES TOPHAM, Philadelphia, Pa. Filed Sept. 13, 1887. Serial No. 249,561. (No model.)



Brief.—In the loom-frame are journaled two rock-shafts so geared together that when one is moved in one direction the other is moved in the opposite direction. To each of these shafts are secured horizontal arms supporting at their forward extremities combs of needles which are arranged to play in and out of each other. These shafts are partially and intermittingly rotated to effect the approach and recession of the needle-combs; and, moreover, means are provided for giving either or both of said shafts a longitudinal movement. These combined movements of the combs and shafts whereby the warps are controlled will cause their crossing over the weft.

Claim.—1. The combination of two rock-shafts, each carrying a comb with eyed prongs through which the warp-threads pass, with mechanism for rocking said shafts and for moving one of them laterally, substantially as described.

2. The combination of a rock-shaft carrying a warp-threaded comb, mechanism for rocking said shaft, a lever acting thereon, an operating-cam, a lever acted on thereby, and a rod connecting the two levers, all substantially as and for the purpose set forth.

383,839. HEATING RAILWAY-CARS. CARTER S. TOWNLEY, Gainesville, Tex. Filed Sept. 6, 1887. Serial No. 248,992. (No model.)

Claim.—1. The combination, with the distributer in the car, the air-pipe, and the heater for heating the air passed through said pipe, of an injector for forcing steam in said pipe and a lime receiver or chamber into which the heated air and steam is conducted in its passage to the distributer, substantially as set forth.

2. In a car-heater, the combination of the heat-pipe, a steam-injector leading into such pipe, a distributer within the car, and a chemical-chamber through which the mixed air and steam is directed in its passage to the distributer, the said chamber being provided with a lime holder or holders having foraminated sides, whereby they will hold the lime and at the same time permit the circulation of the air and steam therethrough, substantially as and for the purposes specified.

3. The combination of the cars or car of a train, a heat-distributer therein, the locomotive having a boiler, the pipe leading through the boiler and having an opening to receive the air, an injector leading into such pipe, the chemical-chamber through which the air and steam are directed in their passage to the distributer, and the connecting pipe or pipes, all substantially as and for the purposes specified.

383,840. NOZZLE FOR SHEET-METAL CANS. WILLIAM VOGEL, Brooklyn, N. Y., assignor to William Vogel & Brothers, same place. Filed Feb. 16, 1888. Serial No. 264,264. (No model.)

Claim.—1. As an improved article of manufacture, the nozzle herein described, consisting of a tube formed with a resilient sleeve at its lower end, of larger diameter than the base of the tube, and having its lower edge struck inward and secured to the edge of the tube and the upper end free from contact with the tube, substantially as and for the purpose specified.

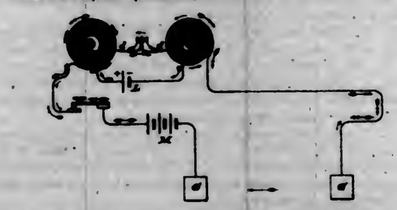
2. The combination, with a sheet-metal can provided with a depressed bung-plate, 3, having a thimble, 6, of a nozzle, B, consisting

383,840.

of a sheet-metal tube provided with a sleeve, 7, of larger diameter than the tube, and having its lower edge turned in and secured to the lower end of the tube and its upper end free from the tube, substantially as and for the purpose specified.

383,841. CORNER BRACE OR BRACKET FOR FURNITURE. FERDINAND VOGELSANG, Boston, assignor to Bardwell, Anderson & Co., Cambridge, Mass. Filed Feb. 3, 1888. Serial No. 262,981. (No model.)

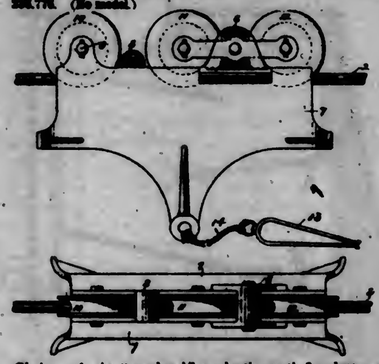
Claim.—The combination of the post *b*, leg *d*, having its inner surface concave to fit the post, the shelf C, corner-brace D, having two converging ornamental faces, *g g*, and the screw *e*, passing through the leg and post into the shelf, all constructed and arranged substantially as described.



383,842. WOVEN SKIRT-WAISTBAND. CARL VOGWERK, Barmen, Prussia, Germany, assignor to Adolph Vorwerk, same place. Filed Oct. 26, 1887. Serial No. 253,203. (No specimens.) Patented in Germany Oct. 12, 1879, No. 9,733, and in England May 12, 1880, No. 1,993.

Claim.—1. The herein-described curved waistband, consisting of an outer web and an inner lining secured to each other, and each having one selvage longer than the other, and its wefts extending across the band radially.

2. The herein-described curved waistband, consisting of an outer web and an inner lining secured to each other at one edge, and by binding-picks within the edge, each web having one selvage longer than the other and its wefts running across the band radially.



383,843. RELAY. JOHN R. WAGNER, Louisville, Ky., assignor to the International Electric Company, same place. Filed Feb. 1, 1888. Serial No. 262,614. (No model.)

Claim.—1. In a receiver, an electro-magnet provided with a continuously-wound helix having portions relatively of high and low resistance respectively connected in the main line and constantly-closed local circuit, separate batteries passing their currents in opposite directions in said portions, and an armature normally counterpoised against the magnetic attraction by a tension conditioned upon the reverse action of the main-line current in said electro-magnet, substantially as specified.

2. An electro-magnetic relay provided with a continuously-wound helix having a portion of high resistance connected in the main line, and a portion relatively of low resistance connected in a constantly-closed local circuit passing its current in the opposite direction to that of the main voltaic current in the main-line portion, to set up therein induced currents opposite in direction to the extra or otherwise induced currents of said main line to neutralize the same, substantially as specified.

383,844. OVERHEAD CONDUCTING SYSTEM FOR ELECTRIC RAILWAYS. GRANVILLE T. WOODS, Cincinnati, Ohio, assignor to the Woods Electric Company, same place. Filed May 2, 1887. Serial No. 236,778. (No model.)

Claim.—1. An "overhead" conducting-path for electro-motive railways, embodying, essentially, a central conductor carried by insulated metallic brackets, and one or more wires for carrying the contact-carriage, held upon suitable arms of said brackets, whereby the current delivered to the first-named conductor is transmitted by and through the bracket-arms to the carrying conductor or conductors, substantially as set forth.

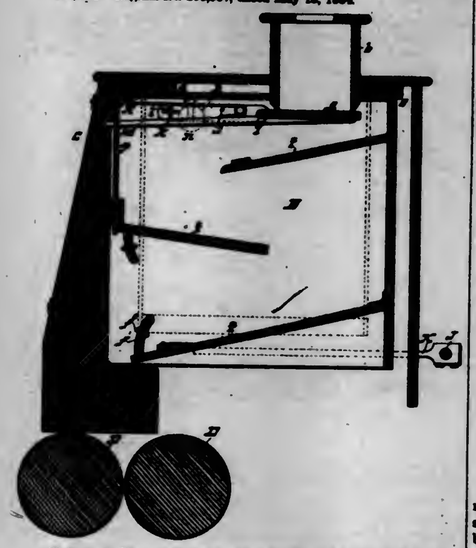
2. In overhead conductors for electro-motive railways, the combination of an insulated suspending-bracket with three conducting-wires—to wit, a central wire connected with the generator and two others supported upon outer arms of the bracket and receiving their charges of current through said suspending-arms from the first wire—substantially as set forth.

3. A bracket for carrying overhead conductors of electro-motive railways, embodying a central stem adapted to engage and hold a central conductor, and one or two outer supporting-arms adapted to uphold the traveling contact-wires and transmit the current from the first-named to the second conductors, substantially as set forth.

4. A traveling contact or carriage for overhead-conducting systems for electro-motive railways, consisting, essentially, of two conducting side plates or frames joined at the top and carried upon three grooved rollers pivoted between the plates, two of said rollers being carried in a truck so pivoted, substantially as set forth.

5. The traveling contact-carriage for overhead-conducting systems for electro-motive railways, embodying, in combination with its carrying-rollers, two side plates joined together at the top, flaring outward below and at the forward and rear ends, one of said plates having a still lower central extension curved inward to the central vertical plane of the carrying-wheels and adapted to receive the motor-connection at the lowest central point, substantially as set forth.

383,845. SAFETY-CAR. ELBERT R. L. WOODWARD, Chicago, assignor of one-half to Frederick S. Woodward, Turner, Ill. Filed Mar. 5, 1888. Serial No. 266,291. (No model.)



Claim.—1. A safety-car for railways, consisting of a detachable roof portion held in position by means of hooks, in combination with rods G, projecting outside the car, substantially as described, whereby the rods are caused to release the hooks when the car is overturned, as set forth.

2. In safety-cars of the character described, the detachable roof D, provided with the hooks E, for engaging holes F in the ventilating portion C, in combination with the rods G, projecting outside the car, and the rod or bar K, connected to the ends of the rods G, for releasing the hooks when the car is overturned, as set forth.

REISSUES.

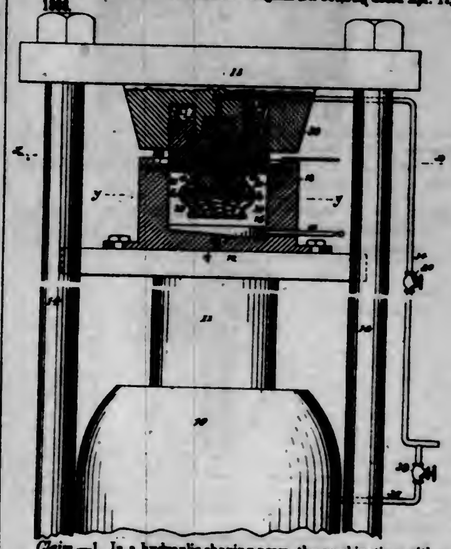
10,933. AUTOMATIC SHELF-FEEDER. WILLIAM M. JEWELL, Pine, assignor, by mesne assignments, to J. A. McAnulty, Denver, Colo., and Simon W. Sperry, Stockton, Cal. Filed Jan. 15, 1883. Serial No. 183,694. Original No. 266,257, dated May 12, 1884.

Claim.—1. The combination, substantially as shown and described, of a stationary hopper, a frame provided with spreading-shelves, means to vibrate or shake such frame, and a shelf pivoted in said frame at the discharge end of said hopper, and provided with a counterbalancing device to render it automatic, and a hook to engage said shelf to limit its range of movement, as and for the purpose set forth.

2. The combination, substantially as shown and described, of the stationary hopper, the shaker suspended beneath it, the shelf for closing the discharge end of said hopper pivoted in said shaker and moving with it, means, as set forth, for vibrating said shaker, the adjustable counterbalancing mechanism connected with said shelf to vary its resistance, and means, substantially as specified, for limiting the fall of the shelf and for positively preventing its fall, as and for the purpose described.

3. In a middlings-purifier or roller-mill, the combination of a hopper with a shaking-frame provided with a pivoted, counterbalanced, and yielding feeder-shelf, and with one or more adjustable shelves arranged beneath said feeder-shelf, substantially as and for the purpose described.

4. In a middlings-purifier or roller-mill, the combination of a hopper with a shaking-frame provided with an adjustable, counterbalanced, and yielding feeder-shelf, and with one or more adjustable shelves arranged beneath said pivoted shelf, substantially as and for the purpose described.



5. The combination, with a stationary hopper, of a counterbalanced and downwardly-yielding feeder-shelf for closing the discharge end of said hopper, and means for shaking or vibrating said shelf beneath the discharge end of said hopper, substantially as described.

6. The combination, with a stationary hopper, of an adjustable, counterbalanced, and downwardly-yielding feeder-shelf for closing the discharge end of said hopper, and means for shaking or vibrating said shelf beneath the discharge end of said hopper, substantially as described.

7. The combination of a stationary hopper, a vibrating or shaking frame provided with spreading-shelves and with a downwardly-yielding feeder-shelf pivoted in said frame and vibrating with it beneath the discharge end of said hopper, and counterbalancing devices, substantially as described.

8. The combination of a stationary hopper, a vibrating or shaking frame provided with spreading-shelves and with an adjustable downwardly-yielding feeder-shelf pivoted in said frame and vibrating with it beneath the discharge end of said hopper, and counterbalancing devices, substantially as described.

10,934. HYDRAULIC SHAPING-PRESS. ANDREW E. HOUSER, Hartford, Conn., assignor of one-half to I. J. Stearns & Co., same place. Filed May 5, 1883. Serial No. 272,904. Original No. 261,943, dated Apr. 17, 1882.

Claim.—1. In a hydraulic shaping-press, the combination, with a ram carrying a die-holder, of a head-block provided with a bearing-surface and arranged above the die-holder, whereby the edge of the blank may be clamped to the surface beneath it, substantially as described.

2. In a hydraulic shaping-press, the combination, with a die-holder, of an apertured head-block provided with a bearing-surface and arranged above the die-holder, whereby the edge of the blank may be clamped to the surface beneath it, substantially as described.

3. In a hydraulic press, the combination, with a ram, of a die-holder carried thereby, and an apertured plunger arranged to enter the die-holder, substantially as described.

4. In a hydraulic press, the combination, with a ram, of a die-holder carried thereby, and another ram arranged above the die-holder, substantially as described.

5. In a hydraulic press, the combination, with a ram, of a die-holder carried thereby, an apertured plunger above the die-holder, and a ram above the die-holder, substantially as described.

6. In a hydraulic press, the combination, with a ram, of a die-holder carried thereby, an apertured plunger arranged to enter the die-holder, and a ring surrounding the plunger, substantially as described.

7. In a hydraulic press, the combination, with a ram, of a die-holder carried thereby, an apertured plunger, and an annular ram surrounding said plunger, as and for the purpose stated.

8. The combination, with a ram, of a die-holder, and a rotary cylindric part having an inclined face and arranged beneath the cavity for the die, substantially as described.

9. The combination, with a ram, of a die-holder and a wedge-shaped block mounted within the holder, substantially as described.

10. The combination, with a ram, of a die-holder supported thereby, a wedge-shaped block mounted within the die-holder and provided with a downwardly-extending pin and an outwardly-extending lever arm or handle, substantially as described.

11. The combination, with a ram, of a die-holder carried thereby, dies adapted to fit said holder, a blank-holding plate arranged to fit within the die-holder above the die, and a head-block provided with a centrally-apertured plunger that is in connection with a water-supply, substantially as described.

12. The combination, with a ram, of a die-holder, 13, dies 20, mounted therein, a plate-holder, 22, a head-block, a plunger, 31, supported thereby and formed with a bore, 32, a ram, 35, mounted about the plunger, and a water-supply, substantially as described.

13. In a hydraulic press, the combination, with a ram, of a die-holder carried thereby, another ram arranged above the die-holder, a water-supply pipe common to both rams, branch pipes leading to the rams, and stop-cocks in said branch pipes, substantially as described.

H. PETERS, Photo-Lithographer, Washington, D. C.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

THE MOSLER SAFE AND LOCK COMPANY *v.* MOSLER, BAHMANN & COMPANY.

Decided May 14, 1883.

1. MOSLER—FIRE-PROOF SAFES—No. 261,640.
Letters Patent No. 261,640, granted July 17, 1882, to Moses Mosler, for improvement in fire-proof safes, adjudged invalid as to the first and second claims for lack of invention and as to the third claim for lack of novelty.

2. SAME—BENDING ANGLE-IRONS.
Letters Patent No. 263,136, granted August 14, 1882, to Moses Mosler, for an improvement in bending angle-irons, adjudged invalid as being for a method of making the article described in the prior patent, No. 261,640.

3. SAME.—FIRE-PROOF SAFES—No. 273,585.
Letters Patent No. 273,585, granted March 6, 1883, to Moses Mosler, for an improvement in fire-proof safes, adjudged invalid for lack of novelty, and because the claim covered simply an aggregation of elements.

4. LATER PATENT FOR PROCESS INVALID WHEN ARTICLE IS PATENTED TO SAME PARTY IN EARLIER PATENT.
After a patent has been granted for an article described or made in a certain way the inventor cannot afterward obtain a valid patent on an independent application for the method or process of making the article in the way described in the earlier patent.

5. AGGREGATION—NOT PATENTABLE.
Where the same combination was employed in square-cornered safes it was simply an unpatentable aggregation to employ it to round-cornered safes.

APPEAL from the Circuit Court of the United States for the Southern District of Ohio.

Mr. G. J. Murray for the appellant.
Mr. James Moore for the appellee.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity, brought in the Circuit Court of the United States for the Southern District of Ohio by the Mosler Safe and Lock Company, an Ohio corporation, against Mosler, Bahmann & Company, another Ohio corporation, for the infringement of three Letters Patent of the United States, each of them granted to Moses Mosler, namely: No. 273,585, March 6, 1883, for an improvement in fire-proof safes, on an application filed February 5, 1883; No. 261,640, July 17, 1882, for an improvement in fire-proof safes, on an application filed December 27, 1881, and No. 263,136, August 14, 1882, for an improvement in bending angle-irons, on an application filed December 11, 1882.

The answer denies that any one of the three patents shows any invention, and also denies that Moses was the first and original inventor, or an inventor at all, of the alleged inventions which the patents purport to secure, or of any of them, and also denies that any one of the inventions has any utility. It also denies infringement, and sets up various references on the question of novelty, in regard to all three of the patents.

A replication was put in and proofs were taken by both parties, and on a hearing the court dismissed the bill on the merits, its opinion, which accompanies the record, being reported in 22 Fed. Rep., 901; 21 O. G., 1669. That opinion sets forth sufficiently the nature of the inventions covered by the three patents, and the contents of the specifications and claims, and we adopt its statement, as follows:

1.—No. 273,585; application filed February 5, 1883; Letters dated March 6, 1883. The object of this invention, as stated in the specification, is to provide an improved means of constructing the outer casing so that the safe may be filled from the bottom. The front and back frames of the safe are formed from angle-bars which have one side cut away, where the heads of the corners are to be made, and the uncut side bent around to close the joint in the corner and form a frame with its outer corners rounded. The meeting joint at the bottom of the frame is overlapped by a short angle-piece which is screwed or riveted to the frame, uniting the joint. A sheet-metal cover is bent around the top sides and around the lower rounded corners of the frames. Upon each edge of this cover, at the bottom of the safe and between the angle-frames, are secured metal bars which project beyond the edges of the cover to form rests for the bottom plate. The safe is made with the customary sheet-metal box forming the interior receptacle, and secured to the cast-metal door-frame in the usual manner. The tops of the outer-frames conform to the curve of the rounded corners, and after the bottom plate is pushed into its place the inner bolts which secure the outer-frames pass through the bottom plate, which they secure, and the angle-frames. The patentee does not claim the bent angle-frames nor the safe composed of these frames and the sheet-metal cover bent around them, (the same being shown and claimed by him in an application then pending,) but limits his claim to the combination, in a fire-proof safe, of the frames, the sheet-metal cover bent around the top sides and lower corners, with projecting metal bars and removable bottom plate, substantially as described.

2.—No. 261,640. This patent differs from No. 273,585 in that a particular description is given in the specification of the cuts in the sides of the angle-bars, where the bends are to be made; but the patentee specifies that the shape of the cut may be varied, its only being essential that enough metal be cut away on one side of the angle-bar to permit the side or end to which it is to be bent, the cut nearest the uncut side being in the form of a curve or curves, so that when said uncut side is bent to form the corner it will bear upon and be supported by the curved end or portion of the cut, and there be rounded by a curve similar to the curve of the cut. The claims are as follows: "1. An angle-bar for safe-frames, consisting, substantially as before set forth, of a right-angled iron bar, one of the sides of which is cut away, leaving a curve facing the uncut side, whereby said uncut side may be bent to bear upon said curve to form a rounded corner. 2. An angle-bar for safe-frames, consisting, substantially as before set forth, of a right-angled iron bar, one of the sides of which is cut away, with curved cuts meeting a right-angled cut, whereby the uncut side may be bent to form rounded corners. 3. In a safe, the combination of the front and back frames formed of angle-bent angle-bars having one side cut away to leave curved ends upon which the uncut side is bent to form rounded corners, and a metal cover, 2, bent around and secured to said frames to form the top sides of the safe, substantially as described."

3.—No. 263,136; dated August 14, 1882; application filed December 11, 1882. The claim is as follows: "The herein-described process of bending angle-irons, which consists in cutting away a portion of one web by a cut which severs the two webs at their junction for a distance equal to the arc of the corner to be bent, and removes sufficient of metal in front of the single part of the apex with to permit the same to bend to the desired angle and to bring the edges of the opening meeting to form a close joint
